The **exclusive economic zone (EEZ)** is defined by the UNCLOS[21] as an area beyond and adjacent to the territorial sea (from 12 to 200 nautical miles[22]) in which the coastal State has sovereign rights for the purpose of exploring and exploiting, conserving and managing the natural resources, whether living or non-living, of the waters superjacent to the seabed and of the seabed and its subsoil. The coastal state also jurisdiction with regard to marine scientific research and the protection and preservation of the marine environment in the EEZ.

The Continental Shelf [23]

Under international law, coastal states also exercise sovereign rights over the non-living resources and sedentary living organisms in the 'continental shelf'.

The term 'continental shelf' is used by marine geologists generally to mean that part of the continental margin which is between the shoreline and the shelf break or, where there is no noticeable slope, between the shoreline and the point where the depth of the superjacent water is approximately between 100 and 200 metres.

Furthermore, this term is defined in Article 76 of UNCLOS according to a complex formula. According to it, "*the continental shelf of a coastal State comprises the seabed and subsoil of the submarine areas that extend beyond its territorial sea throughout the natural*

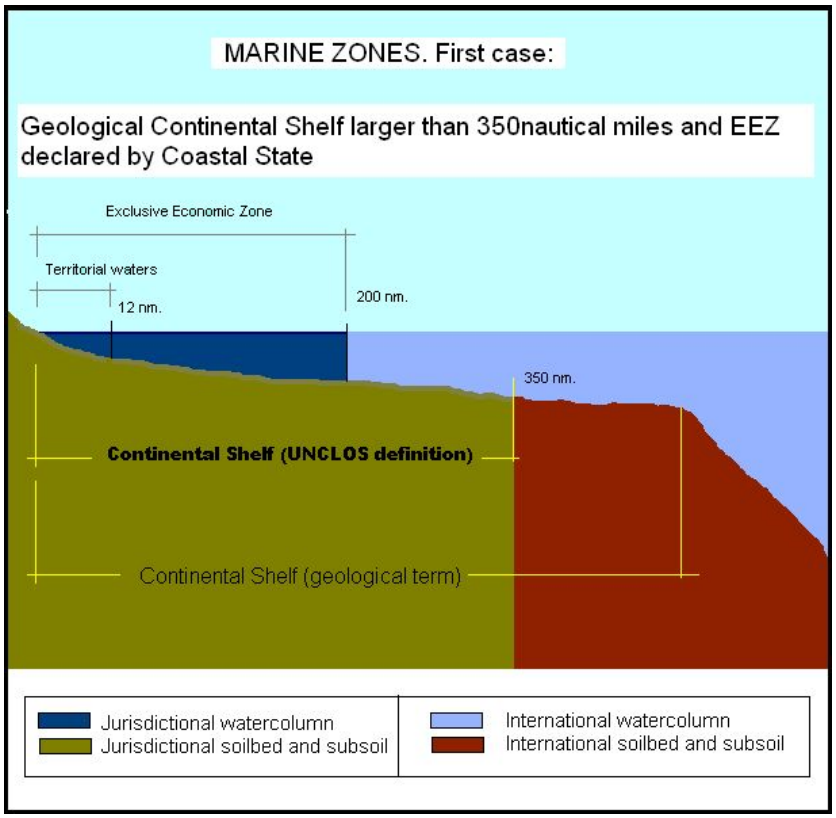
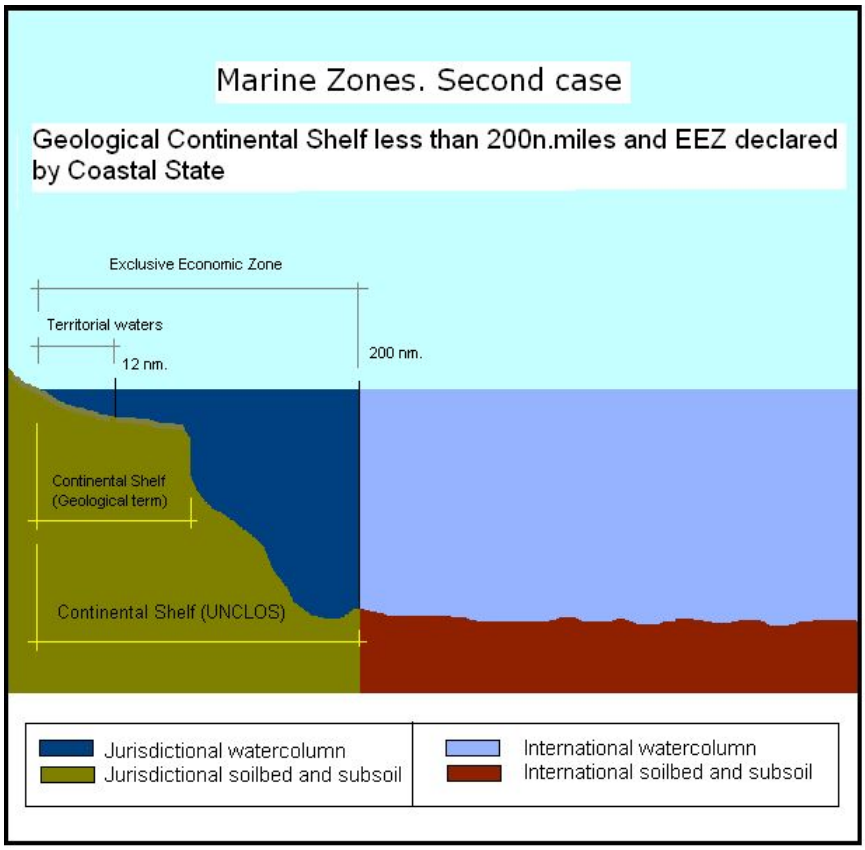
19 A nautical mile is 1' of arc on the equator; 40.000 km/360/60= 1 nautical mile=1,852km; 12nm= 22,2km

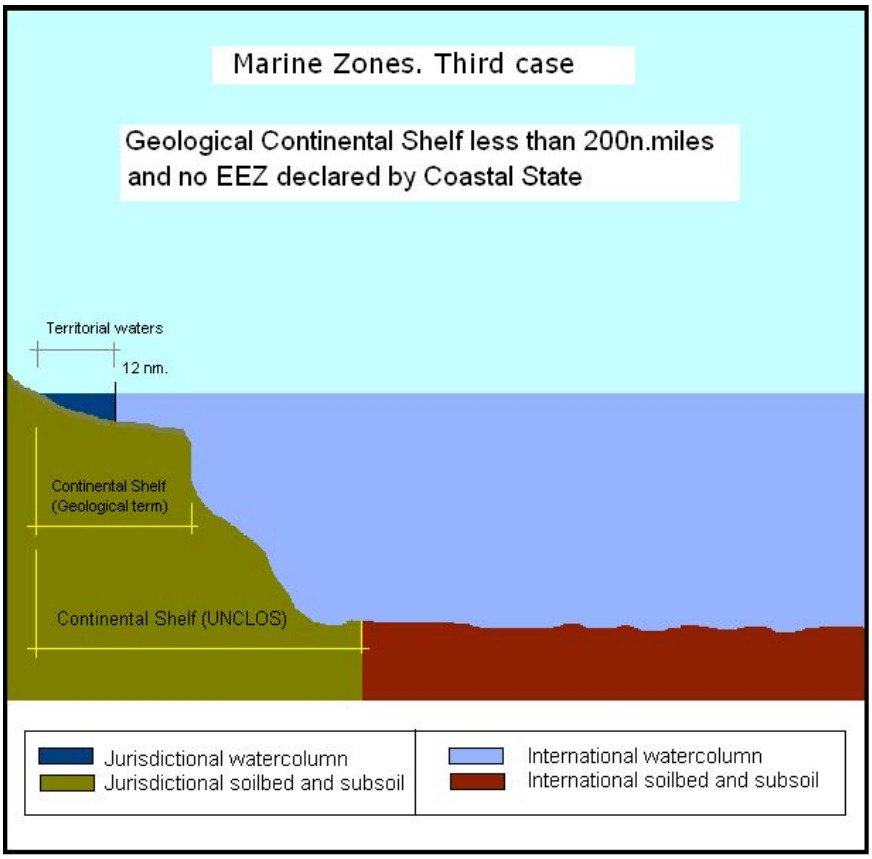
20 http://www.un.org/Depts/los/index.htm



21 *UNCLOS, United Nations Convention on the Law of the Sea, Article 55.* The exclusive economic zone shall not extend beyond 200 nautical miles from the baselines from which the breadth of the territorial sea is measured. (UNCLOS, article 56) http://www.un.org/Depts/los/index.htm



22 From 22,2 to 370,4km



23 Note that Continental Shelf is distinct from the EEZ

prolongation of its land territory to the outer edge of the continental margin, or to a distance of 200 nautical miles from the baselines from which the breadth of the territorial sea is measured where the outer edge of the continental margin does not extend up to that distance".

Therefore, Continental Shelf extends for at least 200nm in the open sea. It may not extend beyond 350nm. The Continental Shelf is the seabed and the subsoil, not the superjacent water column. The term Continental Shelf used in this document is the legal term as defined in the previous paragraph (UNCLOS definition).

Marine Zones. Second case
Geological Continental Shelf less than 200n.miles and EEZ declared by Coastal State
Exclusive Economic Zone
Territorial waters
12 nm.
200 nm.
Continental Shelf (Geological term)

A detailed case by case Coastal State database can be founded in UNCLOS website: http://www.un.org/Depts/los/LEGISLATIONANDTREATIES/index.htm, with all legal references. Several illustrative maps of marine areas are included in: http://www.un.org/Depts/los/LEGISLATIONANDTREATIES/PDFFILES/MAPS/

2.6.2. Applicability of Nature Directives in the Sea. To what extent do Habitats and Birds directives apply?

History of discussions about geographical scope of the directives

The initial position of a number of Member States was to see their obligations restricted to territorial waters, i.e. up to 12 nautical miles from the baselines. The Commission has consistently challenged this, arguing for a more extensive scope since, clearly, the protection of marine habitats and species, which are included in the annexes of the Directives, cannot be adequately achieved in such a limited area. After a number of years of debate and following discussions between the Legal Services of the Commission and Council, the Council recognised the need for implementation of the nature directives in the EEZ as a key element for the protection of the marine ecosystem (See Fisheries Council conclusions Luxembourg, 2001[24]). This acknowledgement supports the application to the exclusive economic zone which in the case of the Atlantic seaboard extends up to 200 nautical miles (370,4km) from the coastline for different Member States.

This opinion was confirmed by the position of the European Court of Justice delivered in the judgment of case C-6/04 of 20 October 2005, and other Member States Courts' positions (e.g.: the UK Case nºCO/1336/1999 The Queen -v- The Secretary of State for Trade and Industry ex parte Greenpeace Limited[25])

Legal principle

In relation to the exploitation and the conservation of the natural resources, the opinion of the Commission is that recognition by a coastal state of exclusive rights in a maritime zone brings not only rights but obligations. Exclusive right to exploit natural resources implies a similar duty to preserve natural resources. Therefore, community law relative to the conservation of natural resources applies in all maritime areas where Member States exercise such rights. That includes the following maritime areas:

- The internal waters and the Territorial Sea,
- The Exclusive Economic Zone (EEZ) and/or to other areas where Member States are exercising equivalent sovereign rights (fishing protection zones, environmental protection zones…)
- The Continental Shelf.

---

[24] Extract from the Annex to Council Conclusions on the Strategy for the Integration of Environmental Concerns and Sustainable development into the Common Fisheries policy, -Luxembourg, 25 April 2001: Point *15. The Habitats and Birds Directives(5), and specially the associated network of protected sites in the marine environment "Natura 2000", constitute a key element for the protection of the marine ecosystem which may have consequences on fisheries. Member States are encouraged, in co-operation with the Commission, to continue their work towards the full implementation of these directives in their exclusive economic zones.*

REF: *http://ue.eu.int/ueDocs/cms_Data/docs/pressData/en/agricult/ACF20DE.html*

[25] http://www.defra.gov.uk/wildlife-countryside/ewd/rrrpac/marine/06.htm#fn

This principle is in line with:

- Council Regulation 2913/92 "Customs Code" (Art 23) in which the definition of *"goods wholly obtained or produced in one country "* includes products taken from the sea-bed or beneath the sea-bed outside territorial waters, if that country has, for the purposes of exploitation, exclusive rights to such soil or subsoil. This regulation incorporates the same definition of goods wholly obtained in a country as previous Council regulation 802/1968. At this early stage, the Community already included into its scope of application the continental shelf that does not belong to the territory of the Member States. The common definition of the origin of goods which provides that produced goods and other products extracted from the sea-bed beyond the territorial sea are goods which are entirely produced in one country provided that the country exercised exclusive rights over the sea-bed for the purpose of its exploitation. Thus, according to this interpretation, the Community Law is applicable in the continental shelf and the EEZ of the EU Member States.

- Council Conclusions on the Strategy for the Integration of Environmental Concerns and Sustainable development into the Common Fisheries policy, -Luxembourg, 25 April 2001, which include the following considerations (Point 15): *The Habitats and Birds Directives (5), and specially the associated network of protected sites in the marine environment "Natura 2000", constitute a key element for the protection of the marine ecosystem which may have consequences on fisheries. Member States are encouraged, in co-operation with the Commission, to continue their work towards the full implementation of these directives in their exclusive economic zones.*[26]

- Jurisprudence of the European Court of Justice (mainly Court case judgement C-6/04[27] and other Member States Court's position delivered in different Court Cases (e.g.: UK: The Queen -v- The Secretary of State for Trade and Industry ex parte Greenpeace Limited, Case no: CO/1336/1999[28])

Duties for Member States

Member States have the duty to apply Community law in the above-mentioned areas, which includes the application of the Habitats and Birds Directives. Therefore, it is expected that Member States propose in the coming years the necessary sites to complete the marine component of Natura 2000 by application of the Birds and the Habitats Directives in their internal waters, Territorial Sea, as well as in their EEZ or other similar declared zones and in their Continental Shelf area.

For management purposes, Member States will take measures for the regulation of activities falling under their responsibility. For other activities, Member States will take the necessary actions to request the appropriate competent authority to take action. In particular cases where the need to regulate fishing activities is necessary to protect a Natura 2000 site in maritime areas under Member States sovereignty or jurisdiction is dealt with in extent in Chapter 6 of this Guidelines document. The general principle is that actions are to be taken in the context of the Common Fisheries Policy and in accordance with its rules. The relevant basic rules are enshrined in Regulation 2371/2002.

---

[26] *See: http://ue.eu.int/ueDocs/cms_Data/docs/pressData/en/agricult/ACF20DE.html*

[27] See Judgement articles 115-120 (http://curia.europa.eu/jurisp/cgi-bin/form.pl?lang=en&Submit=Submit&alldocs=alldocs&docj=docj&docop=docop&docor=docor&docjo=docjo&numaff=C-6%2F04&datefs=&datefe=&nomusuel=&domaine=&mots=&resmax=100)

[28] http://www.defra.gov.uk/wildlife-countryside/ewd/rrrpac/marine/06.htm#fn

In areas beyond Member States sovereignty or jurisdiction, the Community shall, where appropriate, promote actions to be taken through appropriate international fisheries conventions.

There is a special case where the Continental Shelf extends beyond the EEZ or where no EEZ has been declared. In this case, the soil and subsoil, which are covered by Community law, are lying under an International water column. In this case, the duty to protect the marine environment of the seabed needs to be made compatible with the need to respect the international legislation of the upper water column (mainly regulated by the UNCLOS framework).

It is necessary to clearly distinguish in that particular case what natural resources are subject to community law and what are subject to international law. The natural resources of the continental shelf to which Member States have sovereign rights are defined in Part VI of UNCLOS relative to the Continental Shelf (art 77.4): *The natural resources referred to in this Part consist of the mineral and other non-living resources of the seabed and subsoil together with living organisms belonging to sedentary species, that is to say, organisms which, at the harvestable stage, either are immobile on or under the seabed or are unable to move except in constant physical contact with the seabed or the subsoil*.

Therefore, it appears that where the continental shelf is lying under an international water column only the provisions of Habitats Directive as regards habitats and sedentary species would apply, as Community law applies only to the seabed but not to the water column or surface. For the same reason the Birds Directive and provisions of the Habitats Directive related to conservation of non-sedentary species[29] do not apply in this case.

This is particularly relevant in the Mediterranean Sea where Member States -except Cyprus- have not declared an EEZ. It may also be relevant in some parts of the Atlantic Ocean where a coastal Member States claims a Continental Shelf going beyond 200 nautical miles.

In the case of the Mediterranean Sea, any action aiming at the regulation of fisheries activities beyond territorial waters should be taken in line with the policy declaration of the "Declaration of the European Community ministerial conference for the sustainable development of fisheries in the Mediterranean" Venice 25-26 November 2003.

This declaration recognizes that the creation of fisheries protection zones permits the improvement of conservation and control of fisheries and thus contributes to better resource management. However, it is considered that the process for designation of these protected zones should follow a concerted and regional approach. In order to progress in this direction, the Mediterranean States shall cooperate at the appropriate regional level.

In this context, it is useful to also mention several fisheries regulatory measures taken by international organizations as the ICCAT with regard to the Mediterranean Sea and easter Atlantic[30] (e.g.: Recommendations by the ICCAT to establish a multi-annual recovery plan for some fish species as the bluefin tuna…)

[29] which includes *swimming* species of turtles, cetaceans or fish

[30] See http://www.iccat.es/

Maritime zones in the Mediterranean Sea[31]

The situation of different maritime areas in the Mediterranean Sea is particularly complex.

The European Community as well as all its Member States have ratified UNCLOS. Most third States riparian to the Mediterranean Sea[32] have also ratified it (All except Turkey, Morocco, Libya, Israel and Syria)

Cyprus is the only Member State to have declared an EEZ in the Mediterranean. However, France, Spain and Malta have declared different types of protection zones that extend beyond their territorial waters (fishing protection zones, environmental protection zones…)

Tunisia has also declared an EEZ in the Mediterranean Sea in June 2005. Croatia has declared equivalent sovereign rights regrading the exploitation and conservation of living resources beyond its territorial waters.

2.7. Some legal aspects related to the implementation of environmental legislation to marine environment. Some Management issues in the context of different competencies and responsibilities

There is no legal difference between marine and terrestrial environments as regards duties of Member States in relation to the implementation of the Birds and Habitats Directive. The final obligation of delivering a favourable conservation status for species and habitat types of Community Importance is the same in both environments. The obligations of Member States are also the same in relation to the need to ensure that the site designation process is exclusively based on scientific criteria.

As regards areas to be protected under the Birds Directive, the Court of Justice has emphasised that the selection of sites and the delimitation of boundaries should be carried out on the basis of exclusively ornithological criteria[33].

As regards the Habitats Directive, case law confirms that site selection by Member States should be exclusively based on the ecological criteria of Annex III of the directive[34].

Therefore, future management challenges should not be a determining element in this process.

Potential effects on marine species and habitats from human activities that are regulated at the Community or International level are greater in the marine than in terrestrial environment. In such a scenario, it is particularly relevant to consider in which marine zone the protected site is situated, in order to identify the appropriate management approach, as different legal regimes are to be considered for the three above mentioned marine zones *(point.2.6; territorial sea, Exclusive Economic zone, Continental shelf*).

---

34 (judgement of 11 September 2001, Commission v France, C-220/99, ECJ reports, p.5831; judgement of 11 September 2001, Commission v Ireland, C-67/99, ECJ reports, p.5757; judgement of 11 September 2001, Commission v Germany, C-71/99, ECJ reports, p.5811)

For each marine site, the responsible National Authority[35] has to establish the necessary conservation measures to ensure the favourable conservation status of the species and habitats types for which the site is designated. Depending on the site location and the type of action, the responsibility for the implementation of those measures can be different. These measures may have to be taken at Federal, National, European Community or International levels.

Actions to be taken at national and at Community level to regulate human activities in marine Natura 2000 sites will be in accordance with UNCLOS and other relevant international legislation. This is particularly relevant for the offshore marine environment.

Therefore, National Authorities have to identify the necessary conservation measures and the subsequent actors responsible for their implementation and enforcement. Each National Authority shall implement all measures of its own competencies and ask other responsible bodies to take action for measures falling under their own competencies.

A clear example is the Common Fisheries Policy, which is an exclusive Community competency. Point 6 below of this document is dedicated to this issue, given its relevance in relation to the management of the Natura 2000 sites in the marine environment. Shipping is another sector in which competencies also depend on site location.

Limits of competencies

A coastal State has different competencies in different sea zones. In global terms, the further offshore one goes, the less the Coastal State's exclusive competencies are to legislate and/or to enforce legislation. Some of the competencies are shared at Community level. Commercial fishing is a relevant policy where the Community has exclusive legislative jurisdiction. Some activities like military, mining or petrol prospecting/exploitation fall under national competencies over the entire Continental Shelf. Other sectors such as marine transport have different regulatory regimes for different marine zones, with different regulatory authorities. The international legal framework is defined by the *United Nations Convention on the Law of the Sea (UNCLOS).* Relevant bodies in this sector are the *International Seabed Authority (ISA)* and the *International Maritime Organization (IMO).*

2.8. Links with Regional and International Organisations and Agreements

Regional environmental marine organisations and agreements like the Helsinki Convention, OSPAR, Barcelona, and Bucharest Conventions are developing different networks of marine protected areas. The Commission welcomes all these initiatives that concur with EU nature conservation policy developments. Looking for a coherent and complementary approach in the identification process of Natura 2000 sites and other networks of marine protected areas would be a favourable measure that would enhance the global coherence of the network.

As described above (point 2.5), work being carried out by these Regional Organisations / Agreements on marine habitats and species of conservation concern will be relevant inputs to be considered in the first stages of the process of possible future adaptations of the Habitats Directive annexes in terms of the marine environment.

The Helsinki Commission (HELCOM) and the Commission for the Protection of the Marine Environment of the North East Atlantic (OSPAR) have adopted a joint work programme on the

[35] The National Authority responsible for the management of a Natura 2000 site is the administrative body designated in the Standard Data Form that Member States transmit to the Commission for each Natura 2000 site in accordance with 97/266/EC Commission Decision of 18 December 1996 *(Official Journal L 107 , 24/04/1997).*

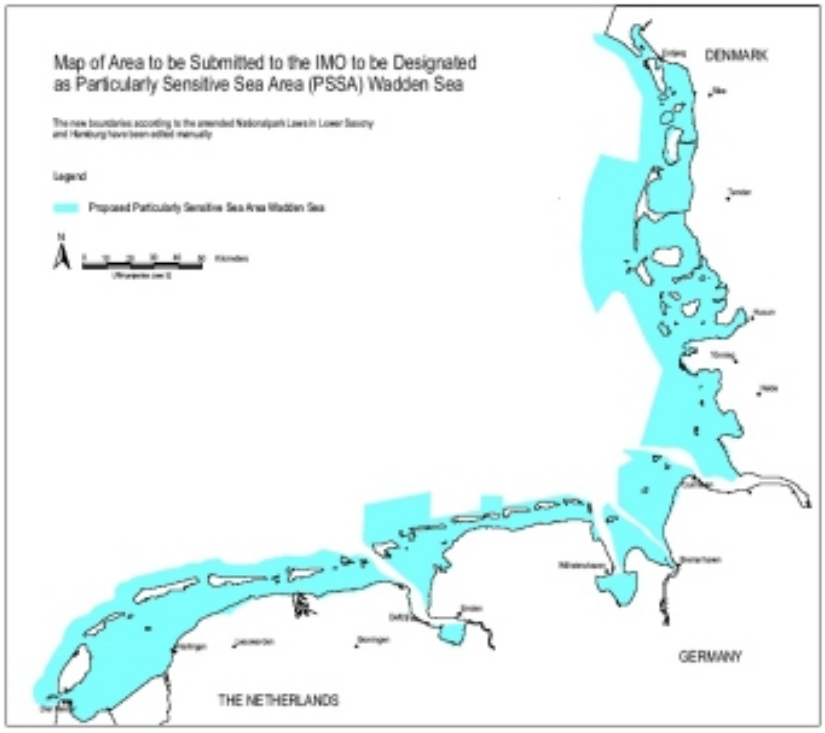
creation of a network of marine protected areas. This programme aims to ensure that by 2010 there is an ecologically coherent network of well-managed marine protected areas for the maritime areas of both the Helsinki Convention and OSPAR. To this end, they have agreed several actions, which include the development of a common proposal for a programme aimed at enhancing the protection of species and habitats in European marine waters, in order to produce suggestions for consideration by the European Community for amendments to the annexes to the Habitats and Birds Directives. (Full information is to be found in report documents -annex 7- of the first joint ministerial meeting of the Helsinki and OSPAR Commissions, Bremen: 25 - 26 June 2003 http://www.ospar.org/eng/html/welcome.html; **Joint HELCOM/OSPAR Work Programme on Marine Protected Areas**)

The parties of the Barcelona Convention agreed a protocol in 1995 concerning specially protected areas and biological diversity in the Mediterranean establishing common criteria for the choice of protected marine and coastal areas to be considered as specially protected areas of Mediterranean importance (SPAMI, http://www.rac-spa.org/index1.htm). The conservation of the natural heritage by the protection of threatened species and their habitats is the basic aim that must characterize a SPAMI[36]. The listed SPAMI and their geographical distribution will have to be representative of the Mediterranean region and its biodiversity.

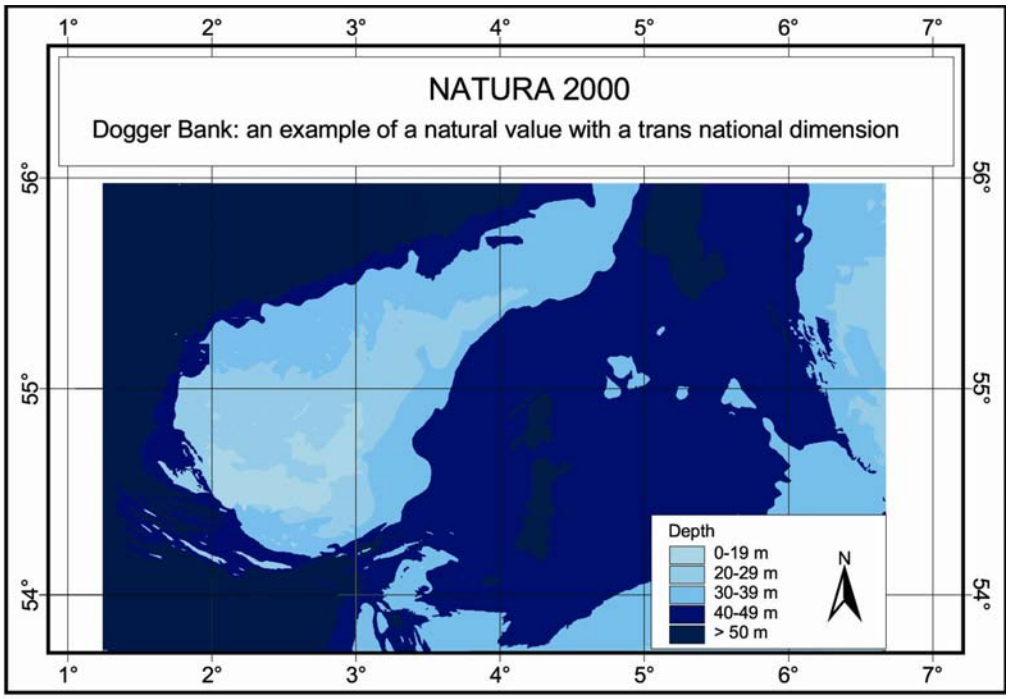
2.9. Trans frontier issues for site designation and management

As the conservation of habitat types and habitats for species can have a trans-frontier dimension, it will also be necessary to ensure the coherence of proposed *Sites of Community Importance (SCI)* and *Special Protection Areas (SPA)* designated by different Member States to be incorporated into the Natura 2000 network. This task will be undertaken by the Commission in partnership with the Member States concerned and with the scientific support of the European Environment Agency.

Any future protection of a feature having an international dimension under the Habitats Directive would require the designation of different SACs in the different EEZs, each country being responsible for its own area. This will be determined by an appropriate assessment to be carried out by each MS for their areas. The appropriateness to propose its part of the feature as Site of Community Importance will be determined by:



- The assessment criteria of Annex III of Habitats Directive (including sufficient representation of this Habitat type in the network and ensuring representatively of the site at national level)



- The interest in ensuring the overall integrity of natural features of Community interest that have a trans-border dimension.

The aim is to ensure that a common approach is taken where a feature has a transboundary dimension to ensure that the sites proposed/designated by the Member States concerned adequately protect this feature in Natura 2000. Such an approach (involving common recognised features and coherent boundary shapes) will favour better management schemes, ensuring the protection of the sites by the implementation of more simple and effective measures.

[36] Protocol concerning specially protected areas and biological diversity in the Mediterranean, art 8

The Wadden Sea is a typical example of a coastal/inshore natural area of international dimension hosting species and habitats types of Community Importance. Shared by Denmark, Germany and the Netherlands, it is one of Europe's largest marine wetlands. It contains numerous features that require protection under the Birds and the Habitats Directive including habitats necessary for species protection: Wild birds listed in Annex I of the Birds Directive as well as migratory bird species, Marine mammals and fish species listed in Annex II of the Habitats Directive. Protection is also required for habitats types included in Annex I of the Habitats Directive: sandbanks which are slightly covered by sea water all the time, estuaries, mudflats, salt marshes and sand dunes...

The Dogger Bank, in the North Sea, is a natural feature that extends through the EEZ of several Member States. The top of the feature is at less than 20 metres depth and is found in UK waters close to the EEZ boundary with NL. The feature continues in a North-Easterly direction stretching through Dutch and German waters and with the water depth progressively increasing.

2.10. Implementation of the Natura 2000 network. Administrative steps from identification to designation of marine Natura 2000 sites.

Marine sites of the Natura 2000 network will provide protection to some of the following natural values:

1. Marine birds in accordance with the provisions of the Birds Directive: bird species listed in Annex I (article 4.1) and other migratory birds (article 4.2).

2. Habitats listed in annex I of the Habitats directive: including all habitats types classified under code 11*("Open seas and tidal areas") and 12* ("Sea cliffs and shingle or stony beaches") and habitat type 8330 (Submerged or partially submerged caves). Four habitat types relevant to marine designation of sites are listed in annex I and present in offshore waters: 1110 Sandbanks which are slightly covered by sea water all the time , 1170 reefs, 1180 structures made by leaking gases and 8330 Submerged caves

3. Species listed in annex II (18 marine species, including fish, reptile, cetacean, and seal species)

4. Marine species listed in annex IV of the Habitats Directive. Sites are not designated based on the presence of annex IV species. However, they will also need to be protected under the provisions of Article 12 of Habitats Directive.

5. Marine species listed in annex V of the Habitats Directive. As above, sites are not designated based its presence. Nevertheless, they will also need to be protected under the provisions of Article 14 and 15 of Habitats Directive.

Sites designated in accordance with Birds Directive provisions

Special Protection Areas (SPA) are identified and designated in accordance with the provisions of the Birds Directive. In Article 4 of this Directive, it is established that Member States shall classify in particular the most suitable territories in number and size as SPAs for the conservation of these species, taking into account their protection requirements in the geographical sea and land area where this Directive applies. Not withstanding the fact that the identification and designation of SPAs is a Member State responsibility, it must be carried out on the basis of ornithological criteria and result in the selection of all the most suitable territories[37].

Once a site is designated as an SPA the legal protective requirements defined in Article 6 (2) (3) and (4) of the Habitats Directive apply to it.

Member States must send to the Commission all relevant information so that it may take appropriate initiatives to ensure that the SPA network forms a coherent whole.

Sites designated in accordance with the Habitats Directive provisions

First step: elaboration of a list of Sites of Community Importance. The criteria for selecting sites eligible for identification as Sites of Community Importance (SCI) are in accordance with annex III of the Habitats Directive and relevant scientific information. Member States will identify and carry out an assessment at national level of the relative importance of sites for each natural habitat type in Annex I and each species contained in Annex II (including priority natural habitat types and priority species). On that basis, each Member State proposes a list of SCI. The list, including appropriate information for each site, is transmitted to the European Commission[38].

Second step: adoption of the list of pSCI. The list of proposed SCI is to be adopted by the Commission in accordance with a procedure laid down in article 21 of the Habitats Directive. This step gives formal legal effect to the protective safeguards defined in Article 6 (2) (3) and (4) of the Habitats Directive.

Third step: designation of special areas of conservation (SAC). Once a site of Community importance has been adopted, the Member State concerned shall designate that site as a special area of conservation (SAC) as soon as possible and within six years at most, establishing priorities in the light of the importance of the sites for the maintenance or restoration, to a favourable conservation status, of a natural habitat type in Annex I or a species in Annex II and for the coherence of Natura 2000, and in the light of the threats of degradation or destruction to which those sites are exposed.

---

[37] See key conclusions of the Court of Justice in its landmark judgement, delivered on 19 May 1998, in this important test case for the implementation of the directive.

[38] a map, its name, location, extent and the data resulting from application of the criteria specified in Annex III provided in a standard format (c.f..: Commission Decision of 18 December 1996 concerning a site information format for proposed Natura 2000 sites *Official Journal L 107 , 24/04/1997).* This format also applies to sites designated under the Birds Directive.

In the marine environment, obligations of Member States are the same as in the terrestrial environment. Therefore, the provisions of the Habitats Directive related to the site designation process are the same: the site designation process is exclusively based on scientific criteria. Future management challenges (related to any future activity such as fisheries, energy generation or distribution…) should not be a determining element in this process.

More information on this topic can be found on the Nature Conservation and Biodiversity webpage of the Commission http://ec.europa.eu/environment/nature/home.htm

2.11. Update on implementation of Natura 2000 network in marine areas. An overview of existing marine SPA and SCI

By June 2006, Member States had designated 480 sites which contain marine waters- (64.754 km^2) as SPAs under the Birds' Directive and 1249 sites (77.784km2) as pSCIs under the Habitats' Directive.

An updated Natura 2000 barometer may be found at the following address: http://ec.europa.eu/environment/nature/nature_conservation/useful_info/barometer/index_en.htm

Most existing marine designated/proposed sites are located in territorial waters. Therefore, present and future efforts of Member States will need to mainly focus on the completion of the Natura 2000 network in the offshore environment.

In this regard, Germany has already proposed a significant contribution to the marine component of Natura 2000 in its offshore environment (10 new sites). Two of these areas have been designated as SPAs and are also protected since September 2005 under German national legislation as nature reserves.[39]

Other Member States are in the process of identifying sites for protection under both Directives. For example in the United Kingdom the Joint Nature Conservation Council (JNCC) has delivered scientific advice to the national authorities (DEFRA) to support *'the identification of offshore marine Special Areas of Conservation and Special Protections Areas'* in the offshore UK waters. This relevant document contains a useful approach and rationale for the identification and future selection of Natura 2000 sites (It may be found in the following address. http://www.jncc.gov.uk/page-2412)

[39] An overview and detailed descriptions of the German process leading to the actual nominations are given in English language by a website (www.habitatmarenatura2000.de) and in the book "Progress in marine Conservation in Europe" (von Nordheim et al. (eds.) 2006). Habitat marenatura2000" http://www.habitatmarenatura2000.de/en/aktuelles-summary-nature-conservation.php

3. HABITAT TYPES AND SPECIES REQUIRING MARINE NATURA 2000 SITES.

3.1. Marine Habitat types' definitions. Update of "Interpretation Manual of European Union Habitats".

At present, only nine marine habitat types are listed in Annex I of the Habitats Directive as natural habitats types of community interest whose conservation requires the designation of special areas of conservation (SAC's).

92/43 Habitats Directive. Annex I ***Open sea and tidal areas natural habitats types of community interest whose conservation requires the designation of special areas of conservation (SAC's)***	
1110	Sandbanks which are slightly covered by sea water all the time
1120 *	Posidonia beds (*Posidonion oceanicae*)
1130	Estuaries
1140	Mudflats and sandflats not covered by seawater at low tide
1150 *	Coastal lagoons
1160	Large shallow inlets and bays
1170	Reefs
1180	Submarine structures made by leaking gases
8330	Submerged or partially submerged sea caves

One of the objectives of the Marine Working Group has been to review the applicability of the existing definitions of marine habitats to the offshore environment and adapt these, where necessary, as a basis for extending the network of protected areas across all the European maritime areas where Member States exercise jurisdiction.

From a first review, it was considered that only three of the above listed habitat types needed a more complete definition in the Interpretation Manual of European Union Habitats[40]. The work of the experts therefore focused on these habitats types:

- 1110 "*sandbanks which are slightly covered by sea water all the time*"
- 1170 "*Reefs*", and
- 1180 "*submarine structures made by leaking gases*"

[40] The Interpretation Manual of European Union Habitats - EUR25 is a scientific reference document adopted by the Habitats Committee.

The main elements in relation to the definitions for each of the habitat types are indicated below. There are also substantial additions to the background information supporting these definitions (see Appendix 1 of this document).

3.1.1. Habitat type 1110 "sandbanks which are slightly covered by sea water all the time"

Based on previous work of the Marine Expert Group, an independent panel of marine experts, co-ordinate by the European Environment Agency (EEA), reviewed the definition of this habitat type in June 2006. The EEA did this with the support of European Topic Centre on Biological Diversity[41], the ICRAM[42] and several other experts on this topic. As a final output of this process, the EEA submitted the following definition, in accordance with the opinion of the above scientific panel.

1110 Sandbanks which are slightly covered by sea water all the time

Definition:

Sandbanks are elevated, elongated, rounded or irregular topographic features, permanently submerged and predominantly surrounded by deeper water. They consist mainly of sandy sediments, but larger grain sizes, including boulders and cobbles, or smaller grain sizes including mud may also be present on a sandbank. Banks where sandy sediments occur in a layer over hard substrata are classed as sandbanks if the associated biota are dependent on the sand rather than on the underlying hard substrata.

"Slightly covered by sea water all the time" means that above a sandbank the water depth is seldom more than 20 m below chart datum. Sandbanks can, however, extend beneath 20 m below chart datum. It can, therefore, be appropriate to include in designations such areas where they are part of the feature and host its biological assemblages.

This definition is based on the best available science and is consistent with the approach already established in the habitats interpretation manual. In delivering this opinion, the above-referred independent panel had full regard of the need for a definition that is valid and operational for all marine waters covered by the EU nature directives. Further to the review of the definition, the panel of experts made several recommendations, which include:

- When identifying and defining sandbanks in inshore and offshore environments, it is likely that Member States will need to use different scales, as variations in natural conditions occur at a much larger scale in offshore than in coastal environments. Sandbanks are generally larger natural features in offshore than in coastal environments.
- It is worth underlining that further expert judgment will be needed when appraising this habitat type at national level.

[41] The European Topic Centre on Biological Diversity. A Topic Centre of the European Environment Agency. See http://biodiversity.eionet.europa.eu/ .

[42] ICCRAM (Istituto Centrale per la Ricerca scientifica e tecnologica applicata al Mare, Roma, Italy) is part of the ETC consortium) http://www.icram.org/

- Section 4 of this guidance provide further examples of the means and methods that can be used to identify the sandbank feature, including with regard to the top level and slopes.

- As for most other habitat types in the interpretation manual, the examples contained in the section 2 on 'characteristic animal and plant species' do not represent an exhaustive list and are not necessarily restricted to this habitat type (See complete definition of this Habitat type in Appendix 1)

In the offshore environment, most of the sandbanks are elevated features arising from the seabed. A sandbank consists predominantly of sandy sediment mainly within a defined range of grain sizes[43]. Larger grain sizes, including boulders and cobbles as well as smaller grain sizes, including mud, may be found on the sandbank, but only in small quantities.

For considering a sandbank as being a feature "slightly" covered by water, it has been decided to define the arbitrary depth of 20 meters below chart datum for the top of the sandbank: other parts of the feature may be found at deeper depths. Effectively, it is appropriate to also include sections of the sandbank extending below 20m in depth where these are an integral part of the overall sandbank feature.

Such features may cover a substantial area, and some of them have a trans-frontier dimension. The Doggerbank in the North Sea is a typical case of a sandbank feature that extends across the marine zones of several Member States.

3.1.2. Habitat type 1170 "Reefs"

In relation to **reefs**, the following definition has been agreeded:

1170 "Reefs"

Definition of the habitat:

Reefs can be either biogenic concretions or of geogenic origin. They are hard compact substrata on solid and soft bottoms, which arise from the sea floor in the sublittoral and littoral zone. Reefs may support a zonation of benthic communities of algae and animal species as well as concretions and corallogenic concretions.

Clarifications:

- *"Hard compact substrata"* are: rocks (including soft rock, e.g. chalk), boulders and cobbles (generally >64 mm in diameter).
- *"Biogenic concretions"* are defined as: concretions, encrustations, corallogenic concretions and bivalve mussel beds originating from dead or living animals, i.e. biogenic hard bottoms which supply habitats for epibiotic species.
- *"Geogenic origin"* means: reefs formed by non biogenic substrata.
- *"Arise from the sea floor"* means: the reef is topographically distinct from the surrounding seafloor.
- *"Sublittoral and littoral zone"* means: the reefs may extend from the sublittoral uninterrupted into the intertidal (littoral) zone or may only occur in the sublittoral zone, including deep water areas such as the bathyal.
- Such hard substrata that are covered by a thin and mobile veneer of sediment are classed as reefs if

[43] For the application of this definition, sand includes grains having a diameter in the range of 1/16mm (= 0.0625mm) to 4.76 mm (passing U.S. standard sieve no. 4). This size range is in accordance with most common geotechnical standard classifications on this field.

the associated biota are dependent on the hard substratum rather than the overlying sediment.

- Where an uninterrupted zonation of sublittoral and littoral communities exist, the integrity of the ecological unit should be respected in the selection of sites.
- A variety of subtidal topographic features are included in this habitat complex such as: Hydrothermal vent habitats, sea mounts, vertical rock walls, horizontal ledges, overhangs, pinnacles, gullies, ridges, sloping or flat bed rock, broken rock and boulder and cobble fields.

Previous interpretation considered "reefs" as basically "*rocky substrates and biogenic concretions which arise from the sea floor"*. Given the importance of this habitat type for the designation of offshore Sites of Community Importance under the Habitats Directive, a clarification was needed to include all existing different types of reefs in EU waters.

Rocky substrates include complex habitats such as seamounts or hydrothermal vents. Biogenic concretions includes encrustations, corallogenic concretions and bivalve mussel beds originating from dead or living animals, i.e. biogenic hard bottoms which supply habitats for epibiotic species.

3.1.3. Habitat type 1180 "submarine structures made by leaking gases"

In relation to **1180 *"submarine structures made by leaking gases"***, the new interpretation distinguishes more clearly two subtypes of such a structure known as "bubbling reefs" and "structures within pockmarks".

1180 "submarine structures made by leaking gases"

Definition of the habitat

Submarine structures consist of sandstone slabs, pavements, and pillars up to 4 m high, formed by aggregation of carbonate cement resulting from microbial oxidation of gas emissions, mainly methane. The formations are interspersed with gas vents that intermittently release gas. The methane most likely originates from the microbial decomposition of fossil plant materials.

The first type of submarine structures is known as "bubbling reefs". These formations support a zonation of diverse benthic communities consisting of algae and/or invertebrate specialists of hard marine substrates different to that of the surrounding habitat. Animals seeking shelter in the numerous caves further enhance the biodiversity. A variety of sublittoral topographic features are included in this habitat such as: overhangs, vertical pillars and stratified leaf-like structures with numerous caves.

The second type are carbonate structures within "pockmarks". "Pockmarks" are depressions in soft sediment seabed areas, up to 45 m deep and a few hundred meters wide. Not all pockmarks are formed by leaking gases and of those formed by leaking gases, many do not contain substantial carbonate structures and are therefore not included in this habitat. Benthic communities consist of invertebrate specialists of hard marine substrata and are different from the surrounding (usually) muddy habitat. The diversity of the infauna community in the muddy slope surrounding the "pockmark" may also be high.

To facilitate better use of this document, a complete definition of the marine habitats types from 1110 to 1180 and 8830 is enclosed in Appendix I.

3.2. Identification of existing marine Habitat types and Species of European importance for different Member States.

The Marine Working Group has compiled general information related to the occurrence of habitats types and species which require protection through the elaboration for the three European Seas of the EU (Baltic, Atlantic and Mediterranean), of different tables showing presence per Member State of:

1. Marine Habitat types listed in Annex I of 92/43 Habitats Directive
2. Marine species listed in Annexes II 92/43 of Habitats Directive
3. Marine birds Listed in Annex I and migratory species.

These lists also distinguish between presence in offshore and inshore waters (internal waters and territorial sea). Draft lists have now been compiled. Those lists are enclosed in Appendix 2 of this document. Once they will be completed, these lists will be considered as reference elements to be submitted to the Habitat + Ornis Scientific Working Groups for their consideration. Member States that have not yet provided the necessary information may send it to the Commission for a future revision of the text.

[44] *Monachus monachus* is a priority species of Community Importance listed in annexes II and IV of the Habitats Directive. EN: Monk seal; FR: phoque moine; ES: Foca monje;

4. AN APPROACH FOR LOCATING AND SELECTING MARINE NATURA 2000 SITES.

This chapter has two main objectives:

1. To propose the best means of locating and assessing Habitats Directive Annex I habitat types and Annex II species, AND Annex I and migratory bird species under the Birds directive, for which marine Natura 2000 sites should be considered

2. To propose a site selection rationale(s).

The guidance on designation and information provided in the following sections focuses primarily on habitats and species found away from the coast and in offshore waters, as many Member States have already identified coastal and inshore Natura 2000 sites, along with guidance and information on their designation. The aim of this chapter is to reflect best available guidance on the methods for locating and selecting marine Natura 2000 sites. It does not provide details on the amount of information required, nor on how to assess the completeness of the resulting network of Natura sites.

4.1. Locating and assessing Annex I Habitats

Given the lack of more detailed biological data than, the identification of Natura 2000 sites in marine areas away from the coast has to be based on more general geological, hydrological, geomorphological and biological data than is the case for coastal or terrestrial areas. For all of the marine habitats on Annex I to the Directive, methodology exists for identifying the location and undertaking physical and ecological assessment of the areas required, although existing data may be sparse or absent in some sea areas (particularly in deep waters hundreds of miles from the coast).

Where the location of sub-littoral Annex I habitat types is not already known, they can be located in two steps using available data. Broad scale geophysical or oceanographic information is often available for large sea areas, and can be used as the first step in the selection of Natura 2000 sites by helping to identify the location of potential Annex I habitats. Step two then involves focussed information gathering or new surveys, directed to those specific areas where existing information indicates that an Annex I habitat is present or is likely to be present. This approach is particularly useful for Member States with large sea areas and deep waters, where detailed biological information is likely to be sparsely distributed. The two steps involve:

1. Using available physical information mapped at a regional scale, such as modelled geological seabed data, bathymetric data (e.g. IOC *et al.* 2003), physical oceanographic data, navigation or naval charts (where they show seabed type), to predict the location of potential Annex I habitat. Table 1 shows the general availability of such data for each Member State, Table 2 indicates which type of broad scale data may be suitable for locating each Annex I habitat type, and Section 4.2.1 describes data sources in more detail;

2. Refine and add to this information using more localised remote sensing datasets such as side scan sonar, acoustic ground discrimination system (AGDS) surveys, multibeam bathymetric survey, aerial photography or satellite images (for some habitats in very shallow water only, such as seagrass beds or maerl). Such remote sensed data will need to be validated in the field (ground truthed) by direct sampling of sediment

and/or biota (grab/core sampling, diver survey, benthic trawls) or by remote observation (video, photography, ROV [Remote Operated Vehicle]). As well as ground validation, data obtained from direct sampling will also be used to assess the biota of the Annex I habitat directly. Section 4.2.2 below gives more detail of methods, and a summary of suitable methods for each habitat type is presented in Table 3.

4.1.1. Regional scale physical data

Potential Annex I habitat types can be identified using existing, broad-scale, physical seabed information. This approach will enable those Member States with large sea areas and deep waters, where detailed biological information is likely to be absent or sparsely distributed, to focus in on a more limited number of areas for the collection/collation of more detailed data. Broad-scale physical data are available in many Member States, but with varying spatial resolution and varying coverage. Table 1 shows, in very general terms, the availability of broad scale datasets for each Member State.

Examples of such datasets which can be used include geological maps of the seabed, bathymetry data (including data from navigational charts, although note that for areas of potential conservation interest outside important navigation areas bathymetry may be very generalised), oceanographic data (such as temperature, salinity, stratification, water currents, turbidity etc.) to enable the identification of different water masses, and in some cases, satellite images. Regional scale datasets used for this purpose tend to be at a scale of approximately 1:250,000 to 1:1,000,000 to cover wide areas, and are generally produced by modelling of data from point samples, seismic tracks, etc. Regional scale data have generally been collected for purposes other than identification of biotopes or habitats, and so may use classification systems which do not fit exactly with the Annex I habitat definitions, therefore, there are limitations to their use, which depend on the habitat or sub-habitat being considered. For example, use of satellite imagery and aerial photography to identify habitats such as *Posidonia* beds is limited to shallow waters (down to approx. -15m water depth under good conditions). Broad scale data may not always be publicly available at a national level (e.g. Spain), or may only be available in paper form, however some digital data is available for wide areas such as the General Bathymetric Chart of the Oceans http://www.ngdc.noaa.gov/mgg/gebco/gebco.html . Table 2 gives an overview of which types of regional scale data can be used in the first step of locating different types of marine Annex I habitat.

Table 1 Availability of broad scale seabed habitat data for each Member State

Table 1 Type of data	Broad scale data availability or coverage throughout most of Member State's waters (out to EEZ/200nm or Continental Shelf)																	
	B	CY	D	DK	E	EST	F	FIN	UK	GR	I	IRL	LT	LV	M	NL	PL	P	S

Satellite images & aerial photography (shallow waters only)	Partially	Partially (won't distinguish between sub-types of reef)			No	No	No	Partially

NOTE: Point or line sampling data, such as benthic grab, dredge, video or photographic sampling can also be used in conjunction with geostatistical analyses to identify habitats.

4.1.2. Local or regional scale remote sensed and physical and biological sample data

The second step to identify and locate Annex I habitat, is to collate any existing physical and biological information on both known areas of Annex I habitat, and on those areas of potential Annex I habitat identified in step 1. Where existing information on habitats is lacking, new survey can be focussed on areas of Annex I habitat identified in step 1, thus avoiding the need to survey vast areas of seabed. Collation of data should involve examination of scientific archives and data from relevant academic, government, NGO, and industry stakeholders. This information can include historical charts of relevant seabed features and fishing grounds.

As well as physical information on the location and extent of an area of Annex I habitat, biological data with which to assess the flora and fauna of a potential site is essential, however, the quantity and quality of data required is difficult to define. As a guide, the information required to be able to complete the Natura 2000 data form[45] must be regarded as the minimum level required. Commission Decision 97/266/EC summarises the information, which must be collected by Member States, and defines the data format for the transmission of information for Natura 2000 sites. There are obligatory fields in the Natura 2000 data form that must be completed: 4.1 "General site character" and 4.2 "Quality and importance". Inclusion of other relevant site-specific biological information is desirable for Section 3.3 "Other important species of flora and fauna". Information necessary to complete these fields would include information on the presence of Red Data book species and species listed on

[45] Standard Data Form. Is defined by 97/266/EC Commission Decision of 18 December 1996 concerning a site information format for proposed Natura 2000 sites *Official Journal L 107, 24/04/1997. See* http://ec.europa.eu/environment/nature/nature_conservation/natura_2000_network/standard_data_forms/index_en.htm

international conventions as well as key and typical species present on the site. Information that is confined to a few easily observed and widespread or common species is generally not sufficient to make an evaluation.

Collated data from archives, existing maps and data from a variety of sources, including from stakeholders, are likely to exist in a wide variety of formats and at different levels of detail. All biological data relevant to marine Annex I habitats should be collated and can be plotted in a geographic information system (GIS) and overlain upon the maps of seabed type or other broad scale physical or hydrographic data. Existing results of benthic mapping programmes using the EUNIS classification should be used, to the highest possible level, to help in characterising habitats biologically (Dahl et al 2004). Historical maps and charts (e.g. of fishing grounds) may also be used to help provide information for certain habitats. Marine habitat survey and mapping has become increasingly common and widespread over the past 5-10 years, spurred on by both improvements in technology and the increasing demand for this type of information. Whilst the purpose for doing the mapping varies considerably (e.g. industry environmental assessments, conservation, fisheries, planning), the underlying techniques and type of data collected have a great deal in common. Table 3 gives examples of the type of data likely to exist and be useful to help in both locating the position of habitat types, estimating the geographical extent of the habitat, and assessing biodiversity.

In Table 3, data obtainable from different types of survey method are shown against different marine habitat types and sub-types likely to be found in offshore waters. In the table, a note is included to indicate whether each type of data could be used:

- to determine the location on the seabed of Annex I habitat types or habitat sub-types ('locate');

- to map the extent on the seabed of the Annex I habitat or habitat sub-type ('extent'); or

- to provide information on the biodiversity of that habitat or habitat sub-type ('biodiversity').

In practice, different types of survey method may be used to provide information on different types of habitat depending on various factors including the financial and time resources available and the depth and area of sea to be covered. Remote sensing methods can be used to cover large areas of seabed, but will need validation by direct sampling such as photographic or grab sampling. Some methods (e.g. satellite images or aerial photography) are only suitable for use in very shallow waters. A few of the direct sampling methods (those which dig-in to the seabed) can be destructive of fragile habitats such as biogenic reefs or seagrass beds, and therefore their use should be restricted to where obtaining a sample (for example to examine infauna) is necessary, and such methods should not be used to determine the extent of a sensitive habitat. For such destructive sampling methods, existing data obtained using these methods may be used to help provide information on areas of seabed, but if new survey is planned, then less destructive survey methods should be used.

Various publications and references give further details of useful methods for mapping and characterising marine habitats. Bäck et al 1996 and 1998 describe methods used for mapping and monitoring marine habitats in the Baltic Sea. Davies et al 2001 provide information on techniques for monitoring marine SACs in the UK, including consideration of the approximate costs of different techniques, and many of the methods can also be used for locating subtidal Annex I habitats and assessing their biodiversity as potential SACs.

Table 3 Type of data	Data useful to locate, determine extent and assess biodiversity of habitat or habitat sub-type?							
	1110 Shallow sandbanks	1170 Reef (bedrock)	1170 Reef (stony)	1170 Reef (biogenic)	1170 Reef (Hydro-thermal)	1180 Submarine structures	8330 Sea caves	1120 Posidonia beds

Epibenthic trawls/dredges[3]	Biodiversity (limited application)	Not applicable	Not recommended[3]	Not recommended[3]	Not applicable	Not recommended[3]	Not applicable	Not recommended

Notes:

[1] For all remote sensing, distinguishing habitats from each other and from the surrounding seabed depends on the resolution of the sampling method – higher resolution will provide better data to distinguish habitats, but covers smaller areas and is more expensive to collect and process than lesser resolution data.

[2] Aerial photography and satellite images are restricted in use to shallow waters (6-7m depth), depending on water clarity and other factors.

[3] Grab/core sampling and benthic trawling/dredging are relatively destructive sampling methods. These methods can provide useful data, but extensive use of these methods is not recommended for assessment of habitats sensitive to physical damage (e.g. biogenic reef, seagrass and maerl beds), and should not be used to identify their extent. Towed video can also be destructive of fragile habitats , if it impacts with the seabed, and is not recommended in these cases.

4.2. Site selection rationale for SACs/SCIs for Annex I Habitats

Article 3.1 of the Directive (92/43/EEC) states that "a coherent European ecological network of special areas of conservation shall be set up", and that "This network, composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range". The network shall also include special protection areas classified by Member States under the Birds Directive (79/409/EEC).

As set out in Article 4.1 of the Habitats Directive, site selection criteria for Annex I habitats are prescribed by Annex III of the Directive text. Stage 1 assessment criteria (listed below for habitats) and are applied at a national level to assess the relative importance of sites for each habitat listed on Annex I to the Directive, as amended in 1997 and 2004.

Stage 1A:

a) "Degree of representativity of the natural habitat type on the site;

b) Area of the site covered by the natural habitat type in relation to the total area covered by that natural habitat type within the national territory;

c) Degree of conservation of the structure and functions of the natural habitat type concerned and restoration possibilities;

d) Global assessment of the value of the site for conservation of the natural habitat type concerned.

Each of these criteria is discussed below.

Once sites are identified by Member States at Stage 1, their Community Importance is assessed, as set out in Article 4.2 and using the Stage 2 criteria included in Annex III to the Directive, by the Commission, with the help of the European Environment Agency and others, and in agreement with each Member State. This assessment is applied to the lists of sites irrespective of whether they have been identified for Annex I habitats or Annex II species or a combination of both. Assessment of the Community Importance of the sites included on the national lists using the Stage 2 criteria for Annex II habitats will take account of :

a) "Relative value of the site at a national level;

b) Geographical situation of the site in relation to migration routes of species in Annex II and whether it belongs to a continuous ecosystem situated on both sides of one or more internal Community frontiers;

c) The total area of the site;

d) The number of natural habitat types in Annex I [and species in Annex II] present on the site; and

e) The global ecological value of the site for the biogeographical regions concerned and/or for the whole of the territory referred to in Article 2, as regards both the characteristic of unique aspect of its features and the way they are combined."

The assessment at Stage 2 has been carried out for terrestrial and inshore sites so far with reference to the biogeographical regions listed in Article 1(c)(iii) of the Directive. The terrestrial boundaries of these regions were derived based on terrestrial ecology. However, for the marine environment it appears reasonable to consider an approach based on the major sea areas. Therefore, when assessing at stage 2 the global ecological value of the proposed marine sites, the marine areas (Internal waters, Territorial Sea, EEZ and Continental Shelf) to consider for each biogeographical region could be the following:

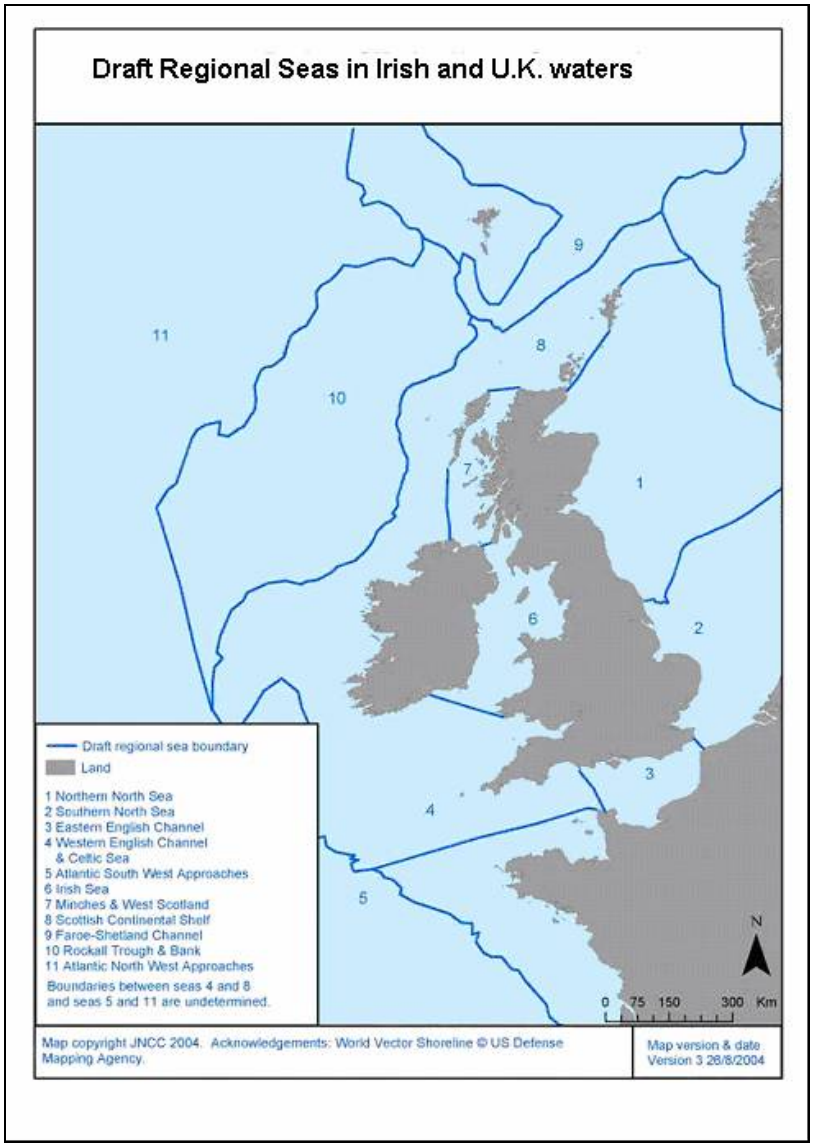
- Marine areas surrounding the three European Macaronesian archipelagos to the Macaronesian biogeographical region
- North East Atlantic Ocean and the North Sea to the Atlantic biogeographical region
- Baltic Sea to the continental and the boreal biogeographical regions.
- Mediterranean sea to the Mediterranean biogeographical region.

The adhesion of Bulgaria and Romania, and future potential adhesion of Turkey, requires considering the Black Sea separately. For management purposes, borders between seas and oceans should be established in accordance with existing borders of regional marine organizations. Division between Baltic and Atlantic will be as defined by HELCOM[46].

4.2.1. Representativity of the natural habitat type on the site

This criterion is a measure of how typical a site is for a particular habitat. The explanatory notes to the Natura 2000 data form (EC 1995) specifically state that it should be linked to the Interpretation Manual of Annex I habitats (EC 1999), as this provides a definition, list of characteristic species and other relevant information for each habitat. The additional information on habitat interpretation for marine habitats provided in Section 3 of these guidelines should also apply. In considering the degree of representativity of Annex I habitat types on individual sites, Member States should take account of the best examples in extent and quality of the main type and its main variants (Hopkins and Buck 1995).

According to Article 3.2 of the Directive, sites should be selected to represent the range of habitat types present within the territory of the Member State. The meaning of territory of the Member State applied to the marine environment is explained in section 2.6 of this document. It includes all marine areas areas where Member States exercise sovereignty or jurisdictional rights (internal waters, territorial sea, Exclusive Economic Zone (EEZ) and/or to other areas where Member States are exercising equivalent sovereign rights and the Continental Shelf.



Because the marine habitat types listed in Annex I to the Directive are very broad, a number of different habitat 'sub-types' may be present within the jurisdiction of a Member State. The range of sites selected for a particular habitat may be selected to represent the range of habitat sub-types present, as well as the geographical natural range of the habitat itself. For example, within the habitat type 1170 reef, sub-types of bedrock reef, stony reef and biogenic reef (constructed by various species) are likely to occur.

In order for the suite of sites identified by each Member State for each Annex I habitat type to represent both the ecological and geographical range of variation present in the marine part of its territory, possible sites, can be identified firstly in terms of the geographic location of areas

[46] (This comment has been supported by representatives of Sweden and Denmark in the Scientific working group of Habitats Committee, February 2006)

of habitat types in national waters, and secondly in terms of their physical and ecological characterisations. For possible sites in offshore waters, note should also be taken of possible sites in neighbouring Member State waters where an area of habitat may straddle national boundaries.

Major marine biogeographical regions can be further sub-divided into regional seas or sub-regional seas as an aid to assess representativity in terms of geographic location. These sea areas should be based on physical and ecological characteristics of seabed and water masses, using topographic form, structural character and substratum type as well as oceanographic characteristics such as depth, water temperature, stratification, salinity, etc. A draft example (Figure 1) has been produced for Regional Seas within the Atlantic biogeographic region, centred on Irish and UK waters (Vincent *et al.* 2004), and sub-regions have also been developed for the Baltic region. Any specifically marine regions developed should be ecologically based, not based on administrative or national boundaries.

4.2.2. Area of habitat types

The Explanatory Notes to the Natura 2000 Standard Data Form (EC 1995) explain that one needs to measure the surface covered by the habitat type on the site, and the total surface of the national territory that is covered by the same habitat type, to be able to select a suitable proportion of the habitat type as SAC/SCI. Although this is evident, it can be extremely difficult to make these measurements, especially those concerning the reference national surface. EU decision 97/266/EC recognises the difficulties in using all the criteria, especially those criteria referring to national territory. For this reason, data entries can be made in broad classes e.g. for the estimation of the relative surface of habitats in an SAC/SCI three classes are sufficient (A: 100>p>15%, B: 15>p>2% and C: 2>p%). A rough estimate of the total surface of the relevant habitats for offshore waters can be obtained where geological maps of the seabed exist, supplemented by other data sources.

When using these classes for broad habitat types such as 1170 reef and 1110 shallow sandbanks, which may be widely distributed in Member State waters with large sea areas (such as UK) most offshore sites are likely to fit into class C, and even very large sites (of the order of 50,000ha) may only fall into category B.

Consideration of area of habitat for candidate site selection is related to other principles used for site selection, for example, structure and functions (see below) are most often best conserved in sites that are extensive (McLeod *et al.* 2002).

With regard to selection of sites at Community level, the Commission has provided a reference document (Hab 97/2 rev4) to assist this process. This indicates certain percentage thresholds for examination of Member States proposals in biogeographic seminars. Where a proposal covers less than 20% of the resource this would normally be considered inadequate. Where it covers more than 60% it would normally be considered sufficient. For proposals that cover between 20 – 60%, the conclusions would need to be based in expert judgement in relation to the particular habitat or species concerned. Priority habitats and species would normally be expected to have the biggest level of representation in the network. However, document Hab 97/2 rev 4 is not a specific reference document for the marine environment, and the figures mentioned are not specific targets for national contribution to the Natura 2000 network, which need to be assessed on a case by case basis.

Different methods used for identification of Natura 2000 sites in the marine environment are described in detail in the book "Progress in marine Conservation in Europe" (von Nordheim et al. (eds.) 2006).[47]

[47] http://www.habitatmarenatura2000.de/en/aktuelles-summary-nature-conservation.php

Swedish practices on selecting Marine Protected Areas, including Natura 2000 sites

in the marine environment

The practice for selecting MPAs and marine Natura 2000 sites in Sweden is a modification of the system suggested by IUCN (Kelleher and Kenchington, 1992). Some conclusions:

Marine biological systems are different in certain respects from systems on land, and therefore criteria for selecting MPAs/Natura 2000 sites may differ from those used to select areas for protection on land. Marine systems also tend to be more open than terrestrial systems and this is why marine protected areas tend to be directed more towards protecting habitats, biotopes or ecosystem functions, rather than individual species.

MPAs and marine Natura 2000 sites are usually not well known to the public, or have little aesthetic value. Therefore, the information to the public about these areas is of the utmost importance.

In the management of a MPA/Natura 2000 site zonation is a way to set management practices and regulations for different activities in different parts of a MPA. (More details in Appendix 4.1)

4.2.3. Conservation of structure and functions

Article 1e to the Habitats Directive refers to conservation status of a natural habitat type, including structure and functions. The Explanatory Notes to the Natura 2000 Standard Data Form (EC 1995) explain that this criterion comprises three sub-criteria:

1. Degree of conservation of structure
2. Degree of conservation of functions
3. Restoration possibilities

Although these sub-criteria could be evaluated separately, they should nonetheless be combined for the requirements of selection of sites as they have a complex and interdependent influence on the evaluation process (EC 1995). Sites selected (and their boundaries) should take into account the structure and function requirements of the particular habitat.

In general, knowledge of the structure and functions of marine habitats is sparse and incomplete. For marine habitats which depend on certain aspects of the wider marine environment for maintenance of their structure (for example, biogenic reef formed by *Sabellaria* spp. depends not only on the presence of the species itself, but on tidal conditions and sediment supply), site selection (and in particular boundary definition) should take account of this.

An indirect method to estimate conservation of structure and functions is to assess the naturalness of the habitat using information on location and intensity of damaging activities, and by comparison with historical data for certain habitats. Use of models can be an effective tool if correlation between pressure factors and important elements of structure and function is established (Dahl et al. 2004). All available data on natural variability and likelihood of damage or vulnerability of the habitat need to be taken into account for assessing the conservation status.

4.2.4. Global assessment

This criterion is used to assess the previous three criteria in an integrated way, and to take into account the different weights they may have for the habitat under consideration (EC 1995).

4.2.5. Additional selection principles

Additional selection principles, such as those outlined below, may be used to assist in the site selection process.

- Priority/non-priority status (see Habitats Directive Article 1 (d));
- Geographical range (see Articles 1 (e) and 3.1);
- Special responsibilities (see Article 3.2);
- Multiple interest (Annex III Stage 2.2(d));
- Rarity;
- Ecological coherence of the Natura 2000 network(Annex III Stage 2.2)

EXAMPLE OF SITE SELECTION FOR ANNEX I HABITAT TYPE REEF (CODE 1170) IN THE GERMAN EEZ
"(BOEDEKER ET AL. 2006)"

SELECTION PRINCIPLES

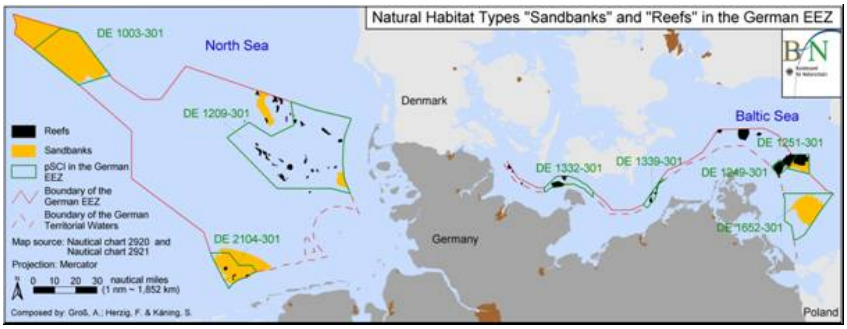
(1) The first step in achieving a complete suite of potential reef sites in the German EEZ was to produce the following national mapping guidance and explanations for the habitat type:

> "Elevations permanently submerged or at low tide emerging, consisting of hard substrates like rocks, littoral rock beds, till (moraine material), biogenic hard substrates (e.g. mussel beds and Sabllaria-reefs), including also fields of boulders and blocks on submarine moraine-ridges. Due to the specific glacial and postglacial development in the North Sea and Baltic Sea complex mosaics with habitat type 1110 (sandbanks) frequently occur. Elevations of mixed substrates (e.g. sands, mud, marl, till) are also classed as habitat type 1170, if hard substrates dominate".

(2) The second step was to identify where the Annex I reef habitat type is present within the North Sea (Atlantic Biogeographic Region) and the Baltic Sea (Continental Biogeographic Region). The following steps were carried out to produce a GIS map of potential reef habitats:

- Identification of potential reefs through analysis of existing maps on sediment distribution, fishery charts, and an evaluation of scientific archives.
- Verification of potential reef sites using sidescan-sonar and/or video profiles.
- Assessment of grain sizes of cobble fields with underwater video recordings (laser measurement), and in some areas scientific diving.
- Ascertainment of biological features through bottom dredge trawls (benthic samplings), and/or video profiles, and in some areas scientific diving.
- Photo and video documentation of habitat types by video profiling and scientific diving.

(3) The third step was to achieve a complete suite of ecologically valuable reefs within pSCI-proposals, which also reflect the different ecological forms and features of the habitat types in a representative way. The following forms of reef habitats occur in the German EEZ:



a. North Sea (Atlantic Biogeographic Region):

- Reefs in the form of boulder or cobble fields, which arise from the sea floor in the central part of Amrum Bank. stony reef bands along the slope of the glacial Elbe Valley and scattered stony reefs (Borkum-Riffgrund).

b. Baltic Sea (Continental Biogeographic Region):

- Stony reefs and mussel beds at the slope of Fehmarn Belt with high salinity (up to 25 psu) and with macrophyte vegetation.

- Stony reefs and mussel beds on and along the slopes of the Darss Sill representing “deeper reefs” with a medium salinity of 10 – 18 psu with macrophyte vegetation. Stony reefs and mussel beds on a deeper bank with low salinity and without macrophyte vegetation (Rönne Bank).
- Reefs in the form of boulder or cobble fields, which arise on the top of a shallow bank with low salinity and rich macrophyte vegetation (Adler Grund).

4.3. Locating and assessing Annex II species

Article 3.1 of the Habitats Directive states that a coherent European ecological network of sites hosting the habitats of species listed in Annex II shall be set up. However, Article 4.1 of the Habitats Directive also states that for aquatic species which range over wide areas, SACs will be proposed only where there is a “clearly identifiable area representing the physical and biological factors essential to their life and reproduction”.

For those Annex II species which spend time in recognised areas on land to breed or moult, e.g. seals and turtles, such areas clearly represent areas essential to the life and reproduction of the species’ concerned, and should therefore be considered for SAC selection. This section of the guidance focuses on the identification of sites at sea away from the coast for marine Annex II species, especially for those species which range over wide sea areas in part or all of their life cycle or geographical range.

For species such as cetaceans or fish which do not spend time on land, and for parts of the life cycle of those species that do, it can be difficult to identify areas of sea “essential to their life and reproduction”. This is partly because such species are mobile within the water column and difficult to observe, and partly because data concerning their distribution patterns while at sea are sparse, and such research is expensive and needs to be conducted over long time periods. However, data are available for some Annex II species in some sea areas, and further research including relatively new methods such as use of PODs (porpoise detectors) and satellite tracking of individual animals (seals, cetaceans and turtles) can provide data on aggregation patterns which may be used to identify areas for consideration as SACs. Geo-statistical techniques, similar to those proposed for identification and delimitation of aggregations of birds at sea (see Section 4.6) may also be used to identify densities and distribution centres in space and time for mobile species such as cetaceans (Schieidat et al 2002). These methods have been used for the identification and delineation of concentrations of harbour porpoise and shad in territorial and offshore waters.

- To assist with identifying SAC sites for migratory species such as harbour porpoise (*Phocoena phocoena*), an *ad hoc* meeting was convened by the European Commission on 14 December 2000 (EC (2001) Habitats Committee, Hab. 01/05) The meeting concluded

that "it is possible to identify areas representing crucial factors for the life cycle of this species" (see below). These areas would be identifiable on the basis of:

- The continuous or regular presence of the species (although subject to seasonal variations);
- good population density (in relation to neighbouring areas);
- high ratio of young to adults during certain periods of the year.

Additionally, other biological elements are characteristic of these areas, such as very developed social and sexual life."

In addition to any protection provided within SACs, or where SACs cannot be identified for these species, Articles 12 and 14 of the Habitats Directive provide mechanisms for the protection of those mobile marine species listed in Annexes IV and V (which include those listed also under Annex II) in the wider sea area.

4.3.1. Data availability for Annex II species

The availability of data at a regional scale on the distribution of Annex II species is very sparse, and data are not available for all marine areas. Types of data which may be used for identification of sites for Annex II species may include:

- Records of cetacean sightings from Seabirds at Sea surveys (in the North Sea and Skagerrak and Kattegat, e.g. Reid *et al.* 2003);
- SCANS survey for parts of the North Sea, Skagerrak and Belt sea (Hammond *et al.* 2002) and additional areas for SCANS II (see box);
- Specific aerial surveys (e.g. Scheidat *et al.* 2004);
- Stationary acoustic device (POD) surveys (for cetaceans, Verfuß *et al.* 2004);
- Satellite tracking of individual animals (for seals e.g. McConnel *et al.* 1999, turtles, Matthiopoulos *et al.* 2004, and cetaceans e.g. Dietz *et al.* 2003, Teilmann *et al.* 2004);
- Statistics from national fish surveys (often data for non-commercial fish are obtainable, but not collated or analysed);
- Incidental sightings and strandings data;
- Satellite images and ice cover maps (specifically for those species such as Baltic ringed seal using sea ice for breeding or moulting);
- Data from dataloggers with capability for reconstruction of movement in space by dead-reckoning (running calculation of estimated position from measurements of speed and travel direction); Ref. Adelung and Wilson, Univ. Kiel, and
- Passive acoustic dataloggers, either as towed arrays behind survey ships or hull-mounted systems on ferries etc. Towed array e.g. Gillespie and Chappell (2002). Hull mounted system not yet developed.

Small Cetaceans in the European Atlantic and North Sea (SCANS I and II)

SCANS I generated the first large-scale abundance estimates for the harbour porpoise, and other small cetaceans throughout the North Sea, Kattegat, Skagerrak and Celtic Sea, in 1994. These estimates were relatively precise and unbiased due to the extensive survey area and methodology used. Using the abundance estimates for harbour porpoise, bycatch levels in the North Sea and Celtic Sea were calculated and shown to be unsustainable by the IWC criteria. This project was largely a success due to the coordinated effort between UK, Denmark, France, Germany, Ireland, Sweden, Norway and the Netherlands.

A follow up on this project is the presently ongoing **SCANS II**, which benefits from the participation of twelve countries. Its three principle objectives are:

- to determine the absolute abundance of small cetacean populations, namely the harbour porpoise (*Phocoena phocoena*), bottlenose dolphin (*Tursiops truncatus*) and common dolphin (*Delphinus delphis*). In addition to the area previously surveyed, SCANS II will also **cover continental shelf waters** to the west of Britain, Ireland, France, Spain and Portugal.

- to develop and test methods to monitor cetacean populations. SCANS-II will develop and test potential methods and recommend a suite of monitoring protocols tailored by species and area.

- to develop a framework for management of by-catch. SCANS-II will develop a management framework based on abundance estimates and other available information to enable conservation objectives to be met in the short and long-term.

First results came in June 2006 and the final report in December 2006 including management recommendation. In 2007 an offshore surveys west of the existing survey area will be started. Results form this project are expected in 2008.

See http://biology.st-andrews.ac.uk/scans2/

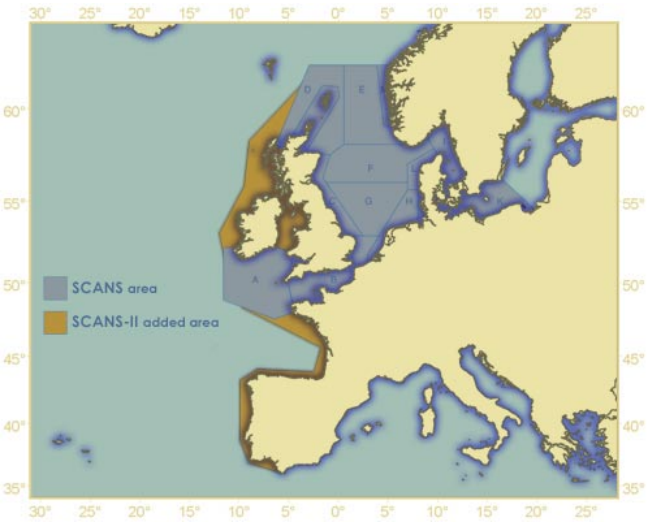


Table 4 Availability of broad scale data on distribution of marine species at sea for each Member State

Type of data	Broad scale data availability or coverage throughout most of Member State's waters (out to EEZ/200nm or Continental Shelf)

Notes: n/a = not applicable

1 Fin: In Finnish waters, ringed seals breed on sea ice in open sea rather than on land. The location and extent of the sea ice varies.
2 Fin: For grey and ringed seal
3 Finland and Estonia: for ringed seal, sporadic in Finland
4 UK and FR: Limited data for few areas and data available for a small number of animals.
5 E. Data related to SCANS II in Atlantic sea areas - Gulf of Cádiz (south-western Spain) and Cantabric Sea (northern Spain).
6 E: For beaked whale in the central-east Atlantic Sea (Canary Islands) and sea turtles in the Mediterranean Sea (south-eastern Spain).
7 E: Specific data for the habitats selection for cetaceans and sea turtles in the Mediterranean Sea (south-eastern Spain).
8 NL: Limited to potential wind park areas
9 NL: Harbour (common) and grey seals
10 DK: Systematic surveys for porpoises in western Baltic. Small-scale systematic surveys for monitoring at offshore wind farms and other developments.
11 DK: For porpoises, harbour and grey seals in areas of inner Danish waters, Skagerrak, Danish Waddensee and other areas.

Member States that have not yet provided the necessary information, may send it to the Commission for a future revision of the text

Table 5

Type of data	Data useful to assist in site identification for Annex II species at sea			
	Seals	**Cetaceans**	**Turtles**	**Fish**
Specific aerial surveys of animals at sea (sightings)	No[1]	Yes	Yes	No
Specific boat surveys of animals at sea (sightings)	No[1]?	Yes	Yes	No

European Seabirds at Sea (ESAS) survey cetacean sightings (Reid *et al.* 2003)	Partly useful (no possible differentiation at species level)	Yes	No	No
Stationary acoustic device (POD) surveys (for cetaceans, Scheidat *et al.* 2004);	No	Yes	No	No
Satellite telemetry (tracking)[2]	Yes	Yes	Yes	?
Incidental sightings or strandings[3]	Supplementary information only	Supplementary information only	Supplementary information only	Supplementary information only
Satellite images/ice cover maps[3]	Yes (ringed seal breeding areas only)	Yes Supplementary information only	No	No
Fishing catch/bycatch records	Supplementary information only	Supplementary information only	Supplementary information only	Yes ?
National fish surveys	Supplementary in some countries	Supplementary in some countries	Supplementary in some countries	Partly

Notes:

[1] Aerial survey provides site exact location for ringed seals on ice only during their moulting season (in Finland). Aerial survey is very reliable, but resource costly with a limited number of repeats. Boat surveys are cheaper and can cover longer periods and have more repeat surveys, but give less precise records.

[2] Very exact but costly method for a limited number individual animals, but may provide estimates of habitat use through predictive use of spatial models.

[3] Information may be used to supplement data used for identification of a site (e.g. identification of high productivity sea areas), but cannot be used to determine the extent of a species aggregation nor to identify a site for that species.

4.4. Site selection rationale for SACs/SCIs for Annex II species

As noted in Section 4.3 of these guidelines, Article 3.1 of the Directive (92/43/EEC) states that "a coherent European ecological network of special areas of conservation shall be set up", and that "This network, composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range". The network shall also include special protection areas classified by Member States under the Birds Directive (79/409/EEC).

As set out in Article 4.1 of the Directive, site selection criteria for Annex II species are prescribed by Annex III of the Directive text. Stage 1 assessment criteria (listed below for species) and are applied at a national level to assess the relative importance of sites for each species listed on Annex II to the Directive, as amended in 1997 and 2004.

Stage 1B:

a) Size and density of the population of the species present on the site in relation to the population present within the national territory;

b) Degree of conservation of the features of the habitat which are important for the species concerned and restoration possibilities;

c) Degree of isolation of the population present on the site in relation to the natural range of the species;

d) Global assessment of the value of the site for conservation of the species concerned.

Each of these criteria is discussed below. Once sites are identified by Member States at Stage 1, their Community Importance is assessed, as set out in point 4.2 and using the Stage 2 criteria included in Annex III to the Directive, by the Commission, with the help of the European Environment Agency and others, and in agreement with each Member State. This assessment is applied to the lists of sites irrespective of whether they have been identified for Annex I habitats or Annex II species or a combination of both. Assessment of the Community importance of the sites included on the national lists using the Stage 2 criteria for Annex II species will take account of:.

a) "Relative value of the site at a national level;

b) Geographical situation of the site in relation to migration routes of species in Annex II and whether it belongs to a continuous ecosystem situated on both sides of one or more internal Community frontiers;

c) The total area of the site;

d) The number of [natural habitat types in Annex I and] species in Annex II present on the site; and

e) The global ecological value of the site for the biogeographical regions concerned and/or for the whole of the territory referred to in Article 2, as regards both the characteristic of unique aspect of its features and the way they are combined."

Further guidance on interpretation of the above criteria, which includes some relevant to marine species, has been developed during Biogeographical Region meetings from 1994 to

2004[48].Site selection for species should include sites or areas important for different aspects of the life cycle of the species (EC 1995). These categories relate primarily to birds, but are also applicable to marine species:

- Resident (to be found throughout the year on the site);
- Breeding/reproducing (uses the site to nest and raise young);
- Staging (site used on migration or for moulting outside breeding grounds); and
- Wintering (uses the site during the winter).

This information must be included in the Standard Data Form (97/266/EC Commission Decision of 18 December 1996 concerning a site information format for proposed Natura 2000 sites Official Journal L 107, 24/04/1997). Explanatory comments on this form may be found in section 4.1.2 of this document

4.4.1. Proportion of Member State population

Where population estimates are available for a species, the proportion of the national population present on the site (or within the area) can be estimated. Defining boundaries for 'sites' in offshore waters which support a given percentage of the national population of some mobile species may be difficult due to the lack of obvious natural boundaries (such as coast, topographical boundaries, etc.) in the open sea. This criterion is also challenging to use in the offshore marine environment where populations may often be distributed across several national boundaries. However, recent progress in the use of geo-statistical techniques to identify densities and distribution centres in space and time for mobile species such as cetaceans (Scheidat et al 2002) and birds (Garthe & Skov 2004, Skov et al 1995 and 2000) can support the site selection process for mobile species. Use of these techniques can normally provide data of sufficient resolution to estimate which of the three population size classes applies: A: 100%>p>15%; B: 15%>p>2%; C: 2%>p>0% (EC 1995)

Where Annex II species populations are too small to be naturally viable, or where they occur only as vagrants, Member States may exclude them from consideration for site selection.

4.4.2. Conservation of features of habitat important for species and restoration

This criterion comprises the two sub-criteria:

- Degree of conservation of the features of the habitat important for the species; and
- Restoration possibilities.

To define sites using this criterion it is necessary to understand which habitat features are of importance for the species being considered. For wide ranging marine species, identifiable sites used for breeding and feeding are obviously important to that species' life and reproduction. There may also be identifiable sites used for other purposes (e.g. moulting) which may be important for the species. However, whether any such site is "a clearly identifiable area representing the physical and biological factors essential to the life and

[48] Additional 'guiding principles' to aid in interpretation of the Stage 1A criteria were produced by UK following the 1994 Atlantic biogeographical region meeting, and these are reproduced in Hopkins & Buck.

reproduction" of the relevant species (Habitats Directive Article 4.1) will need to be determined, for example, by expert opinion.

If a site's features are seen to be in average or partially degraded condition then an evaluation of how possible it would be to restore the features to a well conserved condition needs to be made.

Monk Seal *Monachus monachus* – **Example of site selection rationale**

A Life-Nature project conducted fieldwork in four areas recognised as important strongholds for the monk seal population in Greece. Monitoring actions and fieldwork were undertaken enabling an estimation of the population size, an inventory of biotic and abiotic factors, an identification of threats and an assessment of the importance of each site.

Of these four sites, **two key sites** were identified on the islands of *Kimolos-Polyaigos* and *Karpahos-Saria.* Together these sites represent over **10% of the world population** and therefore are important conservation areas both nationally and internationally.

Based on these results, the island of *Kimolos* was included into the neighbouring Natura 2000 site of *Polyaigos* due to its importance for monk seal breeding habitats. The *Karpathos-Saria* island complex has now also been designated as a Natura 2000 site

See Appendix 4 for more details.

Example of site selection for Harbour porpoises (*Phocoena phocoena*) in the German EEZ of the North Sea

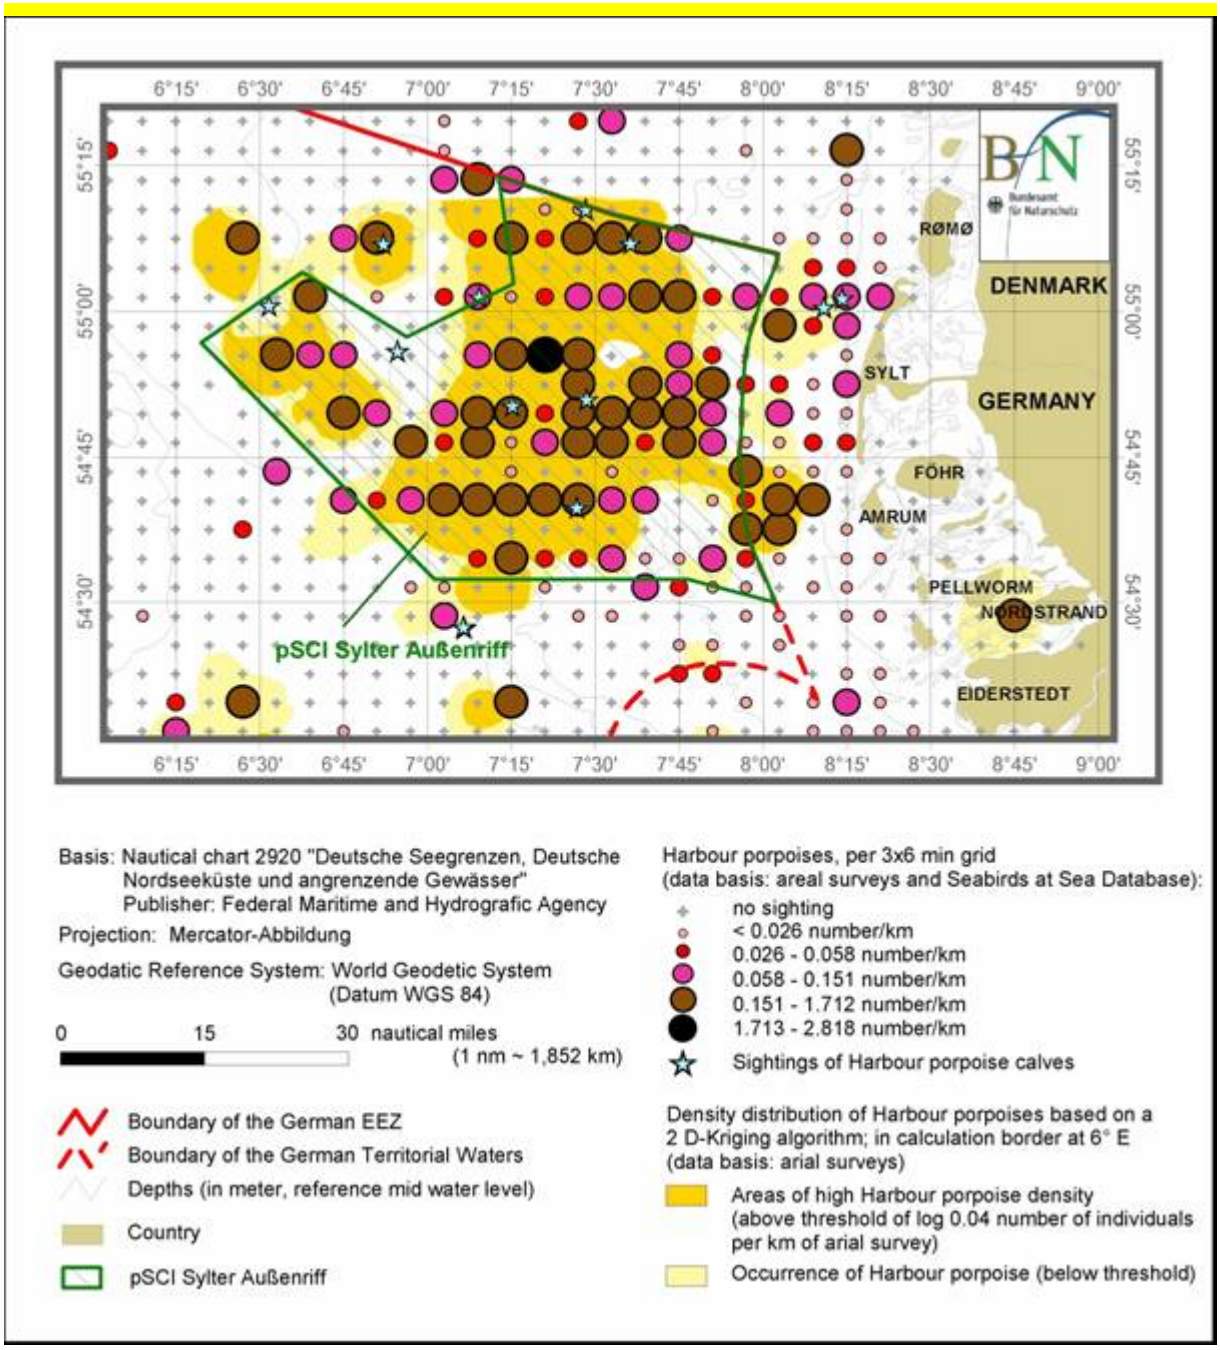
(Krause et al. 2006)

In application of the criteria of Art. 4.1 of the Habitats Directive only one pSCI in the German EEZ of the North Sea was identified and in major parts delineated for Harbour porpoises. The identification and demarcation was possible using the three criteria of the "ad hoc" meeting convened by the EC (EC 2001) (see text) and one additional: high proportion of sensitive behaviour, i.e. resting.

Selection Principles:

(1) **Data collection**: Harbour porpoises occurrence, distribution and behaviour was studied by quasi synoptical aerial transect surveys. In areas with higher occurrence of harbour porpoises additional flights with a higher resolution of line transects were carried out.

These data were completed and verified by long time data sets from the observations in the seabird-at-sea database (SAS), observations of local aerial data collections for environmental impact assessments, data from SCANS I, and data from porpoise detectors (POD). The last method was used successfully in the Baltic Sea only.



(2) **Species distribution maps.** Harbour porpoise concentrations from May to August (reproduction time) were modelled by geo-statistical methods, based on variogram analysis and ordinary kriging, and were visualised as distribution maps in a GIS:

(3) **Concentration areas:** Concentration boundaries were identified by using density threshold suggested by a marine mammals expert (log 0.04 per km² transect).

(4) **Population size estimation:** Within the pSCIs and for the whole German North Sea the population size was calculated and the proportion of harbour porpoises within given borders was estimated.

(5) **Selection and demarcation:** Only one concentration site with an up to 10 fold higher population density of harbour porpoises during the important time span for reproduction was selected. Demarcation of this pSCI was mainly according to the density gradient of harbour porpoises. However, also the distribution of the habitats "sandbanks" and "reefs" were important delineation criteria.

Finally the boundary lines were simplified and straightened in order to ensure simple and secure marking of sites at sea. In most of the other German pSCIs harbour porpoises occur regularly, but were registered in EU data forms as "present" only, because their population density do not fulfil the criteria named in Art. 4.1.

4.4.3. Isolation of species populations

This is an approximate measure of the contribution of a given population to the genetic diversity of the species and of the fragility of the specific population at the site being considered (EC 1995). Using a simplistic approach, the more isolated a population is, the greater its contribution to genetic diversity of the species concerned. Consequently, the term 'isolation' should be considered in a wider context, applying equally to strict endemics, to subspecies, varieties or races, as well as sub-populations of a meta-population (97/266/EC). In this context, the following grading should be used:

A: population (almost) isolated;

B: population not isolated, but on margins of area of distribution;

C: population not isolated within extended distribution range (EC 1995).

Where Annex II species populations are too small to be naturally viable, or where they occur only as vagrants, Member States may exclude them from consideration for site selection.

4.4.4. Global assessment

This criterion is used to sum up the previous criteria and also to assess other features of the site thought to be relevant for a given species using best expert judgement (EC 1995). Such other features may vary from species to species and might include human activities on the site or in nearby areas which are capable of influencing the conservation status of the species, land management, the statutory protection of the site, ecological relations between the different types of habitats and species, etc. (97/266/EC).

4.4.5. Additional selection principles

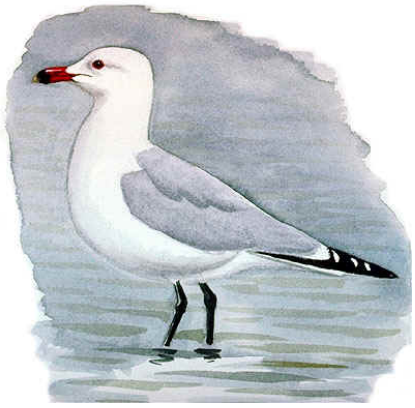
Additional selection principles, such as those outlined below which were developed at Biogeographical Region meetings[49], may be used to assist in the site selection process.

- Priority/non-priority status (see Habitats Directive Article 1 (d) and Annex II);
- Geographical range (see Articles 1 (e) and 3.1);
- Special responsibilities (see Article 3.2);
- Multiple interest (Annex III Stage 2.2(d));
- Rarity;
- Ecological coherence of the Natura 2000 network(Annex III Stage 2.2)

These criteria are in principle very useful, but in practice it is often very difficult to compare different areas on a quantitative level, as there may be lack of data from some areas, and more importantly, data collected by different methods (ship-based and aerial surveys, incidental sighting, passive acoustic monitoring etc.) and under different conditions (time of year, sea state, trained vs. untrained observers etc.). There is a great need for coordinated efforts in the direction of collecting quantitatively comparable data, such as SCANS and SCANSII. Coordination needs to be at both national and trans-national levels.

4.5. Identifying Special Protection Areas for seabirds and other waterbirds

Articles 4.1 and 4.2 of the Birds Directive require Member States to classify "the most suitable territories in number and size as special protection areas" for those bird species included in Annex I of the Directive and also for regularly occurring migratory species of bird, taking account of their protection requirements at sea as well as on land.



Breeding colonies of seabirds and coastal, wintering or resting areas for waterbirds on migration are clearly among the 'most suitable territories', and are relatively easy to identify. However, a variety of Annex I and migratory birds use benthic and pelagic habitats, from the sea bed through the water column to the sea surface, in areas near and distant from the coast, for a variety of purposes, including feeding, resting, and moulting. Such usage occurs throughout the year, and areas of particular importance need to be considered for inclusion in the Natura 2000 network as Special Protection Areas (SPAs).

[49] E.g: Hopkins JJ & Buck AL 1995 The Habitats Directive Atlantic Biogeographical Region. Report of Atlantic Biogeographical Region Workshop, Edinburgh, Scotland, 13-14th October 1994. Joint Nature Conservation Committee Report 247, Peterborough, 31pp

Box A. A complementary approach to the identification of SPAs.

BirdLife International (2004) has prepared a document proposing a general approach to the identification of marine areas that are important for the conservation of birds in Europe. It is included in appendix 4.1 of this guidance document.

Relevant issues for the identification of IBAS as boundary definitions and the use of Marine Classification Criterion are well covered.

Birds are observable on the sea surface for much longer time periods than is the case for those marine species accorded special protection under the Habitats Directive. However, some of the scientific problems encountered when attempting to identify sites for wide-ranging marine mammals at sea are very similar to those that arise when attempting to identify non-coastal marine sites for seabirds and other waterbirds. These relate largely to the scarcity of suitable data for many areas, and of how to robustly determine specific areas ("most suitable" for birds, or "essential to the life and reproduction" of Habitats Directive Annex II species) for species that are highly mobile and may be very widely distributed. In practice, some areas identified for marine species under the Habitats Directive and for seabirds under the Birds Directive are likely to overlap, for example, where they exploit the same food resources or use the same habitats.

For these and other reasons, approaches adopted for the identification of SPAs on land are not easily transferable to the marine environment. Marine habitats, for example, have a greater three dimensional quality. Habitat boundaries are often unseen, may be much more dynamic, both spatially and temporally, and may extend across small to very large scales. Consequently, it can be extremely difficult to define discrete sites, to estimate bird numbers within them, and thereby assess their relative or absolute importance to the birds.

However, seabirds, and other birds that use the sea, distribute themselves in a non-random way when at sea, often showing strong associations with habitat features. These could be the distribution of other birds, marine mammals or other taxa, but also physical and/or biological processes and features. The distribution of prey will clearly be a major determinant of the distribution of feeding birds. Such factors governing bird distribution at sea, along with the biology and ecology of the birds themselves, will also determine the spatial nature of bird concentrations; for example, birds may form large, dense flocks or be more loosely aggregated. The nature of important aggregations will in turn determine the attributes of SPAs such as size and boundary locations.

Therefore, the scales at which seabird and other waterbird dispersion occur in the marine environment vary from very small, tens of metres for example in some non-breeding concentrations of seaduck, to tens or even hundreds of kilometres, such as the dispersion of some procellariids. Nevertheless, at whatever scale, bird distribution will be associated with the distribution of physical habitat features, such as water depth, sea substrate, and other dynamic features such as fronts, as well as biological features such as food resources. So it is

important that where possible, ecosystem processes and functioning be considered when distinguishing such areas because, even if birds use them transitorily (perhaps spending significant periods travelling or at breeding colonies or terrestrial roosts), they may be essential for the survival and reproduction of their populations. That such areas might be used only seasonally or for a short time does not diminish their importance. If Annex I or migratory species occur in numbers that satisfy site selection criteria (see below), then this should be sufficient to determine qualification of the site for SPA status, irrespective of whether the species are accorded special protection under any other international instruments.

However, the process of identifying SPAs in the marine environment will vary among Member States, although the general principles to be applied will be very similar. Application of these guidelines will be determined *inter alia* by the physical and biological nature of the sea territory of each Member State and the bird complement it hosts.

4.5.1. Designation of SPAs: Court of Justice clarifies some Member States' duties

Member States are obliged to classify as Special Protection Areas (SPAs) all the sites, which applying ornithological criteria, appear to be the most suitable for the conservation of bird species listed in Annex I of the Birds Directive. This is the key conclusion of the Court of Justice in its landmark judgement, delivered on 19 May 1998[50], in this important test case for the implementation of the directive. It upheld the Commission's claim that a Member State had clearly failed to classify a sufficient number and area of SPAs.

This case focused on the key duty under Article 4(1) of the directive for the protection of endangered and vulnerable bird species. This requires Member States to '*classify in particular the most suitable territories in number and size as special protection areas for the conservation of these species, taking into account their protection requirements in the geographical sea and land area where this directive applies*'. It was the first time that the Court was confronted with a case relating to the overall nature of the duty to classify SPAs.

This and other judgements have confirmed the importance of ornithological criteria. Scientific criteria for identifying important bird sites had already been elaborated as early as 1981 when the first inventory of important bird areas in the European Community was prepared. During the 1980s the European Commission had also set up a working group, which led to the identification of Community-wide criteria for the selection of SPAs.

The Commission, whilst fully recognising that other conservation measures are required for many Annex I birds, including wider land or waterside measures for dispersed species, argued that these cannot be a substitute for classifying the most suitable territories as SPAs. This failure to classify effectively meant that such areas would not be subject to the protection regime, now defined in Article 6 of the Habitats Directive2, that applies to all SPAs.

[50] Case C-3/96, Commission v Netherlands, supported by Germany. http://curia.europa.eu/jurisp/cgi-bin/form.pl?lang=en&Submit=Submit&alldocs=alldocs&docj=docj&docop=docop&docor=docor&docjo=docjo&numaff=C-3%2F96&datefs=&datefe=&nomusuel=&domaine=&mots=&resmax=100

Main conclusions of the Court

The judgement of the Court of Justice in case C-3/96 includes the following key elements:

- Article 4(1) of the directive requires Member States to classify as SPAs the most suitable territories in number and size for the conservation of the species mentioned in Annex I, an obligation which it is not possible to avoid by adopting other conservation measures
- economic requirements mentioned in Article 2 of the directive may not be taken into account when selecting an SPA and defining its boundaries.
- the margin of discretion that Member States have in choosing the most suitable territories for classification as SPAs does not concern the appropriateness of classifying as SPAs the territories which appear the most suitable according to ornithological criteria but only the application of those criteria for identifying the most suitable territories for conservation of the species listed in Annex I of the directive .
- consequently Member States are obliged to classify as SPAs all the sites, which applying ornithological criteria, appear to be the most suitable for conservation of the species in question
- the IBA inventory, though not legally binding on the Member States concerned, represents a list of sites of great importance for the conservation of wild birds in the Community.
- in this case the IBA 89 had proven to be the only document containing scientific evidence making it possible to assess whether the defendant State had fulfilled its obligation to classify as SPAs the most suitable territories in number and area for the conservation of the protected species.

CRITERIA USED FOR THE 1989 Inventory of Important Bird Areas (IBA)

Breeding sites

1. Sites supporting 1% or more of the breeding pairs of the biogeographic population.
2. If 1) is not appropriate (e.g. the biogeographic population not known, 1% criterion too high to select important sites), criteria have been based on the specific characteristics of dispersion and habitat preferences of the species
3. If 2) also impossible, all sites with proved breeding (this applied to six very poorly known seabirds only: *Bulweria bulwerii, Puffinus puffinus mauretanicus, Puffinus assimilis, Pelagodroma marina, Oceodroma leucorhoa*, and *Oceodroma castro*)
4. Sites of particular importance for marginal or isolated breeding populations, with criteria based on specific characteristics of dispersion and habitat preferences of the species
5. All regular sites of rare or endangered species or sub-species; or small or endangered distinct biogeographical populations: c.2,500 pairs. (for some colonial species a level of five pairs is used to exclude irregular breeding sites).
6. For widely dispersed species, sites are selected on the basis of high densities or good numbers
7. Regular sites for significant numbers of three or more Annex I species

Sites other than breeding sites

8. Sites having 1% (at least 100 individuals) of the flyway or biogeographical population of one species
9. Sites having (at least) 20,000 waterfowl or 5,000 birds of prey on passage during a migration season
10. Sites with particular importance for marginal populations, with criteria based on specific characteristics of dispersion and habitat preferences of the species
11. Sites which hold 5 (gregarious species 25) individuals of rare and endangered species or sub-species or small and endangered biogeographic populations (less than 10,000 individuals in number).
12. Sites regularly holding significant numbers of three or more Annex I species

Sites were also included if they were amongst the 100 most important in the Community, or among the five most important in a region of the Community for Annex I species or sub-species.

4.5.2. Species for which SPAs should be considered

Broadly, there are two categories of Annex I and migratory species for which SPAs should be considered – seabirds and waterbirds. In Europe, seabirds include species in the following families:

Procellariidae (fulmars, petrels, shearwaters)
Hydrobatidae (storm-petrels)
Sulidae (gannets)
Phalacrocoracidae (cormorants)
Stercorariidae (skuas)
Lariidae (gulls)
Sternidae (terns)
Alcidae (auks)

Waterbirds comprise species in the following families:

Gaviidae (divers)
Podicipedidae (grebes)
Anatidae (ducks)

In addition, it may be necessary to consider Phalaropodinae (phalaropes), whose members make significant use of the marine environment.

A list of species that occur in European marine waters for which SPAs need to be considered is presented in Appendix 2 of this Guidelines document (Table 3). Most, if not all, of these species may be considered to be migratory, thereby justifying their consideration for SPAs at sea. The dispersion scales at which these species migrate seasonally will vary both among and within species. Table 3 of appendix 2 indicates those species included in Annex I of the Birds Directive, and also attempts to indicate the scales over which these species might typically be aggregated when not migrating. Every species potentially might be dispersed from small to very large scales, depending on various environmental and other conditions. In highlighting likely dispersion scales, the Table merely attempts to allow some preliminary assessment of the types of SPA that might be appropriate for the species; a comprehensive assessment in the context of the species ecological requirements and known dispersion patterns must be undertaken in order to fully identify potential types of SPA.

Of course, the list of species in Appendix 2, table 3 may not be exhaustive, and it does not preclude from consideration other potential qualifying seabird or waterbird species that use the marine environment.

4.5.3. Types of SPA

Sites selected as SPAs should be clearly identifiable, which renders it necessary to identify discrete aggregations of seabirds and waterbirds, or indeed discrete patches of habitat that are essential for the survival and reproduction of the species. As these aggregations are scale-dependent (spatially and/or temporally), governed by the species' ecology and biology, various types of bird aggregation may be identifiable. Table 3 in Appendix 2 indeed suggests that different sorts of SPAs are necessary for certain species of seabird and waterbird. Similarities in ecological requirements across species, perhaps within families or other taxonomic groups (but not necessarily), enable the identification of four broad types of possible SPA:

i) Extensions of existing terrestrial SPAs into the marine environment. In many cases, it is appropriate to extend existing coastal and island seabird colony SPAs into the marine environment because the birds already protected within these SPAs make extensive use of the waters adjacent to colonies (out to varying distances from the colony) for a wide range of purposes. This may include important inshore feeding areas in the breeding season for species such as divers, and species-specific seasonal concentrations, such as "rafting" Manx and Cory's shearwaters *Puffinus puffinus* and *Calonectris diomedea* in the breeding season;

ii) Areas hosting concentrations of certain species of birds usually, but not necessarily, in the non-breeding seasons, typically in shallow, coastal and inshore waters. For example, many species such as seaduck, divers and grebes form large aggregations outside the breeding season at predictable locations for resting, moulting and feeding. In some cases aggregations of these species may be catered for by extensions of existing terrestrial SPAs supporting assemblages of non-breeding waterbirds;

iii) Offshore areas hosting concentrations of seabirds. Throughout the year seabirds use the seas around Europe for many purposes, notably feeding. If important foraging areas for pelagic species, which might include highly productive fronts, currents, shelf-break areas, gyres and eddies, and upwellings, can be defined then these should be considered for SPA classification. Such areas might be quite distant from breeding colonies and it could be that such concentrations of birds are aggregated at scales too large to allow identification of discrete sites. However, the extent to which these (large-scale) aggregations of birds occur

regularly and comprise sufficient numbers of birds and species to merit SPA status requires considerable attention; few relevant analyses of existing data have been conducted;

iv) Migration hotspots. For some species, it may be necessary to consider areas where birds gather or travel in significant and regularly occurring concentrations during migration. Such areas could be migration staging posts, bottlenecks or pathways that are crucial for the survival of the species.

4.5.4. Data sources for SPA identification

In common with SACs under the Habitats Directive, analytical aspects of the SPA identification process, including issues of data quality, must be considered with respect to the final outcome of that process. Conclusions need to be sound, as far as possible objectively determined, robust to challenge, and reached using repeatable methods.

Identification of marine SPAs should always be at least partly data-driven, and very often will be entirely determined by analysis of (survey) data. For many species of pelagic seabirds, limited information exists on their habitat requirements and other factors governing their fine scale distribution, thereby rendering it difficult to predict where birds occur. However, many appropriate survey data have already been collected in the seas of north-west Europe and the sorts of data needed to enable a range of approaches to be adopted are relatively easy to collect. It is likely that data will derive from sampling and that further manipulation and analysis will be required to inform SPA identification (see below).

As in the terrestrial environment, the best available data should always be used for the SPA identification process, and treatment of these data should follow as far as possible strict scientific protocols. Site determination may be derived in a variety of ways, from *ad hoc* analyses of existing data to customised analyses of especially collected data. The quality of data needs to be assessed. Several factors are pertinent to the assessment of data quality, among them:

i) experience of observers to minimise errors in the estimation of numbers of birds and in species identification;
ii) survey/study design; data from systematic as opposed to casual or opportunistic surveys and observations are likely to be of higher quality, for example in avoiding over- or undercounting arising from bird movement;
iii) spatial and temporal extent of survey; an assessment of whether all parts of an area suitable for the birds should be made in order to identify possible bias or incompleteness, and allow proper determination of site boundaries. This assessment should include whether the count was made from land, aircraft or ship;
iv) sampling bias; an assessment may be required of the representativeness of samples; for example biased sampling of an area will result if surveying follows transect lines that are oriented parallel to important linear habitats, such as elongated banks, river channels, or some oceanographic fronts;
v) survey or recording conditions; some study results might have been affected by unusual events such as poor weather or a pollution incident;
vi) atypical behaviour of birds; it is important that the behaviour or dispersion of birds is not affected by survey platforms, such as low-flying aircraft, or by invasive techniques such as transmitter or logger attachment;

and the results of early manipulations of the data also need to be treated equally cautiously, for example in:

vii) derivation of population estimates; whether a population estimate derives from a complete count or from sampling may affect the likely accuracy of the estimate;
viii) robustness of population estimates; it may be possible to derive more than one population estimate from a single survey. When this is the case, the most robust population estimate should be used.

Any data considered inadequate for population estimation or for determining dispersion patterns must be treated as such, although it may still be useful in determining the need for more detailed or structured survey work in a particular area. Again, it is difficult to be prescriptive here; there are probably limitations attached to most studies. For example, a well-planned and well-executed aerial sampling survey using experienced observers and distance estimation should yield good population estimates, but additional information may be needed from land-based or boat-based surveys to supply accurate species identification or to count inconspicuous species or those close to the shore. In some situations (e.g. small or enclosed sites), boat-based or systematic land-based surveys might provide better population estimates.

As far as possible data should derive from systematic data collection conducted at appropriate scales, over appropriate time periods, and using robust methods. If lower quality data only are available, they must be used with appropriate caution. To reiterate, the quality of all data must be assessed and the degree to which they are appropriate for SPA determination should always be formally assessed; consideration should be given to the collection of new, better-quality data. However, a careful balance will need to be struck between seeking 'perfect data' and ensuring an area of known importance is afforded SPA protection as soon as practicable. Lack of 'perfect data' should not be argued to delay. Opportunities should be identified to make use of existing surveys to supplement data gaps.

The following table indicates the possible sources of data suitable for the identification of different types of SPA outlined above. Table on next page summarises the availability of data on the dispersion of seabirds and waterbirds in Member States.

Sorts of data that might typically be used in the identification of different types of marine SPAs.

Type of SPA / **Type of data**	**Marine extensions to existing colony SPAs**	**Inshore aggregations of birds usually outside the breeding season**	**Offshore aggregations of seabirds**	**Migration hotspots**
Customised aerial transect	Yes	Yes	Possibly (highly clumped aggregations)	No
Customised boat transect	Yes	Yes	Yes	Possibly
Existing at-sea survey data (e.g.	No	Yes (offshore)	Yes	No

European Seabirds at Sea data)				
Telemetry (radio/satellite)[1]	Yes	Yes	Yes	Yes
Bio-logging	No	Possibly	Yes	Yes[5]
Radar	No	Possibly (inshore)	No	Yes[2]
Land-based sightings	Yes	Supplementary information only[3]	Supplementary information only	Yes (partially)[4]

[1] The relative costs of different methods vary, but satellite or other tracking of individuals provides good data for (typically) few birds at considerable cost, so should not be considered unless other methods prove unsuitable. However, for certain species and specific questions this may be a very apt technique.

[2] Radar surveys can provide specific information on migration pathways, but this is a labour intensive and costly method suitable only for use in certain types of areas.

[3] May be a principal source of data for some enclosed coastal sites or where the broad distribution of target species is confirmed by boat or aerial survey to be within the range of land-based surveyors.

[4] As for Inshore aggregations.

[5] GPS loggers are capable of establishing migration corridors or bottlenecks

The availability of data on the dispersion of seabirds and water birds in each Member State.
Broad scale data availability or survey coverage throughout most of Member State's waters (out to EEZ/200nm or Continental Shelf)

Type of data	B	CY	D	DK	E	EST	F	FIN	GB	GR	I	IRL	LT	LV	M	NL	PL	P	S	SL
Customised aerial transect	Yes		Yes	Yes			Yes[8]		Yes[1]							Yes		Yes

[1] UK: only for areas of known wintering bird concentrations; survey is ongoing
[2] UK: database collated for North Sea and parts of Atlantic ocean, database contains data over 25 years
[3] UK: only for a small number of species (Manx shearwater *Puffinus puffinus*, red-throated diver *Gavia stellata*)
[4] UK: from popular coastal areas
[5] NL: near potential windfarms
[6] DK: near potential windfarms
[7] ES: Occasional data from previous survey. Recently survey is ongoing.
[8] FR: the most efficient technique for large areas
[9] FR: Data available for the south-west of France
[10] FR: only for very small number of few species (Cory's shearwater)

4.5.5. Data treatment for SPA identification

SPA identification will most likely be made using distribution and abundance data of birds within study areas. Much of the time these will be existing data, and this will apply largely in those Member States where there is a long history of data gathering. Typically, however, the data will have been collected for purposes other than SPA identification, so they will demand to be analysed in support of SPA identification differently from the ways originally envisaged (and often in novel ways). Similarly, existing data may often be sample data that do not readily act as indicators of total population sizes. In addition, the resolution at which these data have been collected will usually be at a scale too coarse to readily determine site boundaries. Of course, where appropriate data exist these should be used. Care should be taken to ensure the scale at which boundaries are determined reflects the spatial scale at which the qualifying species use marine habitats over time – spatial distribution can vary greatly diurnally, seasonally and between seasons.

Provided existing data are of sufficient quality and quantity, however, it is appropriate that they be used as the basis for further modelling and analysis in order to assess site qualification (in terms of numbers of birds present), as well as boundary determination. Statistical and spatial modelling techniques may also be enhanced by the inclusion of habitat and other environmental data as co-variates within models of bird dispersion. However, if simple count and localised data are adequate to determine the boundary of a site, additional modelling may not be required.

Several modelling techniques exist or may be readily adapted to further interpret bird dispersion data, from simple geographical, through statistical and spatial modelling, or a combination of two or more techniques. In addition to assessing data quality (see above), it is imperative that the data requirements of all statistical and modelling tools applied, including assumptions regarding the underlying distribution of the data, be observed. Whether estimating population size or determining the spatial extent of bird distribution (see below), violations of all test and other methodological constraints should be avoided. However, if it proves necessary to relax test requirements, through lack of data for example, this should be explicitly recognised and the possible consequences for the analysis identified.

Any analysis of marine bird dispersion data should aim to identify potentially suitable areas of high density (or 'hotspots'). In the absence of co-variate data, spatial interpolation methods of various kinds, which apply the inherent spatial structure of observed bird dispersion at a finer resolution throughout the area surveyed, such as kriging (see Boxes E, F), are appropriate Where co-variate data are available, for example habitat information, other modelling tools would also be appropriate, tools that might allow extrapolation of the bird dispersion data to areas outwith the area surveyed.

Whereas most data on the distribution of birds at sea comes from boat-based and aerial surveys, increasingly more data derives from remote (radio and satellite) tracking and biologging. Protocols for the application of such data need to be developed (see Box B). Although methods for the identification of core areas of use have been outlined in BirdLife (2004), some of them, such as kernel analysis, need to be applied with care (Hemson *et al*. 2005) and certainly in consistent ways across relevant research in support of SPA identification. Analytical techniques should be applied at all stages in the determination of site qualification and boundary definition.

Box B. Important Bird Areas for seabirds (marine IBAs) in Spain and Portugal – a multi-faceted approach using novel methods

© Filipe Viveiros

Between 2004 and 2008, BirdLife International partners in Spain (SEO) and Portugal (SPEA) are conducting two strategic Life-Nature projects to contribute to the implementation of the Birds Directive in the marine environment. The projects will develop a methodology for the analysis of the spatial distribution of offshore and pelagic species. This will be based on the newest methods in marine ornithology (BirdLife International 2004) deriving from telemetry data, density distribution maps, and kernel analysis to identify the areas that birds use most intensively

The projects are carrying out detailed inventories, using objective methodological criteria to determine Important Bird Areas (IBA) at sea for those seabird species listed in Annex I of the Birds Directive that occur in Spanish and Portuguese marine waters, which includes some of Europe's rarest bird species, such as the globally threatened *Puffinus mauretanicus, Pterodroma madeira and Pterodroma feae*, and many seabird species that are of conservation concern, e.g. *Calonectris diomedea*, *Puffinus assimilis, Larus audouinii* and *Sterna sandvicensis*.

The inventory will include a characterisation of the Portuguese and Spanish EEZs, and a detailed characterisation for each IBA, with GIS geo-referenced cartography, and a description of the main threats affecting it. To achieve this, the relationship between oceanographic data and the presence/absence of seabirds will be studied. Monitoring of certain species will be carried out through satellite (*Calonectris diomedea* and *Larus audouinii*) and radio tracking (*Bulweria bulwerii*, *Puffinus assimilis*, *Oceanodroma castro),* survey of coastal waters, analysis and mapping of ringing recoveries in Spain and Portugal, and the creation of a database of beached birds. The identification and generic sampling of the most favourable areas is being carried out based on the oceanographic characteristics of the areas concerned.

The combination of these methods will provide evidence on the key areas for seabird conservation (e.g. as foraging grounds). In contrast to gregarious coastal species, pelagic seabirds may depend on less clearly defined areas for their survival. Those areas need to be identified through mostly indirect methods such as telemetry as traditional methods of counting bird aggregations (e.g. Skov *et al.* 1995) cannot be used for these species.

All European globally threatened seabird species live in Portuguese and Spanish waters. Their behaviour at sea is poorly known and the methodologies used to track them are still under development. Both the SPEA and SEO projects will cross-check data from direct observations at sea (boats, plane surveys) with the seabird-tracking data. However, seabird densities at sea may be far lower than those recorded in the northern seas. A standard methodology for the identification and delimitation of IBAs at sea, based on standardized and quantitative criteria, will be developed; this could be used to identify IBAs off other countries, thereby improving the protection at sea for truly pelagic seabirds.

4.6. Site selection rationale for SPAs

While Article 4 of the Birds Directive does not offer precise criteria for SPA selection, some Member States have produced specific guidance for SPA selection. Selection guidelines should be clearly defined, based on scientific principles, agreed judgements, and easily applied. The aim here is to offer guidelines for the identification of marine SPAs and not to offer prescriptive rules to be applied among all Member States. However, application of selection guidelines within individual Member States should follow a procedure as prescriptive as is feasible, one that is tailored to the individual Member State's requirements.

Present guidelines for the establishment of SPAs in the marine environment aim to be consistent with established guidelines for the terrestrial environment, and be formulated with regard to the overall aim of achieving ecological coherence of the SPA and wider Natura networks as a whole.

The achievement of ecological coherence is likely to be an iterative process, both within and among Member States. The principles of coherence should be based upon knowledge of the ecology of all Annex I and regularly occurring migratory species and should also aim to include consideration of functional assemblages of species.

Understanding the protective requirements of the species (as required by Article 4) is an essential step in deciding what level of contribution the SPA network should make to the conservation of each of the species covered by the Directive requiring SPA designation.

Stroud et al (2001) suggest that the species for which the highest proportions of species' populations should be located within a protected area network are those which:

- occur locally in high densities (congregatory species);
- occur, to a large extent, on natural or semi-natural habitats;
- show predictable occurrence at particular sites regularly between years (i.e. species that are not irregular or dispersive);
- have restricted national or international ranges; or
- have small national or international population sizes.

It will be essential to understand the ecological requirements of each species before deciding on the best approach to adopt for each stage of its life cycle. This is particularly true of some seabird species that do not congregate in the same way some waterbird species do, but are likely to occur at sea in higher densities at predictable spatial and/or temporal scales. In respect of foraging birds from seabird colonies, care should be taken to ensure they do not have to qualify twice for SPA designation i.e. once for the breeding colony and once for foraging areas during the breeding season.

Foraging seabirds from a breeding colony are a good example of where traditional percentage thresholds e.g. 1%, should be applied with care, as they may not always give the best indication of whether a particular seabird species is amenable to a site-based approach for part of its life cycle. For example, only one-third of a breeding guillemot colony typically forages at any one time and so may never form congregations of 1% or more of its biogeographic or national population. Yet, it may form feeding concentrations that are spatially stable and predictable in occurrence between years that merit protection to ensure the ecological requirements of a particular breeding colony SPA are secured.

Therefore, assessing the protective requirements of each seabird species will require careful consideration of its ecological requirements and its behavioural characteristics during the different stages of its life cycle.

For example, in the UK, site selection follows a two stage process (Stroud *et al*. 2001). The initial stage, Stage 1, aims at the identification of suitable territories through the application of selection principles based on the objective assessment of the relative numerical importance of the bird populations under consideration. If application of Stage 1 guidelines fails to identify an adequate suite of sites for the conservation of a species, then, Stage 2 judgements must be applied.

Stage 1 Guidelines

Application of Stage 1 guidelines depends on the availability of adequate data for the relevant populations and species being considered for protection within SPAs. If sufficient data are available then important populations should be identified by placing them in an appropriate context.

UK example of Stage 1 guidelines for qualification of areas as SPA

An area qualifies as an SPA if:

(1) it is used regularly by 1% or more of the Great Britain (or all-Ireland) population of a species listed in Annex I of the Birds Directive in any season;
(2) it is used regularly by 1% or more of the biogeographical population of a regularly occurring migratory species (other than those listed in Annex I) in any season;
(3) it is used regularly by more than 20,000 waterfowl (as defined by the Ramsar Convention) or 20,000 seabirds in any season.

Again, Denmark applies very similar Stage 1 guidelines that suggest that an area qualifies if:

(1) it is used regularly by 1% or more of the national population of an Annex I species,
(2) it holds a density of an Annex I species that is more than three times the national average for that species;
(3) it is used regularly by 1% or more of the flyway population of a migratory species;
(4) it holds a density of a migratory species that is more than three times the national average for that species;
(5) it is used regularly by more than 20,000 waterbirds in any season.

In these contexts, "regularity" should be operationally defined. For the most part, the Ramsar definition has been applied:

(1) the requisite number of birds is known to have occurred in two thirds of the seasons for which adequate data are available, the total number of seasons being not less than three; or
(2) the mean of the maxima of those seasons in which the site is internationally important, taken over at least five years, amounts to the required level (means based on three or four years may be quoted in provisional assessments only).

In certain cases, for example for species that are particularly rare or in very remote areas (such as might particularly apply in the marine environment), hotspots might be identified on the basis of fewer data (see Stroud *et al*. 2001).

Population estimates used in the assessment of the importance of potential SPAs should ideally be derived from robust censuses and/or analyses (see above). The basis for designation will naturally be based upon the best available data. Preferably these will be those covering the most recent five years in each appropriate season, but it may be necessary to consider longer series of data (for example 25 years of UK/ Netherlands/ Denmark/ Germany/ Belgian North Sea seabird dispersion data, or 10 years of Belgian nearshore waterbird data). Use of longer time-series can help address the potential problem of long-term (but possibly cyclical) shifts in distribution. This emphasises the need for adequate marine bird monitoring systems to improve understanding of spatial and temporal variations in distribution.

Overall, such Stage 1 approaches offer repeatable and, as far as possible, objective protocols that result in a consistency of solution that might be important in avoiding or countering subsequent challenge.

Stage 2 guidelines

If application of Stage 1 guidelines does not enable the identification of a suitable series of SPAs for any species, for whatever reason, then Stage 2 judgements have to be made. An area

that meets the requirements of one or more Stage 2 guidelines should be considered for SPA classification. These guidelines may (and do in various Member States) accord favoured consideration on the basis of:

(1) Relative population size and density. Areas that host relevant species of birds in greater numbers or higher densities than others should be favoured for selection;
(2) Species range. Areas selected should provide the widest geographical coverage across the range of a species;
(3) Breeding success. Areas of higher breeding success than others should be favoured for selection;
(4) History of occupancy. Areas of known longer history of occupancy should be favoured for selection;
(5) Multi-species areas. Areas holding the larger number of qualifying species under Article 4 of the Birds Directive;
(6) Naturalness. Areas comprising natural or semi-natural habitats should be favoured for selection over those that do not;
(7) Adverse environmental conditions. Areas used at least once every 10 years by significant proportions of the biogeographical population of a species in periods of severe weather or of other unfavourable conditions in any season and which are vital to the survival of a viable population should be favoured for selection.

4.6.1. Alternative approaches to site selection

An alternative approach that combines Stage 1 and Stage 2 judgements is offered by BirdLife International (BirdLife 2005). This approach aims to identify Important Birds Areas in the marine environment. The relevant criteria are presented in Box D.

Box D. Criteria applied by BirdLife International that are pertinent to the identification of Marine Important Bird Areas (see also Box A)

(1) The site regularly holds significant numbers of a globally threatened species, or other species of global conservation concern;

(2) The site is known or thought to hold, on a regular basis, 20.000 waterbirds or 10.000 pairs of seabird of one or more species;

(3) The site is known or thought to hold 1% or more of a flyway population or other distinct population of a waterbird species;

(4) The site is known or thought to hold 1% or more of a distinct population of a seabird species

(5) The site is one of the 'n' most important sites in a country for a species with an unfavourable conservation status in Europe, and for which the site-protection approach is thought to be appropriate; ("*n" to be defined per country for a given species*)

(6) The site is one of the 'n' most important sites in a country for a species with a favourable conservation status in Europe but with its global range concentrated in Europe, and for which the site protection approach is thought to be appropriate;

(7) The site is known to regularly hold at least 1% of the flyway or EU population of a species considered to be threatened in the EU;

(8) The site is known to regularly hold at least 1% of a flyway population of a migratory species that is not considered to be threatened in the EU;

(9) The site is one of the five most important in the European region in question for a species or subspecies considered threatened in the European Union.

4.7. Site boundaries

While the terrestrial model provides a good basis for the identification and classification of Natura 2000 sites, in the marine environment it must be recognised that there are important differences between the two approaches. These relate to:

Site size The boundaries of a potential Natura 2000 site must be defined to ensure that they provide the basis for adequate protection of the features of conservation interest. Where the protected species primarily occurs should be considered the core area of the site, and should be included within the site boundary. Particularly in the case of designation of SPA, where the nature or scale of the species dispersion results in more loose aggregations, resulting in smaller concentrations disjunct from the core aggregation, the decision whether to include such satellite concentrations within a boundary should be made by reference to the overall size of the qualifying interest. It may also be determined by formal rules relating to the regularity with which the satellites qualify as important over several surveys. All concepts introduced here must of course be defined operationally. For the UK working definitions of "satellite", "regularity" of importance, and "importance", see (Webb *et al*. 2004a, b, c; McSorley *et al*. 2004).

Member States might wish to consider the value of identifying buffer zones around Natura 2000 sites. They are not a legal requirement under the Birds Directive of Habitats Directive, although any activities or developments that are harmful to the qualifying feature and which take place outside the site are still subject to the protection and procedural safeguards of Article 6 of the Habitats Directive[52].

Site Shape. In the marine environment, where sites may be far from the coast, it is preferable to have simple site boundaries, based on "straight" lines and convex polygons, which 'box' the qualifying interests. This approach will simplify future management of the site survey and monitoring, and notification of duties to be carried out by other responsible authorities.

4.7.1. Boundary determination for SPAs

The spatial extent of hotspots or bird interest features for which protection is being established must be defined as far as possible by application of objectively defined criteria. Seaward boundaries of sites, may be defined in various ways, but ideally based on the application of "objective", well-established analytical techniques to species dispersion data, and ideally mapped within a Geographical Information System. For example, they may be delimited by isolines that separate regions where the gradient in bird density meets an agreed or operationally defined threshold (e.g. Garthe and Skov 2004; see Box E).

Example of site selection for seabirds in the German EEZ of the Baltic Sea (Krause et al. 2006)

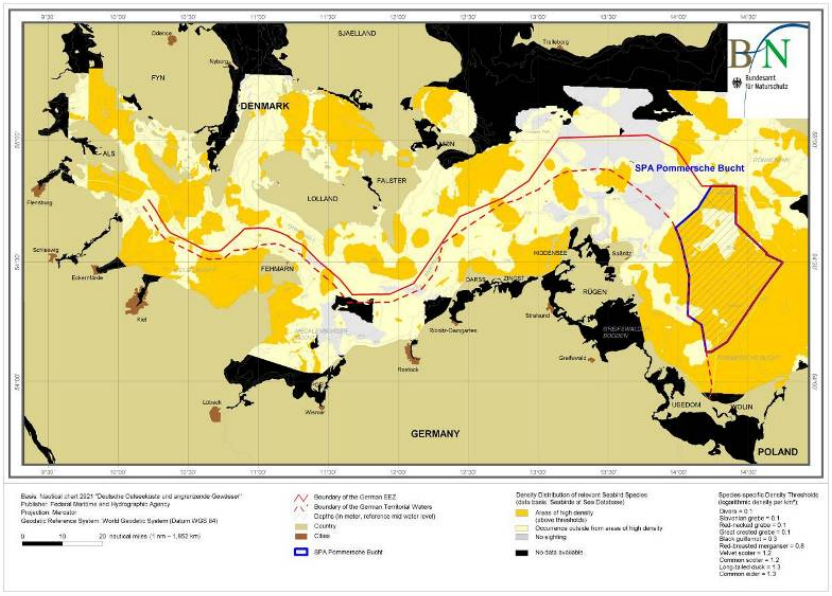
The identification and selection process of Special Protection Areas in the German EEZ of the Baltic Sea results in a single large SPA of ca. 2.000 km² designated and transmitted to Commission in May 2004. This area is defined by overlapping concentrations of more than half a million seabirds, primarily by the distribution and abundance of divers, Slavonia grebe, red-necked grebe, great crested grebe, black guillemot, red-breasted merganser, long-tailed duck, black scoter, velvet scoter, common scoter and common eider.

[52] ICES report on *Distribution of cold-water corals in the North Atlantic and the relation to fisheries in the North East Atlantic. Cooperative research report Nº262. December 2003*

Selection principles:

(1) **Bird species selection for SPA delineation:** Seabird distribution in the Baltic Sea has been studied by aerial transect surveys and from ships. From the total list of 33 species to be considered for the selection of marine SPAs, eleven species of Annex I and migratory bird species were found to occur regularly in offshore areas of the German Baltic Sea and use distinct aggregation areas.

(2) **Species distribution maps:** These bird species concentrations were modelled by geo-statistical methods, based on variogram analysing and ordinary kriging, and were visualised as distribution maps in a GIS.

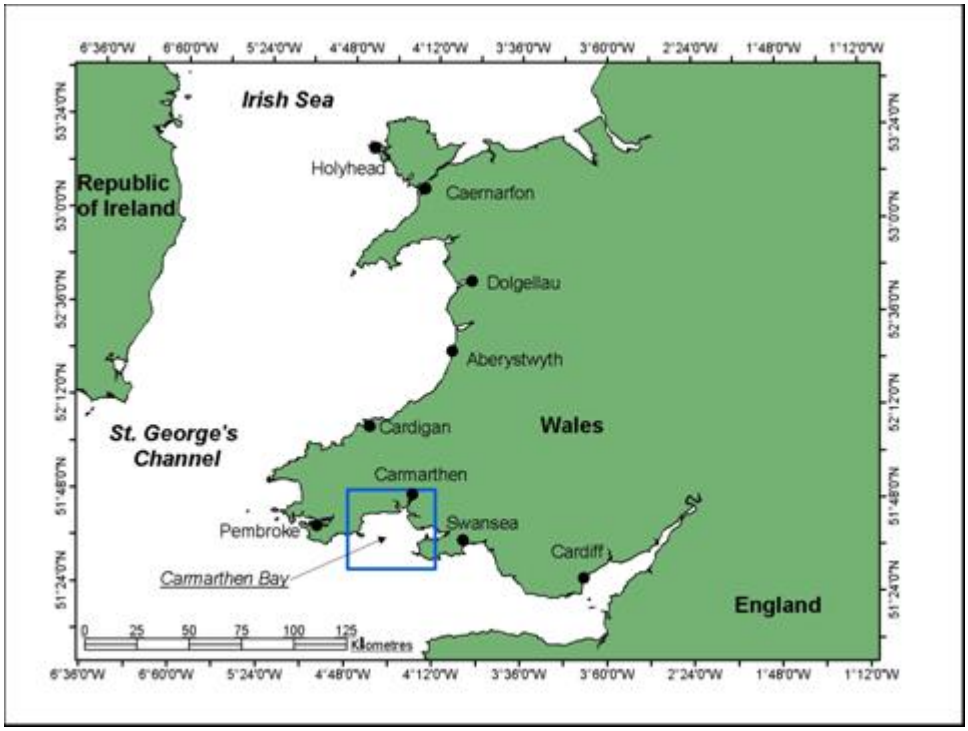


(3) **Definition of important seabird concentrations:** For each of these species, concentration boundaries were identified by gradient analysis (Species-specific density thresholds (logarithmic density per km²) divers 0.1, slavonian grebe 0.1., red-necked grebe 0.1, great crested grebe 0.1, black guillemot 0.3, red-breasted merganser 0.8, velvet scoter 1.2, common scoter 1.2, long-tailed duck 1.3 and common eider 1.3). The density value of the borderlines were used as the species- and season-specific minimum density for each relevant seabird concentration.

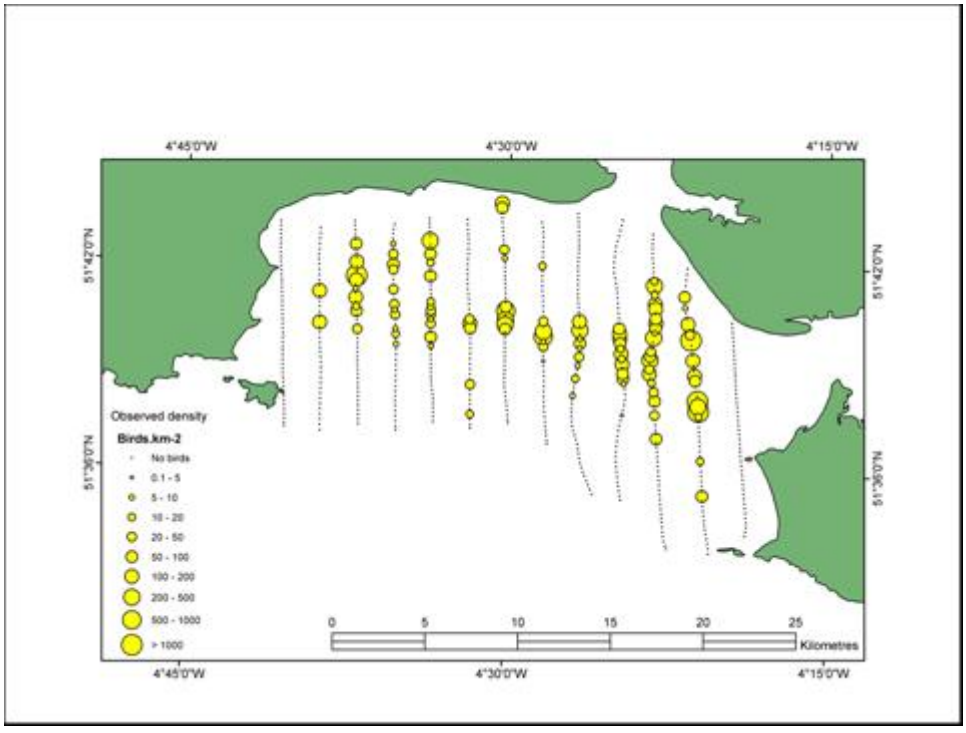
(4) **Converting single-species data into multi-species data:** By overlaying the concentration areas of each single species, the most important areas were identified. The respective areas and contour lines were then combined so that a set of areas of potential conservation areas were identified.

(5) **Population size estimation:** Within each concentration area, the mean density and population size for each species were calculated.

(6) **Selection and assessment of SPAs in the German Baltic Sea:** Finally the most suitable areas in number and size for the protection and conservation of species of wild birds that are listed in Annex 1 of the Directive, and of regularly occurring migratory species were chosen. In case of the German EEZ in the Baltic Sea a single large site was sufficient to nominate adequate populations numbers of the relevant Annex I and migratory bird species.

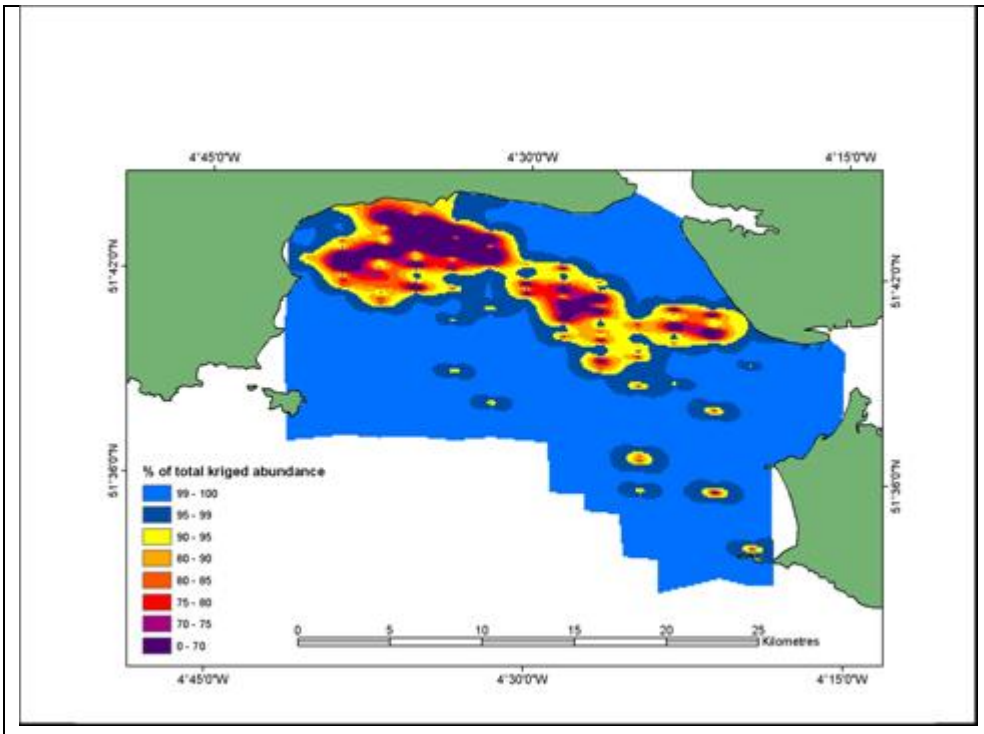


see also : www.habitatmarenatura2000.de



Alternatively, marine SPA boundaries may be identified by that part of the distribution that hosts a similarly agreed or operationally defined threshold of total or total estimated/modelled numbers of birds (e.g. Webb *et al*. 2004a, see Box F).

Box F. Determining the boundary of Carmarthen Bay SPA



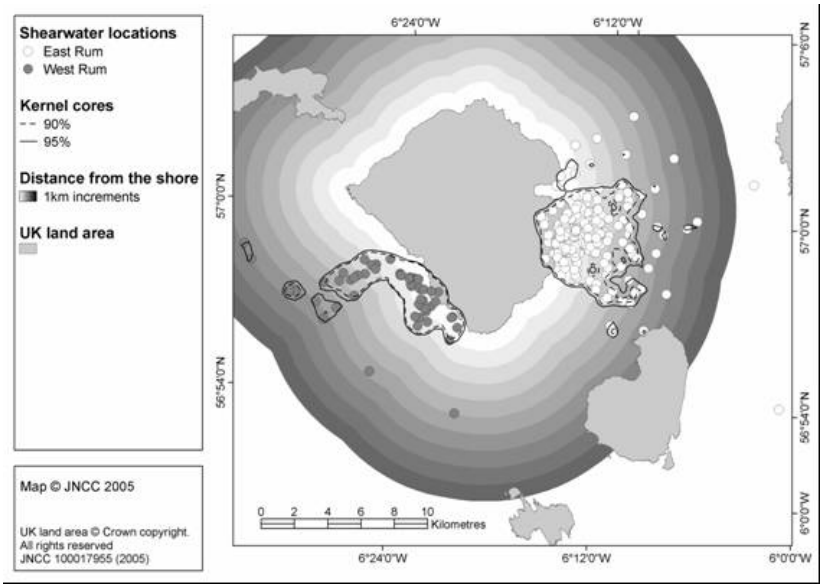
Carmarthen Bay, south Wales, hosts internationally important concentrations of Common scoter *Melanitta nigra* outside the breeding season.

Aerial surveys, deploying a atandardised methodology (Kahlert *et al*. 2000) were undertaken over the area in winter 2001/02. Sampled densities of scoter were converted into total population size using distance methodology (Buckland *et al*. 2001).

Scoter density was modelled throughout the survey area using kriging, a spatial interpolation method based on variography (Cressie 1991).

Recommendations for the seaward boundary of the SPA were made, such that 95% of the modelled population was contained within the boundary. See Webb *et al*. (2004a) for full details of this case study. See also McSorley *et al*. (2004) and Webb *et al*. (2004b,c) for further details of the methods applied in identifying sites and boundaries for inshore concentrations of waterbirds outside the breeding season, including rules for the inclusion of satellite aggregations disjunct from the core aggregation.

Again, boundaries might be identified through analyses of the areas of sea that birds use to a "significant" degree (again operationally defined; see Box G).



Box G. Determination of possible SPAs for Manx shearwaters *Puffinus puffinus* using radio telemetry.

Radio transmitters were attached to breeding Manx shearwaters at three existing terrestrial breeding colony SPAs in the UK – Bardsey, west Wales, Skomer, south-west Wales, and Rum, west Scotland. These birds form dense flocks ("rafts") on the sea before dusk before entering the breeding colony.

In order to identify likely boundaries for an extension of the existing SPAs into the marine environment, the results from radio-tracking birds in rafts were analysed using kernel analysis. This method aims to define the home range or area of greatest use of animals (Powell 2000).

Recommendations for seaward extensions to the SPA boundaries at these three colonies have been made based on the areas within which the birds appear to spend 95% of their time (McSorley *et al*. 2005). Although an arbitrary proportion 95% seemed a sensible one for three reasons:
a) there was little difference between the 90% and 95% kernels at all three colonies;
b) 95% is a useful analogy with statistical significance (though it should not be confused with that);
c) it accords with other studies.

Of course, site boundaries may be identified with reference to known boundaries of habitats important for the species under consideration, which clearly depends on the availability of such data. Investigations incorporating two or more of these approaches might be particularly fruitful and lead to more robust solutions.

Where SPAs abut the terrestrial environment then the landward boundary placement may be determined by other, more practical considerations that are peculiar to the site.

Clearly, qualifying numbers of birds (see above) will be present in any area of the sea if that area is sufficiently large, so in order to identify more discrete areas, or the most important hotspots for each species, other optimisation techniques may be applicable to dispersion data from surveys, for example an appropriate formulation of the Marine Classification Criterion (Skov *et al.* 1995). The MCC ensures that qualifying numbers of birds are contained within appropriately sized (i.e with regard to the species' dispersive abilities) potential SPAs.

4.7.2. Cross-border SPA boundaries

Boundaries for any SPA that extends into the maritime zones of two or more Member States will require to be the subject of co-operation between neighbouring Member States in order to ensure the integrity of the site and to avoid discontinuities in the boundary of a single feature. There will need to be agreement on the extent of the feature concerned at the junction of the Member State jurisdiction, as well as co-operation between policy makers of the individual States to aim to achieve some consistency of approach on boundary determination. Similarly, co-operation with non-Member States may be necessary, for example in the Baltic with Russia, in the Atlantic with Iceland and Norway, and in the Mediterranean Sea with several non-EU countries

5. MANAGEMENT MEASURES TO PROTECT MARINE NATURA 2000 SITES.

The management of marine Natura 2000 sites may present particular challenges due to the complexity of some sites as well as costs of working in this environment. The decision process of some actions to be implemented beyond the territorial sea may also be complex as more Community or international institutions are involved. On the other hand, the total number of stakeholders in these areas is normally less than in those close to the coast or on land. Adequate management schemes to address the threats and to ensure that conservation objectives are achieved have to be supported by appropriate monitoring systems.

This chapter considers the general management issues that frequently need to be addressed for marine Natura 2000 sites. It outlines the legal context for such management and protection of the sites, as defined in Article 6 of the Habitats Directive and for which the Commission has already provided interpretative and methodological guidance. A possible structure and content format for management plans is presented as a tool to assist in the management of sites and the management planning cycle considered. Different types of pressures on Marine Natura 2000 sites, relevant to the management and protection of sites, are identified and major human activities potentially affecting Natura 2000 sites are considered. This chapter is not exhaustive. Management issues related to fishing activities and Natura 2000 are considered in the following chapter. Several marine management case studies are given in this chapter. More examples and details are provided in Appendix 4.

5.1. The legal basis for protection. Community legislation's provisions in relation to management of ongoing activities and governing plans and projects for future developments.

The 'Conservation of natural habitats and habitats of species' section of the 92/43/CEE Habitats Directive addresses the establishment and conservation of the Natura 2000 network. Within this chapter, Article 6 sets out provisions which govern the conservation and management of Natura 2000 sites. This article has three main sets of provisions

- Article 6(1) makes provision for the establishment of the necessary conservation measures, and is focused on positive and proactive interventions. The main objective is the maintenance or restoration of habitats and species at "favourable conservation status". Article 6(1) complements Article 4(4) of the Directive, which requires that, within six years from the adoption of EC lists of Sites of Community Importance (SCI), Member States designate SCI as SAC and establish conservation priorities. Within the same deadline, Member States must establish the necessary conservation measures involving, where necessary, appropriate management plans specifically designed for the sites or integrated into other development plans, and appropriate statutory, administrative or contractual measures which correspond to the ecological requirements of the natural values present on the sites. As for terrestrial based SACs and SPAs, management plans are a useful tool in managing the marine sites and facilitating the achievement of the objectives of Natura 2000.

- Article 6(2) makes provision for avoidance of habitat deterioration and significant species disturbance. Its emphasis is therefore preventative.

- Article 6(3) and (4) set out a series of procedural and substantive safeguards governing plans and projects likely to have a significant effect on a Natura 2000 site.

Within this structure, it can be seen that there is a distinction between Article 6(1) and (2) which define a general protection and management regime and Article 6(3) and (4) which define a procedure applying to specific circumstances.

The protection requirements regarding Special Protection Areas (SPAs) are given in Article 4(4) of Directive 79/409/EEC which provides that, for those areas, '… *Member States shall take appropriate steps to avoid pollution or deterioration of habitats or any disturbances affecting the birds, in so far as these would be significant having regard to the objectives of this Article …'.*

After the entry into force of Directive 92/43/EEC the above obligations are replaced pursuant to Article 7 of Directive 92/43/EEC which provides as follows: '*Obligations arising under Article 6(2), (3) and (4) of this directive shall replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof…'* Thus, the provisions of Article 6(1) do not apply to special protection areas (SPAs). However, analogous provisions apply to SPAs by virtue of Article 4(1) and (2) of Directive 79/409/EEC. As regards the provisions of Article 6(2), (3) and (4), it is clear from the terms of Article 7 that these now apply to already classified SPAs.

The European Commission has published two reference documents on management of human activities in relation to Natura 2000 sites[53]. The first one is entitled *Managing Natura 2000 sites, the provisions of Article 6 of the 'Habitats' Directive 92/43/CEE*. This document aims at providing guidelines to the Member States on the interpretation of key concepts of Article 6 of the 'Habitats' Directive[54]. The second document *Assessment of Plans and Projects Significantly Affecting Natura 2000 sites* provides methodological guidance on the provisions of Article 6(3) and (4) of the Habitats Directive 92/43/EEC in relation to assessment of plans and projects significantly affecting Natura 2000 sites (same rules for marine or terrestrial).

Impact assessment: Other relevant legislation governing the process of future development plans or projects likely to have effects on a Natura 2000 site is that relating to the assessment of the environmental effects of these activities. These Directives are:

- Council Directive 85/337/EEC of 27 June 1985 *on the assessment of the effects of certain public and private projects on the environment*[55] (EIA Directive). The EIA procedure ensures that environmental consequences of projects are identified and assessed before authorisation is given. The public and environmental authorities must be consulted on the application for development consent and the environmental information, and the results of these consultations must be taken into account in the authorisation procedure of the project. The public must be informed of the decision afterwards. The Directive defines which project categories shall be made subject to an EIA, the procedure to be followed and the content of the assessment. It has been amended in 1995 and in 2003 (references in footnote)[56]

54 Relevant Appendixes include i) Considerations on management plans ii) Considerations of plans and projects affecting Natura 2000 sites, iii) Standardized forms for submission of information to the European Commission according to Article 6(4), iv) Court case references and v) Examples of LIFE-Nature projects that have involved management

55 Official Journal NO. L 175 , 05/07/1985 P. 0040 - 0048

56 a): Council Directive 97/11/EC of 3 March 1997 amending Directive 85/337/EEC on the assessment of the effects of certain public and private projects on the environment. Official Journal L 073 , 14/03/1997 P. 0005 - 0015
b): Directive 2003/35/EC of the European Parliament and of the Council of 26 May 2003 providing for public participation in respect of the drawing up of certain plans and programmes relating to the environment and amending with regard to public participation and access to justice Council Directives 85/337/EEC

- Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 *on the assessment of the effects of certain plans and programmes on the environment*[57] (SEA Directive). This Directive requires the environmental effects of certain plans and programmes to be identified and assessed during the preparation of the plan or programme and before its adoption. As with EIA, the public and environmental authorities must be consulted and their comments as well as the environmental report must be taken in to account in the preparation of the plan or programme. Certain information must be provided when the plan is adopted, including details of the arrangements for monitoring the implementation of the plan or programme. A plan which has been determined to require an assessment under Article 6 or 7 of Directive 92/43/EC automatically also requires assessment under Directive 2001/42/EC but in appropriate cases arrangements can be made to combine these assessments into a single procedure complying with both Directives.

- Both Directives 85/337/EEC as amended and 2001/42/EC require consultation with any other Member State that might be affected by the project, or plan or programme as the case may be.

The Commission website[58] provides further information on the European Community's laws on Environmental Impact Assessment of projects and the Environmental Assessment of certain plans and programmes together with other related information, including guidance documents on both the EIA and SEA Directives. As regards Directive 85/337/EEC as amended, guidance documents are available in relation to screening, scoping, the review of environmental information and the assessment of indirect and cumulative impacts, as well as impact interactions. Commission Guidance on the implementation of Directive 2001/42/EC on the assessment of the effects of certain plans and programmes on the environment can also be downloaded from this webpage.

5.2. Conservation objectives

Conservation measures to be established will aim at maintenance or restoration of species and habitat for which the site has been designated, to favourable conservation status. The following box includes the definition of "favourable conservation status" concept, as established in the Habitats Directive provisions.

Favorable conservation status (Habitats Directive provisions, art1)

Conservation status of a natural habitat, in accordance with the Habitats Directive, is considered as the sum of the influences acting on a natural habitat and its typical species that may affect its long-term natural distribution, structure and functions as well as the long-term survival of its typical species. It will be taken as 'favourable' when:

- its natural range and areas it covers within that range are stable or increasing, and
- the specific structure and functions which are necessary for its long-term maintenance exist and are likely to continue to exist for the foreseeable future, and
- the conservation status of its typical species is favourable.

Conservation status of a species means the sum of the influences acting on the species concerned that may affect the long-term distribution and abundance of its populations. The *conservation status* will be taken as 'favourable' when:

- population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats, and
- the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future, and
- there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis;

Possible natural features present in a marine Natura 2000 site, for which conservation objectives have to be defined, are found among the following:

1. Marine birds listed on according with Articles 4.1 and 4.2 of the Birds Directive
2. Habitat types listed in annex I of the Habitats directive (codes 11*, 12* and 8330)
3. Species listed in annex II (18 marine species, including fish, reptile, cetacean, and seal species)
4. Marine species listed in annex IV of the Habitats Directive. Sites are not designated on the basis of annex IV species presence basis but, if they are present in the site, they also will have to be protected under the provisions of Article 12 of Habitats Directive.
5. Marine species listed in annex V of the Habitats Directive. As above, sites are not designated based its presence. Nevertheless, they will also need to be protected under the provisions of Article 14 and 15 of Habitats Directive.

These features are identified in the Standard Data Form that Member States send to the Commission by the competent national authority via the national Permanent Representation for special protection areas (SPA), for sites eligible for identification such as Sites of

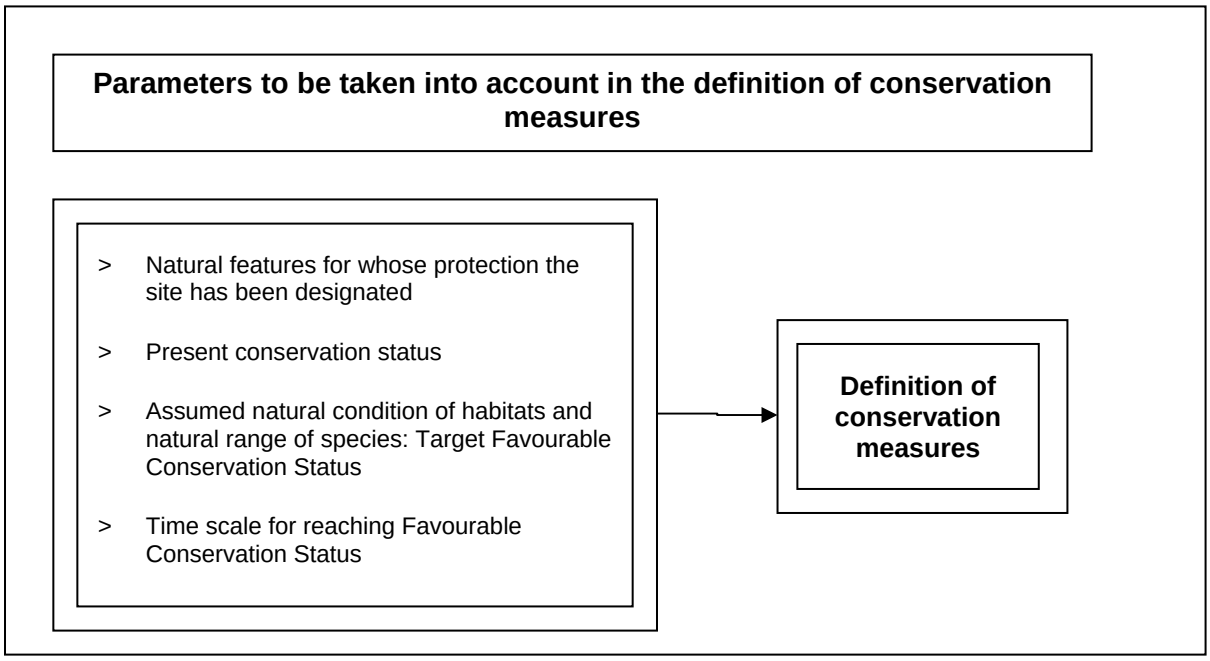
Community Importance (SCI) and for special areas of conservation (SAC) in accordance with the 97/266/EC Commission Decision of 18 December 1996.[60]

From this point it is the responsibility of the competent authorities in each Member State to define the objectives to be reached in terms of conservation status for these features[61]. A clear definition on conservation objectives with measurable indicators and an appropriate monitoring programme are major elements for the successful management of a Natura 2000 site.

Questions to be answered will include: What is the global objective? What are the specific objectives? What is to be protected and/or restored? What is the final agreed target protection level? What is to be done? Who will do it? In what timeframe? Some of these questions may appear obvious. Nevertheless, they are not always easy to respond to in a clear and operational way.

As for terrestrial based SACs and SPAs, management plans are a useful tool in managing marine sites, facilitating achievement of the Natura 2000 objectives. This is an important tool to help effective management decisions, including those aimed at avoiding significant disturbance.

5.3. Definition of conservation measures



Data from surveillance[62] and monitoring programmes should allow Member States to identify the conservation status of species and habitats present in the sites. Member States will also need to identify potential pressures. Thereafter, they will need to define appropriate maintenance and/or conservation measures to deliver favourable conservation status. In fulfilment of Article 6.1 of the Habitats Directive, they will need to establish the necessary conservation measures involving, if need be, appropriate management plans specifically designed for the sites.

For the different features subject to protection in a given site, their conservation status at present, their target status and the time scale to reach it, are the driving elements for the definition of conservation measures to be taken.

[60] http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:31997D0266:EN:NOT

[61] Competent national authority designated responsible for the management of the Natura 2000 site, as transmitted by Members States in accordance with the 97/266/EC Commission Decision of 18 December 1996 concerning a site information format for proposed Natura 2000 sites *Official Journal L 107 , 24/04/1997. Standard data form in section* 1.6 "RESPONDENT(S):"

[62] According to Article 11 of the Habits Directive, "Member States shall undertake surveillance of the conservation status of the natural habitats and species referred to in Article 2 with particular regard to priority natural habitat types and priority species."

5.4. Application of measures

Measures have to be applied by the relevant competent authorities. The identification of the competent authority depends on the type (e.g.: is it related to transport, geological exploitation, fisheries, tourism…) and the location of the measure to be taken -territorial waters or offshore–

Natural protected features subject to similar pressures need similar protection. Nevertheless, depending on the site location and the type of action, the responsibility for the implementation of these measures may be different. These responsible actors can be federal, national, European community or international institutions.

Therefore, the competent authority[63] in charge of the site has to identify the necessary conservation measures and the subsequent actors responsible for its implementation and enforcement. This Authority has to implement all measures under its competence and ask other responsible bodies to take action in areas for which they are competent. (See point 2.7)

5.5. Management plans-contents

While the Habitats Directive does not specify the content of a management plan, there is already a lot of experience on this subject, which Member States are applying to Natura 2000 sites. In this regard, it is potentially an effective tool to help reach the conservation objectives of the site. Several regional organisations and NGOs have developed useful guidance tools to this end, outlining the structure of a management plan for a Marine Protected Area. One useful example of an outline Structure for a Management Plan is that proposed by OSPAR for

[63] National competent authority responsible for the management of the Natura 2000 site, as defined in the 97/266/EC Commission Decision of 18 December 1996 concerning a site information format for proposed Natura 2000 sites *Official Journal L 107 , 24/04/1997. Standard data form, section 1.6 "RESPONDENT(S):"*

its network of marine protected areas. This is reflected in the following box. It is based on the IUCN model developed for this purpose[64].

Example of a Management Plan:

Outline structure for an MPA of the OSPAR and HELCOM Networks

1. **Executive Summary**
2. **Introduction**
   - 2.1 Purpose and scope of plan
   - 2.2 Legislative authority for the plan (national and international)
3. **Description of the site and its features**
   - 3.1 Regional setting: location and access
   - 3.2 Resources (facts pertinent to management; other data in an appendix or separate document)
     - 3.2.1 Physical: e.g., marine landscape features, currents, bathymetry, hydrology
     - 3.2.2 Biological: ecosystems (e.g., cold water coral reefs, seagrass beds); critical habitats (e.g., feeding, spawning); species (e.g., endangered, commercial, charismatic)
     - 3.2.3 Cultural: archaeological, historical, religious
   - 3.3 Existing uses (description, facilities, etc.)
     - 3.3.1 Recreational
     - 3.3.2 Commercial
     - 3.3.3 Research and education
     - 3.3.4 Traditional uses rights, and management practices
   - 3.4 Existing legal and management framework
   - 3.5 Existing and potential threats and implications for management (i.e. analysis of compatible or incompatible uses, solutions
   - 3.6 Existing gaps of knowledge
4. **The Plan**
   - 4.1 Goals and objectives (general and specific)
   - 4.2 Management tactics
     - 4.2.1 Advisory committees
     - 4.2.2 Interagency agreements (or arrangements with private organizations, institutions or individuals)
     - 4.2.3 Boundaries
     - 4.2.4 Zoning plan
     - 4.2.5 Regulations
     - 4.2.6 Social, cultural, and resource studies plan
     - 4.2.7 Resource management plan
     - 4.2.8 Education and public awareness
   - 4.3 Administration
     - 4.3.1 Staffing
     - 4.3.2 Training
     - 4.3.3 Facilities and equipment
     - 4.3.4 Budget and business plan, finance sources
   - 4.4 Surveillance and enforcement
   - 4.5 Monitoring and evaluation of plan effectiveness
   - 4.6 Time table for implementation
5. **Appendices (Proforma for the OSPAR MPAs Network, etc.)**
6. **References**

As regards Natura 2000 sites, the following considerations are relevant to such a plan structure.

[64] Guidelines for the Management of Marine Protected Areas in the OSPAR Maritime Area (Reference Number: 2003-18). http://www.ospar.org/eng/html/welcome.html. http://www.ospar.org/documents/dbase/decrecs/agreements/03-18e_Guidelines%20management%20MPA.doc. Marine and Coastal Protected Areas. IUCN, Gland: 370pp. and Kellerher, G. 1999.

Purpose and scope (Outline structure, point 2.1),

A clear identification and description of the features for which the area has been selected is a key element of a management plan. The key features for SPA designation are birds listed in annex I of the Birds Directive and migratory birds. The key features for SACs are habitat types listed in Annex I and/or habitats for species listed in Annex II of Habitats Directive. Species listed in Annex IV, if they are present in the site, should also to be taken into consideration in the SAC management requirements[65]. This information should be contained in the Standard Natura 2000 data form[66].

In the case of the marine environment, it would be a good and strategically useful management measure to consider, in addition to the key Natura 2000 features, habitat types and species covered in regional agreements protection lists, and areas containing habitat types and species of conservation concern that may, reasonably, be included in a further adaptation of the Habitats Directive annexes. Clearly, this consideration is not a mandatory obligation that Member States have under Community legislation. However, identification of all these complementary features, during the first marine geological survey campaigns carried out as part of the future SCI selection process, might be a relevant task to avoid duplication of works to be carried out in future. This approach will also favour the coherence of future marine protected areas under Natura 2000 and other sets of protected areas.

This approach will also contribute to enhancing the compatibility between Natura 2000 and other networks established under regional agreements/conventions (OSPAR, HELCOM or Barcelona). It will also facilitate the process of selection and management of future sites resulting from a more complete application of the Habitats Directive in the marine environment.

Legislative authority for the plan (Outline structure, point 2.2)

The Legislative authority ultimately responsible for the elaboration of a Natura 2000 site Management Plan is the National Authority[67]. It has a duty to establish the necessary conservation measures to ensure the favourable conservation status of the site. However, as outlined in point 2.7, responsible actors for the implementation of management measures can be Federal, National, European community or International institutions[68].

The responsible authority implements all measures under its competence and asks other bodies to take action in areas for which they are in charge. Management plan objectives and specific measures to be taken have to be agreed by all relevant actors.

Description of the site and its features (Outline structure, Point 3)

One of the key steps for the management of a Natura 2000 site will be the description and assessment of the conservation status of each of the identified features in the Standard Data Form, ideally with quantitative indicators. The definition of this "base line" is a major element for the definition of measures to be taken and for assessing their future effectiveness to ensure favourable conservation status.

---

65 (Sites are not designated on annex IV specie's presence basis but, if they are present in the site, they also will have to be protected under the provisions of Article 12 of Habitats Directive).

66 As defined in the Standard Data Form. (97/266/EC Commission Decision of 18 December 1996 concerning a site information format for proposed Natura 2000 sites *Official Journal L 107, 24/04/1997).*
http://ec.europa.eu/environment/nature/nature_conservation/natura_2000_network/standard_data_forms/index_en.htm

67 Legal basis: 97/266/EC Commission Decision of 18 December 1996 concerning a site information format for proposed Natura 2000 sites *Official Journal L 107 , 24/04/1997*

68 E.g.: Defence, mining, offshore prospecting, research, tourism are national competencies. Fisheries are a community competency. Some aspects of shipping regulation are dealt at international level by the International Maritime Organization (IMO)…

Another key element of a management plan is to understand the nature and interactions of potentially positive and negative external pressures and influences that will affect the global evolution of the conservation status of the features. The use of an impact matrix can be a useful way to gain better understanding of this problem (see chapter 5.8 below).

Summary of LIFE co funded UK marine SACs Project

The UK Marine SACs Project was set up to establish management schemes for selected marine Special Areas of Conservation (SACs). It focused on a selection of twelve coastal marine SACs around the UK and on developing specific areas of knowledge needed for the management and monitoring of European marine sites.

The website (http://www.ukmarinesac.org.uk/index.htm) communicates the experience and knowledge and outputs from the UK Marine SACs Project to a wider audience. All the documents and background information that have been published can be accessed through this site (http://www.ukmarinesac.org.uk/publications.htm). Details in appendix 4

Monitoring and evaluation of plan effectiveness (Outline structure, point 4.5)

Once the site has been designated, Member States will take the necessary measures to maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora for which the site has been designated. (Birds Directive Art. 1 and 4; Habitats Directive, arts.1 & 2)

For this purpose, a monitoring programme is necessary to assess the present condition of the site and to inform appropriate maintenance and/or restoration measures. National Authorities[69] are ultimately responsible for monitoring of sites (Habitats Directive, Article 11). Assessment of the effectiveness and appropriateness of enacted measures will permit the Authority responsible for the site to plan new activities to achieve conservation targets and to report on the conservation status of the site in accordance with the requirements of the Habitats Directive (Articles 11, 17…) and Birds Directive (Articles 4, 12..).

After thorough discussions with Member States, the Commission sent a document (DocHab-04-03/03 rev.3) to the Habitats Committee proposing a framework for assessment, monitoring and reporting of conservation status in view of preparing the 2001-2007 report under Article 17 of the Habitats Directive. This document was approved by the Habitats Committee on 20th

[69] National Authority responsible for the management of the Natura 2000 site, as defined in the 97/266/EC Commission Decision of 18 December 1996 concerning a site information format for proposed Natura 2000 sites *OJ L 107 , 24/04/1997.*

on April 2005. It proposes a reporting format, evaluation matrices, definitions of key terms and a process between Member States and the Commission to accompany that process. More information may be found at: http://forum.europa.eu.int/Public/irc/env/monnat/home

WWF and the World Bank have developed a planning tool for management of protected areas entitled "*Score Card to Assess Progress in Achieving Management Effectiveness Goals for Marine Protected Areas. 2004*"[70]. The following table is included in this document. It has been built to provide some overall guidance in the development of assessment systems and to encourage standards for assessment and reporting.

TABLE 1
Summary of the WCPA Framework

Elements of evaluation	Explanation	Criteria that are assessed	Focus of evaluation
Context	**Where are we now?** Assessment of importance, threats and policy environment	Significance Threats Vulnerability National context	Status
Planning	**Where do we want to be?** Assessment of protected area design and planning	Protected area legislation and policy Protected area system design Reserve design Management planning	Appropriateness
Inputs	**What do we need?** Assessment of resources needed to carry out management	Resourcing of agency Resourcing of site Partners	Resources
Process	**How do we go about it?** Assessment of the way in which management is conducted	Suitability of management processes	Efficiency appropriateness
Output	**What were the results?** Assessment of the implementation of management programmes and actions; delivery of products and services	Results of management actions Services and products	Effectiveness
Outcome	**What did we achieve?** Assessment of the outcomes and the extent to which they achieved objectives	Impacts: effects of management in relation to objectives	Effectiveness appropriateness

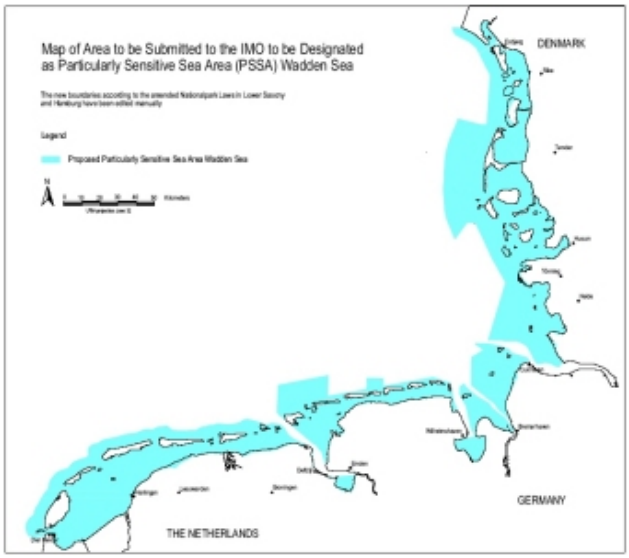
Wadden Sea – transboundary or international management

The Wadden Sea is one of Europe's largest marine wetlands and is shared by **Denmark, Germany and the Netherlands.**

It holds numerous habitats that require protection under the Habitats Directive Annex I including:

• sandbanks, estuaries, mudflats, salt marshes and sand dunes



[70] http://www.icriforum.org/mpa/SC2_eng_nocover.pdf. (see Annex V)

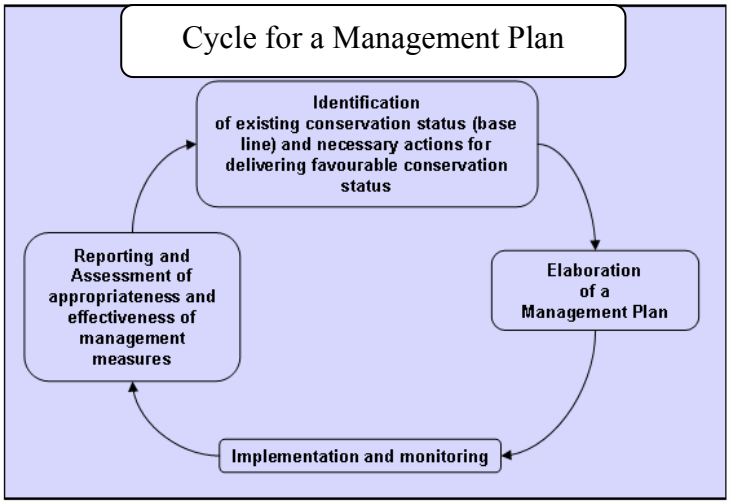
These habitats are important areas for conservation as they represent nursery grounds for fish species, feeding areas for migratory birds and support many marine mammals (Harbour Porpoise *Phocoena phocoena*, harbour seal *Phoca vitulina*).

At the 1982 Wadden Conference, where the three concerned governments met, an Agreement was signed that they would consult each other and coordinate efforts in order to implement relevant EU Directives and other international legal intruments such as the Ramsar and Bonn Conventions.

Many conservation actions have been undertaken trilaterally since. The Seal Management Plan (SMP) is an example of a conservation project that arose from this cooperation and was strengthened by it. Among other actions, a number of seal reserves have been set up throughout the Wadden Sea. The SMP has been recognised as having played a big part in saving the harbour seal population and remains a useful tool for conservation.

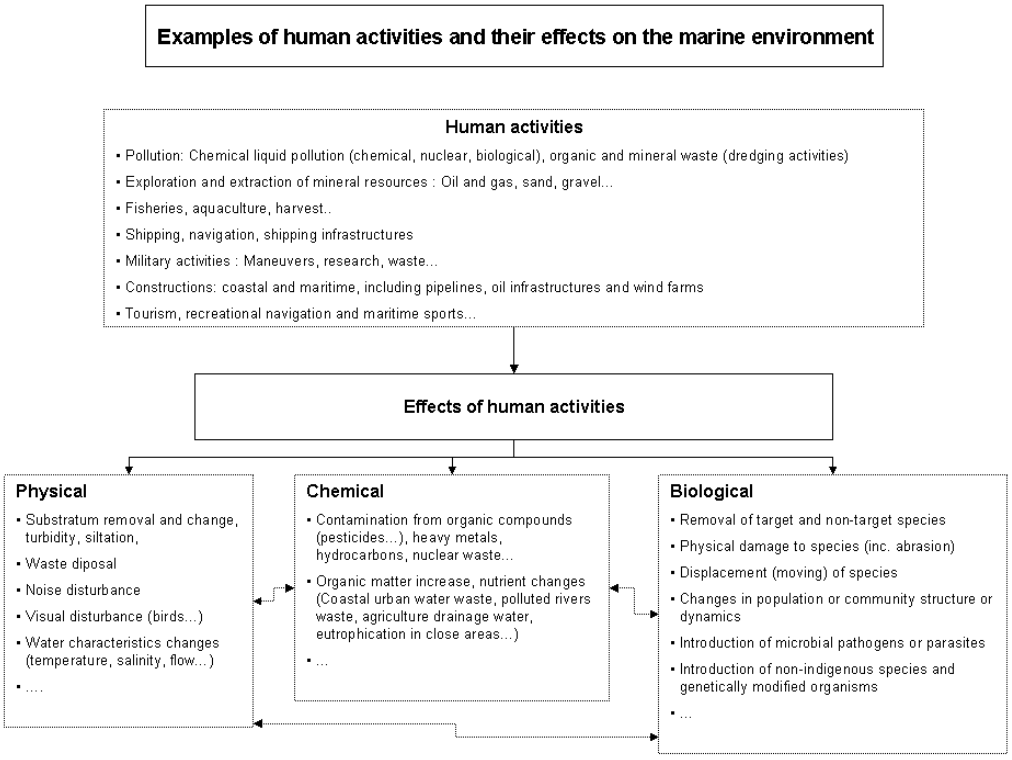
See Appendix 4 for more information

http://www.waddensea-secretariat.org/news/publications/maps



5.6. Time Scale for a Management Plan

Measures considered at the present time as being the most appropriate to maintain or to restore the favourable conservation status of a site will not necessarily be the same in the future. Nature, external forces acting on nature, scientific knowledge and conservation management techniques change over time.



Therefore, management plans have to be revised and/or updated in an appropriate time scale taking full account of changes that have occurred in the site. The plan should have a clear time horizon. Some Member States consider 10 years as a reference period for Management Plans of Nature Protected Areas. Regular monitoring of activities and more periodical assessment of their effectiveness will allow for the taking of intermediate decisions to adapt the action plans.

In general terms, climate change related impacts may be important for the evolution of marine protected Areas. This could be a relevant issue from long term management issues. Environmental changes related to climate change will need to be monitored and management decisions taken with an adaptive approach.

5.7. Pressures and impact of human activities.

A wide range of human activities may affect the marine environment. Several regional seas conventions have developed interesting listings of activities and some of the main effects that they might have on marine habitats and species[71]. The National authority responsible for the Natura 2000 site may need to regulate these activities to ensure the favourable conservation status of the features for which the site has been selected. Some examples of human activities and possible effects are:

[71] http://www.ospar.org/documents/dbase/decrecs/agreements/03-18e_Guidelines%20management%20MPA.doc Adapted from Guidelines for the Management of Marine Protected Areas in the OSPAR Maritime Area (Reference Number: 2003-18)

Habitat restoration in the Azores supported by a Management Plan

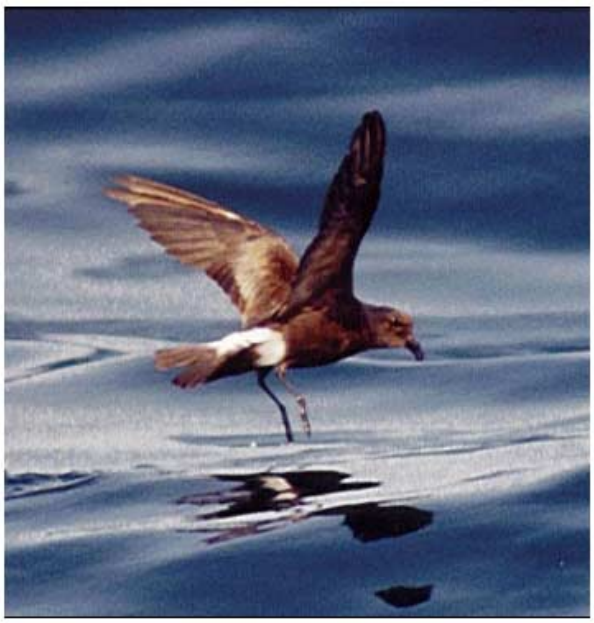
The Azores seabird assemblage is characterised by a transition between tropical and temperate birds and for this reason important for biodiversity conservation.

The following Azorian bird species are covered by the Birds Directive:

Madeiran storm petrel (*Oceanodroma castro*), Roseate tern (*Sterna dougallii*), Cory's shearwater (*Calonectris diomedea borealis*), Common tern (*S.hirundo*), Little shearwaters (*Puffinus assimilis*).

These species are threatened by introduced predators, disturbance from tourism, soil erosion and vegetation degradation which has led to a **loss of nesting habitat** and consequently breeding pairs.

Measures taken to increase populations:



- **Eradication** of the non-native rabbit
- Erosion control and **replantating of native vegetation**
- Contruction of **nest boxes** and artificial nests
- Information panels and nature warden to **raise awareness**.

Breeding numbers are now increasing as a result of these actions.

Praia islet now holds the **largest Common Tern colony in the Azores** with over 1000 pairs.

See Appendix 4 for more details.

5.8. Impact assessment. The basic technique of the construction of matrices

Section 5.1, above, describes existing legal instruments concerning the process of assessment of the impact of development activities on the environment. Environmental Impact

Assessment (EIA) is a key instrument of European Union environmental policy. Since the passage of the first EIA Directive in 1985 (Directive 85/337/EEC) both the law and the practice of EIA have evolved. An amending Directive was published in 1997 (Directive 97/11/EC) and the European Commission have published three guidance documents reflecting current EU legislation and the current state of good practice. These documents concern three specific stages in the EIA process: Screening, scoping and EIS Review.

The aim of the above mentioned guidance is to provide practical help to those involved in these stages in the EIA process, drawing upon experience from around Europe and worldwide. By following the screening and scoping guidance, it is hoped that better decisions will be made on the need for EIA and on the terms of reference for the studies that are required, thus starting the EIA process off on a better footing. The EIS Review guidance aims to help developers and their consultants prepare better quality Environmental Impact Statements and competent authorities and other interested parties to review them more effectively, so that the best possible information is made available for decision making. Full information on this is found on the website of the Commission at:
http://europa.eu.int/comm/environment/eia/home.htm

In order to develop a systematic approach to management, it is useful to identify the sort of activities that could have "a priori" significant negative impacts on the site, including listing the activities (e.g: shipping, fisheries, wind parks, oil and gas exploration…) that could interact with the protected features of the site and effect the conservation status of the habitats types and species of community importance.

In such a context, several Member States use matrices as a tool for decision making. Each matrix should clearly show whether different external human activities are expected to have significant effects on specific conservation features. The following matrix is aimed to be considered as an example only. Real cases should be elaborated with existing Natura 2000 site features and foreseen human activities. Such matrices should be worked out and completed by specialists, preferably with the participation of stakeholders and ensuring that appropriate specialised knowledge is represented.

The matrices should contain all ecological features subject to protection and all users. Only relevant uses for that particular area/sub-area have to be indicated. The first dimension of the matrices concerns the ecological features for which the site has been designated.

In some cases it may also be relevant also to include elements (habitats or species) which are necessary for the favourable conservation status of the protected features under the Birds and Habitats Directives (e.g.: fish stock status needed for protected seals or birds…).

Not all individual marine habitats or species from the annexes of the Birds and Habitats Directives need to appear in the matrix, as they may be grouped according to similar sensitivities. Many species are sensitive to similar activities, and many activities have similar effects. For example, all shellfish species may be impacted by a dredger, beam trawl or other sediment disturbing activity.

The second dimension concerns human activities in relation to the specific sensitivity of the ecosystem.

Different activities/ users or stakeholders should be listed and grouped according to their possible interaction with habitats and species. Only relevant uses for that particular area/sub area have to be indicated. When describing the uses and their impacts it is important that specialists from different regions and backgrounds are involved. It is important to underline

that possible interactions refer to tangible (present or planned) activities rather than different economic sectors/ industries considered in global terms.

A matrix showing the two dimensions could look as follows (this is not filled in. For completed examples showing potential effects, see Annex 3 of this guidance document.)

An example of the use of the matrix Site NNN											
Activities related to	**Habitats**			**Species**				**Other elements of conservation concerns but not listed in EC Directives**

Appendix 3 illustrates several examples of the technique of the use of matrices as a management tool for decision making in a Natura 2000 marine protected area.

5.9. Human activities in marine Natura 2000 sites

Human activities in marine Natura 2000 sites are regulated by the same provisions of the Habitats Directives as for the terrestrial areas. The provisions of Article 6 of the Habitats Directive apply if the effect of an activity, or a combination of them is likely to be significant.

The Communication from the Commission to the Council and the European Parliament of 24 October 2005, "Thematic strategy on the protection and conservation of the marine environment"[72] is also a relevant policy document in which different pressures to the marine environment are identified.

This communication takes into account the environmental quality of the seas and oceans, giving a summary and a more extensive description of the situation. It highlights that the marine environment is under a series of pressures. These include loss or degradation of biodiversity, changes in the ecosystem structure, loss of habitats, contamination by dangerous substances and nutrients, and the potential consequences of climate change.

Related pressures include commercial fishing, oil and gas exploration, shipping, water-borne and atmospheric deposition of dangerous hazardous substances and nutrients, waste dumping including dumping of dredged contaminated sediments, under water noise pollution and physical degradation of habitats due to dredging and extraction of sand and gravel.

Without being comprehensive, some possible effects of human activities on the marine environment are illustrated in the following paragraphs.

5.9.1. Alien Species

Invasive alien species are identified as one of the key causes of loss in biodiversity for the EU and the world at large. Alien species can deteriorate natural habitats and disturb natural species found locally, changing natural conditions that can drive to significant economic and social impacts. In some cases, possible effects of alien species will have to be considered by competent national authorities when establishing management measures for a Natura 2000 site or planning future developments. Effectively, provisions of the Habitats Directive state that Member States are responsible:

- to take appropriate steps to avoid the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the area has been designated (Art 6.2),

- to agree to plans or projects only after having ascertained that they will not adversely affect the integrity of the Natura 2000 site (Art 6.3)

A relevant provision in this area is Article 22 of the Habitats Directive, which requires Member States to *"ensure that the deliberate introduction into the wild of any species which is not native to their territory is regulated so as not to prejudice natural habitats within their natural range or the wild native fauna and flora and, if they consider it necessary, prohibit such introduction"*. However, the accidental, non-deliberate introductions and the introductions into non-wild environments would benefit from a more specific legislation.

Furthermore, under the Habitats Directive difficulties might arise if a species protected under a directive is native in one part of the Community but harmful or potentially problematic

[72] [COM(2005)504] http://europa.eu/scadplus/leg/en/lvb/l28164.htm

elsewhere. This was not envisaged when the Habitats Directive was adopted in 1992, but it could be an issue within the enlarged EU.

Ballast water from shipping, species travelling stuck to ship hulls, aquaculture activities are some of the most significant vectors for introduction of alien species in the marine environment.

Ballast water: The International Maritime Organization has adopted in February 2004 the International Convention for the Control and Management of Ships' Ballast Water and Sediments ("Ballast Water Convention"). This Convention is open for signature by Member States from June 2004. Parties to this convention are required to prevent, minimize, and ultimately eliminate the transfer of harmful aquatic organisms and pathogens through the control and management of ships' ballast water and sediments.

The Convention provides an international framework for the management of ballast water and sediments, while allowing for regional interests to introduce additional measures to meet specific standards or requirements, consistent with international law. All ships designed to carry ballast water will be obliged to implement a Ballast Water Management Plan approved by the Administration (Flag State) and taking into account Guidelines to be developed by the IMO. By July 2005, three Member States (Finland, The Netherlands and Spain) have signed the Ballast Water Management Convention. More information can be found on the website: http://globallast.imo.org/index.asp.

Aquaculture: In the framework of the Biodiversity Action Plan for fisheries, (COM(2001)162, Vol. IV[73]), the Commission has taken initiatives to evaluate the potential impact of non-indigenous species in aquaculture. It supports the application of the International Council for the Exploration of the Sea (ICES) Code of Practice on introductions and transfer of marine organisms and the European Inland Fisheries Advisory Commission (EIFAC) Code of Practice and Manual of procedures for consideration of introductions and transfers of marine and freshwater organisms.

The Commission has prepared a proposal for management rules on the introduction of alien species in aquaculture in the framework of the Strategy for the sustainable development of European Aquaculture (COM(2002)511)[74], which takes into account the above mentioned considerations. This proposal for a Council Regulation (COM (2006) 154[75]) aims to introduce a permit system to regulate the movement tin aquaculture of alien and locally absent species (absent from a zone within the species' natural range). This proposal is expected to be adopted by the Council in the first half of 2007.

5.9.2. Pollution (including noise)

Pollution of the seas is one of the biggest global threats to the marine environment and biodiversity conservation. It may also be a significant threat at local level. Therefore, the Authority responsible for the conservation status of the Natura 2000 site has to deal with this issue when establishing the necessary conservation measures for the site. In most of the cases, this will imply the involvement of external administrations responsible for management of continental waters, maritime traffic…

[73] http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:52001DC0162(04):EN:NOT
[74] http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:52002DC0511:EN:NOT
[75] http://eur-lex.europa.eu/LexUriServ/site/en/com/2006/com2006_0154en01.pdf

In the European environment, most pollution from the sea derives from land-based sources. Therefore, the implementation of the provisions of the Water Framework Directive will play a major role in enhancing the conservation status of the marine environment. This directive deals with all continental, transitional, and coastal water bodies. The global objective of EU Water Policy is to get polluted waters clean again, and to ensure that clean waters are kept in this state. More detailed information can be found on the website of the Commission[76].

Several relevant regional seas conventions, like the OSPAR, Helsinki Convention, Barcelona or Bucharest Convention, have developed strategies to reduce pollution in the sea. These strategies (e.g: Hazardous Substances Strategy adopted by OSPAR) set the objective of preventing pollution of the maritime area by continuously reducing discharges, emissions and losses of hazardous substances.

Pollution types and causes

Pollution can be categorized as *(i)* organic, *(ii)* microbiological, *(iii)* chemical, *(iv)*nutrients *(v)* radioactive and *(vi)* physical (waste disposal, noise pollution…).

Pollution of the sea, the coastal zone and its wetlands by solid and liquid domestic/industrial products is a major problem in many countries as the lack of appropriate treatment is still common among Member States and third riparian countries sharing the same sea with the EU27. In particular, chemical and petrochemical industries concentrated around major coastal cities are a major source of pollution. Agricultural pollution from run-off containing high concentrations of nutrients -fertilizers-, pesticides and other agrochemicals also needs to be taken in consideration. Their combined impact on the health of habitats and on species can be extremely high in some marine areas. However, it should be noted that this is not always an irreversible effect, and biodiversity can be re-established to a considerable degree after the removal of the sources of pollution.

The Commission provides further information on the *Europa* web site[77] on the different pieces of water legislation (and related policies) in the European Community.

The International Convention for the Prevention of Pollution from Ships (MARPOL)[78] is the main international convention covering prevention of pollution of the marine environment by ships from operational or accidental causes. The MARPOL Convention was adopted on 2 November 1973 at IMO covering pollution by oil, sewage, garbage, chemicals and harmful substances in packaged form.

When planning future management measures, it may be relevant in some cases to address some pollution problems from shipping activities. In such a case, site managers may consider some useful tools provided by the London Convention (the Convention on the Prevention of Marine Pollution by Dumping of Wastes, 1972). The purpose of this Convention is to control all sources of marine pollution and prevent pollution of the sea through the regulation of dumping of waste materials. A so-called "black- and grey-list" approach is applied for waste, which can be considered for disposal at sea according to the hazard presented to the environment. For the blacklisted items dumping is prohibited. Dumping of the grey-list materials requires a special permit from a designated national authority to be undertaken under strict control and only after certain conditions are met. Other materials or substances can be

[76] http://ec.europa.eu/environment/water/water-framework/overview.html

[77] http://ec.europa.eu/environment/water/index.html

[78] http://www.imo.org/Conventions/contents.asp?doc_id=678&topic_id=258#1

dumped after a general permit has been issued. However, this approach, adopted in 1973, will be replaced by the 1996 Protocol (pending four more signatories) which has no such differentiation. This revision is guided by the precautionary approach generally assuming that dumping of any substances could be harmful, unless proven otherwise. The 1996 Protocol has already been signed by many European coastal states. (see http://www.londonconvention.org/; http://www.londonconvention.org/documents/lc72/PROTOCOL.pdf)

Dumping is a human activity that may be considered as a plan or project. Therefore, ad-hoc permits would have to be delivered in accordance with the provisions of article 6 (3) and (4) of the Habitats Directive if it is likely that such a plan or project would have a significant effect on a Natura 2000 site.

Noise pollution

For the United Nations Convention on the Law of the Sea [UNCLOS, Art.1.1(4)] "pollution of the marine environment" means *the introduction by man, directly or indirectly, of substances or energy into the marine environment, including estuaries, which results or is likely to result in such deleterious effects as harm to living resources and marine life, hazards to human health, hindrance to marine activities, including fishing and other legitimate uses of the sea, impairment of quality for use of sea water and reduction of amenities*. Noise is therefore to be considered as a form of pollution, being an energy, which is introduced in the environment.

Noise in the marine environment may be defined as the deliberate or incidental introduction of acoustic energy into the water column, from point sources or from those of diffuse origin.

There is a growing body of evidence that noise represents a significant pressure in the marine environment. Scientists affirm that low-frequency ambient marine noise levels have increased in the northern hemisphere by more than a hundred times over the last 60 years.[79] Undersea noise pollution comes from a variety of sources including propeller noise of ships, underwater exploration (hydro-acoustic methods), mining seismic operations, underwater constructions (piling, etc.), and various sonar techniques. Some of the key sources of anthropogenic undersea noise are activities in the following areas:

- Oil and gas research and exploitation: e.g Seismic airgun surveys (or similar techniques) to find fossil fuel deposits
- Active sonar systems for military or civilian purposes (e.g.: loud, medium, and low-frequency sounds produced by sonar devices that can travel for hundreds of miles).
- Supertankers cruise the oceans creating a sound pulse of 190 decibels or more at or below the 500Hz range; smaller boats such as tugs and ferries typically create a soundwave of 160-170 decibels[80]

[79] (a) low-frequency (< 1000 Hz) ambient noise levels that have increased in the northern hemisphere by two orders of magnitude over the last 60 years (3dB/decade). http://www.iwcoffice.org/_documents/sci_com/SCRepFiles2004/56SCrep.pdf. DOLMAN, S.J. and SIMMONDS, M.P. Note of some recent developments in the field of marine noise pollution, including controlled exposure experiments.

[80] Supertankers generate sound pressures of 190 dB relative 1 uPa at 1 meter. Decibels (dB) are always relative to a reference (Values in water cannot be compared directly to values in air, and the reference value should always be included to avoid confusion).

- So called "pingers" are devices that emit a shrill sound to scare away marine mammals (and other species) from fishing gears and aquaculture installations.

The above-mentioned different activities need to be regulated in accordance with the provisions of article 6 (3) and (4) of the Habitats Directive if they are likely to have a significant effects on protected features at a Natura 2000 site. Furthermore, the provisions of article 12 of the Habitats Directive, which includes an obligation to avoid deliberate disturbance, are also particularly relevant in such situation, as all cetaceans' species, being listed in Annex IV, benefit from a strict protection regime under the Habitats Directive.

Four zones of influence are commonly adopted in all work on impact of noise on marine animals[81]. This zonation may be relevant when planning the authorisation of some human activities in relation to Natura 2000 sites:

Zone of audibility

This zone is the largest and covers the area over which the noise source can be heard by a particular species. The fact that a sound is audible does not in itself imply that the animal is influenced by the noise. The zone of audibility is often used as a first approximation in determining possible impact, as it can be calculated with reasonably good accuracy, in contrast to the three other zones. However, this approach is likely to considerably overestimate the impact of the noise.

Zone of behavioural disturbance

This zone is the area where behaviour of a particular species is altered by the noise. The change in behaviour can be negative (avoidance), positive (attraction) or neutral (e.g. change of own sounds to reduce influence from noise). This zone is very difficult to estimate, as behavioural reactions (or lack of) may depend greatly on context and individual differences. It is often in this zone, that the significant impact on the animals are found, e.g. deterrence from important resources. It is thus critical to get good estimates of this zone for relevant species and relevant types of noise.

Zone of masking

Masking is a process where the addition of noise to the ever present background noise makes it more difficult for the particular animal to detect a particular sound (communication sounds, echolocation sounds, sounds from prey or predators etc.). Inside the zone of masking communication distances among individuals of a certain species may be smaller than outside the zone.

Zone of physical injury

This zone is only relevant for very high intensity sound sources, such as seismic air guns, explosions, pile driving, and sonars

In general, there is agreement on three main sources of noise in the ocean on a global/regional scale: motorized shipping, seismic exploration and the use of sonar devices for military or civilian purposes (not listed by priority). On a local scale, many other sources may be more significant than the three big ones. It is fundamental to realize that especially low frequency

[81] Richardson et al (1995). Small Takes of Marine Mammals Incidental to Specified Activities; Seismic Hazard Investigations in Washington State [Federal Register: February 7, 2002 (Volume 67, Number 26)] [Page 5792-5796] http://www.epa.gov/fedrgstr/EPA-IMPACT/2002/February/Day-07/i2998.htm.

sound travels very well in water and that loud low-frequency sounds may be audible to animals over very large areas (up to the scale of entire ocean basins).

This may have important implications in relation to management of protected areas, as noise sources imposing significant negative impact on animals inside the protected area could be located tens or hundreds of kilometers away.

5.9.3. Exploration and extraction of Oil and Gas resources

Member States and regional seas conventions have been working for many years regulating oils and gas extraction activities in order to minimise any adverse effects on the marine environment. In June 1988 the then Paris Commission adopted guidelines for monitoring methods to be used in the vicinity of platforms in the North Sea. These guidelines were based on the overall objective of environmental monitoring, namely to assess the effects and extent of discharges of oil-based drilling fluids made at that time.

Since then, the use and discharge of oil-based drilling fluids, the discharge of drill cuttings containing drilling fluid and the discharge of produced water have all been regulated. New field developments have occurred and new production technologies have been introduced. Some installations have turned into biologically diverse and productive reefs, both in terms of biomass and fish. A coordinated chemical and biological effects monitoring programme is essential in identifying the nature and extent of potential environmental impacts.

Several monitoring studies have been carried out and published at national level. Some regional organisations have also developed useful documents providing Guidance for Monitoring the Environmental Impact of Offshore Oil and Gas Activities (e.g.: OSPAR[82]).

For the Mediterranean Sea, it is relevant to note that the Barcelona Convention has given rise to the *Protocol for the Protection of the Mediterranean Sea against Pollution Resulting from Exploration and Exploitation of the Continental Shelf and the Seabed and its Subsoil* (Pending ratification, not yet in force)[83]

As for other sectoral activities, the effects of new programmes or projects related to oil and gas sector developments need to be evaluated in accordance with the Article 6 provisions of the Habitats Directive. Article 6 (3) and (4) of the Directive provide a balanced framework to ensure that the development of the oil and gas sector activities takes place in a framework which is compatible with the protection needs of the Natura 2000 network. Therefore, the inclusion of a site into the network Natura 2000 does not, a priori, exclude its future economic use.

Negative potential effects of visual impact, noise, disposal of waste material, etc. need to be taken into consideration. Effects of noise produced during research activities also need to be addressed in an appropriate way. Paragraph 5.1 above provides more detailed information related to these provisions of the Habitats Directive.

5.9.4. Fisheries.

In March 2001 the Commission produced a Communication [COM(2001) 143 final] to the Council and the European parliament presenting relevant Elements of a Strategy for the Integration of Environmental Protection Requirements into the Common Fisheries Policy.[84]

---

82 http://www.ospar.org/eng/html/welcome.html

83 http://www.unepmap.org/Archivio/All_Languages/WebDocs/BC&Protocols/BCP_originals/ProtocolOffshore94_Eng.pdf

84 http://eur-lex.europa.eu/lex/LexUriServ/site/en/com/2001/com2001_0143en01.pdf

This document illustrates how different fishing activities, including aquaculture, interact with the marine environment in various ways:

- directly, by removing both target and by-catch species, which may lead to an unfavourable conservation status of some of them, possibly leading to their extinction or local extirpation;
- indirectly, by modifying the energy flow through the food web, which may affect the conservation status of other species of the ecosystem (e.g.: the removal of prey items may pose conservation problems to predatory species);
- directly (e.g. bottom trawling) or indirectly (e.g.: sediments or waste from some aquaculture installations) by modifying the physical environment and threatening the diversity of habitats which may in turn have an effect on their potential to host both commercial and non-commercial species;
- environmental changes, either due to natural causes or to human intervention, which in turn affect the productivity of marine ecosystems and hence fisheries.

Many examples of these effects illustrate why there is a need for full integration of environmental considerations into fisheries management. Beyond the legal obligation derived from the Treaty, there is an ethical obligation to ensure that these effects do not become large, unmanageable, or irreversible[85]. The effects of aquaculture may also include:

- Impact related to the transfer of anti-biotic and anti-fouling substances, excess organic matter, nutrients and pathogens between aquaculture facilities and the wild.
- Introduction in the wild of individuals as escapees which are genetically different from the local populations of the same species.

5.9.5. Shipping

The greater part of the world's trade by volume is carried by ships. Shipping is one of most energy efficient and least environmentally damaging forms of commercial transport[86]. Nonetheless, when major shipping casualties occur these can have extremely damaging consequences to the marine environment. Worldwide, there have recently been serious incidents involving oil tankers the *Nakhodka* (1997), *Erika* (1999) and *Prestige* (2002). To deal with such eventualities, States can prepare themselves to protect the waters for which they are responsible by taking a range of actions in advance:

- preparing national contingency plans, consistent with the International Convention on Oil Pollution Preparedness, Response and Co-operation 1990 (the OPRC Convention)[87]. These contingency plans should include protection measures to prevent/ minimise effects of oil pollution in marine protected areas, in line with the provisions of Art 6.(1) and (2) of Habitats Directive;
- participating in international assistance and co-operation arrangements of a bipartite (e.g. the Manche plan, which is a joint maritime contingency arrangement involving France and the UK), multipartite or regional nature (e.g. the Bonn Agreement, which

[85] http://eur-lex.europa.eu/lex/LexUriServ/site/en/com/2001/com2001_0143en01.pdf, Point 2.
[86] Considering the unitary impact on the environment (e.g.: environmental effects of transporting 1m3 for 1km by ship in relation to rail, road or air transport)
[87] http://www.imo.org/Conventions/mainframe.asp?topic_id=258&doc_id=682

is the regional co-operation agreement of the States bordering the North Sea), again consistent with the OPRC Convention Routing measures;

- achieving agreement in the forum of the International Maritime Organization (IMO) on ships' routing measures to reduce the risk of groundings or collisions;[88]
- establishing shore-based stations to monitor vessel traffic,
- ensuring that powerful tug boats ("emergency towing vessels") are available, so that they can go out and assist vessels which lose motive power; establishing arrangements under which a ship which requires assistance, and whose condition needs to be stabilised, can be brought in to a place of refuge.

All of these actions are valuable as a means of reducing the risk of pollution from a major shipping casualty. Such major accidental ship-source pollution incidents are mercifully rare. However, there are a number of small pollution incidents of an operational nature that are statistically more significant. The key actions that States can take to prevent operational pollution are:

- ensuring that, in their ports, reception facilities are available for the types of waste which are generated on board ship – thereby leaving no excuse for ships to resort to illegally discharging their waste at sea;
- carrying out surveillance (either aerial or satellite) to identify ships carrying out acts of pollution;
- having an effective enforcement regime in place, so that ships identified as carrying out acts of pollution are prosecuted.

The impact on marine life from oil pollution goes beyond the visible effects, such as oiled birds and beaches. Some areas act as spawning or nursery grounds for fish or as harvesting grounds for wildlife populations and human economic activities. By oiling marine and coastal habitats, even temporarily, there can be a significant impact on fish stocks, migratory birds and local human communities that depend on fishing and tourism.

Several maritime areas in Europe [e.g. the Danish straits, Baltic Sea, the English Channel (including the Brittany coast), the Galician coasts, the Straits of Gibraltar and the Aegean Sea] have some of the densest maritime traffic in the world. During recent decades the levels of shipping traffic have not only increased, but the nature of the traffic has also changed. The number of tankers has increased and their size has grown.

There will be areas of overlap between marine Natura 2000 sites and dense maritime traffic areas (some already designated sites are there). In such cases, Member States will have to pay particular attention to ensuring the necessary measures are taken to protect these sites from potentially damaging activities linked to shipping, through preventive programmes and emergency action plans to minimise the negative effects in case of accidental or deliberate ship-source oil spills.

[88] For IMO, creating the conditions in which international shipping can operate safely, securely and with a minimal impact on the global environment remains the Organization's mission.

HELCOM launches the Maritime Accident Response Information System (MARIS)

The MARIS system is used to display available data on response, emergency and aerial surveillance capacities; on the sensitivity of the coastline to oil pollution; on ship traffic and other relevant issues.

MARIS is considered to be a useful tool for the collection and display of information, as well as for risk assessment in the response field. The system can be used to view different oil spill risks and response related datasets over a common background map and indifferent combinations. MARIS also allows officials and other experts in each country to make accurate assessments of maritime risks and response resources in their own areas, based on their knowledge and expertise of local conditions MARIS is now available through the HELCOM web site

(http://www.helcom.fi/gis/maris/en_GB/main/).

Courtesy: HELCOM Press office

In these areas, it may also be appropriate to regulate vessel traffic. In such cases, Member States should ask the International Maritime Organization (IMO[89]) to consider designating a "Particularly Sensitive Sea Area" (PSSA) to include this Natura 2000 site (or group of sites) thus decreasing the harmful effects of international shipping.

A Particularly Sensitive Sea Area (PSSA) is an area that needs special protection through designation by IMO because of its significance for recognized ecological, socio-economic or scientific reasons and which has been demonstrated to be vulnerable to damage by international maritime activities. PSSA status can be used to protect valuable marine and coastal habitats as well as marine wildlife, and to improve maritime safety. Guidelines on designating a "particularly sensitive sea area" (PSSA) are contained in IMO resolution A.927(22). *Guidelines for the Designation of Special Areas under MARPOL 73/78 and Guidelines for the Identification and Designation of Particularly Sensitive Sea Areas.*[90]

A significant policy measure taken by the European Community to increase the marine security has been the establishment in March 2004 of the European Maritime Safety Agency[91].

This Agency will provide Member States and the Commission with technical and scientific assistance in the field of accidental or deliberate pollution by ships and provide additional support, on request, to the pollution response mechanisms of Member States, without prejudice to the responsibility of coastal States to have appropriate pollution response mechanisms in place and respecting existing cooperation between Member States in this field.

89 The International Maritime Organization (IMO) is the international UN body regulating commercial shipping and maritime trade. The United Nations Convention on the Law of the Sea affirms the rights of a coastal State to take measures on the high seas to prevent mitigate or eliminate danger to its coastline from a maritime casualty.

91 Regulation (EC) No 724/2004 of the European Parliament and of the Council of 31 March 2004 amending Regulation (EC) No 1406/2002 establishing a European Maritime Safety Agency (Text with EEA relevance) Official Journal L 129 , 29/04/2004 P. 0001 – 0005. http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:32004R0724:EN:NOT

5.9.6. Electricity power generation at sea: Wind farms and other infrastructure types

Electricity power generation at sea has already been studied for decades in European waters. After some initial experiences on coastal energy generation techniques, based on intertidal energy[92], there is now a growing interest in the development of offshore wind-power installations. Experiments are also underway on wave-power and undersea marine current generators.

Wind energy is an important potential source of energy in the context of the EU's target, under Directive 2001/77/EC[93], to ensure that the increase of the overall share of renewable energy in electricity generation rises from 14% in 2000 up to 21% in 2010.

For wind farm development projects, efforts are focused on finding convenient sites with sufficient wind energy and low human population. Wind-power generation is generally cost-effective when average wind speeds exceed 5 – 6 m/s. Problems with this technology include the space required as well as visual and noise impacts[94]. In addition, there may also be the risk to biodiversity specially to birds from collisions, arising from such installations. Some countries (e.g.: Denmark, Spain, Portugal…) have also developed a significant number of terrestrial wind farms some of which are built in coastal areas.

There are plans in several countries to construct offshore wind parks. Denmark, Germany, the Netherlands, UK, Spain and other Member States have significant programmes in this area (with up to 400 turbines per farm) to be built within the next five years.

The effects of these infrastructures need to be properly evaluated in accordance with the provisions of Article 6 of the Habitats Directive for any potential significant effect on species and habitats of Natura 2000 sites. Potential effects, including visual impact, collision, noise, electro-magnetic consequences need to be taken into account.

At present, there is no evidence that noise levels coming from existing wind farms have a significant effect on seals and porpoises (Madsen et al, 2005), but future taller and larger turbines could be noisier. However, important noise intensity levels may be reached during wind farm construction activities. They are of the same nature as those from other off-shore construction activities and are thus not specifically linked to the wind turbines as such.

An *ad hoc* working group on Wind energy and biodiversity has been set up by DG Environment and DG Energy and Transport Commission services with the view to produce a guidance document to help ensure that wind energy developments are compatible with the nature conservation requirements of the EU and other relevant international nature legislation applicable in Europe.

5.9.7. Military activities

Some military activities may significantly effect the marine environment. The most widespread current concerns are about the impact of sonar activities on marine mammals. The military technological sector is developing more and more sophisticated and powerful active sonar systems to identify the increasingly silent submarines. The sound produced by lower frequencies can travel hundreds of kilometres under water. As cetaceans (dolphins and whales) have very sensitive audition, echolocation and vascular systems, the utilisation of

---

92 An example of tidal power station (240 MW) is located on the Rance estuary, near St Malo in Brittany; it commenced operation in 1967.

93 Directive 2001/77/EC of the European Parliament and of the Council of 27 September 2001 on the promotion of electricity produced from renewable energy sources in the internal electricity market. Official Journal L 283 , 27/10/2001 P. 0033 - 0040

94 Kruckenberg and Jaene, 1999. (Zucco and Merck, Ökologischer Effekt von Offshore-Windkraftanlgen, 2004)

powerful sonar systems can be harmful for these species. These sonar sounds may also have an impact on fish and fish behaviour.

All cetacean species, listed in Annex IV of the Habitats Directive, benefit from a strict protection regime under Community legislation in European waters. Therefore, the provisions of article 12 apply to the protection of cetaceans, including the obligation to avoid deliberate disturbance in all EU waters (inside and outside Natura 2000 sites). Different Member State navies have developed policy initiatives for the use of military sonar taking into account the need to minimise potential environmental effects. Several precautionary actions have been carried out on this issue, launching appropriate studies and creating precautionary zones where use of these sonar activities[95] is restricted.

In relation to the protection of Natura 2000 sites, it is to be considered that for new military plans or projects that might have significant negative effects on them, Article 6 (3) and (4) of the Habitats Directive provides a balanced framework to solve possible conflicts of interest between military activities and nature protection issues.

The relevant duties for Member States when applying the Birds and Habitats Directives in the sea are covered in section 2.6.2 and 5.1 above.

Actions to protect the marine environment should be carried out respecting existing international legislation mainly regulated under the UNCLOS framework. This includes specific provisions in relation to particular rights and obligations of warships. Some legal aspects of this section are complex and go beyond the purpose of this document.

LIFE-Nature has financed two large projects where management planning in areas subject to military activities is being developed in a strategic manner and with Natura 2000 in mind. More information on this topic can be found on
http://europa.eu.int/comm/environment/life/infoproducts/lifeandmilitary_en.pdf

5.9.8. Coastal developments. Integrated Coastal Management

Compared with other continents, Europe has a large continental shelf and a relatively long coastline (89 000 km) in comparison to its land area. More than 50% of the European population live within 100km from the coast. Large parts of the coastal zone of Europe have been (or are now being) rapidly converted from a natural to an urbanised state, through housing expansion, construction of economic/recreational and other facilities, and technical infrastructure, such as harbours, airports and road networks.

This results in total destruction and fragmentation of valuable habitats. Most of the constructed and planned infrastructures are devoted to supplying facilities requested by the tourist industry. However, this degrades the very resource on which they rely: the beauty and attraction of a pristine natural environment. In addition, unregulated land use changes generate further problems of conflict with tourist activities.

These infrastructures cause the modification of sedimentary coastal dynamics, affecting the marine environment. This can result in the destruction of large areas of valuable marine coastal habitats, such as *Posidonia oceanica* meadows and maërl beds. Special mention should be made to some unregulated sand extraction activities for the needs of civil works or to build artificial beaches; the potential deleterious effects of this on sensitive marine ecosystems have been repeatedly demonstrated in the Mediterranean littoral. Another case of

[95] (German Symposium on noise disturbance -June 2003; Spain Defence Ministry and Canary Athorities agreement for avoidance of noise disturbance/behaviour modifications of Cuvier's beaked whale -*ziphius cavirostris*- OJ 102 27/04/2004, page16.643 *http://www.boe.es/boe/dias/2004-04-27/pdfs/A16643-16645.pdf*).

the physical alteration of the sea bottom is the effect of installing pipelines and sewage discharge outfalls.

The EU Recommendation on integrated coastal zone management (ICZM) recognises the threat posed to Europe's coastal zones by increasing urbanisation and invites Member States to control additional urbanisation and to ensure that exploitation of the non-urban areas respects the natural features of the coastal environment. In more general terms, the EU ICZM recommendation introduces principles and strategic aspects upon which coastal management should be based. These include:

- the protection of the coastal environment, based on an ecosystem approach and preserving its integrity and functioning, and sustainable management of the natural resources of both the marine and terrestrial components of the coastal zone;

- working with natural processes and respecting the carrying capacity of ecosystems, which will make human activities more environmentally friendly, socially responsible and economically sound in the long run[96].

In relation to tourism in particular, carrying capacity assessment has been developed as a tool to contain development within sustainable limits[97]. Environmental assessment constitutes a major tool to achieve integration of environment concerns into specific development projects, programmes or plans. Coastal zones are among the sensitive areas specified by the Environmental Impact Assessment Directive (Annex III) which need to be taken into account in determining whether project must undergo EIA. The Strategic Environmental Assessment Directive comprises in its scope plans and programmes relating to spatial and land-use planning, tourism, transport, energy, industry and fisheries.[98]

Appropriate assessment and the EIA and SEA Directives are tools in which interference with sedimentary processes can be addressed. The pan-European project *EUrosion* provided for guidance on EIA and coastal erosion.[99]. This Shoreline Management Guide is an initiative that aims at providing coastal managers at the European, National and - most of all - regional and municipal levels with a state-of-the-art of coastal erosion management solutions in Europe. It is based on the review of 60 case studies, deemed to be representative of the European coastal diversity. It illustrates some of the major issues that may be encountered in deciding which coastal erosion management design is best suited to an area.

5.9.9. Dredging. Gravel and sand extraction

Dredging of shipping lanes or extraction of gravel and sands for construction or beach nourishment purposes are human activities that need to be assessed, as regards the possible impacts on and near the place of operations and, in some cases, also as regards possible coastal erosion aspects.

Dredging is recognised as having the potential for significant environmental impact. Whether in the dredging operation or in the disposal stage, care must be taken to minimise disturbance to marine life. Also, the dredged material should not be regarded simply as waste. Consideration has to be given to the potential beneficial use of the material in some cases. With increasing environmental awareness and tightening legislative control, finding a suitable site to relocate the dredged material can be a major constraint on the implementation of a dredging project.

---

96 2002/413/EC, OJ L 148, 6.6.2002, p.6 ; Chapter I (a), Chapter II (e), Chapter IV.3 b(i).

97 http://ec.europa.eu/environment/iczm/home.htm ; http://www.pap-thecoastcentre.org/publications.html

98 http://ec.europa.eu/environment/eia/home.htm

99 http://ec.europa.eu/environment/iczm/home.htm; www.eurosion.org

As many of the European ports are located in estuaries that are protected under Natura 2000 there is particular interest in the issue of developing guidance on the management of dredging activities and conservation of this habitat type. The Commission services have undertaken work with Member States and key stakeholder groups to help reconcile these objectives.

In relation to the Natura 2000 network, it is to be considered that possible effects of these human activities need to be properly evaluated in accordance with provisions of Article 6 of the Habitats Directive for their potential significant effect on species and habitats in Natura 2000 sites.

In the last decade, advice by HELCOM, OSPAR and ICES was given on sustainable extraction practices, environmental impact assessment, monitoring and restrictions for the granting permits in sensitive areas. In 1998 HELCOM adopted Recommendation 19/1 on marine sediment extraction in the Baltic Sea (BSEP No. 76, 1999). The ICES working group on the effects of marine sediment extraction (WG EXT) recommended a code of practice, which was updated in 2001 (ICES Coop. Res. Rep No. 247, 2001). The contracting parties of OSPAR agreed in 2003 to adopt the ICES guidelines (OSPAR 03/17/1, reference number: 2003-15).

The Barcelona Convention has adopted in 1994 a *Protocol for the Protection of the Mediterranean Sea against Pollution Resulting from Exploration and Exploitation of the Continental Shelf and the Seabed and its Subsoil*. [100]

5.9.10. Tourism, recreational navigation, maritime sports, diving…

More than 200 million tourists per year visit the European coasts (most of them the Mediterranean Sea), leading to huge and often uncontrolled development of recreational activities, mainly in coastal areas and shallow water, in particular during summer.

Over-exploitation by tourists of natural, well-conserved sites constitutes a real problem in some coastal plains by their action of trampling, noise, lighting, etc., or more specific issues, such as disturbing turtle nests due to off-road 4x4 vehicles…. In the marine environment, the main problems are the destruction of intertidal and shallow subtidal bottoms, and the presence of divers at unsustainable levels, causing erosion of sensitive ecosystems, such as coral reefs, or the modification of fish behaviour due to feeding practices.

In recent years, the growing success of sea-watching activities is becoming a potential source of impact for whale and other cetacean populations and such activities need to be carefully managed. More information and references may be found in a guidance document published by ACCOBAMS *"Guidelines for commercial cetacean-watching activities in the ACCOBAMS area"* [101].

Tourism and marine nature conservation. Good practices example: **Whalewatching in Ireland.**
Irish waters are among Europe's richest for cetaceans, with

[100] http://www.unepmap.org/homeeng.asp

[101] See the "Guidelines for commercial cetacean-watching activities in the ACCOBAMS area" (available at http://www.accobams.mc/).

24 species recorded to date.

Whalewatching is one of the fastest growing tourism industries in the word and the potential in Ireland is considered hugely under-developed.

The Irish Whale and Dolphin group (IWDG) supports the development of responsible whalewatching in Irish waters.

Whalewatching can bring economic benefits to coastal communities and can enhance the conservation status and public awareness of whales and dolphins. However, as all whale and dolphin species in Ireland are protected (by national and Community legislation), thus in order to achieve the development of responsible whalewatching, which brings positive benefits to people and whales and dolphins, a development plan is necessary.

Whalewatching is one of the most rapidly expanding tourism products in the world and Ireland with its rich diversity and great abundance of whales and dolphins is well placed to exploit this new tourism product.

The IWDG are encouraging national, regional, and local tourism and development agencies to embrace the opportunities for whalewatching and ensure it is developed sustainably and has a positive impact on whales and dolphins as well as coastal communities. A relevant whalewatching policy document may be downloaded in http://www.iwdg.ie/downloads/WWPolicyDocument_final.pdf

6. LINKS BETWEEN COMMUNITY POLICY ON FISHING AND THE *"HABITATS"* AND *"BIRDS"* DIRECTIVES.

In response to a request of the Fisheries Council, a Communication from the Commission [COM (2002) 186 final[102]] was issued in May 2002, setting out a Community Action Plan to integrate environmental protection requirements into the Common Fisheries Policy (CFP). This Action Plan defines guiding principles, management measures and provides a work programme, aimed at promoting sustainable development. It identifies several priority management actions; a number of which support objectives and requirements of the Habitats and Birds Directives. (e.g.: reducing incidental bycatch, impact on habitats…)

This Communication also encourages Member States to fulfil their obligations under the nature protection Directives within the shortest possible period, in particular those relating to the designation and management of marine sites forming part of the Natura 2000 network.

The EC Regulation for conservation and sustainable exploitation of fisheries resources under the Common Fisheries Policy (CFP[103]) provides an important tool to improve the protection of nature in the marine environment and the attainment of objectives of the Birds and Habitats Directive. Section 2 above covers other relevant instruments of environmental policy for the improving of the marine environment. These include the Water Framework Directive[104], Environmental Impact Assessment Directive (EIA)[105]…

6.1. The Common Fisheries Policy

Since 1 January 2003, the European Union has a new Common Fisheries Policy. The principal text is Council Regulation (EC) N° 2371/2002 of 20/12/2002 mentioned above. The integration of environmental protection requirements into the Fisheries Policy, pursuant to Article 6 of the EC Treaty, was one of the major objectives of the Community legislator while adopting this Regulation.

The aim of the new Common Fisheries Policy (CFP) is to ensure exploitation of living aquatic resources in a way that provides sustainable economic, environmental, and social conditions. For this purpose, the precautionary principle is introduced, the progressive implementation of an eco-system approach to fisheries management is foreseen[106], as well as the need for the adoption of coherent measures concerning the limitation of the environmental impact of fishing.[107]

In the context of this legal framework, a number of measures have been taken to improve the conservation status of habitats and species in the marine environment during the last few years. These include:

In 2003, the Council adopted the shark finning Regulation ((EC) 1185/2003). It is intended to prevent catches of sharks for the sole purpose of trading the fins.

---

102 http://ec.europa.eu/fisheries/doc_et_publ/factsheets/legal_texts/docscom/en/com_02_186_en.pdf

103 CFP: Council Regulation (EC) N° 2371/2002 of 20/12/2002 on the conservation and sustainable exploitation of fisheries resources under the Common Fisheries Policy, OJ L358, p. 59 http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:32002R2371:EN:NOT

104 http://ec.europa.eu/environment/water/index.html

105 http://ec.europa.eu/environment/eia/home.htm

106 Article 2 (1) of Regulation 2371/2002.

107 Article 1 (2), point b of Regulation 2371/2002.

- The three-year sandeel closure in force off the Firth of Forth (Scotland) since 2000 was renewed in 2003 following an expert consultation meeting convened by DG FISH. A study had been completed suggesting that the closure be extended for three more years until new evidence is gathered on the effects of the fishery on the survival of predator populations (birds, marine mammals, large fish).

- In 2003 and 2004 the Commission adopted under the emergency procedure two Commission Regulations ((EC) 1475/2003 and 263/2004) on the protection of deep- water coral reefs from the effects of trawling in the Darwin Mounds (North West of Scotland). These measures were made permanent in 2004 (Council Regulation ((EC) 602/2004)

- In 2004 legislation was put in place on incidental catches of cetaceans in fisheries (Regulation No 812/2004) including compulsory use of acoustic deterrent devices in certain gear and setting up a Community observer programme designed to provide data on by-catch in a large number of fisheries.

- In 2005 legislation was adopted to protect vulnerable habitats such as coral reefs, thermal vents and carbonate mounds from the effects of fishing around the Macaronesian Isles (Council regulation (EC) No 1568/2005). An amendment to the 2004 TAC and Quota Regulation was approved to ensure temporary protection of these habitats in the meantime.

- In 2006 the Council adopted the Mediterranean Regulation ((EC) 1967/2006) which includes measures to protect sensitive habitats such as Posidonia beds and coral aggregations and to ban fishing practices that may damage the physical environment, such as the use of explosives and pneumatic hammers. It includes new technical measures on fishing gear, protection zones and minimal sizes.

- Legislation regulating the use of driftnets in Community fishing vessels (Council Regulations (EC) No 894/97 as amended by Regulation (EC) No 1235/98, (EC) No 812/2004, (EC) No 2187/2005)

- Legislation implementing fisheries restrictive areas to protect vulnerable deep sea habitats in the Mediterranean and in the North East Atlantic is included in Council Regulation (EC) No 41/2006 .

(All the above legislation may be consulted in detail at http://eur-lex.europa.eu/en/index.htm)

The current CFP allows for better integration of environmental protection requirements into fisheries management. It therefore contributes directly to the achievement of the objectives of both the Birds and Habitats Directives. Furthermore, it provides for a system of protection for marine habitats and species from the harmful effects of fishing activities even in cases where the provisions of Natura 2000 do not apply. This is particularly relevant in situations such as the following:

a.) For the protection of nature features not listed in Annexes of the Habitats Directive

b.) For the protection of features that are listed in the Annexes, but occur in areas outside the jurisdiction of Member States.

c.) For the protection of those listed features, located in marine areas under the jurisdiction of Member States but not included in a SCI/SAC (because they are located out of a SCI or waiting for a proposal/designation)

As shown above, the CFP allows for the implementation of fisheries management measures for the protection of the marine environment may already be taken under CFP provisions..

They may be aimed at the protection of sites that are qualified to be designated as SACs or SPA. Fisheries measures may be decided regardless of the stage in which the site designation process would be, as they are not necessarily linked to the implementation of the Habitats or Birds Directives.

However, pressures on the marine environment do not only come from fisheries. Subsequently, designation of Natura 2000 sites is necessary to ensure a global and coherent protection scheme to address the effects produced by other human activities (some of them illustrated in section 5.9.)

Council Regulation (EC) No 1967/2006 of 21 December 20061626/94 of 27 June 1994 lays down certain technical measures for the conservation of fisheries resources in the Mediterranean. This is another example of Community action taken in the context of the Common Fisheries Policy to achieve environmental objectives. Article 43.3 of this Regulation prohibits the use of bottom trawls, seines or similar nets above the Posidonia beds (*Posidonia oceanica*) or other marine phanerogams (it includes some derogations). Posidonia beds are listed as a "priority" habitat type under Annex I of the Habitats Directive	
Full text of the Council Regulation in Eur-Lex: http://europa.eu.int/eur-lex/en/search/search_lif.html Image Courtesy from WWF/ES. More details in: http://www.wwf.es/descarga/informe_posidonia.pdf	

The above examples show how the use of provisions of Common Fisheries Policy plays an important role in marine nature protection, addressing relevant environmental concerns.

Member States have agreed to delegate their national responsibilities in fisheries management to the Community establishing the Common Fisheries Policy as an exclusive Community competence. Therefore, there is a legal obligation to implement measures under the CFP whenever fishing restriction measures at EU level are required in order to address important conservation problems in the marine environment. This is a significant advantage as such measures for conservation purposes may be addressed by a single EU level decision.

A decision taken at Community level will be more efficient than the addition of separate national decisions that would otherwise need to be taken. However, the adoption of Community legislation requires enhanced coordination between Member States, the Commission, and the Council.

 Image from WWF	Taking into account considerations that include relevant provisions of 1) Council Regulation (EC) No 2371/2002 of 20 December 2002 on the conservation and sustainable exploitation of fisheries resources under the Common Fisheries Policy, and 2) Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, Council regulation (EC) No 812/2004 laid down measures concerning incidental catch of cetaceans in fisheries. This regulation sets out that driftnet fishing will be phased out in the Baltic as from 1 July 2004 until a total gear ban enters into force on 1 January 2008. At the same time, the regulation lays down measures aimed at mitigating by-catch. It advocates the use of acoustic devices and at-sea observer schemes as well as providing technical specifications and conditions of use.
Full text of the Council Regulation: http://eur-lex.europa.eu/pri/en/oj/dat/2004/l_150/l_15020040430en00120031.pdf More details in: http://www.panda.org/about_wwf/where_we_work/europe/where/baltics/threats/fishing.cfm	

6.2. Fisheries management measures

The process of establishment, monitoring and conservation status assessment of Natura 2000 has been developed in previous chapters. The assessment of monitoring data may show, in some cases, the necessity to regulate certain fishing activities in order to avoid the deterioration of the site[108]. In such cases, given that fisheries is an exclusive Community competence, fisheries management measures should be decided in the context of the Common Fisheries Policy and according to its rules. The basic rules are enshrined in the Regulation 2371/2002.

Fisheries management measures must be taken in consultation with stakeholders and, in particular, with the Regional Advisory Councils (RACs) which are becoming an essential instrument of the CFP.

Fishery management measures under the CFP could also be implemented in marine areas once the MS (or MSs) has proposed the relevant area as Site of Community Importance and is waiting for the area to be declared as Natura 2000 site after adoption of appropriate Commission's decision. In such cases, MSs must provide the necessary information justifying the need for temporary protection of the area.

To ensure consistency, non discrimination, and best implementation of regulatory measures, whenever possible, MSs sharing a vulnerable marine feature should coordinate and make proposals of Sites of Community Importance covering the entire valuable feature at the same time. In line with the Habitats Directive, the approach should be regional and not national: the final objective is the establishment of a coherent ecological network of protected areas by marine regions that often extend across several Member States. In order to avoid displacement

[108] 92/43 Directive: Art 6.2*: Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive*. http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:31992L0043:EN:NOT

of fishing effort to neighbouring areas, management measures should be the same for the entire marine region.

MSs shall ensure effective control inspection and enforcement of the rules of the CFP. Therefore, fisheries management measures proposed in Natura 2000 areas must be controllable in a cost-effective way and should be accompanied by the relevant monitoring and control measures as well as an estimation of the cost of controlling such areas. VMS is the more efficient monitoring tool in the EEZ. Small and scattered areas are very difficult to monitor and should be avoided.

The definition of possible measures regulating fishing activities in a particular site will depend on the combination of many different parameters such as the number and nature of the features to be protected, their conservation status, time scales, the location of the marine site, etc. By combining these parameters, it is possible to find a large number of different nature conservation cases needing some regulation of fisheries activities.

For this reason, it is not possible to develop in this document an exhaustive catalogue of all possible actions to be taken under the CFP, which need to be determined on a case by case basis for which specific technical and legal advice would be required. The information contained here is therefore of general nature.

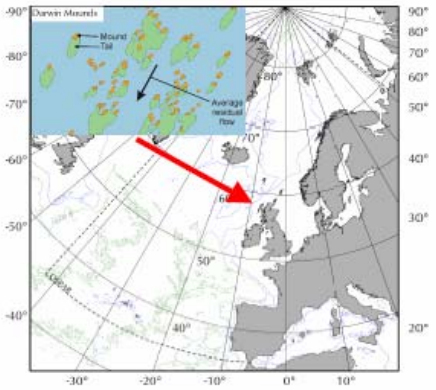
On the basis of article 37 of the EC Treaty, it is for the Council, based on a proposal from the Commission, to adopt measures regulating fisheries. This applies also to measures regulating fishing activities in order to protect a Natura 2000 site. Measures under the CFP are non discriminatory and permanent and are therefore the best option. However, Articles 8, 9 and 10 of Regulation 2371/2002 delegate some limited powers to the Member States to regulate fisheries.

More specifically, Article 8 allows Member States to take emergency measures, the maximum duration of which is 3 months, if there is evidence of a serious and unforeseen threat to the marine ecosystem resulting from fishing activities. However, due to their limited duration such measures will only exceptionally be considered in the framework of establishment of conservation measures addressing an environmental concern of a more permanent character.

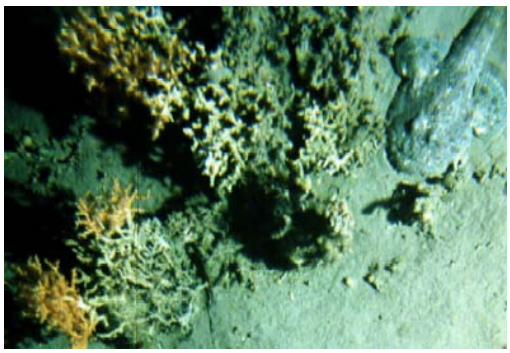
On the basis of Article 9, Member States can take non-discriminatory measures to minimise the effect of fishing on the conservation of the marine ecosystems within 12 nautical miles of their coast if the Community has not adopted measures specifically for this area. If these measures are liable to affect the vessels of another Member State, a consultation procedure with the Commission, other Member States and Regional Advisory Councils concerned is necessary before the adoption of the measures.

Finally, Member States can take measures in waters under their sovereignty or jurisdiction if they apply solely to their fishing vessels (Article 10).

In cases where a Member State considers that a fishing activity has to be regulated in order to protect a Natura 2000 site, but it has not the competence to do so on the basis of the Regulation 2371/2002, it is for the Community to finally take fisheries measures. In practice, the Member State concerned will provide the data at its disposal to the Commission, indicating the measures that it considers appropriate. However, neither the Commission's right of initiative in proposing fisheries measures, nor the Council's broad legislative discretion in adopting such measures, can be legally restricted by the request of the Member State. Nevertheless, the Commission and the Council while exercising their legislative discretion in the fisheries sector have to comply with article 6 of the EC Treaty obliging the integration of environmental protection requirements in all Community policies.



As indicated above, measures taken in the framework of the Common Fisheries Policy (CFP) are decided in a coordinated manner at Community level, which should enhance their coherence and effectiveness.



The Darwin Mounds is a deep cold coral reef formation, discovered in 1998, in the offshore waters of North Scotland. The United Kingdom has declared its intention to propose this area as a future Special Area of Conservation in fulfilment of its obligation under the Habitats Directive.

With this intention in mind, and en response to a request from the UK, the European Community adopted a Regulation [(EC) No 602/2004 of 22 March 2004] to prohibit the use of bottom trawls and similar gear, in order to avoid damage to corals, in the area surrounding the Darwin Mounds.

This is an example of Community action taken in the context of the Common Fisheries Policy (CFP) aimed at achieving environmental objectives. Integration of environmental protection requirements into the CFP has spurred this Community measure to be taken in anticipation of future SCI/SAC designation

In February 2006, ICES initiated a new project entitled "Environmentally Sound Fishery Management in Protected Areas" to develop fisheries management plans for each of the ten German NATURA 2000 areas[109]. For each of the ten pSCI/SPA the central questions to be answered are:

- To what extent do the fishing activities in the MPA represent a significant interference with the NATURA 2000 concept and objectives?
- To what extent do the fisheries activities need to be regulated?
- How can such regulations provide a balance between the requirements of NATURA 2000 and fisheries?

[109] See http://www.ices.dk/marineworld/protectedAreas.asp

The answers to these questions will be based on existing and, where appropriate, newly collected data – in particular from cooperation with fishers and the fishing industry. The project intends to significantly improve the data used for evaluation of the potential conflicts between fisheries and nature conservation interests in German waters and will require an analysis of fishing activities of all fishing vessels operating in (and around) the MPAs.

Update of “Interpretation Manual of European Union Habitats”

COASTAL AND HALOPHYTIC HABITATS

Open sea and tidal areas

1110 Sandbanks which are slightly covered by sea water all the time

PAL.CLASS.: 11.125, 11.22, 11.31

1. Definition:

Sandbanks are elevated, elongated, rounded or irregular topographic features, permanently submerged and predominantly surrounded by deeper water. They consist mainly of sandy sediments, but larger grain sizes, including boulders and cobbles, or smaller grain sizes including mud may also be present on a sandbank. Banks where sandy sediments occur in a layer over hard substrata are classed as sandbanks if the associated biota are dependent on the sand rather than on the underlying hard substrata.

"Slightly covered by sea water all the time" means that above a sandbank the water depth is seldom more than 20 m below chart datum. Sandbanks can, however, extend beneath 20 m below chart datum. It can, therefore, be appropriate to include in designations such areas where they are part of the feature and host its biological assemblages.

2. Characteristic animal and plant species

2.1. Vegetation:

North Atlantic including North Sea:

Zostera sp., free living species of the *Corallinaceae* family. *On many sandbanks macrophytes do not occur.*

Central Atlantic Islands (Macaronesian Islands):

Cymodocea nodosa and *Zostera noltii*. On many sandbanks free living species of *Corallinaceae* are conspicuous elements of biotic assemblages, with relevant role as feeding and nursery grounds for invertebrates and fish. *On many sandbanks macrophytes do not occur*.

Baltic Sea:

Zostera sp., *Potamogeton* spp., *Ruppia* spp., *Tolypella nidifica*, *Zannichellia* spp., carophytes. *On many sandbanks macrophytes do not occur*.

Mediterranean:

The marine Angiosperm *Cymodocea nodosa*, together with photophilic species of algae living on the leaves (more than 15 species, mainly small red algae of the *Ceramiaceae* family), associated with *Posidonia* beds. *On many sandbanks macrophytes do not occur*.

2.2. Animals:

North Atlantic including North Sea:

Invertebrate and demersal fish communities of sandy sublittoral (e.g. polychaete worms, crustacea, anthozoans, burrowing bivalves and echinoderms, *Ammodytes* spp., *Callionymus* spp., *Pomatoschistus* spp., *Echiichtys vipera, Pleuronectes platessa, Limanda limanda*).

Central Atlantic Islands (Macaronesian Islands):

Fish, crustacean, polychaeta, hydrozoan, burrowing bivalves, irregular echinoderms.

Baltic Sea:

Invertebrate and demersal fish communities of sandy sublittoral (fine and medium grained sands, coarse sands, gravely sands), e.g. polychaetes: *Scoloplus armiger, Pygospio elegans, Nereis diversicolor, Travisia* sp., e.g. bivalves: *Macoma balthica, Mya arenaria, Cerastoderma* sp., e.g. crustaceans: *Crangon crangon, Saduria entomon, e.g. fish species: Platichthys flesus, Nerophis ophidion, Pomatoschistus* spp., *Ammodytes tobianus*.

Mediterranean:

Invertebrate communities of sandy sublittoral (e.g. polychaetes). Banks are often highly important as feeding, resting or nursery grounds for sea birds, fish or marine mammals.

1120 * Posidonia beds (*Posidonion oceanicae*)

PAL.CLASS.: 11.34

1) Beds of *Posidonia oceanica* (Linnaeus) Delile characteristic of the infralittoral zone of the Mediterranean (depth: ranging from a few dozen centimetres to 30 - 40 metres). On hard or soft substrate, these beds constitute one of the main climax communities. They can withstand relatively large variations in temperature and water movement, but are sensitive to desalination, generally requiring a salinity of between 36 and 39‰.

2) Plants: *Posidonia oceanica*.
Animals: Molluscs- *#Pinna nobilis*; Echinoderms- *Asterina pancerii, Paracentrotus lividus*; Fish- *Epinephelus guaza, Hippocampus ramulosus.*

5) **Belsher, T. *et al* (1987).** *Livre rouge des espèces menacées de France - tome 2, espèces marines et littorales menacées,* Ed. F. de Beaufort. Museum National d'Histoire Naturelle - Paris.

1130 Estuaries

PAL.CLASS.: 13.2, 11.2

1) Downstream part of a river valley, subject to the tide and extending from the limit of brackish waters. River estuaries are coastal inlets where, unlike 'large shallow inlets and bays' there is generally a substantial freshwater influence. The mixing of freshwater and sea water and the reduced current flows in the shelter of the estuary lead to deposition of fine sediments, often forming extensive intertidal sand and mud flats. Where the tidal currents are faster than flood tides, most sediments deposit to form a delta at the mouth of the estuary.
Baltic river mouths, considered as an estuary subtype, have brackish water and no tide, with large wetland vegetation (helophytic) and luxurious aquatic vegetation in shallow water areas.

2) Plants: Benthic algal communities, *Zostera* beds e.g. *Zostera noltii* (*Zosteretea*) or vegetation of brackish water: *Ruppia maritima* (= *R. rostellata* (*Ruppietea*)); *Spartina maritima* (*Spartinetea*); *Sarcocornia perennis* (*Arthrocnemetea*). Both species of fresh water and brackish water can be found in Baltic river mouths (*Carex* spp., *Myriophyllum* spp., *Phragmites australis*, *Potamogeton* spp., *Scirpus* spp.).
Animals: Invertebrate benthic communities; important feeding areas for many birds.

3) Corresponding categories
German classification : "D2a Ästuare (Fließgewässermündungen mit Brackwassereinfluß u./od. Tidenhub eingeschlossen werden", "050105 Brackwasserwatt des Ästuare an der Nordsee", "050106 Süßwasserwatt im Tideeinfluß des Nordsee".

4) An estuary forms an ecological unit with the surrounding terrestrial coastal habitat types. In terms of nature conservation, these different habitat types should not be separated, and this reality must be taken into account during the selection of sites.

5) **Brunet, R. et al.** *Les mots de la géographie-dictionnaire critique*. Ed. Reclus.
Gillner, W. (1960). Vegetations- und Standortsuntersuchungen in den Strandwiesen der schwedischen Westküste. *Acta Phytogeogr. Suec*. 43:1-198.

1140 Mudflats and sandflats not covered by seawater at low tide

PAL.CLASS.: 14

1) Sands and muds of the coasts of the oceans, their connected seas and associated lagoons, not covered by sea water at low tide, devoid of vascular plants, usually coated by blue algae and diatoms. They are of particular importance as feeding grounds for wildfowl and waders. The diverse intertidal communities of invertebrates and algae that occupy them can be used to define subdivisions of 11.27, eelgrass communities that may be exposed for a few hours in the course of every tide have been listed under 11.3, brackish water vegetation of permanent pools by use of those of 11.4.
Note: Eelgrass communities (11.3) are included in this habitat type.

1150 * Coastal lagoons

PAL.CLASS.: 21

1) Lagoons are expanses of shallow coastal salt water, of varying salinity and water volume, wholly or partially separated from the sea by sand banks or shingle, or, less frequently, by rocks. Salinity may vary from brackish water to hypersalinity depending on rainfall, evaporation and through the addition of fresh seawater from storms, temporary flooding of the sea in winter or tidal exchange. With or without vegetation from *Ruppietea maritimae, Potametea, Zosteretea* or *Charetea* (CORINE 91: 23.21 or 23.22).

- Flads and gloes, considered a Baltic variety of lagoons, are small, usually shallow, more or less delimited water bodies still connected to the sea or have been cut off from the sea very recently by land upheaval. Characterised by well-developed reedbeds and luxuriant submerged vegetation and having several morphological and botanical development stages in the process whereby sea becomes land.
- Salt basins and salt ponds may also be considered as lagoons, providing they had their origin on a transformed natural old lagoon or on a saltmarsh, and are characterised by a minor impact from exploitation.

2) Plants: *Callitriche* spp., *Chara canescens, C. baltica, C. connivens, Eleocharis parvula, Lamprothamnion papulosum, Potamogeton pectinatus, Ranunculus baudotii, Ruppia maritima, Tolypella n. nidifica*. In flads and gloes also *Chara* ssp.(*Chara tomentosa*), *Lemna trisulca, Najas marina, Phragmites australis, Potamogeton* ssp., *Stratiotes aloides, Typha* spp.
Animals: Cnidaria- *Edwardsia ivelli;* Polychaeta- *Armandia cirrhosa*; Bryozoa- *Victorella pavida*; Rotifera - *Brachionus* sp.; Molluscs- *Abra* sp., *Murex* sp.; Crustaceans- *Artema* sp.; Fish- *Cyprinus* sp., *Mullus barbatus*; Reptiles- *Testudo* sp.; Amphibians- *Hyla* sp.

3) Corresponding categories

1160 Large shallow inlets and bays

PAL.CLASS.: 12

1) Large indentations of the coast where, in contrast to estuaries, the influence of freshwater is generally limited. These shallow [1] indentations are generally sheltered from wave action and contain a great diversity of sediments and substrates with a well developed zonation of benthic communities. These communities have generally a high biodiversity. The limit of shallow water is sometimes defined by the distribution of the *Zosteretea* and *Potametea* associations.
Several physiographic types may be included under this category providing the water is shallow over a major part of the area: embayments, fjards, rias and voes.

2) Plants: *Zostera* spp., *Ruppia maritima*, *Potamogeton* spp. (e.g. *P. pectinatus*, *P. praelongus*), benthic algae.
Animals: Benthic invertebrate communities.

3) Corresponding categories
German classification : "B31 naturnaher Boddengewässerkomplex", "B32 Boddengewässerkomplex, geringe Belastung", "A2a Flachwasserzonen der Nordsee (Meeresarme u. -buchten, incl. Seegraswiesen)".

[1] National experts consider inappropriate to fix a maximum water depth, since the term 'shallow' may have different ecological interpretations according to the physiographic type considered and geographical location.

1170 Reefs

PAL.CLASS.: 11.24, 11.25

1. Definition of the habitat:

Reefs can be either biogenic concretions or of geogenic origin. They are hard compact substrata on solid and soft bottoms, which arise from the sea floor in the sublittoral and littoral zone. Reefs may support a zonation of benthic communities of algae and animal species as well as concretions and corallogenic concretions.

Clarifications:

- "*Hard compact substrata"* are: rocks (including soft rock, e.g. chalk), boulders and cobbles (generally >64 mm in diameter).
- "*Biogenic concretions"* are defined as: concretions, encrustations, corallogenic concretions and bivalve mussel beds originating from dead or living animals, i.e. biogenic hard bottoms which supply habitats for epibiotic species.
- "*Geogenic origin"* means: reefs formed by non biogenic substrata.
- "*Arise from the sea floor"* means: the reef is topographically distinct from the surrounding seafloor.
- "*Sublittoral and littoral zone"* means: the reefs may extend from the sublittoral uninterrupted into the intertidal (littoral) zone or may only occur in the sublittoral zone, including deep water areas such as the bathyal.
- Such hard substrata that are covered by a thin and mobile veneer of sediment are classed as reefs if the associated biota are dependent on the hard substratum rather than the overlying sediment.
- Where an uninterrupted zonation of sublittoral and littoral communities exist, the integrity of the ecological unit should be respected in the selection of sites.
- A variety of subtidal topographic features are included in this habitat complex such as: Hydrothermal vent habitats, sea mounts, vertical rock walls, horizontal ledges, overhangs, pinnacles, gullies, ridges, sloping or flat bed rock, broken rock and boulder and cobble fields.

2. Examples for typical reef species

2.1 Reef vegetation:

North Atlantic including North Sea and Baltic Sea:

A large variety of red, brown and green algae (some living on the leaves of other algae).

Atlantic (Cantabric Sea, Bay of Bizcay): *Gelidium sesquipedale* communities associated with brown algae (*Fucus*, *Laminaria*, *Cystoseira*), and red algae (Corallinaceae, Ceramiceae, Rhodomelaceae).

Central Atlantic Islands (Macaronesian Islands) and Mediterranean:

Cystoseira/*Sargassum* beds with a mixture of other red algae (*Gelidiales, Ceramiales*), brown algae (*Dictyotales*) and green algae (*Siphonales, Siphonacladales*).

2.2. Examples for typical reef animals:

2.2.1 Examples for animals forming biogenic reefs:

North Atlantic including North Sea:

Polychaetes (*e.g. Sabellaria spinulosa, Sabellaria alveolata, Serpula vermicularis*), bivalves (e.g. *Modiolus modiolus, Mytilus sp.*) and cold water corals (e.g. *Lophelia pertusa*).

Atlantic (Gulf of Cádiz): Madreporarians communities: *Dendrophyllia ramea* community (banks), *Dendrophyllia cornigera* community (banks); white corals communities (banks), (*Madrepora oculata* and *Lophelia pertusa* community (banks). *Solenosmilia variabilis* community (banks). Gorgonians communities: Facies of *Isidella elongata* and *Callogorgia verticillata* and *Viminella flagellum*; Facies of *Leptogorgia* spp.; Facies of *Elisella paraplexauroides*; Facies of *Acanthogorgia* spp. and *Paramuricea* spp. *Filigrana implexa* formations.

Central Atlantic Islands (Macaronesian Islands):

Warm water corals (*Dendrophilia, Anthiphates*), serpulids, polychaetes, sponges, hydrozoan and briozoan species together with bivalve molluscs (*Sphondillus, Pinna*).

Baltic Sea: Bivalves (e.g. *Modiolus modiolus, Mytilus* sp., *Dreissena polymorpha).*

Mediterranean: Serpulid polychaetes, bivalve molluscs (e.g. *Modiolus sp. Mytilus sp.* and oysters). Polychaetes (*e.g. Sabellaria alveolata).*

South-West Mediterranean: Dendropoma *petraeum* reefs (forming boulders) or in relation with the red calcareous algae *Spongites* spp or *Litophyllum lichenoides*. *Filigrana implexa* formations. Gorgonians communities: Facies of holoaxonia gorgonians (*Paramuricea clavata* "forest", *Eunicella singularis* "forest"), mixed facies of gorgonians (*Eunicella* spp, *P. clavata, E. paraplexauroides, Leptogorgia* spp). Facies of *Isidella elongata* and *Callogorgia verticillata*; Facies of scleroaxonia gorgonians (*Corallium rubrum*). Madreporarians communities: *Cladocora caespitosa* reefs, *Astroides calycularis* facies. Madreporarians communities: *Dendrophyllia ramea* community (banks); *Dendrophyllia cornigera* community (banks); white corals communities (banks): *Madrepora oculata* and *Lophelia pertusa* community (banks).

West Mediterranean: Polychaetes (exclusively *Sabellaria alveolata).*

2.2.2 Examples for non reef forming animals:

North Atlantic including North Sea:

In general sessile invertebrates specialized on hard marine substrates such as sponges, anthozoa or cnidaria, bryozoans, polychaetes, hydroids, ascidians, molluscs and cirripedia (barnacles) as well as diverse mobile species of crustaceans and fish.

Central Atlantic Islands (Macaronesian Islands):

Gorgonians, hydrozoans, bryozoan and sponges, as well as diverse mobile species of crustacean, molluscs (cephalopoda) and fish.

Baltic Sea: Distribution and abundance of invertebrate species settling on hard substrates are limited by the salinity gradient from west to east. Typical groups are: hydroids, ascidians, cirripedia (barnacles), bryozoans and molluscs as well as diverse mobile species of crustaceans and fish.

Mediterranean: Cirripedia (barnacles), hydroids, bryozoans, ascidians, sponges, gorgonians and polychaetes as well as diverse mobile species of crustaceans and fish.

Relevant types within “A1.1, A1.1/B-ELR.MB, A1.2, A1.2/B-MLR.MF, A1.3, A1.3/B-SLR, A1.4, A1.5, A1.6, A2.8, A3.1, A3.2, A3.2/M-III.6.1.(p), A3.2/H-02.01.01.02.03, A3.2/H-02.01.02.02.03, A3.3, A3.4, A3.5, A3.6, A3.6/B-MCR.M, A3.7, A3.8, A3.9, A3.A, A3.B, A3.C, A4.6, A5.1, A5.6”, A6.2, A6.3.

HELCOM classification:

"Sublittoral soft rock reefs of the photic zone with little or no macrophyte vegetation (2.1.1.2.3)", "Hydrolittoral soft rock reefs with or without macrophyte vegetation (2.1.1.3.3)", "Sublittoral solid rock reefs of the photic zone with or without macrophyte vegetation (2.1.2.2.3)", "Hydrolittoral solid rock reefs with or without macrophyte vegetation (2.1.2.3.3)", "Sublittoral stony reefs of the photic zone with or without macrophyte vegetation (2.2.2.3)", "Stony reefs of the hydrolittoral zone with or without macrophyte vegetation (2.2.3.3)".

Trilateral Wadden Sea Classification (von Nordheim et al. 1996):

"Sublittoral (old) blue mussel beds (03.02.07)", "Sublittoral oyster reefs (03.02.08)", "Sublittoral sabellaria reefs (03.02.09)", "Eulittoral (old) blue mussel beds (05.01.07)", "Benthic zone, stony and hard bottoms, rich in macrophytes, incl. artificial substrates (03.02.06)", "Benthic zone, stony and hard bottoms, few macrophytes (03.02.04)".

Nordic classification (Kustbiotoper i Norden, Nordiska Ministerrådet 2001):

"Klippbottnar (7.7.1.3; 7.7.2.3; 7.7.3.3; 7.7.4.3; 7.7.5.3; 7.8.1.3; 7.8.2.3; 7.8.3.4; 7.8.4.3; 7.8.5.3; 7.8.6.13; 7.8.7.16)", "Sublittorale samfund på sten- och klippebund (7.9.1.2)", "Sublittorale samfund på stenbund (7.9.2.2; 7.9.3.2)".

4. Associated habitats:

Reefs can be found in association with "vegetated sea cliffs" (habitats 1230, 1240 and 1250) "sandbanks which are covered by sea water all the time" (1110) and "sea caves" (habitat 8830). Reefs may also be a component part of habitat 1130 "estuaries" and habitat 1160 "large shallow inlets and bays".

1180 Submarine structures made by leaking gases

PAL.CLASS.: 11.24

1. Definition of the habitat

Submarine structures consist of sandstone slabs, pavements, and pillars up to 4 m high, formed by aggregation of carbonate cement resulting from microbial oxidation of gas emissions, mainly methane. The formations are interspersed with gas vents that intermittently release gas. The methane most likely originates from the microbial decomposition of fossil plant materials.

The first type of submarine structures is known as “bubbling reefs”. These formations support a zonation of diverse benthic communities consisting of algae and/or invertebrate specialists of hard marine substrates different to that of the surrounding habitat. Animals seeking shelter in the numerous caves further enhance the biodiversity. A variety of sublittoral topographic features are included in this habitat such as: overhangs, vertical pillars and stratified leaf-like structures with numerous caves.

The second type are carbonate structures within “pockmarks”. “Pockmarks” are depressions in soft sediment seabed areas, up to 45 m deep and a few hundred meters wide. Not all pockmarks are formed by leaking gases and of those formed by leaking gases, many do not contain substantial carbonate structures and are therefore not included in this habitat. Benthic communities consist of invertebrate specialists of hard marine substrata and are different from the surrounding (usually) muddy habitat. The diversity of the infauna community in the muddy slope surrounding the “pockmark” may also be high.

2. Characteristic species:

“Bubbling reefs”

Plants: If the structure is within the photic zone, marine macroalgae may be present such as *Laminariales*, other foliose and filamentous brown and red algae.

Animals: A large diversity of invertebrates such as Porifera, Anthozoa, Polychaeta, Gastropoda, Decapoda, Echinodermata as well as numerous fish species are present. Especially the polychaete *Polycirrus norwegicus* and the bivalve *Kellia suborbicularis* are associated species of the “bubbling reefs”.

“Pockmarks”

Plants: Usually none.

Animals: Invertebrate specialists of hard substrate including Hydrozoa, Anthozoa, Ophiuroidea and Gastropoda. In the soft sediment surrounding the pockmark Nematodae, Polychaeta and Crustacea are present.

3. Associated habitats:

“Bubbling reefs” can be found in association with the habitat types ”sandbanks, which are covered by sea water all the time (1110)” and “reefs (1170)”.

4. Geographical distribution and regional varieties:

Shallow water examples of “bubbling reefs” colonised by macroalgae and/or animals are observed in Danish waters in the littoral and sublittoral zone from 0 to 30 m water depth. They are present in the northern Kattegat and in the Skagerrak and follow a NW SE direction parallel to the Fennoscandian fault line.

“Pockmarks” are found in many areas of the European shelf seas. Deep water examples of pockmarks with benthic fauna communities exists at approximately 100 m water depth in the UK part of the North Sea as depressions in areas of predominantly muddy seabed. Examples of extensive areas with pockmarks are found on the Galician coast (Spain) at the bottom of Rias at a more shallow water depth compared to the pockmarks in the North Sea. Present emission of gas has been reported, as well as other inactive pockmarks filled by more modern sediments. Another difference with the “bubbling reefs” of the Danish coast is that gas stocks are closer to the present bottom surface.

5. Corresponding categories:

HELCOM classification:

All subtypes under “Bubbling reefs (2.10)”

EUNIS:

Relevant types under A3.C.

Examples of possible outcomes after evaluation of the different impacts of human activities on the ecosystem of the sites “A” and “B”

1. Wind parks

Wind parks can be accommodated in SAC’s based on bottom biotopes. The pylons and bottom protection (mostly stone) will have an impact on the sediment, but the area impacted is so small compared to the distance the turbines are from each other (600 -750 m) that the impact in the specific natural values could be regarded as non-significant. Installation of wind parks will need implementation of safety measures that will need regulation of other uses such as dredging or bottom disturbing fisheries.
For the bottom biotopes of Site «A» and Site «B» spatial regulations may be required in order to place the structures outside the hotspots. Therefore the squares are marked yellow.

Apart from the sediment the Site «A» is designated because of the occurrence of the guillemots in late summer, when adult males with their young swim there coming from XXX for moulting and growing up of the chicks. The birds are not able to fly in that period, so there is no danger for collisions with the turbines. However the turbines have a disturbing impact on the birds. Thereby reducing the value as a bird habitat. The disturbing impact on feeding and moulting guillemots is not known, and has to be studied before permission for establishing a park can be granted. The matrix squares dealing with impacts on species are grey or yellow (with some question marks)
In case a SAC such as Site «A» would contain small reefs (biogenic such as oyster, mussel or sabellaria reefs, or rocky outcrops or large stones (Ice age relics)), zoning regulations within the SAC can be applied in order to prevent impacts on these areas which are relatively small compared to the whole Site «A». Therefore the matrix square is yellow.

2. Oil and gas exploration

For offshore platforms partly the same reasoning is adopted as for wind turbines. The space occupied is relatively small, so there is no significant impact on the bottom ecosystem. There may be disturbing impact on birds, but the number of platforms and the distance between them is not comparable to the much higher density of turbines. For migrating birds, among which there may be species listed in the Annexes of the directives, platforms may have a negative impact on some nights or with fog when birds are disoriented by light or flares. This impact will be prevented by mitigation measures.
For both Site «B» and Site «A», very strict safety regulations in order to prevent release of lipophilic substances (oil or detergents) to the sediment or water surface have to be implemented.

3. Oil pollution

Oil slicks occur everywhere where shipping occurs or where wrecks are still lying at the bottom. Frequency, timing and location are almost unpredictable. For both Site «B» and Site «A» floating slicks will have little impact on the bottom community. Combating slicks with dispersing agents has to be prevented because these cause the oil to disperse into the water column where the small globules may be more toxic, or cause the oil to coagulate and sink to the bottom.
Because the Site «A» has a specific value for floating and foraging birds it should be prevented that oil slicks reach the area, especially in the period between July and November, when high densities of guillemot and razorbill are present. Combatment plans should be implemented and equipment and specialized manpower ready for action.Matrix squares related to oil pollution are all red

4. Beam trawl fisheries

Beam trawl fishery is detrimental for bottom dwelling organisms and therefore not compatible with SAC’s that are implemented because of these organisms or bottom habitats. This type of fishery should not occur in a SAC. For fishermen this means loss of fishing ground, but not necessarily measurable loss of catch. Most commercial fish species are rather mobile and migrate over such distances that at some stage they will be caught outside the SAC. It has been calculated that closure of areas up to several ICES quadrants (each approximately 55 x 55 km) in the Dutch EEZ will not result in significant lower catches for the Dutch fisheries sector. Because regulatory actions for fishery in the open sea are the responsibility of the EU, international agreements will be necessary.

5. Gravel mining

Gravel does not occur in the Site «A». If small patches had occurred, prevention of mining would be sensible because the gain for the sector would be minimal.
In the Site «B» gravel mining is proposed. Because the gravel is the reason for SAC implementation, this activity should not be allowed. There are no direct financial losses for the sector because there is no extraction yet, but it will prevent future opportunities.

Appendix 4.2 LIFE and the Marine Environment. Publication of December 2006

1. Towards the identification of marine IBAs in the EU: an exploration by the Birds and Habitats Directives Task Force

This paper is meant as a first step towards a general approach to the identification of marine areas (i.e. those beyond the coastline) that are important for the conservation of birds in the Europe Union. It is based on current knowledge on how birds (mostly waterbirds) are distributed and make use of the marine environment. It concerns truly marine specialists that only approach land in order to breed. These are the so-called 'pelagic' species, the whereabouts of which are still insufficiently known for the proper identification of the areas of highest importance at the European level. Methodological criteria to identify and set the limits to those areas are currently under development, both within (notably in Spain and UK by SEO and RSPB, respectively) and beyond Europe by the Partnership of BirdLife International.

The current paper will focus on the species and IBA categories for which sufficient information is available to warrant an objective proposal by BirdLife International. A separate (second) part of this paper will deal with dispersed pelagic species when solid criteria have been developed and tested for EU waters.

I. General introduction and coast related IBAs

1. In the last two decades, BirdLife International (and its forerunner ICBP) has been very successful in the identification of Important Bird Areas and subsequently getting general recognition that these sites represent prime sites for bird conservation. The European network of IBAs has formed an important scientific reference for the designation of special protection areas (SPAs) under the Wild Birds Directive of the European Union. It is now accepted BirdLife policy that in the EU, all IBAs should be classified as SPAs. Until now, the IBA programme of BirdLife International has been mainly focused on terrestrial and coastal habitats and the bird species using these habitats. Thanks to the increasing knowledge of the importance of inshore waters for waterbirds a number of inshore[1] sites have been identified particularly in the Baltic and North Sea area (note that many of these have been selected using different criteria to current IBAs). On the contrary, little attention has been paid so far to the identification of offshore areas important for predominantly marine species including pelagic species. Apart from lack of information this was due to the limited, if any, legal possibilities for site protection. IBA boundary selection guidelines say that an IBA should be an area which can in some way be managed. This has implications for the selection of areas at sea where ability to manage is severely curtailed.

2. The application of the Environmental Community law beyond territorial waters over which the MS exercises exclusive rights of exploitation and exploration of natural resources[2] was confirmed by a judgment of the European

[1] For practical reasons, inshore is here defined as the area of marine waters within 12 nm (about 22km) from the coastline, but excluding estuaries and intertidal mudflats; offshore concerns marine waters beyond 12 nm from the coastline. This distinction does not have an ecological meaning but is based on the maximum extent of territorial waters under UNCLOS (United Nations Common Law of the Sea, 1982).

[2] Other Member States have declared for this purpose Exclusive Economic Zones (EEZs) which extend at maximum 200 nautical miles from the coastline (the area may be limited by the presence of other countries)

Court of Justice (mainly Court case judgement C-6/04[3]). Apart from the EU perspective other instruments like the OSPAR convention[4], the Helsinki Convention[5] and the Barcelona Convention[6] cover the protection of species and habitats in the marine environment. Therefore, there is an urgent need to adapt criteria and to establish guidelines for the identification of marine IBA's. This paper prepared by BirdLife international for the Birds and Habitats Directives Task Force is meant as a starting point for the preparation of such guidelines. It takes account of work that has already been done in this field and considers the possibilities to extend the IBA concept to the marine environment.

3. Marine habitats

Marine habitats are normally defined by relevant topographical or oceanographical features. The EUNIS Habitat Classification[7] makes in the first place a distinction according to strata: the sea bed and the water column. Next the sea bed is divided in littoral habitats and habitats that are permanently water-covered[8]. The latter is subdivided in continental shelf[9] and the deep sea. The shelf break occurs at variable depth, but is generally over 200 metres. Another useful contour line is the 20 m depth line. The waters between this and the coastline are generally known as coastal waters and are not always considered truly marine. In many cases, coastal waters have already been included in land-based IBAs (e.g. next to breeding colonies). In this paper "pelagic" refers to the open sea beyond coastal waters.

Geographical scope

3. This paper is dealing with the identification of IBAs beyond the littoral zone in European Union waters although much may be applicable elsewhere in the Western Palearctic. It is mainly based on experience from the continental shelf (in particular Baltic Sea and North Sea) because few published data is available on seabird distribution patterns further away and elsewhere. The Birds and Habitats Directives are applicable where Member States claim sovereign rights or an EEZ (Exclusive Economic Zone) has been declared[10]. The latter consists of the continental shelf and the "superadjacent" waters up to a limit of 200 nautical miles from the baseline from which the territorial sea is measured. Although the OSPAR and Barcelona Conventions covering the entire NE. Atlantic (up to Greenland) and the Mediterranean respectively require also the protection and conservation of ecosystems and the biological diversity of the maritime area, these requirements are less specific (and partly dependent on soft law) than those of EU law of which the compliance can be effectively enforced. As far as the implementation of the EU Birds Directive is concerned BirdLife should presumably focus its attention now on the territorial waters and EEZ's of the Member States, including major parts of the North Sea and the Baltic Sea.

[3] See Judgement articles 115-120 (http://curia.eu.int/jurisp/cgi-bin/form.pl?lang=en&Submit=Submit&alldocs=alldocs&docj=docj&docop=docop&docor=docor&docjo=docjo&numaff=C-6%2F04&datefs=&datefe=&nomusuel=&domaine=&mots=&resmax=100)

[4] Convention for the Protection of the Marine Environment of the North-East Atlantic which entered into force in 1998 (threatened and declining species according to preliminary list indicated in table 3)

[5] Convention on the Protection of the Marine Environment of the Baltic Sea Area (1992); entered into force in Jan 2000

[6] Convention for the Protection of the Mediterranean Sea against Pollution (1976) and its Protocol concerning Mediterranean specially protected areas (1982)

[7] A common European reference set of habitat units with a common description of all units and a common hierarchical classification. EUNIS is the European Nature Information System, developed and managed by the European Topic Centre for Nature Protection and Biodiversity (ETC/NPB in Paris) for the European Environment Agency (EEA) and the European Environmental Information Observation Network (EIONET).

[8] also referred to as pelagic waters: i.e. the open-water environment, or water column, as distinct from the bed or shore, inhabited by swimming marine or freshwater organisms.

[9] The gently seaward-sloping seabed surface that extends between the shoreline and the top of the continental slope at about 150 m depth. The average gradient of the shelf is between 1:500 and 1:1000 although it varies greatly, the average width is approximately 70km (North Sea and Baltic Sea are part of the continental shelf).

[10] Note that where EEZ's have not been declared (like in the Mediterranean) the application is restricted to the territorial zone which extends from 12 nm from the coastline.

What are IBAs?[11]

5. The aim of the Important Bird Areas (IBAs) programme is to identify and protect a network of sites at a biogeographic scale, critical for the long-term viability of naturally occurring bird populations, across the range of those bird species for which a site-based approach is appropriate. The network is considered the minimum essential to ensure the survival of these species. In essence it is BirdLife policy that, with some minor qualifications, all IBAs should be classified as SPAs under the Birds Directive. Four categories of species have been considered of which threatened and congregatory species concern the main categories (see table 6). To summarise, IBAs:

Some characteristics of IBA's

- are places of international significance for the conservation of birds at the global, regional or sub-regional levels;
- are practical tools for conservation;
- are chosen using standardised, agreed criteria applied with common sense;
- must, wherever possible, be large enough to support self-sustaining populations of those species for which they are important;
- must be amenable to conservation and, as far as possible be delimitable from surrounding areas;
- will preferentially include where appropriate, existing Protected Area Networks;
- are not appropriate for all bird species, and for some are only so in parts of their ranges; and
- should form part of a wider, integrated approach to conservation that embraces sites, species and habitat protection.

6. In addition to the above characteristics it also useful to refer to the definition of boundaries (underlined sentences that are problematic for marine areas):

Defining the boundaries of an IBA (from IBA2000)

- A site is defined so that, as far as possible, it:

i) is different in character or habitat or ornithological importance from the surrounding area;
ii) exists as an actual or potential protected area, with or without buffer zones, or is an area which can be managed in some way for nature conservation;
iii) is, alone or with other sites, a self-sufficient area which provides all the requirements of the birds (that it is important for) which use it during the time that they are present.

- Where extensive tracts of continuous habitat occur which are important for birds, only characteristics ii) and iii) apply. This definition is not applicable to migratory bottleneck sites.
- Practical considerations of how best the site may be conserved are the foremost consideration.
- Simple, conspicuous boundaries such as roads or rivers can often be used to delimit site margins, while features such as watersheds, ridge-lines and hilltops can help in places where there are no obvious discontinuities in habitat (transitions of vegetation or substrate). Boundaries of ownership are also relevant.
- There is no fixed maximum or minimum size for IBAs — the biologically sensible should be tempered with the practical. Neither is there a definitive answer on how to treat cases where a number of small sites lie near each other. Whether these are best considered as a series of separate IBAs, or as one larger site containing areas lacking ornithological significance, depends upon the local situation with regard to conservation and management.

What has been done so far?

Marine IBAs[12]

7. The marine environment[13] is important for birds in Europe. European seas support over 60 species of bird that either have an unfavourable conservation status in Europe (Tucker & Heath 1994) or are marine specialists which are highly dependent upon the continuing integrity and quality of marine ecosystems (Tucker & Evans 1997). These species include four species that are globally threatened or near-threatened with extinction. Many of these species

[11] Paragraph taken from "Identification and demarcation of marine IBAs and their relationship to the Birds Directive" prepared by Duncan Huggett and presented for BirdLife International at various conferences (see references).
[12] Paragraphs 4-5 largely taken from Heath & Evans (2000), page 51 (abbreviated as IBA2000)

[13] i.e. marine habitats below the low-tide mark (Tucker & Evans 1997) thus excluding intertidal areas

congregate at certain times of the year, such as seabirds at breeding colonies or loons (divers) and seaducks at favourable feeding grounds in winter. Yet despite its importance for bird conservation, the marine environment has, until recently, received relatively little attention in terms of the identification of Important Bird Areas. This is due primarily to the difficulty of defining, identifying and delineating priority sites in areas of homogeneous appearance, coupled with the difficulty of stimulating international co-operation to establish integrated protection and management schemes for important sites outside national territorial waters. This inventory identifies 470 IBAs in Europe that have some marine habitat, including 147 IBAs that have more than 50% marine habitat cover and at least 25 IBAs are solely marine. Within the scope of IBA2000 no specific attempt has been made, to provide complete listings of marine areas important for birds in Europe (see for situation in a number of countries Appendix I).

Previous inventories of marine areas that are internationally important for birds

8. Three major publications have attempted to define, identify and delineate important areas for birds in European seas: *Important bird areas for seabirds in the North Sea* (Skov *et al.* 1995), *Important marine areas for wintering birds in the Baltic Sea* (Durinck *et al.* 1994) , and *Important bird areas in the Baltic Sea* (Skov *et al.* 2000).[14] In SW. Europe a first attempt has been made to describe the methodology and identify marine areas in Spain: *Towards the identification of Important Bird Areas (IBAs) at sea -- Preliminary notes from Spain* (Carboneras & Viada in prep.).

North Sea The study area covered the entire North Sea, the Channel and the Kattegat, bounded by the coastlines of the United Kingdom, Norway, Sweden, Denmark, Germany, the Netherlands, Belgium and France (…). It included all territorial and international waters between the western Channel, the Northern Atlantic and the Kattegat. Data were analyzed from coastal and continental shelf seabird surveys during 1979–1994. The distribution of 30 species provided the basis for identifying important areas for birds. Twenty areas were identified as internationally important for birds in the area, of which the top six sites comprising less than 5 % of the region hold more than 80% of the cumulated sum of proportions for the species in question.

Baltic Sea The study area encompassed the Baltic Sea, the Danish Straits and the Kattegat (Durinck *et al.* 1994, Skov *et al.* 2000). Data were presented for 30 species for which 1% or more of their biogeographic population winters in the Baltic Sea. Thirty-nine areas were identified as internationally important for wintering birds in the region, of which the top 10 sites, which cover less than 5% of the region, hold about 90% of the total estimated number of wintering birds.

Spain The preliminary analysis by Carboneras & Viada (in prep.) was based on a number of physical and ecological characteristics which, when combined, helped identify important areas for seabirds in each of Spain's three distinct marine zones (Mediterranean, Atlantic and Macaronesia), and set their limits. They matched oceanographical criteria (topography, salinity, temperature, currents, upwellings, nutrients) against the regular use that seabirds made of those areas and obtained a preliminary list of 13 marine IBAs for seabirds in Spain. Their analysis mainly focused on birds which behave as strictly marine when they occur in Spanish waters (divers, petrels, shearwaters, storm-petrels, gannets, cormorants, skuas, gulls, terns and auks). The analysis was not only based on concentrations of seabirds but on the regular use that they made of certain areas, and the relevance of such areas for the conservation of seabird species. Thus, the identification of areas on which seabirds depend during part of their life cycle was key to the process. They included important foraging grounds, sites of importance along migration routes, waters where seabirds develop part of their breeding cycle as well as areas where significant aggregations occur (for resting, moulting, in winter, etc.).

9. The first three of those studies referred to above applied the so-called Marine Classification Criterion (MCC) that measures marine bird concentrations and their international significance. The methodology is dependent on having sufficiently large amounts of quantitative data available on bird distribution in marine areas. It enables the use of the 1%-threshold which is widely applied to waterbirds for the identification of wetlands of international importance under the Ramsar Convention (IBA criterion B1i). The MCC requires the quantification of three parameters (Skov *et al.* 2000):

- The size of the area based on the borders of a high-density aggregation of a waterbird or seabird species (parameter "A");
- The proportion of the total biogeographic or flyway population estimated to occur within the borders of the aggregation; and
- The degree of concentration displayed by the aggregation.

The border of the high-density aggregation has to be determined accurately by the use of robust and fine-scale interpolation techniques creating a minimum amount of false information. Important aggregations contain over 1% of

[14] Although two of these studies refer explicitely to "Important Bird Areas" standard data checking and validation procedures by the BirdLife Secretariat (Heath & Evans 2000: 10) were not adhered to (cf. critical review of Skov *et al.* 2000 and other reports, Ardea 89: 551-553).

the total biogeographic or fly-way population of the species in question. The degree of concentration is regarded as important where 1% or more of a population is concentrated in an area of no more than 3000 km^2. The application of the MCC requires the precise delineation of the borders of species aggregations by the use of standard GIS routines[15]. In the North Sea report all regularly occurring species were considered including divers, grebes, cormorants, fulmar, gannet, diving ducks, sea ducks, gulls, terns and auks. The Baltic Sea report (2000), which covers both inshore wetlands[16] and offshore marine areas, concerns mainly divers, grebes, cormorant, diving ducks, sea ducks, and auks (in relation to offshore areas).The areas considered of international importance for birds identified using the MCC method are shown for the North Sea in table 1 and figure 1 and for the Baltic in table 2 and figure 2.

Seaward extensions of breeding colony IBAs

10. When viewed together with the intensive use of coastal and continental shelf waters around some European coasts and the potential impacts of these activities on seabirds, it is clear that the conservation of seabirds needs actions to be targeted on both the terrestrial and marine environments. The Birds Directive provides the statutory incentive to establish marine protected areas for seabirds. RSPB has made a detailed study including specific recommendations on the extension of seabird colonies into the marine environment to include feeding areas (RSPB 2000, Huggett 2001).

11. The information brought together in that report confirms that while it would be desirable to have more information on how and where seabirds use the sea and on the significance of particular areas to seabirds, enough is known about seabird ecology to put forward some sound proposals on how the boundaries of SPAs could be extended to include marine feeding areas. It has been possible to develop and apply criteria to the SPAs holding seabird colonies in a way that conforms with the Birds Directive, is based on the importance of the areas to seabirds, is transparent, logical and systematic and which can be applied in spite of uncertainty or limited information. The following criteria were developed for the delimitation of boundaries of breeding seabird SPAs at sea:

- The boundary at sea should be drawn as a radius from points at the margins of the colonies and parallel to the shoreline where the colony extends along a stretch of coast.
- The distance to the seaward boundary should be determined on the basis of information on foraging range, feeding and surface use of breeding seabirds.
- The distance to the seaward boundary should be species-specific and refer to those breeding species at the site which fulfil the IBA criteria.
- When there is more than one breeding IBA species using the site, the highest recommended figure should be used to set the distance to the seaward boundary.
- Known and regularly used feeding areas adjacent to a recommended boundary should be incorporated within the site.
- Where known and regularly used feeding areas do not lie adjacent to recommended boundaries, these locations should be considered as sites in their own right.
- Where the recommended seaward boundaries of sites overlap they should be merged to form a single site for management purposes.

12. Three groups of seabird species have been identified suggesting boundaries 5, 15, and 40 km from the nesting colonies (table 3). This gives a reasonably detailed breakdown based on best interpretation of the data at the present time. A map of UK SPA's holding seabird colonies with suggested modifications taking into account of feeding areas is shown in figure 3. Species with extensive feeding ranges like Gannet, Fulmar and Storm Petrel, cannot be covered by this kind of seaward extensions of breeding colonies, although they will profit to a certain extent from extensions made for other seabird species.

[15] The numerical criteria applied for the drawing of the boundaries were not explained. The process is only described in technical terms: "In this inventory, the boundaries of Inshore and offshore IBAs were integrated and analysed by standard GIS routines. […] Delineation of the borders of species aggregations were defined by fine-scale linear interpolation (normal kriging) of corrected densities […].The boundaries were determined by density lines (polygons), which marked the plateau of higher densities following a density gradient" (Skov *et al.* 2000: 20).

[16] Note that the Ramsar definition of wetlands in the marine environment is restricted to "areas of marine water the depth of which at low tide does not exceed six metres" although designated sites may include "bodies of marine water deeper than six metres at low tide lying within the wetlands, especially where these have importance as waterfowl habitat".

13. In this approach generic, precautionary radii are defined for each species based on their known foraging ranges and then apply these to each of their colony IBAs. Its advantage is that it does not require a detailed assessment of sea use or colony-specific foraging ranges. It will be relatively robust to variations in marine distribution among colonies and across years. However, the draw-back of the radius-based approach is that it will often incorporate sea areas that seabirds seldom use. Ideally, site-specific radii should be estimated for each seabird species for which a site is designated at each of their colony IBAs, and the radius that encloses a certain proportion of the species' marine distribution selected as the outer boundary. However, reliable foraging radii are only available from a small number of colony IBAs in the UK and so site-specific criteria that encompass a given proportion of foraging trips for a species for which a site is designated, around each of it's colony IBAs, cannot be implemented. Obtaining this data would require considerable time and expenditure of limited conservation resources (Huggett 2001)[17].

Which species?

14. Bird species in the marine environment can be divided into two categories: seabirds and waterbirds (IBA2000). The term 'waterbird' is used in the same sense as that used for 'waterfowl' under the Ramsar Convention, and includes (in Europe) marine bird species in the following families: Gaviidae (divers), Phalacrocoracidae (cormorants), Anatidae (ducks), and Laridae (gulls and terns). By this definition waterbirds include, for example, cormorants, gulls and terns, which some authors have more traditionally considered as seabirds. Most of these have an inland and/ or coastal distribution but some of them notably gulls and terns also occur commonly on the continental shelf[18]. Species like Audouin's Gull, Kittiwake, Sandwich Tern, and Roseate Tern are exclusively marine during their entire life cycle. The term 'seabird' covers, in Europe, all bird species in the following families: Procellaridae (fulmars, petrels, shearwaters), Hydrobatidae (storm-petrels), Sulidae (gannets), Stercoraridae (skuas) and Alcidae (auks). For the purpose of this paper gull and tern species that are largely dependent on the marine environment during part of their annual cycle (e.g. the non-breeding season) are considered seabirds ("seabirds+").

15. During the non-breeding season many seabird species are largely pelagic. It should be noted that some of these species feed hundreds of miles from the breeding colony, including Fulmar, Leach's Petrel, Storm Petrel, Manx Shearwater and Gannet.

16. For the selection of IBA's in Europe twenty IBA criteria have been developed. These allow the identification, based on a site's international importance for (table 6): Threatened bird species, Congregatory bird species, Assemblages of restricted range species, and Assemblages of biome-restricted species. The latter two categories do not concern marine areas, so these are not relevant for this purpose. Threatened bird species refer to three categories: globally threatened species (5), Species of European Conservation Concern categories 2 and 3 (26) and (sub-)species included in Annex I of the Birds Directive (29[19]) (37 subspecies or species in total; table 4). Twenty-three marine species and subspecies which are not considered threatened at the European level or listed in Annex I, are listed in table 5[20]. In total both categories concern 60 (sub)species occurring in EU waters of which 27 have a largely non-coastal/ pelagic distribution outside the breeding season. Some predominantly inland species have been excluded (e.g. Larus ridibundus). The majority of these species are covered by the habitat conservation requirements of the Birds Directive either as Annex I species or as migratory species not listed in Annex I.

17. Outside the breeding season not all the species listed in tables 4 and 5 are relevant for the identification of marine IBA's in Europe, because (a) they do not winter in European waters and passage occurs rapidly (most petrels and

[17] In respect of the generic foraging radii approach, it might be worth noting UK Government criticism of this approach: "One of the difficulties with employing a generic radius approach encountered during work carried out by JNCC on extensions to bird breeding colonies, is that feeding locations for birds from a particular breeding colony appear to be specific to that colony, rather than determined by a generic foraging distance for each species" (Johnston et al. 2002, page 140; see also page 123). Apparently it is the UK Government view that the approach is not that helpful as it is felt insufficient data exists to define radii and much unutilised sea would be included.

[18] defined as marine waters from 20 to 200 metres in depth (see also footnote 33)

[19] including Polysticta stellerii, Larus minutus, and Puffinus yelkouan, which will be added to Annex I with the accession of new Member States in May 2004 (the latter species is already included in Appendix II of the Bern Convention).

[20] The (total) list of marine species largely taken from Tucker & Evans (1997), chapter Marine habitats, Table 3

skuas), and (b) species with a low conservation interest (some gulls). The from a conservation point of view most relevant species for the identification of marine IBA's have been tentavily indicated in tables 4 and 5 (set in bold type).

IBA2000 criteria

18. Seabirds are covered by the following IBA2000 criteria[21]:

A1. The site regularly holds significant numbers of a globally threatened species, or other species of global conservation concern
A4iii. The site is known or thought to hold, on a regular basis, ≥ 20,000 waterbirds or ≥ 10,000 pairs of seabird of one or more species

B1i. The site is known or thought to hold 1% or more of a flyway population or other distinct population of a waterbird species [includes global criterion A4i]
B1ii. The site is known or thought to hold 1% or more of a distinct population of a seabird species [includes global criterion A4ii]
B2. The site is one of the 'n' most important sites in a country for a species with an unfavourable conservation status in Europe (…), and for which the site-protection approach is thought to be appropriate.
B3. The site is one of the 'n' most important sites in a country for a species with a favourable conservation status in Europe but with its global range concentrated in Europe, and for which the site protection approach is thought to be appropriate.

C1. the same as criterion A1.
C2. The site is known to regularly hold at least 1% of the flyway or EU population of a species considered to be threatened in the EU.
C3. The site is known to regularly hold at least 1% of a flyway population of a migratory species that is not considered to be threatened in the EU.
C4. the same as criterion A4iii.
C6. The site is one of the five most important in the European region in question for a species or subspecies considered threatened in the European Union.

19. Within criterion category C (European Union importance) C2, C3 and C6 have been widely applied to identify breeding colonies of marine species. They could not be applied for non-migratory species which are not included on Annex I (e.g. Cepphus grylle and in temperate Europe, Larus argentatus). Outside the breeding season these criteria are less appropriate although the 1%-criterion has been applied for some waterbird species which winter in congregations like Melanitta nigra, Somateria mollissima, and Clangula hyemalis. However, the occurrence of such concentrations is dependent on shellfish banks (e.g. Spisula subtruncata) of which the locations may vary from year-to-year. IBA North Sea north of the Wadden Sea (Netherlands) along 150 km coast line[22] includes large concentrations of Melanitta nigra, but in some years the Spisula banks are located just south of this area. This example shows that even for highly congregatory seaducks the delimitation of marine sites may be difficult.

Four types of marine IBAs

20. Four types of bird distribution patterns can be distinguished in the marine environment:
a) Seaward extensions of breeding colonies IBAs: such extensions used in particular for feeding, resting and social interactions can be small or large but the total area is limited by the feeding range of the breeding birds concerned. The extent of the area is species dependent; the maximum distance from the breeding colony varies from several kilometres to over 30 km. These same areas may be important for sedentary species around the year;

[21] Note that criterion C7 has been exclusively applied to retain existing IBAs which did not qualify under the C1-C6

[22] Total area 187,000 hectares, seaward extension to the 20 meter depth line (3-5 nm wide); the Special Protection Area (2000) has a seaward boundary of three nautical miles and covers about two thirds of the IBA.

b) Non-breeding waterbird concentrations: coastal areas, which hold feeding and moulting concentrations of waterbirds[23] in particular divers, grebes and benthos feeding ducks;
c) Migration hotspots: sites where, because of their geographical position, seabirds fly over in the course of their regular migrations. These sites normally correspond to special land features (headlands, straits) and are identified by the number of birds passing by. In some cases, the area also holds rich feeding grounds or is the site of important concentrations where birds stop during their migrations;
d) Important areas for pelagic species: This type concerns marine areas which are completely unconnected to the coastline (i.e. not offshore islands and rocks). This type includes sites which pelagic seabirds use regularly to feed. Very often, other marine animals use them too and important fisheries occur in the same areas. These areas tend to have specific oceanographic features and their biological productivity is invariably high. It concerns also sites where seabirds regularly gather in large numbers although not necessarily to feed. They can be moulting, resting or courting grounds, during the breeding season or outside it. These areas are identified by the high number of birds that use them on a regular basis.

Similar categories (a, b, d) have also been recognised by JNCC (Johnston et al. 2002) as "three main types of functional concentrations of seabirds to enable the identification of marine SPAs"[24]. The first three types refer to areas which are related to the coastline, and they may include coastal areas and wetlands. The next paragraphs of this paper will be confined to these so-called "marine IBA's related to the coastline". The fourth type, marine IBA's that are rich feeding for pelagic species, will be dealt with in a separate part II of this paper that will be finalised at a later stage.

Towards marine IBA's related to the coastline

Setting marine boundaries

21. When it comes to defining the boundaries of a marine IBA, the guidelines given in para 6 need to be adapted to the particular characteristics of the marine environment. Any marine IBA should aim at covering the whole of the area that is regularly used by seabirds at critical moments of their lifetime. Those sites should, therefore, be homogeneous extensions of a given 'habitat' and be distinct from sorrounding areas. The identification of a marine 'habitat' is thus key to the process. Relevant oceanographic features which can be used to set the limits of marine IBAs are: the presence and extent of regular upwellings (upward currents that bring nutrient-rich bottom waters to the surface), sea currents, eddies, nutrient-outflows (such as rivers) and temperature / salinity anomalies (or disruptions), normally known as areas of convergence.

22. At the Natura 2000 in Offshore Waters seminar held in June 2002 (Turnbull et al. 2002) some general points were made. Boundaries need to be based on good science, focusing in the first place on the interest feature for sites. However, for all habitats (particularly extensive and patchy habitats, e.g. iceberg ploughmarks, cold water coral reef) boundaries should be wider rather than tight around habitats and should be pragmatic and bear in mind future management needs. Existing systems, e.g. ICES blocks, could be used so long as they are fully justified and appropriate. The precautionary principle should be used in setting boundaries around sites where uncertainty exists over the full extent of the interest feature. The management regime could be varied within the site and remain flexible to accommodate future information acquisition.

23. The common guidelines for defining the boundaries of IBAs need amendment (cf. para 6) having full regard to relevant European case law .The statement "Where extensive tracts of continuous habitat occur which are important for birds, only characteristics ii) and iii) apply" (see para 6) is very relevant for the marine environment. To which extent should the following characteristics be retained for marine IBAs:

ii) A site exists as an actual or potential protected area, with or without buffer zones, or is an area which can be managed in some way for nature conservation;
iii) A site is, alone or with other sites, a self-sufficient area which provides all the requirements of the birds (that it is important for) which use it during the time that they are present.

Condition iii) cannot apply to marine areas because sites not connected to land do not provide breeding sites during the breeding season. For some species they also not provide sheltered locations for roosting. Condition ii) does seem to be relevant for marine IBA's because we are aiming at "manageable" sites for which legal protection measures are

[23] note the definition of the term "waterbirds" in paragraph 11

[24] These have also been included in the "Concluding principles" of the European seminar "Natura 2000 in UK Offshore Waters: Implementation of the EC Habitats and Birds Directives in UK offshore waters" (Turnbull et al. 2002). The artificial split between inshore and offshore sites (category d confined to offshore waters, i.e. 15 km from the coastline and category b indicated as "coastal marine areas") was however not supported by BirdLife.

feasible. The general remark on the size of IBA's ("the biologically sensible should be tempered with the practical") is equally applicable for marine IBA's.

It is recommended to add the following guideline on defining boundaries of marine IBA's:

> In the case of marine areas beyond the sublittoral and inshore zones only characteristics i) and ii) apply. This definition is not applicable to migration hotspots.
> The guideline "where extensive tracts of continuous habitat occur …" should be confined to non-marine and inshore habitats.

Seaward extensions of breeding colony IBAs

24. The RSPB has developed an useful and simple methodology for defining boundaries of feeding areas around seabird colonies: the radius of the feeding range from points at the margins of the colonies and parallel to the shoreline where the colony extends along a stretch of coast (para 10-13). The minimum information necessary is an indication of the feeding ranges of the species for which the site was selected or designated. Feeding ranges differ widely from species to species and they may, to a lesser extent, also vary from colony to colony. If more precise data on feeding locations are available they should be used: this may lead to smaller or larger areas. Species which are feeding long distances away from the colony (like petrels) are less well protected but their dispersive nature and wide feeding range make them generally less vulnerable. Otherwise such areas have to be considered as "type d" areas (areas for pelagic species).

25. The main criticism refers to the risk of inclusion of areas which are not important for the birds concerned, so that unnecessary constraints are put on the human use (in particular fisheries) and new projects (e.g. oil exploration, wind parks) within such areas. However, the reverse situation (damage to SPA populations that should be protected) may result in a breach with the Directive and is equally unacceptable. In our view the precautionary principle should be applied, which in this particular case means that proof of evidence (important numbers of birds using the area or not) is moved from the designation process to the assessment procedures of article 6. In fact it really does not matter whether a certain marine area within the feeding range of a SPA designated for its colonial breeding seabirds is inside or outside the boundaries. In the latter case the obligation also exists to assess whether any human activity taking place or planned does not jeopardy the integrity of the SPA (including its seabird populations) concerned. If research indicates that the sea area concerned is not important for the SPA's seabirds the site's integrity is not affected and the human activity can continue (or started).

26. For this category of marine IBA's amendment or extension of the IBA2000 criteria is not necessary because it concerns only a methodology of delimiting the seaward boundaries of IBA's selected on the basis of the existing criteria (i.e. A4iii, Bii, C2, C3, C6).

Non-breeding waterbird concentrations

27. Some species of waterbirds stay in large numbers or even exclusively in shallow marine areas. These include benthos feeding ducks like Aythya marila, Melanitta nigra, Somateria mollissima, Clangula hyemalis and piscivorous species like Gavia stellata, Podiceps grisegena and Mergus serrator. In particular in the Baltic Sea quite a few other waterbird species are also using marine areas in important numbers: grebes Podiceps (3 species), swans Cygnus and geese Anser (6), dabbling ducks Anas (5), other ducks (9), and Coot Fulica atra (number of species refer to the German part, Gellermann et al. 2002). These species are not listed in tables 4 and 5 because they are not considered as species that are largely dependent on the marine environment during at least part of their annual cycle. Naturally this does not preclude their role in the selection and delimitation of marine IBA's.

28. Along the North Sea these species are mainly found close to the coastline[25] so that the seaward delimitation of IBAs can often be related to sea depth and is not too difficult. In the Baltic Sea such shallow areas are also found further from the coast because of the presence of banks separated from the coastline by deeper waters. Delimitation of such areas is more difficult than along the North Sea and the Marine Classification Criterion (MCC) might be an appropriate method to standardize site selection and delimitation. In any case the Baltic Sea report (Skov *et al.* 2000) provides data on 169 coastal and marine sites covering a relatively small proportion of the Baltic Sea and Kattegat. These sites could be considered IBA's as meant by BirdLife International. However, the problems noted in Appendix II apply also, although may be less prominent.

[25] A notable exception are the shallow waters of IBA Eastern German Bight (listed as DK123 only) which extend up to 40 nm from the coastline of Schleswig-Holstein

29. The term "European region" plays an important role in the application of criterion C6 (see para 18) because it determines the maximum number of sites that can be selected under this criterion. However, the division of EU NUTS regions used for this criterion is largely based on administrative boundaries on land and it does not cover the sea (except coastal zones). It is suggested that a division is made between Baltic Sea, North Sea, NE. Atlantic, SE. Atlantic and Mediterranean. The boundaries between these regions can be based on those used by the International Council for the Exploration of the Sea (ICES). The same division is used by the EU in the framework of the Common Fisheries Policy[26]. For most small countries this means one region (e.g. Portugal SE. Atlantic) and for large countries two regions (e.g. Germany: Baltic Sea and North Sea).

30. The application of the MCC for waterbirds at sea can be done under the existing set of criteria. It can fall within the scope of criteria B1i, C2, C3 and C6 as it is merely considered a tool to delimit sites with waterbird concentrations. If it is not possible to use the MCC methodology the delimitation of sites can also be made manually, in particular because most marine waterbird concentrations outside the Baltic Sea region are presumably more or less linearly distributed along coast lines.

Migration hotspots

31. The IBA2000 criteria include a separate criterion (B1iv) for migration bottlenecks for selected groups of terrestrial species: "The site is a 'bottleneck' site where over 5,000 storks, or over 3,000 raptors or cranes regularly pass on spring or autumn migration"[27]. The corresponding global criterion (A1iv) includes a threshold of 20,000 for all these species combined[28]. The most obvious European examples of bottleneck sites for seabird passage are the Strait of Gibraltar and the Bosporus (Turkey). These "hotspots" have been included in IBA2000 under criteria B1i/ B1ii and B1ii respectively[29]. Nevertheless the introduction of a separate criterion for "marine" bottleneck sites (or extension of the existing bottleneck criteria to cover marine birds) would be useful to distinguish these sites from breeding, wintering and staging areas. This may be also necessary because doubts can be raised whether the verb "to hold" applied in criteria B1i and B1ii covers also birds on passage at bottleneck sites.

32. The bottleneck criterion for seabirds could be similar to B1iv, for example:

> The site is a "migration hotspot" where at least x seabirds or 20,000 waterbirds regularly pass through a narrow strait or along a headland during spring or autumn migration.

Apart from narrow straits the criterion covers also headlands along which marine birds funnel during migration. The local topography of such sites needs further clarification[30]. The threshold for waterbirds equals the threshold in criterion A4iii. The threshold for seabirds has not yet been determined ("x"). Presumably the seabird threshold will be larger[31] than those for waterbirds and seabirds (10,000) in criterion A4iii. The thresholds need to be tested (and resident birds to be excluded) against site data to establish what is appropriate.

[27] The EU criterion C5 is the same except that the word "over" has been replaced by "at least" twice (as in A41iv!).

[28] The site is known or thought to be a 'bottleneck' site where at least 20,000 storks (Ciconiidae), raptors (Accipitriformes and Falconiformes) or cranes (Gruidae) regularly pass during spring or autumn migration.

[29] the same sites are also bottlenecks for migratory terrestrial species qualifying under criterion A1iv and/ or B1iv for storks and raptors

[30] The African IBA Book (Fishpool & Evans 2001) gives a helpful explanation of bottleneck sites used by terrestrial migrants (box 7, page 14).

[31] SEO has commented as follows: "The two most important migration hotspots in Spain hold incredibly big numbers: >150,000 Cory's Shearwaters through Straits of Gibraltar twice a year (plus many other species), >300,000 seabirds along Estaca de Bares (Galicia) each autumn. The figure of 20,000 is probably much too low: the Ebro delta population of Audouin's Gull, for example, numbers in excess of 28,000 birds and most of these migrate S along the coastline."

Document History

First version completed 14 May 2002, circulated to participants of BirdLife's marine seminar, 24 May 2002
[Johnston et al. 2002 became only available after completion of this version]
Third version completed 26 July 2002, circulated to participants to BirdLife meeting to further discuss the identification of marine IBA's, 2 August 2002
Fourth version completed 13 October 2002 for discussion at the BHDTF meeting of 18 October 2002
Fifth version, part I completed 19 July 2003 for approval at the BHDTF meeting of 31 July 2003 (part II dealing with "rich feeding areas"not related to the coastline to be finalised at a later stage)
Sixth and final version completed 4 February 2004 (in this version amended according to comments by SEO/ BirdLife (31 July 2003), which were received after the completion of the 5th version)

Table 1. Areas considered of international importance for marine birds in the North Sea, Channel and Kattegat. Sum of proportions is the total percentage of populations occurring within the area in internationally important concentrations (from Skov *et al.*1995).

Area name (see figure 1)	Area size (ha)	Depth (m)	No. species	Sum of proportions
1 Northern Kattegat	1,100,000	0-60	10	96,7%
2 Orkney – Shetland	2,200,000	0-200+	7	93.0
3 Moray Firth – Aberdeen Bank - Tees	4,900,000	0-100+	9	71.7
4 Skagerrak – Southwest Norwegian Trench	4,850,000	20-400	6	47.3

5 Eastern German Bight	1,280,000	0-30+	6	47.3
6 Cap Gris Nez – Schiermonnikoog	1,600,000	0-20+	7	35.4
7 Flamborough Head and the Hills	1,600,000		7	27.8
Other 13 areas (total area estimated)	2,400,000		1 – 3	1.0 – 10.9
Total area of these 20 areas	c. 20,000,000			
Total area of North Sea, Channel & Kattegat	75,000,000			

Table 2. Selected large marine IBA's in the Baltic and Kattegat (data from Skov *et al.* 2000).

Code	Area name	Area (ha)	Depth (m)	Main species	Population	% Flyway
SE050	Inshore area East Gotland	152,500	0-40	Long-tailed Duck	164,000	3,6%
SE065	Hoburgs Bank	157,900	10-40	Long-tailed Duck	872,000	19,0%
SE066	Northern Midsjö Bank	85,760	10-40	Long-tailed Duck	65,000	1,4%
SE067	Southern Midsjö Bank	81,430	20-40	Black Guillemot	770	1,7%
SE072 DK129	Lille Middelgrund	126,000	10-50	Kittiwake Razorbill Guillemot	99,000 93,500 93,000	1,2% 6,9% 1,6%
FI045	Merenkurkku Archipelago	223,652	0-10	Velvet Scoter Long-tailed Duck	100,000 100,000	10% 2,2%
EE049	Irbe Strait	378,900	0-50	Long-tailed Duck Black Guillemot	700,000 3900	15,6% 8,7%
LV059	Seashore at Palanga	113,000		Steller's Eider	1400-2300	4,7-7,7%
LT001 RU220	Seashore at Nida	77,000		Velvet Scoter Long-tailed Duck	80-160,000 68,000	8-16% 1,5%
PL080	C. Polish Inshore waters	272,500		Long-tailed Duck	217,000	4,7%
DE040	Pomaranian Bay	623,500		Long-tailed Duck	837,000	18,2%
DK083	Hyllekrog - Rodsand and Fehmarn belt	100,000		Tufted Duck Red-br Merganser	22,000 4100	2,2% 3,3%
DK128	Northwestern Kattegat	580,000		Common Scoter Eider	360,000 264,000	22,5% 19,6%
DK130	Smålandsfarvandet	135,300		Tufted Duck	16,880	1,7%

Table 3. Marine boundaries around seabird breeding colonies for three categories of feeding ranges of species breeding in the British Isles (RSPB 2000).

GROUP I	GROUP II	GROUP III
Radius 5 km	Radius 15 km	Radius 40 km
Stercorarius parasiticus	*Puffinus puffinus* (rafts only)	*Catharactes skua*
Sterna albifrons	*Phalacrocorax carbo*	*Larus argentatus*
Cepphus grylle	*P. aristotelis*	*L. fuscus*
	Larus canus	*L. marinus*
	Sterna paradiseae	*Rissa tridactyla*
	Sterna hirundo	*Uria aalge*
	Sterna sandvicensis	*Alca torda*
	Sterna dougalli	*Fratercula arctica*

Table 4. Threatened bird species at the global level, in Europe (SPEC 1-3 and/ or in the European Union[32] which are wholly or partly dependent on the marine environment. This indicative list is confined to species that (may) regularly occur in EU waters in important numbers (thus excluding species largely confined to the Arctic). Species which may be most relevant for the identification of marine IBA's across European marine waters (thus excluding rare and localised species) tentavily set in bold type.

[32] Species that will be included in Birds Directive Annex I with the extension of the EU within parentheses

Species	Globally	SPEC	Annex I	Non-breeding [33]	Where mostly in Europe [38]
Gavia stellata		4	4	Coastal	NE. Atlantic, Baltic
Gavia arctica		4	4	Coastal	NE. Atlantic, Baltic
Gavia immer		P	4	Coastal	NE. Atlantic
Pterodroma feae	4	4	4	Pelagic	Macaronesian
Pterodroma madeira	4	4	4	Pelagic	Macaronesian
Bulweria bulwerii		4	4	Pelagic	Macaronesian
Calonectris diomedea		4	4	Pelagic	All, except Baltic
***Puffinus puffinus* s.s.**		4		Pelagic	NE. Atlantic
Puffinus mauretanicus [34]	4	P	4	Pelagic	Mediterranean, NE. Atlantic
Puffinus yelkouan		(4)	(4)[32]	Pelagic	Mediterranean, NE. Atlantic
Puffinus assimilis		4	4	Pelagic	Macaronesian
Pelagodroma marina		4	4	Pelagic	Macaronesian
Hydrobates pelagicus		4	4	Pelagic	NE. Atlantic, Mediterranean
Oceanodroma leucorhoa		4	4	Pelagic	NE. Atlantic
Oceanodroma castro		4	4	Pelagic	Macaronesian
Morus bassanus		4		Pelagic	NE. Atlantic, Mediterranean
Phalacrocorax a. desmarestii		[35]	4	Coastal	Mediterranean
Aythya marila		4		Coastal	Baltic, NE. Atlantic
Polysticta stellerii	4	4	(4)	Coastal	Baltic
Melanitta fusca		4		Coastal	Baltic, NE. Atlantic
Phalaropus lobatus		P	4	?[36]	NE. Atlantic
Larus minutus		4	(4)	Coastal	All
Larus melanocephalus		(4)	4	Coastal	Mediterranean, East Atlantic
Larus genei		P	4	Coastal	Mediterranean
Larus audouinii	4	4	4	Coastal	Mediterranean, East Atlantic
Larus fuscus fuscus		(4)		Coastal	Baltic, Mediterranean
Larus canus		4		Coastal	Baltic, NE. Atlantic
Sterna caspia		4	4	Coastal	Baltic, Mediterranean
Gelochelidon nilotica		4	4		Mediterranean
Sterna sandvicensis		4	4	Coastal	NE. Atlantic, Mediterranean
Sterna dougallii		4	4	Coastal	NE. Atlantic, Macaronesian
Sterna hirundo			4	Coastal	All
Sterna paradiseae		P	4	Pelagic	Baltic, NE. Atlantic
Sterna albifrons		4	4	Coastal	E. Atlantic, Mediterranean
Cepphus grylle		4		Coastal	NE. Atlantic, Baltic
Fratercula arctica		4		Pelagic	NE. Atlantic
Uria aalge ibericus		P	4	?	NE. Atlantic

Table 5. Non-threatened bird species in Europe which are wholly or partly dependent on the marine environment (main occurrence not filled in for Black Sea). This indicative list is confined to species which (may) regularly occur in EU waters in important numbers. The most important candidate species for the identification of marine IBA's have been tentatively set in bold type.

[33] "coastal" refers to marine waters less than 20 m deep and "pelagic" to marine waters deeper than 20 m.
[34] named Puffinus puffinus mauretanicus in Annex I of the Birds Directive (also considered conspecific with yelkouan in Birds of Europe (1994) and IBA2000). BirdLife International has reviewed the taxonomic status of Puffinus mauretanicus, which is now listed, as Near-Threatened, in its Threatened Birds of the World 2000)
[35] Subspecies not assessed by Birds of Europe (1994)
[36] Pelagic in its tropical winter quarters.

Species	SPEC[37]	Breeding	Non-breeding	Dispersion	Where mostly Europe [38]
Fulmarus glacialis	P	4	Pelagic		NE. Atlantic
Puffinus gravis	P		Pelagic		NE. Atlantic, Macaronesian
Puffinus griseus	P		Pelagic		NE. Atlantic
Oceanites oceanicus			Pelagic		NE. Atlantic
Phalacrocorax carbo carbo		4	Coastal		NE. Atlantic
Phalacrocorax carbo sinensis		4	Coastal		Baltic, Mediterranean [39]
Phalacrocorax aristotelis aristotelis	4	4	Coastal		NE. Atlantic
Aythya fuligula		4	Coastal	Congregatory	Baltic
Mergus serrator	P	4	Coastal	Congregatory	Baltic, NE. Atlantic
Clangula hyemalis	P	4	Coastal Pelagic	Congregatory	Baltic
Somateria mollissima	P	4	Coastal	Congregatory	Baltic, NE. Atlantic
Melanitta nigra	P	4	Coastal	Congregatory	Baltic, NE. Atlantic
Stercorarius parasiticus	P	4	Pelagic		NE. Atlantic
Stercorarius longicaudus	P		Pelagic		NE. Atlantic
Catharactes skua	P	4	Pelagic		NE. Atlantic
Larus argentatus	P	4	Coastal		NE. Atlantic
Larus cachinans		4	Coastal		All, except Baltic
Larus marinus	4	4	Coastal		Baltic, NE. Atlantic
Larus fuscus graelsii	4	4	Coastal		NE. Atlantic
Rissa tridactyla	P	4	Pelagic		NE. Atlantic
Uria aalge (excl. ssp. ibericus)	P	4	Pelagic		NE. Atlantic, Baltic
Alca torda	4	4	Pelagic		NE. Atlantic, Baltic
Alle alle	P		Pelagic		NE. Atlantic

Table 6. Categories of species which are used to identify Important Bird Areas

Category	Explanation	IBA criteria
Species of conservation concern	Species of global conservation concern Species with an unfavourable conservation status in Europe Species with a favourable conservation status in Europe, but concentrated in Europe (Sub-)species listed in Annex I of the Birds Directive	A1, C1 B2 B3 C2, C6
Congregatory species		A4, B1, C3, C4, C5
Assemblages of restricted range species	Species whose breeding distribution define an Endemic Bird Area or a Secondary Area [terrestrial in Europe]	A2
Assemlages of biome-restricted species	Species whose breeding distribution are largely or wholly confined to one biom [terrestrial in Europe]	A3

Appendix I. Identification of marine IBA's, species and data availability in 11 European countries
(data provided by participants of BirdLife's seminar on marine issues, Brussels, 30 May 2002)

Appendix II. Drawbacks related to the application of the Marine Classification Criterion for pelagically distributed seabirds.

- The validity of setting maximum area (parameter "A") must be tested. It is likely that the total area of selected sites and the bird numbers covered depend on "A" (3,000 km^2 in the quoted MCC inventories[53]). It would be interesting to see the effects of different maximum areas (e.g. 1000 and 2000 km^2) on population coverage and total IBA area selected[54].

[42] Azores 14, Madeira 9, mainland coast 1
[43] site included under IBA criterion C7
[44] some data for birds feeding in breeding and post-breeding season (i.e. Roseate and Little Tern); some SPA's include 500 metre zone around breeding colonies
[45] only data on tern species feeding close to breeding colonies
[46] includes IBA #083 (100,000 ha), #118 (162,500 ha), #119 (870,000 ha; also Alca torda), IBA #120 (100,000 ha), #122 (120,000 ha), #123 (1,150,000 ha)
[47] distribution inshore/ offshore not well known
[48] any regular counts are from the Wetland Bird Survey which would pick up birds nearshore
[49] some data on movements of Puffinus yelkouan through the Strait of Gibraltar to the Cantabrian Sea for post-breeding concentrations and moulting. Offshore sites located there.
[50] some evidence of post-breeding concentrations of Little Gull and tern species on offshore banks
[51] yes, for other species than P. yelkouan but more data and scientific evidence needed
[52] yes, for P. yelkouan, that will probably coincide with feeding areas of other species
[53] This figure is based on the feeding range of Razorbills from their breeding colony. This appears to be a rather arbitrary choice and its logic is far from satisfactory: what is the relation between the feeding range of a particular species during the breeding season and the non-breeding dispersion of seabirds in general?

[54] Meanwhile it appears that this has been done and it is concluded that "the selection of the globally important areas for seabird species with clustered distributions is less sensitive to this parameter (within the range of 1000-3000km^2" (Draft: *A quantitative method for evaluating the importance of marine areas for conservation birds;* see also Appendix IV*).* However, this refers to the number of sites selected; the effect on the total area of the sites selected is unclear. Furthermore, the data presented in Appendix IV show that this conclusion mostly refer to waterbirds; the numbers of sites selected for gannets and auks indicate a clear effect of reducing the maximum area size from 3000 to 1000 km^2.

- MCC uses very low densities of birds over wide areas to establish important areas (as low as 100 birds/km2). Questionable whether this constitutes a congregation or dispersed. Even without the C4 criterion, the areas selected are too large - not consistent with the IBA concept
- The methodology does not have regard to bird activity/ use of the site. An observed occurrence of birds may not be site specific. It requires repeat counts or behavioural observations to indicate site fidelity.
- Little is known to which extent the distribution patterns of seabirds vary from year-to-year. If the "concentrations" move in time this would be another factor that enlarge marine IBAs. Anyway the issue of seabird site fidelity is something BirdLife needs to look at more carefully because IBAs require areas to be regularly used.
- The approach to actually defining site boundaries is unclear. At least 5 'limitations' or variables are identified but the impact of changing these is not known.
- It is not clear on the basis of what criteria sites are combined (see discussion of IBA Northwestern Kattegat in Appendix III).
- Technique is too data hungry: it can only be properly applied with a vast amount of survey data that are only available from a very limited number of marine areas in the world.
- Technique is too complex, requiring specialists to employ it. Its application is complicated because of interpolation of census data and the necessity of a GIS software.
- The application of the criterion does not lead to consistent results as shown in the Ardea review of Skov *et al.* 2000 (see Appendix III and see Skov's reaction in Appendix IV).

SKOV H., VAITKUS G., FLENSTED K.N., GIRSHANOV G., KALAMEES A., KONDRATYEV A., LEIVO M., LUIGUJOE L., MAYR C., RASMUSSEN J.F., RAUDONIKIS L., SCHELLER W., SIDLO P.O., STIPNIECE A., STRUWE- JUHL B. & WELANDER B. 2000 - *Inventory of coastal and marine important bird areas in the Baltic Sea* - BirdLife International, Cambridge, 287pp. ISBN 9986-756-97-9, softback, mono-colour, 72 maps. Available from BirdLife Denmark, Copenhagen.

Birdlife International produced yet another report on Important Bird Areas (IBAs), this time again with emphasis on marine or coastal areas, and only in the Baltic Sea. BirdLife International has been rightly praised into heaven for its recent collations of data (e.g. Heath & Evans 2000; Stattersfield & Capper 2000). Their efforts should be acknowledged and their work is very important indeed. The present report is remarkable, however, because it is said to be complementary to Heath & Evans 2000, which was published as a two volume book at about the same time and which looked like the 'definitive' work for Europe, at least for the time being. Complementary means that the report identifies more IBAs in the Baltic than the book, while some "old ones" have had their boundaries altered. There must be a relationship with two earlier reports, not least because of the overlap in authors, one of which dealt with wintering areas for marine birds the Baltic (Durinck *et al.* 1994), and one of which referred to the North Sea (Skov *et al.* 1995). All publications have dealt with the Kattegat, so that a local manager will have to pick his choice. Does he get the same results in each? As a user, I checked one of the most important areas for consistency in each report.
Northern Kattegat is "an exceptionally important area for wintering seaduck and pelagic species (divers and auks). Seaduck are mainly within Danish watets, the pelagic species mainly in the Swedish parts." Moreover, "This is the most important wintering area in north-west Europe for *Somateria mollissima*, *Melanitta nigra*, and *Alca torda*." (Heath & Evans 2000a). A comparison between the reports (see Table):

	Durinck *et al.* 1994	Skov *et al.* 1995	Heath & Evans 2000	Skov *et al.* 2000
surface area	10 500 km^2	11 000 km^2	10 500 km^2	5800 km^2
period	1988-93	1980-93	[-] 1993	1987-93
divers	2900	1150	2900	2160
Red-necked Grebe	2350	1600	2350	1880
Common Eider	400 000	264 000	400 000	264 000
Common Scoter	495 000	396 000	495 000	360 000
Velvet Scoter	82 000	148 000	82 000	76 500
Razorbill	129 000	223 000	129 000	not listed

'Northern Kattegat' is the fourth most important area of the Baltic according to Durinck *et al.* 1994. Numbers of birds are average total winter- ing numbers based on' survey periods between 1988 and 1993', indicating that 13.3% of the north-western European wintering population of Common Eiders, 38.1% of Common Scoters and 10.8% of Razorbills occurred.
'Northern Kattegat' is the most important area of the North Sea and Kattegat according to Skov et at. 1995. Their area is slightly larger, however, while numbers of Common Eiders and scoters, divers and Red-necked Grebes are markedly smaller. The figures are averages again and are said to 'not represent the total number of birds within the area'. So be it, but Razorbills have, mysteriously, nearly doubled in numbers (22.5% of the biogeographic population).
'Northern Kattegat' is listed as Danish IBA 119 in Heath & Evans (2000a). The bird figures of Durinck et at. 1994 were copied rather than the update of Skov et at. 1995, although both reports were listed in the references. There is no clarification why the first and not the second report was adopted. Data were listed as from 1993, which is not true given Durinck et at. 1994 (average numbers over 1988-93), and the range for minimum-maximum population presented (using Durinck's averages for the lower and higher values) is an error. Skov et at. (1995)'s average of 223 000 Razorbills over 1980-93, "a concentration" that "has been observed every year since 1987", has gone.
In the present report, Northern Kattegat has been replaced by 'Northwestern Kattegat'. IBA 128 includes the 'old IBAs' 119 ('Northern Kattegat'), 002 (coast between Dokkedal and Lyngså), and 010, (south Læsø). The area is a lot smaller than previous publications (53% of the 'Northern Kattegat' of Skov et at. 1995), while it has identical numbers of Eiders but fewer seaduck, no Razorbills at all, and substantially more divers and Red-necked Grebes as in Skov et at. 1995, and higher densities of all species (except Razorbills) than in any earlier publication, except for Velvet Scoter, for which higher densities were reported in a two times larger area by Skov et at. 1995. Surveys used: 1987-93 for divers, 1980-93 for seaduck, so the same underlying data were used. In the text for Sweden (IBA 072) as well as in the

text for Denmark (IBA 129) we are now confronted with a 1260 km^2 area 'Lille Middelgrund', which is a new IRA "selected on the basis of information from offshore habitats", but that in fact used to belong to the 'Northern Kattegat' IBA. Here we find 93 500 Razorbills again (72% of the lowest figure produced earlier for 'Northern Kattegat'), but up come 93 000 Guillemots out of the blue, not mentioned in any of the earlier publications. Survey period for all these data: 1987-93...

So what has happened? Three out of four publications are from BirdLife International, Durinck et at. (1994) is a 'Report to the European Commission' by the National Environmental Research Institute and Ornis Consult in Denmark. All reports seem to have used the same data sets, constantly altering precise borders, occasionally altering total/ average or whatever bird numbers on the basis of which the areas have been given IBA status.

The report reviewed here states that a particular problem for marine IBAs is that there are no "obvious site boundary features" and it therefore promotes a system that could overcome that problem. Is that system different from previous site descriptions? So which report is the most authoritative? Is changing site definitions and numbers of birds within sites at an alarming rate based on the same underlying data an example of proper database analysis? Have we now left out major bird concentrations in comparison to the three earlier publications, or is the new method more conservative in the result? Northern Midsjö Bank (Sweden 066) is a new IBA "selected on the basis of information from offshore areas" (just an example). That data were collected 1992-93, so what's the explanation for the difference with the two-volume book!? The reports do not even try to give explanations for particularly high numbers of birds and why the borders of certain marine areas are where they were drawn. We simply have to rely on the authors, who seem to produce different results every time they're asked. If details are different but while the main conclusions are similar (IBAs are in urgent need for better legal protection), is it perhaps time to stop rewinding old data? Are we satisfied with a site description in which the underlying data are completely out of sight and with the text shortened as a list of facts with no reference to original work? Is it a signal that the present report has 16 authors and only 27 references (none of which is providing background infonnation for any of the data presented in this report)? Browsing through the lists of references in all reports and BirdLife books gives at least the impression that the authors have consulted only their own previous reports and copy (or sometimes mysteriously alter) the numbers of birds listed. Is the recruitment of local knowledge (and hence a long list of 'authors' or an immense, Acknowledgements' section) a guarantee for high quality data?

The present report is printed as an A4 size paperback in blue tones. The maps are ugly, typical computer generated GIS products with far too much detailed coastal contours and excessively detailed bathymetry. The shading of landmasses does not fit the coastal contours and crucial information is hidden in the same colours (blue tones) and shadings. Most maps are wider than they are high (giving latitudinal degrees the same distance as longitudinal degrees, which is wrong at 60° N), others, showing exactly the same part of the globe, are higher than wide but give a more traditional view of this part of the world. Figure 6 shows nine species-specific, but largely overlapping, IBA polygons as lines in different styles and tones of blue, so that, I guarantee, none could be reproduced in isolation without errors. The text template used is similar to that for descriptions of marine and coastal IBAs as in Heath & Evans 2000, but with no reference to sources of infonnation and therefore no help for anyone trying to work out how reliable the presented infonnation actually is.

My bookshelf is rapidly filling up with massive reports and even bigger books describing and, listing IBAs in Europe. 'Major challenges', milestones' and a 'tremendous effort' are terms that BirdLife managers and the authors themselves use to describe their work. I believe that, and I do see a need to identify areas important for birds, I do appreciate the importance of this work (which is the reason why I collect, keep and use these publications), ...but as a tool, not a goal. Understanding bird distribution and habitat requirements leading to effective bird conservation are important goals. Also, milestones should mark one-mile distances, not every one-hundred metres. What do we achieve by a repetition of the same (ca. 10-15 year old) data in different formats and with different figures in a series of glossy reports and book volumes? At least the impression has been given that we have stopped collecting data in marine areas in 1993, which is worrying given the far from fixed population levels and distribution patterns. I would recommend that future IBA overviews are more informative with respect to the original sources, more conservative with respect to boundaries chosen, and that only new, additional data were used to re-assess the status of a particular region. Four partly overlapping reviews, using different methods but the same underlying data, giving different results and abundance estimates, within a time span of only six years is a little over the top and arguably leads to confusion by the end-users.

Recent development of the Marine Classification Criterion (MCC)

Designation of marine EU Special Protection Areas

The identification of marine IBAs by the use of the MCC in the North Sea (Skov et al. 1995) and the Baltic Sea (Skov et al. 2000) has created a framework for the current designation of marine SPAs by the involved member states. The first truly marine SPA will be the Hoburgs Bank (IBA no. 65), which was designated by Sweden earlier this year. Hoburgs Bank, which is of global importance to Long-tailed Ducks *Clangula hyemalis*, is an offshore bank of about 1200 km^2 located 25-50 km from the Swedish coast. In general, however, the scale of the maps and the lack of a geo-statistical basis for the definition of IBA boundaries has made it difficult to use the IBA information in the 1995 North Sea report as more than general guidelines for the location of potential SPAs. The selection process by the individual member states is now refining the boundaries using the same techniques as in the Baltic 2000 report. As an example, Germany is just finalising the analyses of seabird data in their part of the Baltic and the North Sea, - the improved methods have resulted in a more fine-scale resolution of the core areas of high densities for the species in question.

Critical size of an area supporting 1%

The critical size of an area supporting 1% of a bio-geographic reference population was preliminarily set to 3000 km^2 based on the size of seabird concentrations in the North Sea and the Baltic and known feeding ranges of auks around colonies of international importance. Ideally it should be defined on the basis of estimations of marine habitat ranges for species with clustered distributions. With the present knowledge it is possible to model marine habitat ranges for most marine key species, - a priority activity for the team behind the MCC (Mark Tasker, Joint Nature Conservation Committee, Mardik Leopold, Alterra, Jan Durinck and myself from Ornis Consult).

The MCC team has just finalised tests of the effect of changing the critical size on the selection of IBAs as published in Skov et al. (1995) for the North Sea and in Skov et al. (2000) for the Baltic. The result (see table below) shows that of the pelagic species the total selection of IBAs for divers, grebes, seaducks and auks was affected moderately, while the selection of IBAs for gulls and gannets was strongly affected. Due to characteristic pattern of dispersal of the key marine bird species in the two seas, the selection of the more important IBAs is less sensitive towards the choice of the critical size. The major portion of the non-breeding populations of divers, grebes, seaducks and auks concentrate in relatively few, but large areas. Thus, the populations are in fact highly clustered when measured over the entire distribution range. Due to the high proportion of the biogeographic populations present within these concentrations, these areas will meet the MCC even if the critical size is reduced to 1000 km^2.

The table shows the number of areas selected for different groups of common seabirds occurring during winter in the Baltic Sea and the North Sea when different sizes for *A* is chosen.

Baltic Sea

Species group	***A* = 3000**	***A* = 2000**	***A* = 1000**
Divers	11	11	8
Grebes	14	14	12
Swans	17	17	17
Aythya ducks	29	29	29
Seaducks	43	42	37
Goldeneye and mergansers	43	41	41
Auks	20	17	14

North Sea

Species group	***A* = 3000**	***A* = 2000**	***A* = 1000**
Divers	14	13	13
Grebes	5	5	5
Cormorants and shags	6	6	5
Gannets	4	4	1
Seaducks	15	14	14
Larus Gulls	11	5	4

Auks	14	12	11

Accurate delineation of concentrations of birds at sea

Ornis Consult has developed the spatial IBA routines so that the definition of IBA boundaries at sea can now be described as a generic process involving a suite of linked GIS and geo-statistical routines. This means that defining IBA boundaries no longer introduces an element of subjectivity, - the characterisation of distribution patterns and the selection of contours marking the boundaries of an IBA are both computer-driven and can be reproduced by different teams. The application of spatial models has also involved the European Seabirds at Sea Database (ESASD) and we are now offering courses in the use of these techniques to colleagues (like in the case of SPA selection in Germany). As an important by-product of the geo-statistical basis for the mapping routines, the boundaries of IBAs can now be computed with confidence intervals, which will effectively pinpoint areas where boundary definitions are shaky, and where more data are needed.

Application outside the Baltic and the North Sea

It has still to be tested whether the results for the Baltic and parts of the North Sea are unique, - does the MCC apply equally well in the Mediterranean or the Biscay ?. However, the available data on seabird distribution at sea in these two regions is yet inadequate to carry out such tests. There is a great need to improve the ESAS (European Seabirds at Sea) database for these regions, and luckily new data are on the way for the Bay of Biscay. BirdLife International are recommend to push for the development of the knowledge of seabird distribution in these two regions.

Response to a review (published in Ardea) by C.J. Camphuysen of 'Inventory of coastal and marine important bird areas in the Baltic Sea 2000'

Although the review is covering the 2000 marine IBA report, the bulk of it is in fact a comparison between the three different published assessments of important marine bird areas in the Baltic. As such, this comparison is not too meaningful as methods used to select areas have changed significantly during the seven-year period between the first 'Important Marine Areas for Wintering Birds in the Baltic Sea' and the new report. I guess the reviewer can be excused due to the relatively short 'methods' sections available in the three reports, but his mistakes are great. The major differences between the reports can explain all the differences in estimated numbers of bird and area sizes listed. One major difference is the method used for delineation of important areas, which in the 1994 report for the Baltic and the 1995 report for the North Sea was b-spline approximation techniques, while the more rigorous geo-statistical method (kriging) was only used in the 2000 Baltic report. The benefit of applying geo-statistics in the 2000 report as compared to the other two reports is as mentioned above that extrapolation of high densities into poorly surveyed areas is minimised and a more accurate account of the boundary is produced. This explains the reduction in the size of many areas (and the split of the Northern Kattegat into two IBAs) and the increase in average densities within these areas in the 2000 report. Equally important, the databases used are not identical between the three reports, as different seasons are used (November-March in the 1994 report, variable and species-dependent in the two other reports) and more data were included in the 1995 account as compared to 1994 and more data again in 2000 as compared to 1995. In fact, the 2000 Baltic report is the first ever attempt to perform a basin-wide analysis of all coastal (and marine) bird data available and so, despite the meagre appearance (lay-out etc) it contains much more background data than the other two reports. Recent data (1995-2000) were also added to the data. On top of this, the MCC was not applied in the 1994 report, only in the two later studies, and correction factors for undetected birds in transect were only applied using line-transect theory and non-linear functions in the same two reports. Thus, in relation to the current discussion of the definition of IBAs the 1994 and the 1995 reports can only be used as rough indications of areas of importance and in case of the 1994 report estimated densities are generally too low. One can regret that we didn't wait publishing information about important bird areas until the MCC and the geo-statistical basis for delineation of boundaries of high-density areas was developed. However, the development of more fine-scale and statistically sound methods for mapping boundaries of IBAs is a process common to both terrestrial, coastal and marine IBAs. In fact, the boundary of many coastal IBAs in the Baltic Sea can now be regarded as less rigorous than the boundary of marine IBAs, as in many cases coastal counts cover large stretches of coastline with variable levels of densities of waterbirds, and often the boundary of the stretch counted can not be unambigously determined from the count database. During the production of the 2000 IBA report for the Baltic Sea it became clear that checking boundary errors and utilise GIS mapping routines should be an important part of the work for the coastal IBAs in the next European update. What is not clear to the reviewer is that the assessment of the importance of IBAs and the refinement of mapping techniques is an ongoing process. The rest of the review provides useful criticism of the obviously poor co-ordination between the European 2000 and the Baltic 2000 reports and the 'thin' presentation of methods and underlying data.

Henrik Skov 2002-07-25

2. GOOD PRACTICES EXAMPLES RELATED TO SITE SELECTION PROCESS OR MANAGEMENT OF DESIGNATED MARINE NATURA SITES

Relevant actions of the NGO, Spanish Cetacean Society, were the creation of a national database and standardized research protocols and the so-called Project: "Identification of Areas of Special Importance for the Conservation of Cetaceans in the West Mediterranean, in Spain" with the collaboration of the former Directorate General for Biodiversity, Ministry of Environment.

The results of three years of research carried out in the context of this Project, in addition of the previous monitoring programme on cetacean and sea turtle, it has highlighted the relevance of the special oceanography conditions of the Alboran Sea and its adjacent Mediterranean and Atlantic waters for the conservation of the three marine pelagic species present in Annex II of the Habitat Directive: *Tursiops truncatus*, *Phocoena phocoena* and *Caretta caretta*. Outcomes of this project were identified as proposals on Special Area for Conservation (SACs) - Habitat Directive - as well as on nominated areas as Specially Protected Area of Mediterranean Importance (SPAMIs) - Barcelona Convention -.

Furthermore Spanish Cetacean Society sets up the LIFE Nature Project: "Conservation of Cetaceans and Sea Turtles in Murcia and Andalusia" in order to provide a follow-up to the abovementioned Project, to contribute to the adequate inclusion of the region in the Natura 2000 network and to ensure the social acceptance of the proposed marine protected areas. Efforts are focused at three levels:

- Development of proposals on management and Conservation Plan for the three pelagic marine species included in Annex II of the Habitat Directive: *Tursiops truncatus, Phocoena phocoena* and *Caretta caretta*;
- Development of cost efficient tools for the monitoring of cetacean and sea turtle populations;
- Identifying of management schemes and developing public awareness programmes.

Other global objectives established were identified as follows: to reduce the impact caused by fisheries interactions, maritime traffic and marine debris pollution on target species; to ensure the long-term socio-economic viability of the management and monitoring of these species and their habitats in the region; to create a monitoring GIS tool based on the development of a series cost-efficient long-term research programmes and on the compilation of opportunistic observations of target groups *inter alia* fishermen and maritime police, and on the existing databases from the environmental and fisheries regional and national authorities; to analyse sea turtle migration routes and habitat use; to optimise the sea turtle recovery centres network; and finally, to promote new "environmentally friendly" tourism activities through conservation strategies (whale watching, artisanal fisheries, environmentally friendly scuba-diving activities and water sports).

POSITIVE EXPERIENCES IN RELATION TO FISHERIES TECHNIQUES TO REDUCE BIRD BY-CATCH

With regard to some positives experiences concerning to fisheries techniques to reduce bird by-catch, a competition of ideas was organised by SEO/BirdLife (BirdLife International partner organisation in Spain) as a contribution to the *Save the Albatross* campaign. The competition launches as well as the ideas received are part of a programme of considerable scope. It was officially launched in New Zealand (Southern Seabird Solutions) - Jul. '02; Hawaii (II International Fisher's Forum) - Nov. '02; Brazil (Projeto Albatroz) - Jan. '03; Spain (several events) - Mar. / Apr. '03.

Most albatrosses and several other seabird species are heading for extinction. They are being unintentionally drowned in large numbers by "longline" fishing boats. Longlining is the single greatest threat to the world's seabirds. BirdLife's Save the Albatross Campaign is trying to stop the needless slaughter of these magnificent birds by ensuring that relevant international agreements are implemented that will benefit both the birds and the legal fishing industry. Albatrosses and other seabirds often feed by scavenging for food behind fishing vessels and other boats, waiting for prey to be disturbed or scraps thrown overboard. When longlining, fishing boats set thousands of baited hooks on a fishing line to catch fish. Some birds swallow the hooks and are dragged underwater and drown. More than 300,000 seabirds are killed in this way each year. 26 species of seabird, including 17 species of albatrosses, are in danger of extinction because of the deaths caused by longlining. Once set, the hooks are too deep for the birds to reach. To stop birds being needlessly killed, it is essential to stop them having the opportunity to swallow the baited hooks before they have sunk. Many cheap and readily implemented solutions have been, and are being developed. Employing these will be of benefit to the fishermen themselves because the more bait eaten by birds, the smaller the catch of fish.

The initiative was widely publicized in many countries (particularly in New Zealand, US Pacific coast and South America) in magazines, listservers, newsletters, TV and radio. More than 3 months before the closing date (30 June 2003) for entries, over 20 requests from 8 countries were dealt with, and several innovative ideas were already put forward.

Some of the ideas submitted were identified as follows: Visual and sounding bird-scarer - new design of bird-scaring line with simple elements which reflects and sounds as it is towed on the water surface -; taste deterrent - mixing fish bait with simple materials that make it unpalatable for birds -; distraction (food) - system of offal (discards) disposal away from setting boat, to attract birds to a distant point -; visual bird-scarer - towing of simple element that reflects on water -.

Besides the ideas already submitted, it is known that various fishermen from New Zealand and Australia who are experimenting with new designs to increase the hooks' sinking rate. 87 ideas were submitted, 60 of them came from Spain, that means the great importance of the Spanish longline fisheries in the world. Several hundred fishermen have heard of it and, by so doing, have learnt more about the seabird bycatch problem. Fishermen and the specialised media alike, everyone was welcomed SEO/BirdLife's competition as it signals a new, collaborative approach to a serious problem that occurs

every day in the world's oceans. So the fishermen's competition was proving a tool for communication among the fishing community about the unwanted death of large numbers of seabirds in the world's oceans every year.

POSITIVE EXPERIENCES IN RELATION TO OIL SPILL DAMAGE PREVENTION

Mid- and long-term proposals on impact studies due to oil spill damage have accomplished certain conservation measures for "wide ranging" species. Some of these proposals are synthesized as follows: Accurate monitoring on post-oil spill damage, studies deal with the deep knowledge of trend dynamic populations, considering mainly an assessment due to the impact as well as a final damage evaluation on species and habitats. Other proposals concerning conservation measures are not only focused on threatened species but on the most affected areas. Finally, strategies drafting will be carry out applied to target groups and others, and even with the purpose of developing activities related to tourism (i.e. the presence of bird watching tourism in the affected area).

Taking into account that an existing estimate of species affected by oil slick may collect and register from previous environment disaster, it might be implemented recovery measures for the affected species and habitats. The monitoring plan includes a monitoring, control and surveillance programme. Emergency Plan reports a detailed definitions of the recommendations, which are the basis of solving another similar cases that require the develop of appropriate corrective and preventive actions/ measures that can be taken to correct the near-term condition.

The Prevention Plan has been designed in response to a control process that relates to mitigate any potential oil spill damage. The preliminary stage of the proposed Plan has been endorsed for coastal areas. It has been determined that it will be considered as main part of an specific Investment Portfolio by the National Park Unit, and it has been approved yearly. To ensure its efficiency within the determined timeframe, the scope is the identification of preventive measures that could reasonably be expected to reduce or preclude any potential oil spill damage in three different areas: Islas Atlánticas National Park - Atlantic region -, Cabrera National Park -Mediterranean region -, and Timanfaya National Park – Macaronesian region -.

3. Important Bird Areas (IBAs) for seabirds in Spain

Project reference: LIFE2004NAT/ES/000049
Project executor: SEO/BirdLife

CONTEXT
The project focuses on the sea waters of Spain (including the Balearic and Canary islands) and seeks to identify Important Bird Areas (using scientifically-sound criteria) for the seabird species listed in Annex I of the Birds Directive with populations in Spain. This project contributes to the implementation of the Birds Directive in the marine environment and to the future designation of Special Protected Areas (SPAs) in coastal and pelagic waters.

Due to its geographical location and productive marine waters, Spain enjoys one of the richest and most varied seabird faunas in Europe, including species which are endemic to our country and are seriously threatened with extinction. From a biogeographical perspective, three distinct marine regions can be found around Spain: the endemic-rich Mediterranean Sea, the subtropical waters around the Canary islands and the highly productive Atlantic region between Galicia and the Bay of Biscay. All of these regions sustain important fisheries and all are subject to a heavy human pressure.

PROBLEMS TO BE SOLVED
In Spain, as in most other European Union countries, a reasonable network of SPAs protects seabirds on their nesting colonies, which are invariably on land. However, the current number, location and extension of marine SPAs is clearly insufficient to guarantee the survival of the Annex I species in the habitat where they feed, rest, migrate and spend most of their time, the sea.

It is essential to identify the areas of the sea that are most important for the conservation of seabirds. For those areas, all relevant threats need to be known and addressed, so that appropriate action can be taken towards the preservation of healthy ecosystems that can sustain viable populations of seabirds.

OBJECTIVES
- To carry out a complete and detailed inventory, with objective methodological criteria, of the Important Bird Areas (IBA) at sea for the seabird species listed in Annex I of the Bird Directive with populations in Spain.

- To include in the marine IBA inventory a characterisation of each IBA, with GIS geo-referenced cartography, a description of the main threats affecting it and a number of conservation measures proposed.

- To develop a standard methodology for the identification and delimitation of IBAs at sea and to disseminate the methodology so that it can be applicable to other countries.

ACTIONS TO BE UNDERTAKEN
(a) map seabird distribution
Create maps showing distribution at sea and use of space in the marine environment for seabird species listed in Annex I of the Birds Directive with populations in Spain. 2 types of analysis are carried out: specific monitoring (i.e., remote tracking) in the case

of bigger species for which it is technically feasible, and generic sampling of the most favourable areas in the case of smaller species.

Specific actions consist of:
→ satellite tracking of 40-44 *Calonectris diomedea* (*diomedea* as well as *borealis*) and 20-24 *Larus audouinii*;
→ radio tracking of 26-30 *Bulweria bulwerii*, 16-20 *Puffinus assimilis*, 26-30 *Oceanodroma castro* from the Canaty islands, and 26-30 *Phalacrocorax aristotelis desmarestii* from the Mediterranean;
→ analysis and mapping of the 16.000 recoveries of ringed seabirds in Spain;
→ survey of coastal waters around *Larus* and *Sterna* breeding colonies in the Ebro delta and Albufera de Valencia (2000 hrs during breeding season), in order to establish the feeding radius for each species;
→ use of observers on board of fishing vessels (>300 days in various fisheries), to rpovide data on seabird use of fishing grounds as reliable feeding areas;
→ create and analyse a data base of oiled and other seabirds found dead on beaches

(b) predict seabird distribution using oceanographic variables
Identify and map the various factors (oceanographic: physical & biotic, and anthropic) that determine the distribution patterns of seabirds at sea. Using those data, (pre)identify areas of highest probability of holding significant concentrations of seabirds.

(c) develop standard methodology
Develop standard methodological criteria for the identification of marine IBAs:
→ organise a specialised workshop on identification of marine IBAs;
→ take part in 3 international meetings on marine IBAs;
→ formulate final document on standard methodology;
→ publish leaflet on identification of marine IBAs and distribute through BirdLife International network

(d) characterise marine IBAs, identify threats, recommend conservation measures
Select and define the limits of marine areas that fit the criteria to qualify as IBAs; characterise each IBA and identify threats, recommending set of conservation measures needed; publish detailed inventory "Important Bird Areas for Seabirds in Spain"

CONCLUSIONS
The present project seeks to identify those areas of the sea that are most important in terms of seabird conservation, and to propose ways of address their current threats and, therefore, to guarantee their preservation. This work is based on scientifically-sound criteria and methods, so that it can be applied objectively to other regions and species groups. The project is aimed at obtaining an inventory of areas of the ocean with high conservation value that warrant SPA designation. The ultimate goal is to have a network of marine SPAs in place that is representative and serves the purpose of conserving healthy seabird populations.

Finland's communication to the Marine working Group of Habitats Committee

14.8.2004

4. Proposal of good practices for SCI/SPA site selection process in Finnish marine offshore areas and experiences in protection of wide ranging species

This document describes practices that are recommendable and conceivable in the offshore site selection process from Finland's point of view, informs WG2 about the legal circumstances and mapping situation of the Finnish offshore areas and measures taken to protect wide ranging species.

Occurrence of Annex I habitats (in practice sandbanks and reefs) and Annex II species of the Habitats Directive (in practice seals, porpoise and salmon) and Annex I species of the Birds Directive in Finnish offshore areas should be examined as soon as possible after enforcement of the Finland's Exclusive Economic Zone (EEZ). The Finnish government bill for the EEZ law is currently in debate in committee, and is expected to come into operation in late 2004.

Potential occurrence of Reefs (1170) can be first assessed based on bathymetric maps. Potential areas for occurrence of Sandbanks (1110) can be assessed from geological data in some in inshore parts of the Finnish marine areas, but no systematically collected data exists yet from offshore (future EEZ) areas. Areas where first hand assessments suggest presence of reef or sandbank habitat, more detailed inventories should be carried out using e.g. remote sensing by aerial photography, seismic and echolocation techniques, sediment sampling and underwater videography.

Offshore areas important for Annex II species of the Habitats Directive and Annex I of the Birds directive should be recognized based on long term records kept by national institutes. Whenever possible, these data should be supplemented by records collected by non-governmental organizations.

Finnish authorities and institutes have readiness to use all the mapping techniques brought up in the Marine Expert Group so far. Finland will take into account the procedural recommendations on the site selection process suggested by HELCOM in the Marine Expert Group.

It is desirable that the Finland's national submarine inventory programme launched in 2003 gained resources for and carried out marine habitat inventories in Finnish offshore areas in addition to its primary task, which is to generate comprehensive knowledge on occurrence of marine Annex I habitats in inshore areas and existing conservation areas. Completion of the programme will take up to ten years and it should enable evaluation of the conservation status of the marine Annex I habitats in Finland and ecological coherence of Finnish Marine SAC's. Site designation process in offshore areas should be based on scientific information regardless of the fact that decisions must likely be made prior to the inventory programme's full completion. Exchange of information and co-operation with neighboring Member States (Estonia, Sweden) and with Russia during the site selection process should be encouraged to ensure that selected sites contribute to ecologically coherent network of marine SAC's in the Baltic Sea.

Measures taken to protect wide ranging Habitats Directive Annex II species in Finland include establishment of sanctuaries in inshore seal resting areas and moving salmon fishery closure during migration to spawning rivers. However, yearly hunting/fishing quota system is in use for grey seal and salmon. Baltic salmon stock is supplemented by reared salmon, but fishing is not restricted to reared stock. Especially offshore fisheries exploit wild salmon relatively heavily. E.g. WWF Finland recommends total salmon fishery closure in Finnish offshore areas as means to ensure existence of the northern Baltic natural salmon stock. Such a measure was ideally taken in joint position with Sweden and Estonia.

5. Swedish practices on selecting marine protected areas, including Natura 2000 sites in the marine environment

The practice for selecting MPAs and marine Natura 2000 sites in Sweden is a modification of the system suggested by IUCN (Kelleher and Kenchington, 1992). The main categories of criteria are naturalness, bio-geographic importance, ecological importance, economic importance, social importance, scientific importance and international or national significance, and practicality/feasibility.

It should be noticed that so far there are only 8 designated marine nature reserves in Sweden, why our experiences are limited.

In the process of selecting MPAs/Natura 2000 sites criteria is used for two purposes:

1. Value criteria: used to evaluate sites
2. Priority criteria: used to set a list of priority among sites (to rank sites)

Marine biological systems are different in certain respects from systems on land, and therefore criteria for selecting MPAs/Natura 2000 sites may differ from those used to select areas for protection on land. Marine systems also tend to be more open than terrestrial systems, why marine protected areas tend to be directed more towards protecting habitats, biotopes or ecosystem functions, rather than individual species.

Marine sites selected for protection are mainly coastal sites, which to a large extent are influenced by natural processes and human activities occurring on land. For that reason the protection of a coastal site may need restrictive measures also for activities on land e.g. in a drainage area. On the Swedish west coast the Gullmarn nature reserve and Natura 2000 area is a fjord, where beside the ordinary restrictions in the drainage area certain additional restrictions have been introduced. In order to reduce the nutrient load to the fjord these restrictions cover sewage treatment plants and agricultural practices in different zones of the drainage area of the river Örekilsälven entering the fjord.

MPAs and marine Natura 2000 sites are usually not well known to the public, or have little aesthetic value. Therefore, the information to the public about these areas is of vital importance.

In the management of a MPA/Natura 2000 site zonation is a way to set management practices and regulations for different activities in different parts of a MPA. A zonation may encompass:

1. A core zone, where changes in present activities may be necessary, and where new uses should be avoided.

2. A buffer zone, where most present day activities are allowed, and where new activities can be allowed after careful evaluation of their effects on the environment.

3. A transition zone, where activities (new or old) can be allowed provided they do not negatively influence the biological values of the core and buffer zones.

The zonation is often easier to implement and control and it is suited for local participation. The alternative to zonation is to have the activities regulated in more detail and encompassing the whole MPA/Natura 2000 site.

Monitoring
Monitoring and investigations have to be carried out once a MPA/Natura 2000 site is declared. The management and the rules for a MPA should be possible to modify in accordance with changed needs and knowledge. The monitoring programme should be responsive to the users of the area as well as to the conservationists. However, a monitoring programme is costly. With scarce resources the monitoring programme should focus on the feature you want to protect. Therefore the monitoring programme should concentrate on the investigation of:

- that the values the MPA was set up to protect really are protected, and
- that the management practices implemented actually contribute to the protection.

The monitoring should start before the MPA is set up and repeated a number of times thereafter. Regulations and zonation of the MPA should then continuously be evaluated, based on the results from the monitoring programme.

Fishing techniques to reduce bird by-catches
Swedish experiences of measures to reduce bird by-catch in fisheries are so far very limited.
With regard to oil spill in the seas around Sweden it is already forbidden to disperse oil in the marine environment. The greatest problem we have with regard to oil spill is the illegal oil spills although the Baltic Sea is a Special Protected Area regarding oil. In order to better control the shipping in the area the Baltic Sea countries in an application to IMO have got the Baltic Sea classified as a PSSA area (april 2004). The Baltic riparian countries now have two years to provide IMO with the additional protective measures they want to introduce for the Baltic Sea PSSA.

Management of marine Natura 2000 sites in Sweden – existing experience and ongoing developments

Sweden has several designated Natura 2000 sites in our coastal areas, most in the archipelago areas. Several of these areas have been selected based on already existing nature reserves, where the main reason for the protection is the terrestrial values and to which a water area has been added. Very few of the coastal sites are plain marine sites. Some of them have been investigated appropriately but for most of these sites there is a lack of scientific knowledge of their marine nature values, habitats and species. Basic more systematic inventories on the coastal marine Natura 2000 sites have been planned to start during 2005. With the increasing need to create an ecological coherent network of Natura 2000 sites and other marine protected areas habitat mapping has come up high on the agenda at the national as well as international level. The designation of MPAs/marine Natura 2000 sites demand scientifically based background information of the sites. Therefore it should be a joint interest of member states to co-operate as far as possible in habitat mapping activities, including methodological development, monitoring, quality assurance and surveillance. This joint work, independent of the financial sources, should be connected to/coordinated with the regional marine conventions such as HELCOM and OSPAR.

So far Sweden has designated three marine offshore Natura 2000 sites. These are Hoburgs Bank (outside the territorial boundary) in the Baltic Proper, Lilla Middelgrund (partly outside the territorial boundary) and Fladen (inside the territorial boundary) both in the Kattegat.

The Swedish government has commissioned the Swedish Environmental Protection Agency to start a general inventory of about 20 marine offshore areas all around the Swedish coast. The selected areas are areas, which have been announced being of interest for marine windmill establishments as well as areas that may be of certain interest for marine nature conservation. The inventory started in 2003 and will continue during 2004 and 2005. The results of the inventory will be presented to the government in the beginning of 2006.

The areas that will be investigated are sand banks and reefs down to 30 m. The inventory consists of four parts:

- Marine geology (SGU) – bottom conditions
- Hydrology (SMHI)– circulation and stratification
- Biology (Marine Research Centre of Göteborg, Stockholm and Umeå) - species abundance, coverage and habitat distribution
- Data handling and management (GIS consultant) – GIS application with GIS generalizations, pattern analysis and area estimations.

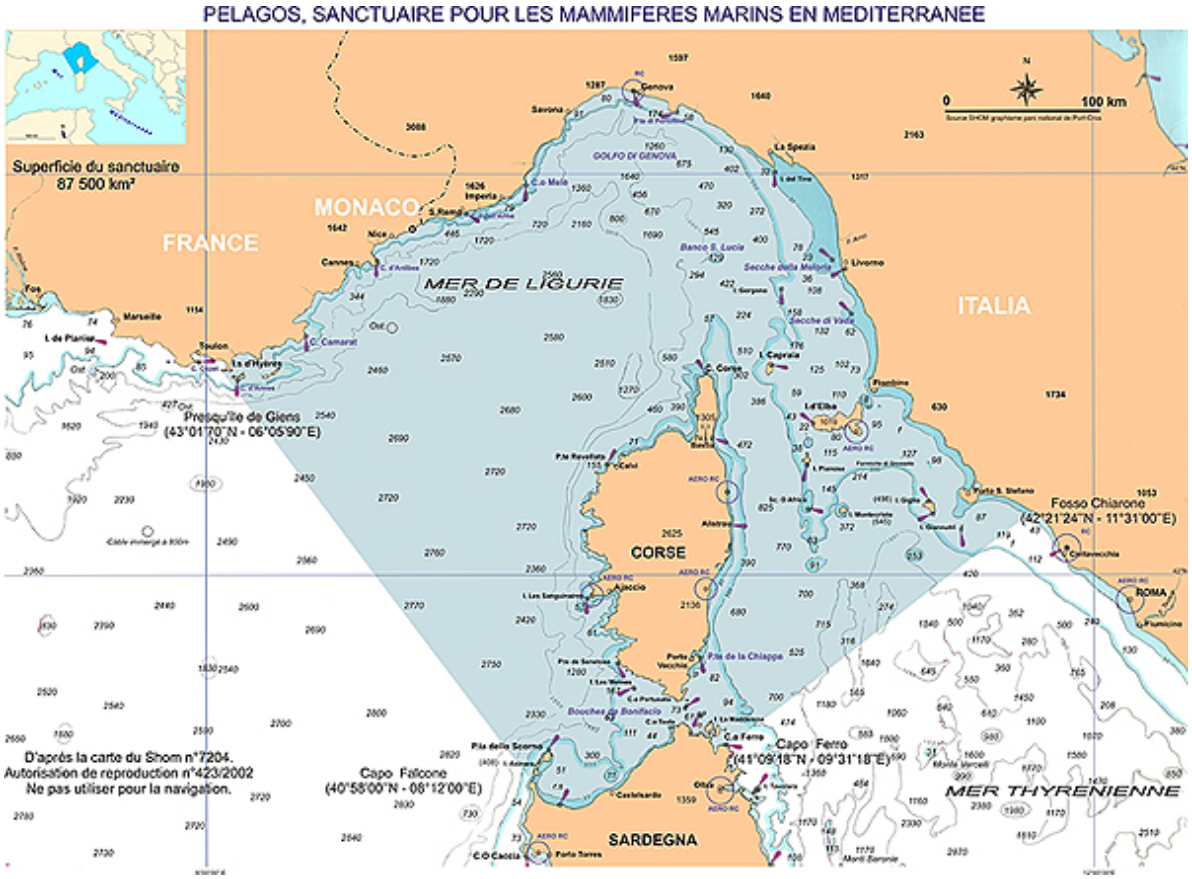
Implementing Natura 2000 sites as well as MPAs means management of conflicts between interests for protection and other users of coastal and marine resources. Fisheries management is in this respect an especially sensitive issue. The management of different marine user interests demands a more planned management than currently is the case in most countries. In this respect integrated coastal zone management (ICZM) has turned up as a useful tool in the spatial planning process. The concept of integration includes: interaction, involvement, participation, cooperation and co-management. The ICZM-work should provide the basic features of the aim of the management process and the expected achievements in terms of sustainability and quality of available environmental assets and socio-economic conditions.

Integrated coastal zone management is a planning tool not specifically adjusted to planning and management of marine protected areas but a tool for a more comprehensive planning and management in coastal and marine areas. However, the ICZM-process involving interaction, involvement, participation, cooperation and co-management can be used. In Sweden the Environmental Code is the legal instrument for protection of marine nature conservation sites independent of the area is a Natura 2000 site or a MPA. This act is valid in Swedish territorial waters as well as in the Swedish Exclusive Economic Zone (EEZ). The process for planning and management is independent of where a site is situated. However, the involved agencies are different. While the municipalities and County Councils are the main responsible actors inside the territorial boundary the government and central agencies are the main responsible actors in the EEZ. So far we have not made a management plan for a Natura 2000 site or a marine nature reserve in the EEZ. Therefore there are some uncertainties with regard to responsibilities among the central agencies. The Swedish Environmental Protection Agency (SEPA) has proposed a pilot study at Hoburgs Bank, in order to go more closely into the matter of making a management plan for that area.

The Swedish experiences of planning and management of marine sites come from marine nature reserves inside the territorial boundary. Based on the Environmental Code the planning and management of a nature reserve can, in principle, address any human activity that may

have an impact on the nature value you want to protect. The development of a management plan for a protected area is a long and complicated process of participation, involvement, integration, coordination and cooperation. In the Koster-Väderö Natura 2000 site in the Skagerrak a management plan has been developed for the area, in which shrimp trawling is the main threat to the cold water corals to be protected. A group of representatives from public authorities, fishing organizations, individual fishermen and scientists have been working to reduce the damaging trawl effects on the corals. Based on the work of the group an agreement has been reached with the fishermen on how to fish in the area. Certain gear regulations have been introduced and a number of small areas within the Natura 2000 site have been identified as protected zones, where the trawling is forbidden. So far the agreement has been successfully introduced and followed.

A special issue with regard to marine reserves and Natura 2000 sites is the control of the effectiveness of the management of a site. In this respect the Swedish Coast Guard usually is given special responsibilities for control and enforcement on sites inside the territorial boundary and would most certainly be given the same task outside the territorial boundary.



6. PELAGOS: An international Marine mammal sanctuary in the North-Western Mediterranean sea

The agreement concerning the creation of PELAGOS, a marine mammal sanctuary in the Mediterranean sea, was signed on the 25th of November 1999 in Rome by the governments of France, Italy and the Principauty of Monaco. Parties may invite other States or international organisations to participate.

Area of application

- PELAGOS is located in the territorial waters of France, Italy and the Principauty of Monaco, and extends to areas of the Mediterranean high seas under their national jurisdictions. These areas are rich in biodiversity and are crucial to the conservation of marine mammals. The sanctuary covers an area of 87500 km2 and includes 2022 km of coasts. It would host around a thousand whales and 25000 dolphins.

- PELAGOS boundaries are clearly stated in the article 3 of the agreement. It extends from the peninsula of Giens in France to the Toscan archipelago in Italy and includes Corsica.

Objectives

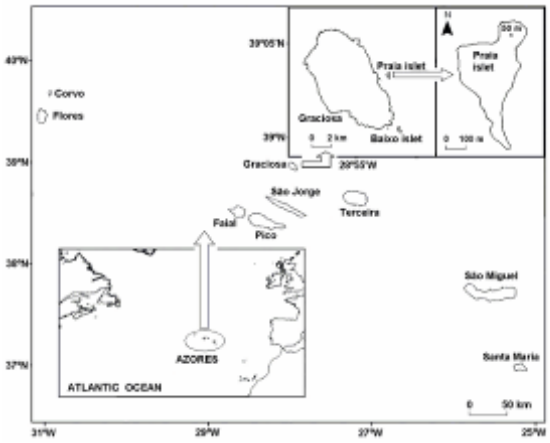
Pelagos aims are to:

- Guarantee a favourable conservation status of all marine mammal species by protecting them, protecting their habitat, and mitigating direct and indirect impacts of human activities.
- Organise the cooperation between States to evaluate periodically the status of mammal populations, mortality causes, threats on their habitats, and more specifically, threats on vital functions such as reproduction and feeding processes.
- Intensify pollution monitoring and control activities.
- Adopt national strategies to suppress progressively toxic wastes that are being dumped in the sanctuary area.

Jurisdictional effects

- Within the sanctuary, Parties :
    - forbid intentional catch or disturbance of marine mammals. They may authorise non lethal catches in emergency cases or for the sake of *in situ* scientific research.
    - Apply the international and European Union legislations, regarding in particular the use of fishing gears that could be detrimental to cetaceans.
    - Set up together regulations regarding the use of fishing gears that might be involved in the accidental catch of mammals or could threaten their food resources, and submit these regulations for adoption to international forums.
    - Regulate mammal sighting tourism
    - Regulate and if necessary forbid motorised contests within the sanctuary.
    - Harmonise all activities mentioned above
- Parties are allowed to adopt national measures that are stricter than those foreseen in the agreement.
- Parties hold frequent meetings to implement the agreement and follow it up. They encourage national sensitisation campaigns (e.g.: prevention of collisions between mammals and boats, how to inform local authorities in case of sighting of a mammal in danger…) and international research programmes to support the implementation of the agreement.
- To ensure the implementation of the agreement, parties organise control mechanisms within the boundaries of the sanctuary. They cooperate to organise the surveillance. They apply simplified procedures to facilitate one another use of their ports and airports.

- Parties invite other non member States that are active in the sanctuary (through fishing or tourism activities…) to respect the measures applied by the parties to protect mammals within the sanctuary.
- The sanctuary has been listed on the list of the Mediterranean specially protected areas (MSPA)of the Barcelona Convention in 2001. A management plan has been adopted by the three parties and institutional dispositions such as the creation of a secretariat, the provision of a budget and the creation of a scientific committee are under way.



First concrete results:

- 230 000 euros have been invested in the French part of the sanctuary on research programmes to reconcile human activities and the presence of cetaceans.
- Speed Boat races within the sanctuary have been forbidden ever since 2001.
- A code of conduct targeting cetaceans watching tourism from boats has been set up.
- The suspension of the use of the 'thonaille', a local fishing gear, has been adopted from the 15th of August till the 15th of September to avoid the frequent by-catch of dolphins that would take place around this period.
- The obligation for fishermen to equip their boats with 'pingers', an acoustic device which frightens dolphins away has been adopted.

7. Habitat restoration on Praia islet, Graciosa (Azores)

Maria C. Magalhães [1], Joël Bried [1], Mark Bolton [1, 2], Verónica C. Neves [1, 3], José M. Pereira [4], Maria José Pitta Groz [4], Luís Aguiar [5], Luís R. Monteiro [1, †] and Ricardo S. Santos [1]

[†] Deceased

Context

The Azores seabird assemblage represents a transition between tropical and temperate avifaunas. For this reason, it has an international scientific importance. Because seabirds essentially breed on oceanic islands free of native terrestrial predators, these species generally lack adaptations that would enable them to cope successfully with introduced predators or with perturbations of their nesting habitat.

Consequent on the introduction of alien mammals in the Azores archipelago by the Portuguese during the 15th century, most seabird species became extirpated from the main islands and are now restricted to a few islets and remote coastal strips. This is likely to have resulted in higher inter-specific and intra-specific competition for nest sites at this locality. Therefore, one of the priorities was to eradicate introduced mammals and to restore habitat whenever and wherever possible. Due to its accessibility to man and to the richness of its seabird community, Praia islet (0.12 km^2), off Graciosa island, was chosen for such an experiment. Praia islet holds more than 40% of the Azorean breeding population of Madeiran Storm Petrels *Oceanodroma castro*, both from hot and cold season populations. Roseate Terns *Sterna dougallii*, Common Terns *S. hirundo*, Cory's Shearwaters *Calonectris diomedea borealis* and Little Shearwaters *Puffinus assimilis* also breed on the islet. All these species are included in Annex I of the EU Wildbirds Directive 79/409and Annex 2 of Bern Convention.

Problems to be solved

Like at several other localities, the presence of Rabbits *Oryctolagus cuniculus* on Praia islet, has resulted in the disappearance of some native plant species and in increased soil erosion, as well as in the destruction of seabird breeding sites and hence a decrease in seabird breeding numbers.

Objectives

Eradicating the rabbits and restoring the habitat on Praia islet, both in terms of vegetation and suitability for seabirds.

Actions undertaken

Rehabilitation measures were implemented from 1995 onwards. They included rabbit eradication, habitat restoration, installation of artificial nests for terns and storm petrels and educational measures.

Rabbit eradication

Rabbit eradication was conducted from 12 September to 2 October 1997, using brodifacoum, an anticoagulant.

Control of erosion

Due to the presence of the rabbits and the nature (friable substrate) of the islet, erosion was very important in some areas. In order to minimize this phenomenon, branches cut down from trees and debris dams made of rock piles and wooden planks were installed in the erosion scars in 1995 and 1997.

Replanting the native vegetation

The species that should be (re-)introduced on Praia islet were determined from the results of a preliminary study conducted on the neighbouring Baixo islet (*ca* 2 km south of Praia) in 1996. Small plants of 9 native species collected on Baixo islet and on Graciosa island were planted on Praia islet from May 1998 onwards, according to their habitat preferences. Operations are still ongoing.

Measures to increase seabird populations

Construction of nest boxes for roseate terns:

To enhance Roseate Tern establishment on Praia islet, 50 wooden nest boxes (0.4 x 0.4 x 0.2 m) were built and installed on the islet at the onset of the 1996 breeding season in order to increase the number of suitable areas for this species. Since then, nests boxes have been installed every year in early April and removed in September, after all the chicks have fledged.

Construction of artificial nests for Madeiran Storm Petrels:

In 2000 and 2001, 150 artificial nests were installed on Praia islet to increase the breeding populations of the two seasonal morphs of Madeiran Storm Petrels. Since then, these nests have been annually monitored for each seasonal population, monitoring consisting in short visits to the colony (5-10 days) to determine occupancy rate, the number of breeding pairs, and chick productivity. Adults and chicks are ringed.

Educational measures

In 1995, informative panels explaining the impact of human disturbance on seabirds were put on the islet to limit the access by visitors to tern colonies, and awareness campaigns were conducted.

Results:

Rabbit eradication

Rabbit eradication proved to be successful. No evidence of the presence of Rabbits has been found since the end of the 1997 campaign.

Control of erosion

Putting tree branches into erosion scars and building debris dams proved their efficacy in terms of soil retention, and herbaceous plants had already started to colonise the soil in 1998. In 2004, all the erosion scars were partially filled up and contained vegetation.

Replanting the native vegetation

The program is still ongoing due to some difficulties experienced with some species like *Azorina vidalii* or *Solidago sempervirens* which have very low growth rates, whereas other species such as *Festuca petrea* already started to spread. However, the plants of *A. vidalii* introduced in 1998 already produced seeds that have germinated, giving birth to several young plants. Exotic plants that attempt to colonise the islet, (essentially *Carpobrotus edulis*) are removed. Plant introductions and removal of exotic species are currently conducted by the nature warden from Graciosa.

Measures to increase seabird populations

Construction of nest boxes for roseate terns:

Rabbit eradication and the installation of nest boxes resulted in the increase in the breeding populations of terns on the islet, although not immediately. Roseate Terns had been almost totally absent from Praia islet since 1991. Despite the installation of nest boxes, they did not breed between 1996 and 1998. Except for two pairs in 1998, the first noticeable breeding attempts by this species occurred in 2000; since then, breeding numbers have kept increasing, exceeding 300 pairs in 2003.

A few tens of Common Tern pairs have always been breeding on Praia since 1989, except in 1995 and 1996. This species bred again in 1997, before Rabbits were eradicated. Since then, breeding numbers have kept increasing, and Praia islet currently holds the largest Common Tern colony (about 1000 pairs) of the Azores.

Concerning wooden boxes, however, adult terns never used them, but chicks use them as shelters from both predators and weather.

Construction of artificial nests for Madeiran Storm Petrels:

The occupancy rate of artificial nests by Madeiran Storm Petrels has kept increasing since 2000, with 46 breeding pairs for each seasonal morph in 2004. This represents a two-fold increase for the cool season morph and a 3.5-fold increase for the hot season morph. A long-term demographic survey is being conducted to estimate the demographic parameters of each seasonal population.

Educational measures

Every summer, informative panels are still installed on Praia islet. Although visits on the islet are still allowed, they have been discouraged and overnight stays are only permitted to researchers. Although he is not obliged to do it, the nature warden from Graciosa island is present during diurnal visits to inform the public about the sensitivity of seabirds to human disturbance and the vulnerability of the ecosystem of Praia islet.

Conclusion: future work

Praia islet remains a vulnerable area since people come with boats for diurnal visits, most of which occur between May and August, i.e. when the weather is the most settled, but also coinciding with the breeding period of seabirds. However, the nature warden is present during these visits and he keeps the visitors informed about the bird species that are present to ensure that people will not disturb birds during the breeding period. Despite this, people may land on the islet at any time of the day or night (that is, outside the working hours of the nature warden) and cause disturbance inadvertently. Therefore, it is desirable to maintain sessions of environmental education. On the islet, control and/or removal of exotic plants remain necessary. So does the maintenance of the tern nesting habitat (installation of wooden boxes for terns each summer, removal at the end of the breeding season), and that of the storm petrel artificial nests (removing the vegetation at the entrance of the nest boxes).

8. The Wadden Sea : an example for Best-Practices in Marine Conservation

The Wadden Sea - Location, Habitat Types and Species

The Wadden Sea is Europe's largest and most important marine wetland. It is a marine area of outstanding international importance, which is shared by Denmark, Germany and the Netherlands. Nowhere else in the world is there an area on a similar scale and multifaceted, containing such a complex of tidal flats, gullies, salt marshes, dunes and islands. The Wadden Sea is an exceptional, highly dynamic tidal ecosystem and its exceptionality relates to its extensiveness, complexity and interrelationship of habitats and species as well as its high biomass productivity, which provides the foundation for an abundance of species.

Sandbanks, estuaries, mudflats and sandflats not covered by seawater at low tide, large shallow inlets and bays, reefs, salt marsh habitat types and dune habitat types are the main natural European habitat types according to the EU Habitat Directive, which can be found in the Wadden Sea. About 10 to 12 million waterbirds pass through the area to build up the necessary energy reserve for their migration flight. The most numerous native marine mammal species in the Wadden Sea is the Harbour seal with some 10,800 individuals (2003). The Wadden Sea is the main nursery ground for fish species that are hatched in the North Sea. The commercial fishery of the North Sea is dependent on these nursery ground facilities. (see list of relevant Habitat Directive habitats and species in **Annex 1**)

Man settled in the Wadden Sea area more than 2000 years ago. The Wadden Sea of today is partly the result of man´s interference with the Wadden Sea environment through land reclamation and altering of the landscape. The Wadden Sea has been subject to a generation of protection and management, also in an international context, as shared by three countries. The trilateral Wadden Sea Cooperation celebrated its 25-year anniversary in 2003. There is hence a long experience in terms of protection and management of a large and complex marine area located in a part of Europe with many pressures and developments impacting the area both in a national and international context.

It has been recognized that the Wadden Sea could only be protected and managed in the context of an overall management of the coastal zone both landward and offshore because

many of the pressures on the area occur outside the area subject to the protection. The Wadden Sea case provides an extraordinary opportunity to examine the management of a large marine protected area on a national and international scale and in the context of a complex coastal zone.

2 Managing the Wadden Sea – The Trilateral Perspective

The collaboration between the three countries on the protection of the Wadden Sea is based on the Joint Declaration, which was concluded at the 1982 Wadden Sea Conference. The three governments declare their intention to consult each other in order to coordinate their activities and measures to implement relevant EU directives and other international legal instruments such as the Ramsar and Bonn Conventions. The Joint Declaration is a political declaration of intent made by the three governments expressing a joint responsibility for the protection of the Wadden Sea as a shared marine wetland area. In 1987 the Common Wadden Sea Secretariat was established to facilitate and support the cooperation.

Wadden Sea Plan: Geographical delimitation - External Impacts

In 1997, the Wadden Sea countries adopted the Wadden Sea Plan, which is the key joint policy and management plan for the overall protection, management and sustainable use of the Wadden Sea. The Wadden Sea Plan is applicable to the Wadden Sea Area as defined by the trilateral Danish-German-Dutch Wadden Sea cooperation as the area between basically three nautical mile offshore and the seawalls on the mainland including the estuaries up to the brackish water limit and the islands. The Wadden Sea Area covers an area of almost 15,000 km^2 of which almost 12,000km^2 constitutes the trilateral Conservation Area of the national Wadden Sea nature reserves and national parks (see **Figure**: Map of the Wadden Sea Area and Conservation Area). The Wadden Sea is also subject to international designations such as the designation as candidate Special Areas of Conservation (cSACs) according to the EU Habitat Directive and a Special Protection Area (SPA) according to the Bird Directive and Ramsar Convention. It is important to acknowledge that the Wadden Sea Area geographically covers basically all of the Wadden Sea ecosystem including its natural habitats but also to appreciate that the protection and management regime is in principle confined to this area though the significance of external impacts on the area is well recognized.

Regarding the impact of shipping off the Wadden Sea, the designation of the Wadden Sea as a Particularly Sensitive Sea Area (PSSA) in the year 2002 is a recognition of the vulnerability of the Wadden Sea. The protective measures, which have been taken off the Wadden Sea, are now recognized as associated measures, which serve to protect the Wadden Sea from impacts from shipping.

Trilateral Objective, Management Principles and Targets

The guiding principle of the trilateral Wadden Sea policy is to achieve, as far as possible, a natural and sustainable ecosystem in which natural processes proceed in an undisturbed way (Wadden Sea Plan, §I,8, 1997). This guiding principle is a compelling political statement on the objective of the efforts of the countries to protect and conserve a natural ecosystem for present and coming generations. Seven management principles, such as the precautionary principle have been agreed to, which are fundamental for decisions on activities and projects within the Wadden Sea Area. A list of those shared principles is in **Annex 2**.

The conservation and management is hence directed towards maintaining and achieving the full scale of habitats, which belong to a natural and dynamic Wadden Sea by working towards targets set for habitats, birds and mammals, quality of sediment and water, and landscape and cultural aspects. A list of the Targets is in **Annex 3**. The Targets were developed upon the extensive scientific documentation of the area and the Quality Status Reports of which two have been issued. The Targets are open-end formulated based on the assessment that in order to achieve a natural and sustainable ecosystem the area, which is natural and undisturbed, should be increased. The target approach is concerning one of the few areas, if any, in Europe where such a management approach is applied to and politically accepted. Recently, it was concluded that the Targets complies with the requirements of scientific credibility, management usefulness and suitability for communication with stakeholders.

For each of the Targets a comprehensive set of joint policies and management has been adopted by the countries as encompassed by the Wadden Sea Plan. These policies and management cover all relevant activities and uses in the Wadden Sea Area related to the Targets on landscape, water and sediments, habitats, birds and marine mammals. These includes policies on coastal protection, agriculture, industry and harbour, fisheries, tourism and recreation, extraction of oil and gas, sand and gravel extraction etc. as listed in the Wadden Sea Plan.

3 Implementation on the National Level

The trilateral protection and management scheme as laid down in the Wadden Sea Plan through a coherent system of management principles, targets, measures, monitoring and assessment, constitutes an integrated ecosystem management of the Wadden Sea as one shared ecosystem. A shortcoming in the approach is the legally non-committal nature of the agreements and the institutions.

The implementation of the agreements made in the framework of the trilateral Wadden Sea Cooperation is the task of the national responsible, primarily of the nature conservation authorities but also other authorities, which have a stake in Wadden Sea conservation and management. There are some notable differences between the national protection schemes.

The German national parks have established a unified management of the protected areas through an overall zoning system. The national parks authorities are also strong institutional elements, which potentially guarantee a strong implementation and enforcement of the

stipulations of the national park laws. Its weakness is the lack of integration with the developments and activities in the adjacent land and sea territory.

In opposition to this, the Dutch approach is one, which in principle has integration as a leading principle horizontally and vertically between the authorities and, which take account of developments in the adjacent area. A weakness is potentially the problems in pursuing conservation objectives in conjunction with the lack of a strong institutionalized lead agency for the Wadden Sea. During the developments of the last decades, however, there have been fewer principle differences between the two approaches, also because of the development of common trilateral framework.

The Danish Wadden Sea nature reserve was established by state order since the Danish state has sole responsibility on the sea territory is very similar to the German national parks with a few essential exceptions. The zoning system is activity related and not a fixed system. Furthermore no special authority has been established but the existing state authority of the Danish Forest and Nature Agency is the competent authority for management and issuing of permits and exemptions.

5 Wadden Sea protection - Assessment and Measures

The implementation of the trilateral Targets is monitored and assessed by the Trilateral Monitoring and Assessment Program (TMAP) on the basis of a common list of agreed parameters. The TMAP is set up to enable an appraisal of the measures, which have been introduced and, if necessary, to design and introduce new ones if required to achieve the Targets. The Targets, measures, monitoring of the Targets and recurring policy assessment is in principle a very consistent system, which is applicable to all other systems and protected area management schemes.

The 1999 Quality Status Report (QSR) is the most recent comprehensive quality assessment of the Wadden Sea based on the Targets, which has made use of the TMAP data to the extent available. Some essential results as summarized (summary available at www.waddensea-secretariat.org) are

- Water, sediment and biota: phosphate levels have decreased significantly in most parts of the Wadden Sea, whereas this is not the case for nitrate; concentrations of most heavy metals in sediment are approaching background levels but an exception is mercury, which is still three to ten times higher than background levels; also concentrations of PCBs in sediment and HCB and HCH in bird eggs show a steady decrease.

- The tidal area: the target of an increased area and more natural development of natural mussel beds, eelgrass meadows and sabellaria reefs has not been reached; the decline of mature beds of the blue mussel and seagrass meadows has continued in the 90s; as a result of human interference, most notable fixed coastal constructions but also fisheries, dredging, sand extraction and gas extraction – the ability of the system to compensate for sea level rise may have decreased.
- Salt marshes: much has been achieved to in the 90ies to improve the natural situation in salt marshes by the reduction, or phasing out of grazing and artificial drainage.
- Birds: the population of several bird species have increased in the last decades and few have declined; the main factor for the increase of breeding birds are, amongst others, an improved protection during the breeding season; Kentish plover and Little tern populations have decreased, which is due to lack of sufficient undisturbed breeding habitats caused by recreational activities.
- Marine mammals: the Harbour seal population has increased significantly and though the population was affected by an epidemic in 2002 as in 1988, the population may be regarded as viable.
- Estuaries: only few estuaries have remained in the Wadden Sea area and consequently natural transitions of fresh and salt water hardly exist; the anthropogenic impact on the three main estuaries is still increasing as a result of current deepening and the building of a storm surge barrage.

The protection of the Wadden Sea ecosystem has benefited much from the comprehensive and integrated protection scheme, which was launched almost a generation ago. The 1999 QSR points to a number of positive developments in particular with regard to birds and seals and some of the habitats such as the salt marshes. The QSR also identifies a number of areas of concern for which an improvement is needed. This concerns the developments in the tidal area and with regard to the external impacts from pollution and other developments in the coastal zone. The next QSR including the assessment until 2003 is being compiled at the moment and will be published in 2005.

6 The Seal Management Plan

The Wadden Sea seal population slumped in the mid-1970s to about 3,900 individuals – the lowest number ever logged. A ban on hunting was introduced in all three Wadden Sea countries and as a result seal numbers stabilized and began to rise in some places. This positive development was interrupted by a dramatic epizootic at the end of the 1980s caused by the highly infectious phocine distemper virus (pdv). By 1988, the seal population slumped by about 60 percent. It happened again 14 years later, once more reducing the seal population tremendously. Yet in the meantime a positive new factor had entered the equation.

In October 1991, an Agreement was struck between Denmark, Germany and the Netherlands on the Conservation of Seals in the Wadden Sea. It was the first regional Agreement under the Bonn Convention (CMS) and its aim was trilateral cooperation to improve the conservation prospects of seals in the Wadden Sea. After the first pdv epizootic, between 1988 and 2002, seal numbers rallied significantly. Aerial surveys of the entire Wadden Sea in 2002 counted some 20,975 seals. This comeback was attributed to a higher reproductive rate and lower initial juvenile mortality. But later that same year, pdv struck again and half the Wadden Sea's seals (about 10,500) were found dead. One year later, however, the maximum number of surviving seals counted during the moult period in August 2003 amounted to some 10,800 seals. In other words the population was 53 percent below pre-outbreak levels. Though in absolute numbers more seals died than during the earlier epizootic of 1988, the evidence showed that relative mortality was evidently lower this time around.

It was widely acknowledged that the Seal Agreement played a part in turning the tide. The Agreement required Parties to develop a 'conservation and management plan for the seal population' on the basis of scientific knowledge – the Seal Management Plan (SMP). This plan, which was compiled with the support of the results of the EC funding project 'Joint Management Plan for the Wadden Sea Seal Population', has become the key instrument for achieving and maintaining the objectives of the Seal Agreement. Among other provisions, it set up seal reserves throughout the Wadden Sea, which are closed to all activities in periods when the animals are giving birth and nursing young. The environmental conditions of seals, however, are still not satisfactory. The present and short-term conservation status of the seals in the area is primarily determined by pollution and disturbance as results of various human activities are the main problems.

A rise in seal populations may run the risk of conflict with fishermen. It may also challenge the current reserve system if additional reserves are needed to cope with growing numbers. Research projects on the feeding ecology of Harbour seals, and investigations of habitat requirements of seals in relation to recreational demands are the top two priorities for implementation under the revised SMP for 2002-2006 (available at http://www.waddensea-secretariat.org/). The SMP remains an essential tool for heading off potential future conflicts of interest in an area with lots of commercial users. It aims to strike a balance between managing the area for human uses, and conserving viable stocks of seals to maintain a natural breeding cycle.

7 Conclusions - Lessons Learnt

Looking back at a generation of Wadden Sea protection it seems justified to conclude that the entire approach in terms of conservation and management of a comprehensive marine wetland has been a very progressive one. The level of environmental protection and management can be characterized as unique in terms of harmonized international and national policies, management arrangements, and integrated environmental monitoring and assessment procedures. The measures have been successful in conserving species and habitats though there still remain issues of concern in particular the quality of water, sediment and biota caused by the input of hazardous substances and nutrients from sources outside the Wadden Sea. This issue can only be addressed in a larger context.

Furthermore, there is much concern related to the possibility for compensating the effects of the sea level rise and responding to accelerated sea level rise, which is also an issue that requires addressing developments outside the Wadden Sea Area. The decline of mature beds of blue mussel and sea grass meadows and the increasing impact in the estuaries are also a major cause of concern. The comprehensive protection and management of the Wadden Sea as a coastal marine area has been a very positive achievement, which needs to be continued. The management of the Wadden Sea has practiced coastal management for a long period along the principles for integrated coastal zone management as outlined in the European Union program.

A4.5 Fen orchid

Annex 2:

Shared Principles of the Trilateral Wadden Sea Cooperation - Wadden Sea Plan

The Guiding Principle of the trilateral Wadden Sea policy is ”to achieve, as far as possible, a natural and sustainable ecosystem in which natural processes proceed in an undisturbed way” (ED §1). The Principle is directed towards the protection of the tidal area, salt marshes, beaches and dunes (LD §8).

In addition, seven Management Principles have been adopted which are fundamental to decisions concerning the protection and management within the Wadden Sea Area (Esbjerg Declaration §3):

- the Principle of Careful Decision Making, i.e. to take decisions on the basis of the best available information;
- the Principle of Avoidance, i.e. activities which are potentially damaging to the Wadden Sea should be avoided;
- the Precautionary Principle, i.e. to take action to avoid activities which are assumed to have significant damaging impact on the environment, even where there is no sufficient scientific evidence to prove a causal link between activities and their impact;
- the Principle of Translocation, i.e. to translocate activities which are harmful to the Wadden Sea environment to areas where they will cause less environmental impact;
- the Principle of Compensation, i.e. that the harmful effect of activities which cannot be avoided, must be balanced by compensatory measures; in those parts of the Wadden Sea, where the Principle has not yet been implemented, compensatory measures will be aimed for;
- the Principle of Restoration, i.e. that, where possible, parts of the Wadden Sea should be restored if it can be demonstrated by reference studies that the actual situation is not optimal, and that the original state is likely to be re-established;
- the Principles of Best Available Techniques and Best Environmental Practice, as defined by the Paris Commission.

Unreasonable impairments of the interests of the local population and its traditional uses in the Wadden Sea Area have to be avoided. Any user interests have to be weighed on a fair and equitable basis in the light of the purpose of protection in general, and the particular case concerned .

Annex 3:

TRILATERAL TARGETS

Landscape and Culture

- Identity - to preserve, restore and develop the elements that contribute to the character, or identity, of the landscape.
- Variety - to maintain the full variety of cultural landscapes, typical for the Wadden Sea landscape.
- History - to conserve the cultural-historic heritage.
- Scenery - to pay special attention to the environmental perception of the landscape and the cultural-historic contributions in the context of management and planning.

Water and Sediment

- Background concentrations of natural micropollutants.
- Concentrations of man-made substances as resulting from zero discharges.
- A Wadden Sea which can be regarded as a eutrophication non-problem area.

Salt Marshes

- An increased area of natural salt marshes.
- An increased natural morphology and dynamics, including natural drainage patterns of artificial salt marshes, under the condition that the present surface area is not reduced.
- An improved natural vegetation structure, including the pioneer zone, of artificial salt marshes.
- Favorable conditions for migrating and breeding birds.

Tidal Area

- A natural dynamic situation in the tidal area.
- An increased area of geomorphologically and biologically undisturbed tidal flats and subtidal areas.
- An increased area and a more natural distribution and development of natural mussel beds, *Sabellaria* reefs and *Zostera* fields.
- Viable stocks and a natural reproduction capacity, including juvenile survival, of the Common Seal and the Grey Seal.
- Favorable conditions for migrating and breeding birds.

Beaches and Dunes

- Increased natural dynamics of beaches, primary dunes, beach planes and primary dune valleys in connection with the offshore zone.
- An increased presence of a complete natural vegetation succession.
- Favorable conditions for migrating and breeding birds.

Estuaries

- Protection of valuable parts of the estuaries.
- Maintaining and, as far as possible, restoring the river banks in their natural state.

Offshore Area

- An increased natural morphology, including the outer deltas between the islands.
- A favorable food availability for birds.
- Viable stocks and a natural reproduction capacity of the common seal, grey seal and harbour porpoise.

Rural Area

- Favorable conditions for flora and fauna, especially migrating and breeding birds.

Birds

- Favorable conditions for migrating and breeding birds:
  a favorable food availability;
  a natural breeding success;
  sufficiently large undisturbed roosting and moulting areas;
  natural flight distances.

Marine Mammals

- Viable stocks and a natural reproduction capacity of the Common Seal including juvenile survival.
- Viable stocks and a natural reproduction capacity of the Grey Seal including juvenile survival.
- Viable stocks and a natural reproduction capacity of the Harbour Porpoise

9. Overview of the measures included in the existing management plans of the French marine Natura 2000 sites

Normandy , Brittany, Corsica, Poitou Charentes and Provence Alpes Côte d'Azur as at 20th of June 2005

Below is a synthesis of the measures that are proposed in some French marine Natura 2000 sites that already apply a management plan. The evaluation of their impact will take place in the near future. On the basis of these measures and their effect, a national working group will be proposing additional measures that should be taken into account locally when drafting future management plans.

1. ***Public awareness and information :***

Awareness campaigns are being caried out on the need to protect and better manage wild habitats and species and on the existing legislation : development of education tools (guides for sustainable leisure fishing, information on nesting sites, leaflets on Natura 2000 and its legislation, delimitation of sites with informative signs…)

2. **E*co-label*ling** of products is being encouraged

3. ***Protection activities***

It consists in:

- Promoting nature reserve projects
- Harmonising local legislations
- Protecting and restoring sites that host or could host bird and fish species : spawning and nesting sites, resting sites, feeding grounds
- Controlling invasive species: rats, ravens, … to limit the predation on marine birds nesting sites, *Caulerpa taxifolia* in Mediterranean sites to protect *posidonia* beds.

4. ***Sustainable development***

The following activities are being set up:

- Collaboration with local producers to adapt their activities to a sustainable use of the resource : design of ways suitable for motor vehicles for the exploitation of oysters and mussels that are not detrimental to birds, development of mooring sites outside of *zoostera* and *posidonia* beds, no trawling over fragile habitats, protection of waterways between lagoons and the open sea in the Mediterranean sea…
- Limitation of the use and development of the shores and nearby seawaters located in ecologically rich areas. Projects that could have an impact on the substrata (dredging, etc), on sea habitats (harbour developments, embankments, etc), on water quality and the biological balance of natural habitats (sewage treatment plants, aquaculture farms, etc) are being thoroughly screend.
- Follow up of the impact of fisheries (trawls and dragnets), evaluation of local interrelations between seafood farming and marine habitats, support to sustainable fishing practices (e.g. by avoiding the overexploitation of sea urchins predator fish species or limiting the size of herbivorous species feeding on sea grass beds).
- Maintenance of natural harbours and their biodiversity (by avoiding the accumulation of silts, limiting dredging activities…)
- Promotion of the cleaning of beaches and sea wracks by a selective manual sorting of waste; limitation of the amount of waste from sea food farming activities.

5. Implication in other programmes related to water quality

Support to local water management plans, water quality evaluation schemes. Integration of marine water preservation needs into the set criteria used for the management of the continental watershed.

6. Follow up and evaluation of habitats and species

It consists in:

- Setting up local marine biodiversity observatories
- Further developing inventories of marine habitats and species (though the design of more precise marine habitat maps, the closer follow up of endangered habitats and those that have a rich biodiversity and/or that are under strong pressure…
- Increasing the knowledge of marine mammal populations (diet, use of water space, …) and their long term viability (genetic bank…), protecting their resting sites, sensitising the public (tourists, tour operators, fishermen…).
- Protecting migratory fish species through a better knowledge and the suppression of migration obstacles.
- Protecting the feeding grounds of marine species and birds
- Protecting the habitats of the European otter and supporting its installation on the coast line

10. Limitation to the negative interactions between dolphins and human activities (LINDA) Corsica, France

Project Background

The bottlenose dolphin (Tursiops truncatus) has a very large distribution range and is found everywhere around European coasts, from the Mediterranean to the North Sea. However, few data exists on the species and its populations, being classified as «data deficiency » by the UICN. The 3 sites of the project (the 2 marine nature reserves of Bonifacio and Scandola and the Agriates, all of them being proposed Natura 2000 sites) are included in the international marine sanctuary (PELAGOS) and hold half of the total Corsican population, estimated to be between 198 to 242 individuals.

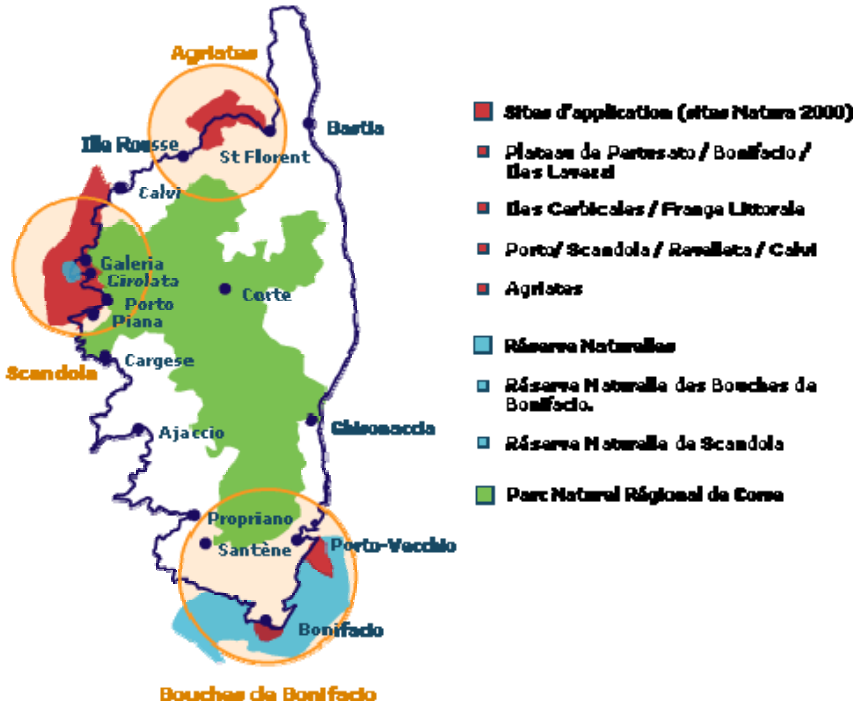
The bottlenose dolphins are essentially gregarious and exploit a large variety of coastal habitats up to 200 meters of depth. They have learnt how to take advantage of man fishing techniques to satisfy their needs, by pilfering directly in fishing nets. However, due to the damages produced this behaviour has led to the hostility of the fishermen. Voluntary aggressions and accidental captures are the consequences of this behaviour. Moreover, the overfishing and the reduction of fish stocks could lead to the accentuation of competition between dolphins and fishermen.

Other threats are maritime traffic and motorboat racing (inducing sound pollution, disturbance, injuries and death by collisions), uncontrolled whale watching activities and pollution.

Project Objectives

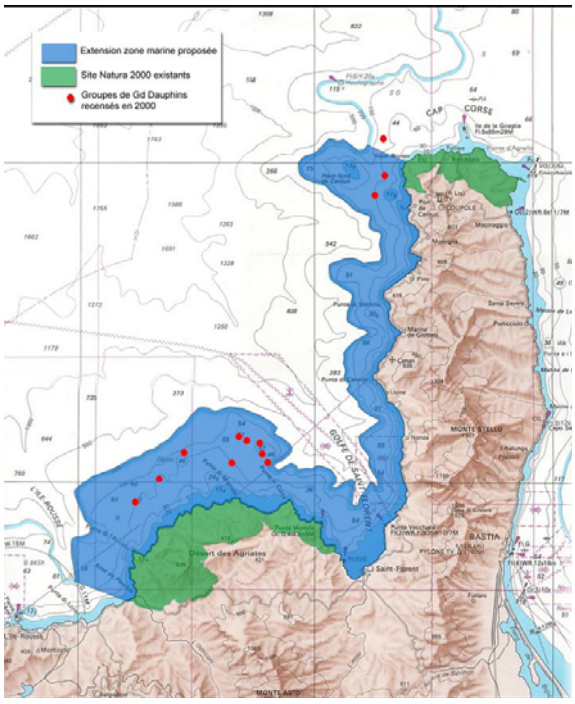
The LINDA started in 2004 and will last until 2007. The project aims at maintaining the populations of bottlenose dolphins in Corsica in an accurate status of conservation through securing an harmonious cohabitation between the presence of the species and the economic activities. The main stakeholders, local authorities and tourists collaborate to develop sustainable fishing, yachting and whale-watching practices.

For the achievement of these goals, the LINDA project:



-Monitors the population of bottlenose dolphins and human activities affecting the species (sound pollution, interactions with fishing activities, yachting…) so as to assess the project impact and to produce a regional action plan for the species at the end of the project.

-Implements measures to minimise conflicts between bottlenose dolphins and fishermen (acoustic repellents on fishing nets, alternative fishing practices…)



-Promotes dolphin-friendly management of activities related to water sports (motorboat racing, whale watching and yachting) and launch communication initiatives for public awareness.

Foreword

Peter Gammeltoft

The world's oceans and seas cover 71% of the Earth's surface and contain more biological diversity than terrestrial and freshwater ecosystems. The marine environment is a precious asset and a great contributor to economic prosperity, social well-being and quality of life. However, the marine environment is under pressure. Waste dumping, dredging and extraction of sand and gravel, water borne and atmospheric deposition of dangerous substances and nutrients, oil and gas exploration and shipping are just some of the activities examples causing the degradation of our seas. Other activities such as bottom trawling and over-fishing are also contributing to the destruction of marine habitats and species.

The European Union, aware of the increasing concern about the state of Europe's oceans and seas, included in the Sixth Environment Action Programme a commitment to develop a strategy for the protection and conservation of the marine environment with the overall aim being "to promote sustainable use of the seas and conserve marine ecosystems".

The Marine Strategy focuses on the protection of the regional seas surrounding the EU, taking into account international commitments and the importance of reducing the EU's impact on the marine environment in a global context. The Marine Strategy must also be seen within the broader context of the development of the new EU Maritime Policy.

The European Commission's LIFE (Financial Instrument for the Environment) programme has contributed to the conservation of highly endangered marine species and habitats. It has also gathered information and experience for the establishment and implementation of the Natura 2000 Network in the marine environment, and has promoted the implementation of the Habitat and Birds Directives on the European seas and oceans.
This LIFE Focus brochure details the accomplishments of various projects that with their actions contributed to the knowledge, protection, prudent use, and understanding of the marine environment.

The marine environment status

Europe borders four major seas and two oceans: the Mediterranean, Black Sea, Baltic Sea, North Sea, and the North Atlantic and Arctic Oceans. Almost every EU-25 country[1] has coastal areas, and the maritime surface area under their jurisdiction is larger than the total land area of the European Union. Europe's identity, quality of life and economic development are directly related to the health and diversity of its seas and oceans. However, the marine environment is under significant pressure.

1 Excluding Austria, Luxembourg, Slovakia, Czech Republic and Hungary

Main threats to the marine environment

Current pressures on Europe's marine environment that are putting the sustainability of our oceans and seas at risk include:

> Overfishing
This is a common problem in all European seas, although management systems for the exploitation of these resources have been introduced within the Common Fisheries Policy. A number of important commercial fish stocks have reached historically low levels. In addition, intensive fishing activities may have also significantly damaged non-target fish species and other marine life (cetaceans, seals, seabirds and turtles) and may damage important marine habitats such as maerl beds, *Posidonia* seagrass beds and deep-sea reefs.

> Alien species
The introduction (unintentional or deliberate) of non-indigenous species, genetically modified or disease-bearing organisms to the marine environment can have a catastrophic effect on natural ecosystems, thus threatening marine biodiversity.

> Habitat modifications and disturbance
Human activity along coasts and offshore (such as the development of ports and harbours, coastal protection, land reclamation, tourism, sand and gravel extraction, offshore oil, gas and wind power installations) has a significant impact on the marine habitats. This is the result of direct destruction, excessive demands for marine services and goods, increasing traffic, acoustic disturbance (underwater and on the surface), exploration and installation of offshore platforms.

> Pollution (hazardous substances)
Industrial and urban discharges and emissions that reach the marine environment may contain various hazardous substances. Some substances[1] have been shown to be able to disrupt the biological processes of marine species and to interfere with the ecological food chain.

> Eutrophication
This is a condition caused by the excessive influx of nutrients (nitrogen and phosphorous). Although this is predominantly from agricultural and urban sources, the atmospheric deposition of airborne nitrogen compounds (for instance from seagoing ships) may also be a relevant factor. The abundance of nutrients can promote spectacular growths of macroscopic algae – *algal bloom*.

> Oil pollution
The majority of oil pollution at sea is not the result of spectacular oil slicks but comes from routine operations, such as leaks from coastal installations, harbour tanker terminals and coastal transport pipelines to refineries, and widespread operational discharges from tankers and other vessels on the ocean. The damage caused to coastlines from oil pollution is costly and takes a long time to recover. As a result, the marine ecosystems and centres of human activity (for example, aquaculture sites and tourist centres) may be affected.

> Climate change
The possible consequences of climate change on the marine environment are far from being fully understood, but some of the results are already noticeable. The consequences may include changes to the strength and transport capacity of ocean currents, the speed of formation of water masses, sea-level height variation, the intensity and frequency of climatic phenomena, rainfall and the flow of waterways, with downstream effects on ecosystems and fisheries. One of the most visible effects of rising sea levels is coastal erosion. One fifth of the EU's coastline is already affected, and some places are losing between 0.5 to 2 metres a year and even up to 15 metres in a few alarming cases. A particular worrying effect is the increase in the acidity of marine waters, resulting from increased rates of dissolved CO_2.

1 These include, inter alia, tributyltin (TBT), PCBs (Polychlorinated Biphenyls), organochlorine pesticides, PAHs (Polycyclic Aromatic Hydrocarbons) and heavy metals

This publication shows, through LIFE case studies, how the conservation of marine ecosystems and marine biodiversity can be incorporated into policies and management plans to preserve the EU´s seas. The LIFE examples featured in this brochure enhance the knowledge of our marine environments (thus promoting the implementation of the Natura 2000 Network), promote the protection of endangered species and habitats, ensure the prudent use of marine goods and services, build partnerships between stakeholders, and improve the environmental quality of our seas.

EU marine policy in an international context

One of the particular features of the marine environment is the number of organisations, regional conventions and international bodies that are concerned with its protection. In addition, the EU itself has an extensive body of legislation, policies and programmes that directly or indirectly impact upon the quality of our oceans and seas.

A review of current EU policies and legislation[1] shows the existence of a wide variety of EU measures that contribute to the protection of the marine environment. However, as most of this is sectoral and as the geographic scope varies, there is no integrated EU policy focused on the marine protection. The institutional and legal complexity of marine protection is indeed one of the main challenges to be confronted.

EU marine environment policy has evolved in a broader context of treaty obligations at global and regional levels. There are a large number of different organisations contributing to the protection of the marine environment. There is an important overlap in the geographical area covered by these organisations and in terms of membership.

At a global level, the United Nations Convention on the Law of the Sea (UNCLOS) and the Convention on Biological Diversity (CBD) are among the most relevant bodies under which the EU has committed itself to protect the marine environment. Further agreements and commitments at a regional level, under the OSPAR Convention for the North-East Atlantic, the Helsinki Convention (HELCOM) for the Baltic Sea and the Barcelona Convention for the Mediterranean Sea, should also be highlighted.

Two recent environmental initiatives of the European Commission should be underlined:

1. The European Marine Strategy, which is intended to provide an integrated framework for action to deal with the impact of human activities on the marine environment;
2. The full implementation of the Birds and Habitats Directives in all waters under the jurisdiction of EU Member States. Once completed, the Natura 2000 Network in offshore waters will constitute a very important tool to ensure the proper protection of marine wildlife.

The Law of the Sea

The UNCLOS – United Nations Convention on the Law of the Sea was signed by participating countries under the auspices of the United Nations (UN) at Montego Bay (Jamaica) on 10 December 1982, and has gained virtual universal acceptance. One hundred and forty-nine nations have ratified the convention since its entry into force on 16 November 1994. The convention establishes general obligations for safeguarding the marine environment and protecting freedom of scientific research on the high seas. It also creates an innovative legal regime for controlling mineral resource exploitation in deep seabed areas beyond national jurisdiction, through an International Seabed Authority*.

** More information on: http://www.un.org/Depts/los/index.htm*

International Council for the Exploration of the Sea

The International Council for the Exploration of the Sea (ICES) is an intergovernmental organisation that coordinates and promotes marine research in the North East Atlantic, the Baltic Sea and North Sea. More than 1,600 marine scientists from 19 countries around the North Atlantic gather information about the marine ecosystem. As well as filling gaps in existing knowledge, this information forms the basis for unbiased, non-political advice on fish and shellfish stocks, the marine environment including contaminants, and the status and outlook for marine ecosystems including the effects of human exploitation. The ICES plans and coordinates marine research, and prepares technical advice on catches of fishing stocks, as well as strategies and measures to mitigate the impact of human activities on the marine ecosystem, to its including the European Commission and other international regulatory bodies such as OSPAR and HELCOM*.

** More information can be found on http://www.ices.dk/*

The European Marine Strategy

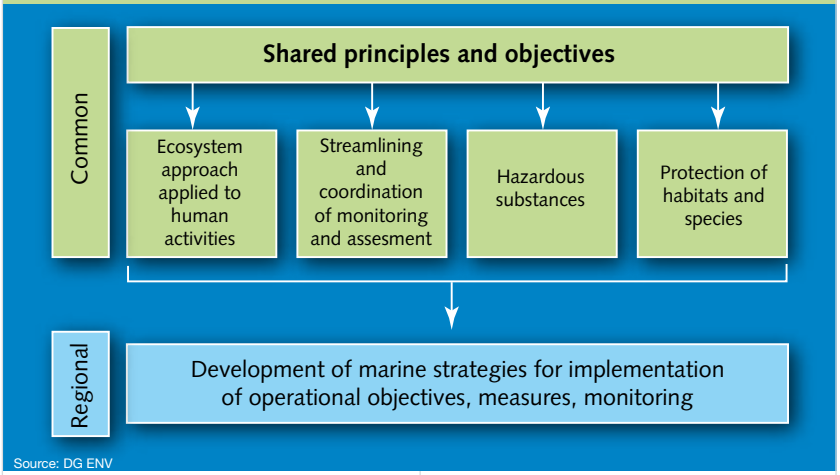
The "Thematic Strategy on the Protection and Conservation of the Marine Environment" aims to ensure that all European seawaters are in good environmental status by 2021. This ambitious Marine Strategy, launched by the Commission on 24 October 2005, targets the protection of the marine environment and is also the key component of the future Maritime Policy, which has been proposed by the Commission.

Coastal and marine ecosystems are among the world's most productive ecosystems and provide a wide range of services to society. However, the marine environment is under significant pressure. The UN Millennium Ecosystems Assessment[1] points out that human activity is the main cause of degradation and loss of marine species and habitats, and forecasts "a great risk of collapse of all major fish stocks and climate change-induced sea-level rise (with mean value of 0.5 – 0.7 m)".

Although some significant improvements in the quality status of seas surrounding Europe have been achieved and some of the worsening pollution trends have been halted or reversed, a large number of problems have yet to be fully addressed and major threats still persist. The reasons for this include:

- A complex and inadequate legal framework for the management of the seas within and outside the EU, and the number of actors concerned;
- Gaps in basic knowledge, due to a lack of alignment between research priorities and needs;
- A lack of an integrated marine protection policy.

1 UNEP (2006) Marine and costal ecosystems and human well-being. A synthesis report based on the findings of the Millennium Ecosystems Assessment.



European Marine Strategy logo

Taking into account the underlying problems that affect the marine environment, the Sixth Environment Action Programme (6th EAP) considered the conservation and the protection of the marine environment as a key environmental priority. In 2002 the European Commission adopted the Communication "Towards a strategy to protect and conserve the marine environment". After three years, this communication was followed by a "Thematic Strategy on the Protection and Conservation of the Marine Environment." The Commission proposed a "Marine Strategy Directive", requiring Member States to take measures to achieve good environmental status for all the EU's marine waters by 2021. To this end, they have to prepare and implement programmes of measures in close cooperation with other Member States and third countries that share the same waters, through the development of marine strategies for its marine waters. Cooperation between EU Member States and with countries outside the EU would be encouraged within the framework of existing Marine Regional Conventions (OSPAR, HELCOM, Barcelona Convention and the Bucharest Convention).

Regional marine strategies will contain a detailed assessment of the state of the environment, a definition of "good environmental status" at regional level and the establishment of clear environmental targets and monitoring programmes. To take account of regional differences, the Commission's proposal puts forward a "two level" approach that sets out common objectives and

Figure I: **Two-level approach of the Marine Strategy**

Source: DG ENV

principles to be implemented at regional level. As a result, Member States sharing a marine area will be responsible for working in close cooperation to ensure the good environmental status of their common waters (see Figure I).

The Ecosystem[2] approach

The Convention on Biological Diversity (CBD)[3] defines the ecosystem approach as "a strategy for the integrated management of land, water and living resources that promotes conservation and sustainable use in an equitable way". The CBD also recognises that "humans, with their cultural diversity, are an integral component of ecosystems". The proposal for the Marine Strategy is based on the ecosystem approach and focuses on the integrated management of human activities.

Extensive work on application of the ecosystem approach to the marine environment was carried out during a stakeholder consultation process before the adoption of the Strategy[4]. This approach is instrumental to the sustainable development of Europe's oceans and seas and to the effective protection of the marine environment. It builds upon concepts such as "favourable status of conservation" and "good ecological status". It should apply to all areas, including coastal seas, territorial waters, exclusive economic zones or equivalent ones as well as all activities taking place in these areas that affect the marine environment

The endorsement of this approach results in a well-defined way of working that starts with the consideration of the objectives stemming from the Vision or desired state adopted for the marine environment in general and the existing principles and obligations that apply. These objectives have to be put into action. The effectiveness of the actions has to be monitored by using indicators and targets that will allow further adjustments of the actions to ensure that the objectives are eventually achieved. A summary of the process is shown in Figure II.

The Marine Strategy and the new EU Maritime Policy

In addition, the European Commission is launching a wide debate on an EU Maritime Policy that coordinates the current sectoral policy approach. On 7 June 2006 the European Commission published a Green Paper titled "Towards a future Maritime Policy for the Union: A European vision for the oceans and seas". It aims to accomplish the objectives of the Lisbon Strategy and integrate many related maritime policy areas such as transport, renewable energies, trade, tourism, fisheries, aquaculture, marine research, coastal and harbour industries. The Marine Strategy will constitute the "main environmental pillar of the EU Maritime Policy"[5] and be seen as the environmental component of the overall policy. A period of consultation with citizens and stakeholders has followed, starting 7 June 2006 and ending 30 June 2007. All documents, including the Green Paper and information of events, can be found on the Commission's maritime website[6].

Natura 2000 and the Marine Strategy

Rather than creating new legal provisions or requirements for designating Marine Protected Areas (MPAs), the proposed Directive supports the full implementation of the Natura 2000 ecological network in the marine environment under the Habitats and Birds Directives, as an important contribution to achieving good environmental status of marine waters.

The proposed marine strategy requires the Member States to identify measures that need to be implemented in order to achieve good environmental status, taking into consideration the measures relevant for MPAs in general. Measures aimed at achieving the conservation objectives set for Natura 2000 sites included in a marine region should then be inserted in the plan of measures for the region as a whole.

2 Ecosystem definition – "a dynamic complex of plant, animal and micro-organism communities and their non-living environment interacting as a functional unit" (Article 2 of the CBD)

The marine component of the Natura 2000 Network

The Natura 2000 Network is an ecological network of natural areas designated to conserve Europe's rich but vulnerable habitats and species. The network includes more than 20,000 sites from all 25 Member States of the EU. Collectively, they cover almost a fifth of Europe's land and continental waters.

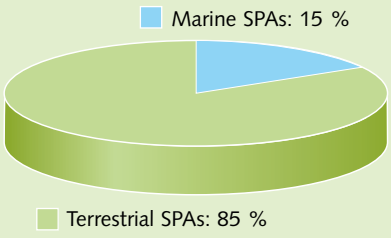

Photo: ImagDOP@Svizinho

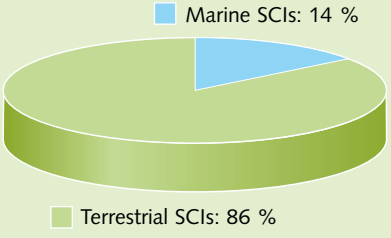


Ponta do Castelo marine site in the Azores

The Natura 2000 ecological network, set up by the EU Habitats and Birds Directives, is the cornerstone of the EU's nature conservation policy. The marine component of the Natura 2000 Network will be an integral component of the overall Natura 2000 Network.

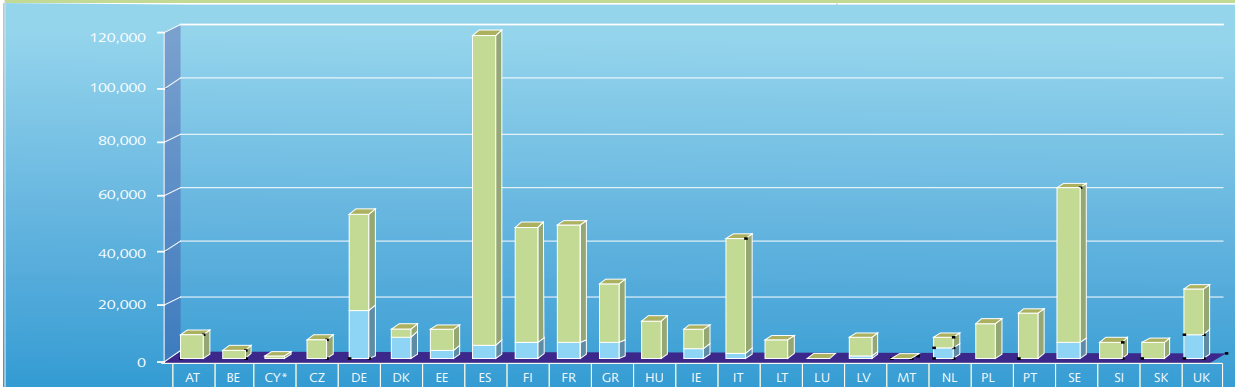
Marine Special Protection Areas (SPAs) in Europe

Marine Sites of Community Interest (SCIs) in Europe

Together with the Special Protection Areas (SPAs) designated under the Birds Directive, the areas designated under the Habitats Directive as Special Areas of Conservation (SACs) shelter species and habitats that are rare or endangered at European level. This network is one of the principal means of implementing the commitment made by the Union's Heads of State and Government at the Gothenburg summit in June 2001 to "halt the loss of biodiversity by the year 2010". It will also contribute to fulfilling obligations stemming from

international conventions such as the CBD Convention. For the first time, all Member States are working together towards the same conservation goal and within the same legislative framework (the two directives) to protect and manage vulnerable species and habitats across their natural range, irrespective of political boundaries. Designation of SPAs and proposals for SACs (the so-called Sites of Community Importance, SCIs) is now almost complete in the old EU15, and the process is well under way in the new Member States. The total EU25 marine and terrestrial SCIs' area covers 559,082 km² and the SPAs' area covers 444,368 km².

Photo: ImagDOP@Svizinho



Release of Madeiran Storm-Petrel, an endangered seabird that spends most of its life at sea

The Natura 2000 Network introduced a series of key elements in nature conservation related to the marine environment:

- The inclusion of open sea as a breeding, feeding or resting zone for the targeted species in a network of protected areas, the protection of valuable habitat types, as well as the specific protection of habitats such as cold water reefs and *Posidonia* beds (underwater sea-grass prairies).
- The protection of each area as part of a coherent network, rather than as isolated sites.
- The freedom of choice for Member States to guarantee the conservation of sites either with specific management plans or through conservation measures included in broader development plans, rather than the establishment of one set of strict rules and regulations for general application.

Many conservation actions funded by LIFE focus on building a sound knowledge base on marine species and habitats in order to be able to develop appropriate conservation measures to protect them.

LIFE on the sea

Although a relatively small fund in EU terms, LIFE's contribution has helped establish and manage the Natura 2000 Network on open water, promoting innovative techniques for the protection of the marine environment and capacity-building around the Mediterranean and Baltic Seas.

Establishing and managing Natura 2000 sites costs money. The Habitats Directive acknowledges this, and in its Article 8 foresees a contribution from the Community towards these costs. Launched in 1992 – at the same time as the Habitats Directive came into force – the nature strand of LIFE III is the only EU programme primarily dedicated to nature conservation and to the creation of the Natura 2000 ecological network. LIFE-Nature is assigned 47% of the total LIFE III programme budget for actions that contribute to the protection of species and maintaining or restoring of natural habitats under the Birds and Habitats Directives. It has so far contributed more than € 700 million to more than 800 nature projects with a total budget of € 1.3 billion across the EU and Romania. It was not intended to financially cover the implementation of the Natura 2000 Network wholesale (that would require much more money) but to help establish the network and demonstrate how it can work in practice. Some 2,000 sites, representing over 10% of the total network, have been targeted by LIFE-Nature projects so far.

Another LIFE III programme strand, LIFE-Environment, aims to implement Community policy and legislation on the environment in the EU and Romania. This approach enables the demonstration and development of new methods and innovative techniques for the protection and the enhancement of the environment. Nearly half – 47% – of the LIFE III programme budget goes to LIFE-Environment. Five areas, all with a potential impact on the marine environment, are tackled by LIFE-Environment projects:

- Land-use development and planning.
- Water management.
- Environmental impact of economic activities.
- Waste management.
- Environmental impact of products through an integrated product policy.

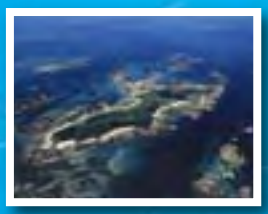

Photo: ©IFAW

Striped dolphin (Stenella coeruleoalba) *an Annex IV Habitats Directive species*

LIFE-Third Countries, which specifically aims to provide capacity building in countries outside the EU around the Mediterranean and Baltic Seas, is the third LIFE III programme strand, taking around six percent of the LIFE budget. LIFE-Third Countries projects in the marine environment cover issues like the development of national and international systems for responding to accidental marine pollution, establishing effluent limits based on best available technology, reducing heavy metal pollution and establishing marine environmental action plans.

The LIFE programme, as a whole, has demonstrated its effectiveness as a key financial and technical tool helping Member States to fulfil their obligations as regards the protection of the marine environment. Some of the most common actions funded are:

- Information gathering about the status and requirements of marine species and habitats, including monitoring sea mammal, bird and fish populations.
- Identification and designation of Natura 2000 sites in open waters.
- Elaboration and implementation of management actions (including management plans) for marine sites, with the aim of avoiding the depletion of endangered species and of maintaining and restoring valuable habitats.
- Demonstration and testing of innovative methods and technologies for preventing pollution and mitigating the effects of environmental accidents.
- Consultation with the public on plans and projects for the elaboration and adoption of integrated management plans for marine areas.
- Promoting capacity building in the private and public sectors in countries bordering the Mediterranean and Baltic seas.

Enhancing our knowledge of the marine environment

Implementing the Habitats and Birds Directives in the marine environment presents some substantial challenges, especially as regards the offshore environment, due to the difficulties in obtaining scientific knowledge on the distribution and abundance of species and habitats. So while the designation of Natura 2000 sites in coastal and inshore waters is considered to be fairly advanced, there are still important gaps in the offshore marine environment network.

The LIFE programme has helped to enhance the knowledge of the marine environment needed to designate Natura 2000 sites in the open sea.

Implementation of the marine component of the Natura 2000 Network

Knowledge and designation of Natura 2000

Implementing the Habitats Directive, which includes some marine species and habitats, presents substantial challenges, especially for the offshore marine environment due to existing knowledge gaps about the distribution and abundance of species and habitats and the cost of carrying out oceanographic research. In addition, the need for a more precise definition of marine habitat types in Annex I of the Habitats Directive is widely acknowledged. Many of these species and habitats are also listed in regional conventions such as the OSPAR, Helsinki or Barcelona Conventions. On the other hand, all marine bird species are covered by the Birds Directive, which makes its implementation more straightforward.

The full establishment of the marine component of the Natura 2000 Network will be a significant step towards the protection of the marine environment in EU waters.

Part of the problem in implementing Natura 2000 in the sea is that there is insufficient data when compared with terrestrial environments. Offshore marine surveys are difficult to do and also tend to be very costly. As a result, the amount of data on the distribution of species and habitats tends to decrease the further one goes from the shore. Nevertheless, a basic level of knowledge is essential if suitable marine sites are to be selected for the Natura 2000 Network.

Member State Nature Directors agreed that further work was needed to develop a common understanding of the provisions of the Birds and the Habitats Directives to designate and manage marine Natura 2000 sites. The European Commission was asked to establish an ad hoc working group under the Habitats Committee, with a view to providing guidance on this subject.

Since March 2003, a Marine Expert Group has been working on the development of a common understanding of the provisions of Natura 2000 relating to the marine environment in order to facilitate the designation and future management of these areas. This should help Member States achieve this important task and will provide useful reference material for other stakeholders.

Legal aspects of applying the Birds and Habitats Directives to the marine environment

The opinion of the Commission is that the claim by a Member State of rights on the maritime zone should include obligations as well as those rights: “The provisions of the Habitats Directive automatically apply to the marine habitats and marine species located in territorial waters (maximum 12 miles). However, if a Member State exerts its sovereign rights in an exclusive economic zone of 200 nautical miles (for example, the granting of an operating licence for a drilling platform), it thereby considers itself competent to enforce national laws in that area, and consequently the Commission considers in this case that the Habitats Directive also applies, in that Community legislation is an integral part of national legislation*”.
This opinion was confirmed by the Position of the European Court Justice delivered in the case C-6/04 on 20 October 2005.

Thus the exclusive right of exploiting natural resources implies also the conservation of the marine ecosystems and applies to all the maritime areas claimed by the Members states, including:

- The internal waters and the Territorial Sea;
- The Exclusive Economic Zone (EEZ) and/or to other areas where MS are exercising equivalent sovereign rights (fishing protection zones, environmental protection zones…);
- The Continental Shelf.

Marine site selection

After the clarification of where the Habitats and Birds Directives apply, the question is: how to select marine sites for Natura 2000?

There are nine marine habitat types, 18 species listed in the Habitats Directive and numerous seabirds (under the Birds Directive), for which Member States are required to propose sites for the Natura 2000 Network. The procedures for the delineation of sites are the same as on land. The assessments must take into account the size, the distribution and conservation status of the target habitats and species and their overall contribution to the Natura 2000 Network.

The first step is to distinguish between coastal and inshore water species and habitats, and the true pelagic species (species that live in the open sea). Fish species such as those belonging to the genera Valencia or Aphanius, terns (genus Sterna), and habitats such as coastal lagoons (Habitats Directive Annex I code - 1150* - priority) or estuaries (1130) are related to coastal areas. For these cases the site designation procedure is similar to land sites and the surveying and delineation of areas is relatively easy to accomplish. These sites also provide for the conservation of land areas where marine species spend a part of their lifecycle, such as islands for seabirds, sandbanks for seals, and nesting beaches for loggerhead sea turtles.

Thus, the requirement for the identification and proposal of offshore sites is linked to a shorter list of habitats and species. For these cases the answer is to carry out surveys focusing on habitats and species. The surveys have to be appropriate (for example not all would depend on sea floor information) and sometimes would be linked with oceanographic information (geology, bathymetry-sea depth, currents sea temperature, salinity levels, nutrients and plankton patterns). For a wide range of species (sea mammals and seabirds) the surveys must include onboard surveys and satellite/radio tracking to build up a picture of the species' distribution patterns and behaviour.

LIFE-Nature has been contributing to projects that aim to carry out preliminary studies and surveys of the marine environment. This could be considered as something of an exception to its normal rule of not funding scientific studies and surveys. This approach allowed the funding of more than 50 projects that had an important information gathering and survey component, and thus provided important data that is used for the identification of sites and their inclusion in the Natura 2000 Network. Some of the projects contributed for the first time to the production of real large-scale results that covered wide areas of the European seas.

LIFE in action

SCANS: Abundance of small cetaceans in the North Sea and adjacent waters

The SCANS LIFE project increased knowledge of the abundance and distribution of North Sea cetaceans. Its survey produced reliable information which formed the basis for establishing threshold levels for the sustainability of cetacean populations and for implementing conservation measures.

Across the world, sea mammals are under threat. Accidental entanglement (the by-catch) in fishing nets, pollution, overfishing of their food supplies and hunting are contributing to the problem. The threats faced by cetaceans in EU waters are recognised in the Habitats Directive, which lists those that require strict protection (Annex IV). Furthermore, Annex II of the directive lists the harbour porpoise *(Phocoena phocoena)* and the bottlenose dolphin *(Tursiops truncatus)* as species that Member States should protect under Special Areas of Conservation (SACs).

The International Whaling Commission (IWC) has stated that the level of by-catch for cetacean populations should be less than 1%. Also, the Agreement on the Conservation of Small Cetaceans in the Baltic and North Seas (ASCOBANS) advised that the maximum annual by-catch for harbour porpoises should not exceed 1.7% of the population. Nonetheless, the by-catch of harbour porpoise in fish nets has reached high levels and has given rise to calls for the introduction of management measures. In this respect, the adoption of a Common

Common dolphin (Delphinus delphis) *spotted during the SCANS project surveys*

Onboard survey of the sea for cetaceans

Fisheries Policy Regulation[1] setting measures aimed at reducing cetacean by-catch should be seen as a breakthrough. In any event, assessing the impact of by-catch and implementing concrete conservation measures requires good estimates of the population of cetaceans in European waters. Quantitative information on the distribution and abundance of cetaceans is essential for the conservation and management of these species and serves as a baseline for their future monitoring.

The LIFE-Nature SCANS project, coordinated by the Sea Mammal Research Unit (SMRU) and involving extensive international partnerships, proposed to collect information on the distribution and abundance of cetaceans in the North Sea.

1 Council Regulation (EC) No 812/2004 of 26.4.2004

Habitats Directive Annex II cetaceans' species

The harbour porpoise *(Phocoena phocoena)* is a small cetacean on average 1.8 m long, weighing between 50-70 kg. It has a circumpolar distribution in the Northern Hemisphere, and occurs, as its name indicates, mainly in coastal waters or river estuaries. Though it is the most abundant cetacean species in the North Sea, it is considered endangered by the IUCN*. The bottlenose dolphin *(Tursiops truncatus)* is the most common and well-known dolphin species. It ranges form 2 to 4 m in length and weighs between 150 and 650 kg. In north European waters it is found in coastal waters and further offshore. Its diet consists of fish, squid and shrimp.

** Red List of Threatened Species IUCN (International Union for Conservation of Nature), 2006*

What did LIFE do?

The SCANS project estimated the absolute abundance and distribution of the harbour porpoise and other small cetaceans in the North Sea and adjacent areas. The survey was carried out by international teams of observers onboard research ships and small aircraft during July 1994. The estimated population of harbour porpoise was 341,000. Most of the countries with a North Sea coast were included in the survey to map the distribution and to estimate the abundance of the harbour porpoise and other species. The project also included the revision of the methodology for collecting and analysing survey data. The intention of the project was to use these distribution and abundance estimates to set the limits of by-catch and assess the impacts on the target species.

Figure IV: **SCANS-1 project survey areas**

What was the outcome?

The LIFE SCANS project produced the first large-scale estimates of the abundance of harbour porpoise, white-beaked dolphin and minke whale in the North Sea. The extensive survey coverage and the

Figure V: **SCANS-II project survey areas covering 1,011,000 Km² of sea**

Cetacean observation box installed at the bow of the survey boat

methodological developments resulted in precise, scientific estimates.

The SCANS results are now widely used by a range of international organisations (IWC, International Council for the Exploration of the Sea, ASCOBANS and the European Commission) to assess the impact of by-catch and to implement conservation measures on small cetaceans. The by-catch of harbour porpoises in these areas has decreased due to a combination of reduced fishing and the use of acoustic "pingers" (acoustic devices which emit ultrasonic signals to warn cetaceans of the proximity of nets). Furthermore, the project contributed to the development of new survey and analysis methods that are now widely accepted by the world's scientific community.

The project results provided important data essential for the conservation and management of cetaceans in the North Sea.

Life after LIFE

The SCANS project provided the first reliable information on the abundance and distribution of small cetaceans in the North Sea. Nevertheless such estimates are only useful if repeated at ten-year intervals to monitor changes in populations and distribution. The SMRU, now based at the University of St Andrews in Scotland, proposed a follow-up LIFE-Nature SCANS II survey that started during the second half of 2004 and aimed to update the estimates. In addition to the area surveyed during SCANS, this project will also cover continental shelf waters to the west of Britain, Ireland, France, Spain and Portugal.

The first survey was carried out in 2005 and covered more than 30,000 km of sea survey transects and 200 hours of flying time. Another part of the project aimed to refine methods to determine cetacean abundance via shipboard and aerial surveys. The information on abundance and monitoring from this project can be used to assess by-catch and provide scientific information to managers so that they can ensure conservation objectives are met. This project will aid Member States and the Commission in the definition and assessment of favourable conservation status for cetaceans as required under the Habitats Directive.

Conclusions

This project and the follow-up SCANS II project were very successful. The data acquired and the current update has been adopted as a standard for the implementation of the Natura 2000 Network in European waters.

LIFE in action

Portugal and Spain: Marine IBAs

LIFE-Nature co-funded projects in Portugal and Spain are providing guidelines for the implementation of the Birds Directive in the marine environment. These projects involve extensive survey work covering vast offshore and costal areas of the Atlantic and Mediterranean seas. Among the expected results from these pioneering projects is the publication of an inventory of marine IBAs that will subsequently be considered as a proposal for the identification of future Marine SPAs under the European Birds Directive.

Marine birds spend most of their life at sea. They use the marine environment to roost, feed or migrate. Indeed, some species only visit the coast during the breeding season. Seabirds, in their offshore marine habitat, are under threat as a result of increasing pollution, fishing activities, marine transport and depletion of food sources.

Thus, the implementation of the Birds Directive in the marine environment is crucial for the conservation of all seabirds and has to include more than just the simple delimitation of Special Protection Areas (SPAs) on some coastal breeding sites These sites must be sufficient in number and size for the conservation of birds listed in Annex I of the Birds Directive as well as migratory species, taking into account their protection requirements. The difficulties for implementing Natura 2000 offshore are related to a lack of scientific knowledge and the high costs of offshore research and surveying.

Pedro Geraldes

Cory's Shearwater (Calonectris diomedea) *seabird surveyed by the project*

Two LIFE-Nature projects run by SEO and SPEA (BirdLife partners in Spain and Portugal) aim to identify Important Bird Areas (IBAs) in Spanish and the Portuguese Economic Exclusive Zone (EEZ), including those of the Canaries, Madeira and the Azores archipelagos.

What is LIFE doing?

These two projects are contributing to the implementation of the Birds Directive in the marine environment and will identify the most suitable areas for Annex I marine birds, that can later be proposed as SPAs in coastal and pelagic areas within Portugal and Spain.

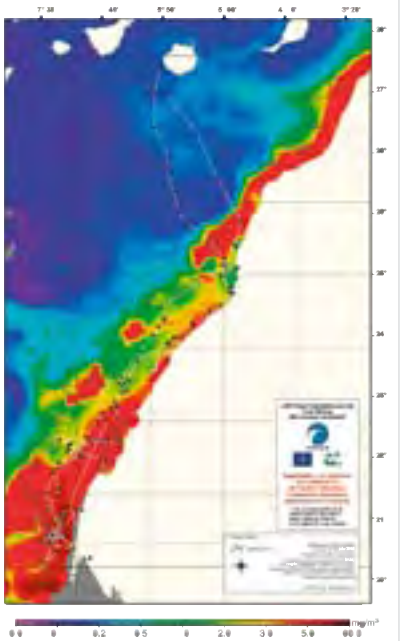
** Considered as "priority for funding under LIFE"*

Survey boat Noruega *used for the detection of seabirds*



In 2005, the projects organised two international seminars in Lisbon and Vilanova (Barcelona) that addressed the definition of practical and methodological parameters for marine IBAs' determination and the subsequent implementation of Natura 2000 in the marine environment. The debate focused on the application of terrestrial bird IBA criteria to the marine environment. Normally this simple approach results in enormous sites. Among the conclusions of these two workshops was a new definition of the four types of marine IBAs:

- Important feeding areas at sea;
- Areas with important regular concentrations of seabirds;
- Seaward extension of breeding colonies;
- Migration hotspots where due to the geographical position, seabirds fly in large concentrations during the migrating season.

These two projects target all the seabirds included in Annex I of the Birds Directive and are currently implementing the following actions:

- Aerial and marine census of seabirds (some of the marine censuses were done together with the LIFE-Nature project SCANS II);
- Satellite and data-logger tracking of individual birds;
- Radio-tracking of the smaller seabird species;
- Oceanographic characterisation of the marine environment (salinity, chlorophyll, temperatures, currents etc);
- Analysis of fishing activity and the presence of marine mammals.

All the data will be analyzed and correlated in order to sketch out the potential distribution for both coastal and offshore distribution patterns of seabirds. Maps are being produced showing areas of interaction with human activities and correlations with ecological and oceanographical data. From this it should be possible to identify the most appropriate areas that could qualify as IBAs. Such pre-selected areas will then be described in detail, threats to them identified and recommendations made for their conservation.

LIFE in action

UK: Establishing management schemes on Marine Special Areas of Conservation (SACs)

The UK's marine habitats are highly diverse and support a range of human activities, with intensive fishing, recreational and industrial uses. A LIFE-Nature project aimed to improve knowledge of the marine habitats around the UK by studying their ecology and developing management schemes for 12 marine sites within a framework that would be transferable to other marine SACs in the EU in order to fulfil the requirements of the Habitats and Birds Directives.

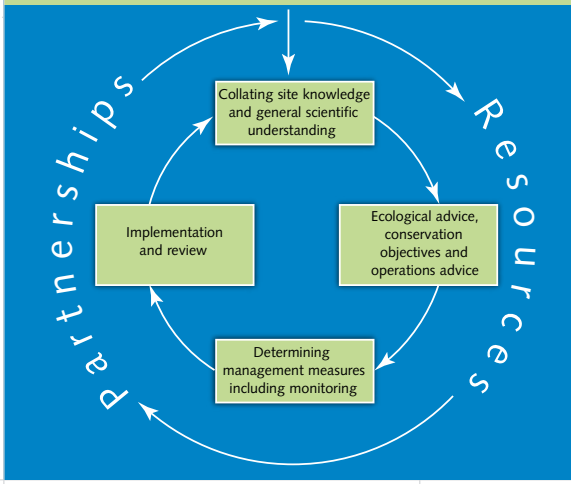
Successful conservation of the marine environment and effective implementation of management measures in protected areas must be based on comprehensive understanding of marine species and their habitats. An important aspect of this is understanding the sensitivity of different areas to human activity.

The UK's marine habitats range from coastal lagoons and estuaries, to sea caves and reefs. The UK's coastal waters are heavily used for fishing, recreation, and industry. All of these uses pose potential threats to marine species and habitats. The UK government has adopted legislation (UK Habitats Regulations) providing for management schemes to be established for marine SACs. These are designed to ensure that use of the sites is compatible with the conservation needs of the habitats and species of European interest.

The project defined and established management schemes for 12 sites around the UK, based on nine marine habitat reviews reports, guidelines, and seven studies on the impact of human activities on marine sites. The nature conservation interest of each site was defined, along with guidelines designed to ensure that the key features – such as bottlenose dolphins in Cardigan Bay or *Zostera* eel-grass habitats along the north Norfolk coast – are maintained. The guidelines also address how to monitor sites for change, and how to respond if detrimental changes are detected.

What did LIFE do?

The project was carried out by a consortium of UK nature conservation agencies. Its key innovation was a partnership approach involving the main marine user, interest, and specialist groups, including port authorities, fisheries authorities, local and regional councils, scientific research institutes and recreational interest groups.



The four year project sought to develop approaches to and techniques for the management and monitoring of twelve marine Natura 2000 special conservation areas, thus fulfilling the EC Habitats Directive objective of setting up protected marine areas. The success of the project was based on gathering existing knowledge on the dynamics and sensitivity of marine features and on the impact of human activities, and from this developing practical techniques for monitoring and assessing the state of marine species and habitats. The project also anticipated the sharing of good practice on developing appropriate management schemes and raising awareness in the UK and continental Europe.

What was the outcome?

The project encouraged the development of management schemes at other UK marine sites by providing a national centre of expertise, by developing the skills base amongst consultants and others, and by disseminating information to a wide audience.

For each management plan a management group was established, which coordinated the gathering of survey data, the filling of knowledge

Process approach to management of marine SACs

The 12 marine project sites covered by management schemes

gaps, data mapping, the defining of conservation objectives, evaluation of current and potential operations, identification of monitoring programmes, and the drafting and finalising of management schemes.

The project involved the relevant authorities that have a special role in the management of a Natura 2000 marine site (local authorities, sea fisheries committees, port, harbour and navigation authorities, etc.). The project also focused on a democratic participatory approach and gave stakeholders the opportunity to voice their opinions.

The project produced surveys and marine habitat maps cartography, and compiled essential information with the help of various UK experts. This information was used to produce nine detailed review reports for habitats and communities common to many of the 12 sites covering: Zostera beds, intertidal reef biotopes, intertidal sand and mudflats and subtidal mobile sandbanks, infralittoral reef biotopes with kelp species, sea pens and burrowing megafauna, circalittoral faunal turfs, subtidal brittlestar beds, biogenic reefs, and maerl beds. The review reports underpinned the development of the marine site management plans and provided definitive reference sources that could be used in all EU marine sites.

The project published 12 guidelines for developing conservation objectives for marine SACs that give the framework for a management and monitoring plan. The guidelines cover the legal background, practical development, supporting information, and presentation of conservation objectives.

In addition, within the scope of the project, seven series of studies were produced focusing on the impacts of human activities on marine species and habitats. These covered recreational activity, ports and harbours, water quality, collecting bait, fisheries practice, water quality in saline lagoons, and aggregate extraction. The studies have helped to establish common ground across conflicting interest groups, and their use may reduce the time needed for consultation when developing future management schemes.

In addition the project implemented a wide range of activities to raise awareness about the project sites, targeted at the general public but also local stakeholders and the European scientific community.

Life after LIFE

Conservation objectives and operations advice was provided for each of the 12 sites. In addition the guidelines for developing conservation objectives for marine SACs are not a statement of nature conservation agency policy but an opportunity to transfer the learning from the project to conservation agency staff and practitioners in the UK and other Member States. The monitoring handbook, meanwhile, fulfils the monitoring requirements under the Habitats Directive and the Water Framework Directive and gives a thorough background to the legislation and links to existing monitoring programmes.

Conclusions

The project made a major contribution on compiling and filing gaps in information regarding the implementation of management plans in marine Natura 2000 sites. Overall, it was a major breakthrough in the monitoring and management of marine sites, species and habitats.

Project number: LIFE96 NAT/UK/003055

Preserving and protecting marine species and habitats of Community interest

Over the last 10 years, LIFE-Nature has contributed some € 40 million to around 50 marine projects across the EU´s Natura 2000 marine sites. Many have focused on the conservation of highly endangered marine species such as the loggerhead sea turtle *(Caretta caretta)*, sea mammals like the harbour porpoise *(Phoconea phocoena)*, and rare seabirds such as Audouin's gull *(Larus audouini)*. Projects have also focused on the conservation and improvement of marine habitats such as *Posidonia* beds, reefs and sea caves.

The European Seas

GENERAL VIEW

North Sea

The shallow areas of the sea are among the most productive marine areas in the world. This high productivity supports a wide range of species and habitats and one of the world's most important fishing grounds. The seabed is also rich in oil and gas.

Species
Harbour Porpoise *(Phocoena phocoena)*

Habitats
Mud flats (1140)

Threats
Anthropogenic impacts have been significant for many years. Pollution is still the main issue for the North Sea. Over the last decade, awareness of and concern about the precarious status of North Sea fish stocks and the impact of fisheries on other parts of the ecosystem has increased.

North-East Atlantic Ocean

The North-east Atlantic Ocean along the Western coastline of Europe is dominated by deep ocean basins. The overall biodiversity is high and the ocean hosts unique habitats, such as high diverse cold-water coral reefs, hydrothermal vents, and rare species including seabirds, several seals and whales.

Species
Zino's Petrel *(Pterodroma madeira)*

Habitats
Reefs (1170)

Threats
Around the North-east Atlantic Ocean the human population is concentrated in the coastal area. Increased human activity around the coasts has led to an increase in sewage discharge, in maritime transport, use of the sea for tourism and recreation, and exploration of the sea's natural resources. Over-fishing, eutrophication, dumping, direct discharges and spills of contaminants are all threats to biodiversity in this ocean.

Mediterranean Sea

The Mediterranean Sea is almost completely enclosed by land. This results in high water temperatures, low nutrients, high salinity (it is the most saline of Europe's seas), and reduced tidal range variation. The Mediterranean Sea is one of the world's highest biodiversity areas, particularly in the coastal zone where this is high occurrence of endemic species.

Species
Monk seal *(Monachus monachus)*

Habitats
Posidonia oceanica beds (1120)

Threats
The Mediterranean coast hosts many human activities that degrade the marine ecosystem. The main threats are: urban, industrial and oil effluents, coastal eutrophication, coastal urbanisation and biological invasions (manly via the Suez Canal).

Baltic Sea

The Baltic Sea region is one of the largest brackish water areas in the world and in many aspects is similar to an estuary or inland lake. Only the shallow waters between Denmark and Sweden connect the Baltic to the open sea. These unique features contribute to highly diverse communities ranging from fresh to salty water habitats. The surrounding land is heavily industrialised and populated.

Species
Ringed seal *(Phoca hispida* subsp. *bottnica)*

Habitats
Large shallow bays (1160)

Threats
The Baltic sea is a semi-enclosed area that is very sensitive to anthropogenic pressures. Eutrophication remains the most pressing problem in the region. Nitrogen and phosphorus inputs are still too high, despite considerable efforts to reduce discharges. Overexploitation of fish is also considered a severe problem, mainly due to fishing quotas being exceeded and excessive fleet capacity.

Black Sea

The Black Sea is a deep water depression. Due to the relatively high salinity and density of the water, the ocean bed to surface currents are highly reduced and result in a naturally anoxic (without oxygen) environment, which also has high levels of hydrogen sulphide. Its almost landlocked position, the major influx of fresh waters from its tributary rivers, such as the Danube and Dnjeper, and hydrological factors make this sea a very unique environment and highly sensitive to anthropogenic impacts.

Species
Dolphin *(Tursiops truncatus)*

Habitats
Estuaries (1130)

Threats
The Black Sea is probably one of the most environmentally degraded seas on our planet. Pollution and eutrophication by land-based sources (agriculture, industrial activity and inputs of insufficiently treated sewage), overexploitation and no overall management of fish stocks are the main threats that the Black sea faces.

The annexes to the Habitats and Birds Directives list nine habitat types, 29 seabirds and 16 other marine animals in need of protection in view of their precarious conservation state. These include such well known species as the Mediterranean monk seal, the loggerhead sea turtle, and the bottlenose dolphin, as well as rare habitats such as cold water reefs and *Posidonia* beds (underwater prairies).

Marine environnent natural habitat types in Annex I of the Habitats Directive (92/43/EEC)

- Sandbanks which are slightly covered by sea water all the time - 1110
- *Posidonia* beds *(Posidonion oceanicae)* - 1120*
- Estuaries - 1130
- Mudflats and sandflats not covered by seawater at low tide - 1140
- Coastal lagoons - 1150*
- Large shallow inlets and bays - 1160
- Reefs - 1170
- Submarine structures made by leaking gases - 1180
- Submerged or partially submerged sea caves - 8330

Marine environment species in Annex II of the Habitats Directive (92/43/EEC)

> Sea Mammals
- *Tursiops truncatus*
- *Phocoena phocoena*
- *Halichoerus grypus*
- *Phoca vitulina*
- *Monachus monachus**
- *Phoca hispida* subsp. *bottnica*
- *Phoca hispida* subsp. *saimensis**

> Sea turtles
- *Caretta caretta**
- *Chelonia mydas**

LIFE in action

France: Rescuing Mediterranean *Posidonia* beds from invasive algae *Caulerpa taxifolia*

A growing menace to some of Europe's unique marine habitats lies under the blue waters of the Mediterranean. *Caulerpa taxifolia*, an invasive green algae, is quickly destroying high bio-diversity *Posidonia* beds. In 20 years, the ecological integrity of more than 15,000 hectares of sea-bed has been compromised. The LIFE programme funded two projects to monitor the spread of the invasive species in the Mediterranean, and to establish guidelines and approaches to help manage it.

Despite its beauty Caulerpa taxifolia *is an invasive species*

Posidonia seagrass beds[1] are an important part of the Mediterranean sea's marine ecosystem. The beds are mainly comprised of the seagrass *Posidonia oceanica*. Human pressure on this habitat has increased significantly in the last few years, resulting in a reduction of the surface area of the seagrass beds. The principal cause of this decline is a Caribbean green algae that competes with the seagrass. This non-native species, *Caulerpa taxifolia*, was introduced in 1984. As well as its impact on biodiversity, it also threatens food resources, and can pose a risk to human health because of transmission of the algae´s toxins along the food-chain. As a consequence of this coastal fishing for fish, molluscs and crustaceans, has become impossible in some areas.

1 A priority conservation habitat classified under Annex I of the Habitats Directive.

What did LIFE do?

Between 1992 and 1999, the LIFE programme funded two projects (LIFE92 ENV/F/000066 and LIFE95 ENV/F/000782), led by Marseilles University and with the involvement of Spanish and Italian partners (universities, local authorities and scientific centres). These projects aimed to build knowledge about the ecology of *C.taxifolia* in

order to predict its possible spread in the Mediterranean, and to establish a scientific and technological basis for its management and thus the conservation of the *Posidonia* beds.

The projects deoped a strategy and tools for surveying *C.taxifolia* and monitoring its expansion into new locations. In order to conduct the survey, the beneficiary distributed 60,000 pamphlets in six languages to fishermen, divers and yachtsmen, asking them to report the presence of the plant and, when found in nets and on anchors, not to throw it back into the sea. With this information it was possible to build a predictive model of the algae's expansion, and thus identify 'at-risk' areas and habitats. The projects also worked to improve eradication techniques using copper, as an alternative to manual eradication.

The beneficiary produced identification and eradication guidelines in English, French, Catalan and Spanish, and conducted a public awareness campaign that was also extended to southern Mediterranean countries (Malta, Tunisia and Algeria), which are also affected by the spread of *C. taxifolia*.

What was the outcome?

As a result of the LIFE projects, *Caulerpa taxifolia* is a very well known, introduced species. Unfortunately, the project has also confirmed that once the algae is introduced, it cannot be completely eradicated. Nevertheless, a Mediterranean detection and survey network has been developed, and strategic guidelines for the control of the invasive algae have been implemented. The projects have also carried out stakeholder and public awareness campaigns.

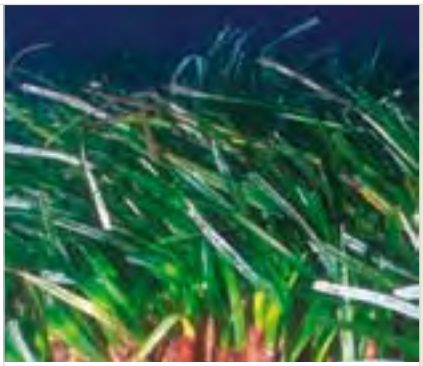

Photo: LIFE00 NAT/E/007303

Posidonia oceanica *beds an endangered Mediterranean habitat*

Life after LIFE

Following the formal closure of the projects, the regional governments of the Balearics, Catalonia and Valencia drew up anti-Caulerpa regulations. In France, the Parliament is examining an anti-*Caulerpa taxifolia* law. Also, on the Côte d'Azur, diving enthusiasts, both amateur and professional, perform annual systematic underwater searches, and manually clear *Caulerpa taxifolia*.

Posidonia oceanica

Posidonia oceanica, named after Poseidon, the god of the sea, and commonly called Neptune grass, is a seagrass that plays an important role in the ecosystem of the Mediterranean sea by providing a vital habitat for a wide variety of marine species. It lives in a narrow coastal strip, normally on beds of soft sediment, at depths of between five and 50 metres, depending on water clarity. It is a true plant, in that it can bear flowers and disperse seeds.
The *Posidonia* habitats are increasingly being destroyed by human activities (trawler-fishing, the development of new marinas and offshore constructions, and boat anchoring). However, one of the greatest threats comes from competition with the invasive *Caulerpa taxifolia*.
The European Environment Agency's 2006 report "Priority Issues in the Mediterranean Environment", considered the *Posidonia oceanica* "a key species for the Mediterranean region".

Greece: Recovery of the loggerhead sea turtle population on Crete

The loggerhead turtle *(Caretta caretta)* is an endangered species in Europe. It is threatened on land, where it comes to nest, and at sea, as a result of the activities of fishermen. One of several LIFE-funded projects to protect the loggerhead turtle focused on increasing, in the long term, the numbers that nest on the island of Crete. Volunteer monitoring patrols were established, and public-awareness campaigns were introduced to encourage local involvement in the protection of the sites used as nesting areas. In addition, a management plan was drawn up to ensure the long term viability of these sites. Crete can play a crucial role in the survival of the loggerhead turtle. One in four of the total population of Greece nests on the island, and the turtle returns to the same nesting sites year after year.

The use of the same nesting sites means that the survival of sea turtles is dependent on the viability of the beaches for nesting. If a nesting site is destroyed, the female may not find an alternative and eventually the local population could be wiped out through lack of recruitment. However, the sandy beaches of Greece have attracted tourists, which have caused severe degradation of the sites. Beaches have natural protection against erosion in the form of sand replenishing dunes, but constructions on the dunes can affect this process and leave beaches vulnerable. Umbrellas and sunbeds, pathways and light pollution pose an increasing threat to the nesting sites of the turtles. They impede access to the back of the beach where nests are constructed, while artificial light disorientates newly hatched turtles that use reflected moon or starlight to navigate their way to the sea.

As a result, a strategy for sustainable development of tourism and other forms of land use is vital for the protection of the beaches.

The LIFE programme in Crete aimed to tackle these problems through the protection of nesting sites, public-awareness campaigns and the implementation of a management plan for sustainability. The beneficiary was the Sea Turtle Protection Society (STPS), which was set up in 1983 to lobby for the protection of sea turtles initially on the island of Zakynthos, as well as raising awareness among the public about the threats they face. Six years after its formation, as a result of a nationwide beach survey of Greece, the STPS identified important nesting sites for loggerhead sea turtles on the island of Crete and began small-scale initiatives in these areas.

Caretta caretta *a priority species listed in Annex II of the Habitats Directive*

Unlike Zakynthos, the density of turtle nests on Crete is relatively low and the population could only be sustainable provided certain conditions are respected. Islanders, however, were largely ignorant of the sea turtles existence, so raising awareness was a key first step. Public funding for the

necessary protection of the three principal beaches was insufficient. Therefore in 1995, STPS applied to LIFE-Nature for funds.

What did LIFE do?

LIFE funding supported the daily patrol of the beaches to assess the number of nests dug and, later in the season, the number of hatchings. The patrol also included protection measures such as placing metal cages in situ to avoid human disturbances, and shading to prevent hatchling disorientation through light pollution. The beaches of Crete are prone to high seas due to strong northerly winds. As there is a danger of nests being destroyed by flooding, vulnerable nests were relocated higher up the beach, or at one of the natural hatcheries away from the danger. A major campaign was launched to persuade hotel and sunbed operators to stack their chairs each night at the back of the beach. Similar campaigns were run to reduce light pollution, and curb the use of vehicles on the beaches.

An awareness campaign was launched that targeted local authorities, businesses, hotels, tourists, and schools. It consisted of the distribution of printed material, presentations at hotels, meetings with local businesses, talks and projects with schoolchildren and the setting up of information kiosks. The public was also informed of the beach work. Finally, a management plan for the long-term conservation of the sea turtle in Crete was agreed and circulated widely for consultation. The final version was presented to the local authorities for adoption at the end of the project.

What was the outcome?

Over the three years of the project, STPS attracted a large number of volunteers to monitor the three beaches and protect nests. At the end of the third year, hatchling rate had already increased.

Attempts to persuade hoteliers to voluntarily stack sunbeds were only partly successful, and focus has now

Municipality of Platanias information board

Marking and protection of turtles' nests

Painting the street lights facing the sea

shifted towards achieving stacking of sunbeds through regulations determined by the relevant authorities. Similar regulations would also be helpful in reducing the effects of artificial light. However, 25 operators were persuaded to make changes to their lightings for the benefit of the nesting sites, and project members painted the sides of lights facing the sea to reduce artificial light on the beach.

The project was also successful in persuading those responsible for municipal beach-cleaning activities to take into account the needs of the turtles, that is, not compacting the sand with heavy machinery. Its awareness initiatives included around 300 hotel presentations per year, reaching an estimated quarter of a million visitors over the three years. Press releases also generated wide media coverage.

Life after LIFE

The end of the project has by no means signalled an end to the volunteer work. In fact, volunteer numbers have almost doubled. With a sufficient workforce, STPS has been able to continue its monitoring and protection work on the three beaches.

Under the LIFE project vulnerable nests were commonly transferred to hatcheries, but following international consultation, nests are now transferred as close as possible to the original location of the nest. However, STPS realised that too little was known about the potentially damaging effects of these transfers, and noted that 35-40% of the nests laid on the monitored sites need to be transferred or they would otherwise be destroyed through inundation.

The STPS has also been the beneficiary of two subsequent LIFE programmes: the implementation of a management plan for the sea turtles in Southern Kyparissia Bay (LIFE98NAT/GR/5262) and a project to reduce turtle mortality at sea (LIFE02NAT/GR/8500).

Coast guards take an injured turtle to ARCHELON's centre

Conclusions

The LIFE project has played a vital role in the survival of the loggerhead turtle on Crete. It has helped establish the beneficiary as a powerful advocate for the species on the island and has enabled it to protect nest sites. The profile of the species has also risen locally and internationally, and a strong emphasis on cooperation has shown that sea turtles and tourism can exist side by side.

A strategic long-term approach to conservation is still required, however, and it is important that national and local authorities are engaged. Legal obligations to protect beaches point the way forward, and STPS can be an effective lobbying agency in bringing these about.

Conserving marine life in Spanish waters

Spanish waters off the coast of Andalusia and Murcia are home to many protected habitats that contain endangered marine life including turtles and cetaceans. A 2002 LIFE project aimed to draw up management plans for habitats in the area in collaboration with local stakeholders.

A recent LIFE project in the marine areas around the southern coast of Spain concentrated on developing marine management plans in collaboration with local stakeholders. The range of stakeholders with an interest in marine environments tends to be both diverse and uncoordinated. Moreover, few interest groups have previous experience of marine conservation issues. As a result, any attempt to change existing practices or attitudes is best accompanied by a targeted campaign to inform stakeholders of the issues and the potential impacts for them.

Such an approach was very successful for the southern coast of Spain. Previously the beneficiary, the Spanish Cetacean Society, had identified several potential marine Natura 2000 sites along the narrow sea that links the Mediterranean to the Atlantic. The project organisers recognised that attempts to protect these sites would be met with great resistance from local interest groups that would feel their livelihoods unjustly threatened. The project therefore launched a major awareness-raising campaign targeted at potential stakeholder groups along the coast. The aim was to explain why the rich seas around Andalusia and Murcia needed protection and to engage the different interest groups in discussions about the best ways to conserve this natural resource, while respecting the needs of local communities.

Atlantic spotted dolphins (Stenella frontalis) *surface breathing*

In 2002, three boats travelled to 19 ports on the coast to deliver talks and hold events, excursions and other awareness-raising activities aimed at local stakeholders. A follow-up trip, a year later, took the process one step further and engaged local stakeholders in discussing the protection of these valuable resources, especially in areas where there are potential conflicts with existing human activities.

The final trip aimed to reach a consensus on draft management plans for the areas that were prepared on the basis of the extensive consultation process. In addition to the general information campaign activities, formal meetings were held with stakeholder groups at strategic locations along the coast to take the process forward.

So far signs are encouraging. The discussions are being held in a spirit of cooperation and constructive dialogue. Stakeholders are now aware of the important issues, meaning they can concentrate on finding practical solutions in specific areas of conflict

Figurehead of the project boat Toftewaag

Project boat, Toftewaag*, in Almería harbour*

without questioning the whole concept of marine protection.

Although objections to the designations cannot be ruled out, the inclusive nature of the preparatory work should facilitate local acceptance of potential restrictions to activities. Threats addressed include poor fishing practices (especially harmful to turtles), illegal fishing, noise and marine pollution. Where restrictions are likely, the project will encourage new economic ventures such as whale watching.

Reducing by-catch and pollution

To help the management planning process further, the project is also undertaking a number of practical actions relating to fisheries by-catch and marine pollution. Through its partners, the Ministry of Fisheries and the Spanish Oceanographic Institute, satellite tracking is being used to determine the movements of turtles through this narrow sea passage and to correlate this with information on water temperature and long-line fishing operations. The results are expected to highlight the areas of greatest conflict in order that they may be specifically addressed. Already it is clear that swordfish and red tuna long lines are the most problematic.

The project is also tackling the problem of marine rubbish. Not only is this unsightly, but it also causes problems for many marine animals. For example, turtles sometimes ingest plastic bags and bottles thinking it is food and birds can get caught up in plastic material and drown. Working with local fishermen and port authorities, the project installed dustbins on all main fishing harbours and on 25 fishing vessels. This was accompanied by an awareness-raising campaign. Numerous spent lightbulbs, used during night fishing and then simply discarded overboard, have already been safely disposed of.

Building on experience

Several LIFE-Nature projects have already been coordinated by the Spanish Cetacean Society, and the regional government of the Canaries. The first conservation project for the protection of turtles and dolphins in the Canary Islands began in 1997. In cooperation with the regional government and the Society for the Study of Cetaceans in the Canary Archipelago, it identified the key marine sites and regulated activities adversely affecting them.

Surveys showed that waters surrounding the Canaries contain some of the most densely populated areas for bottlenose dolphins in the EU. Several new sites were identified to be of key importance to the species. As a result, boundaries of existing Natura 2000 marine sites were adjusted and the standard datasheets updated to reflect the presence of dolphins in the existing marine sites.

The project also addressed the issue of whale watching which is becoming a major industry in the Canaries bringing in over € 30 million a year. After studying the biological and socioeconomic aspects of the industry, the project developed a series of measures to regulate whale watching activities in order to ensure they do not unduly disturb the mammals. By the end of the project a new law had been passed which tightened up the regulations for operating a whale watching business.

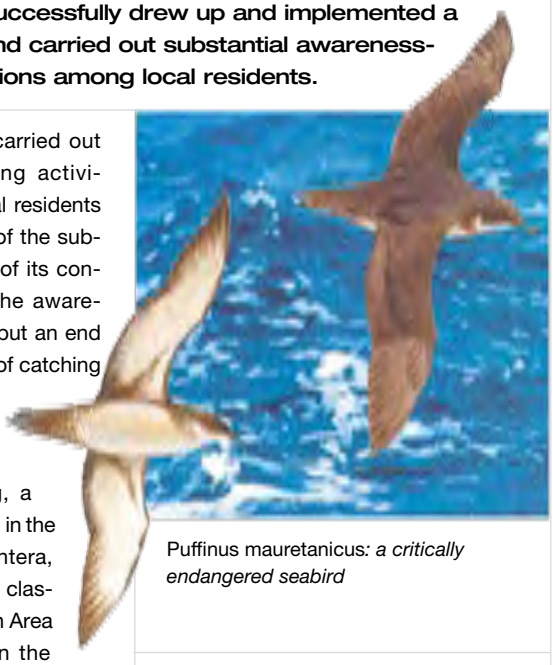
LIFE in action

Spain: Recovery plan for the Balearic shearwater *Puffinus mauretanicus*



The LIFE-Nature "Puffinus" project carried out detailed monitoring of Balearic shearwater *(Puffinus mauretanicus)* colonies – providing valuable information on numbers, biology and behaviour of this critically endangered seabird species. The project also successfully drew up and implemented a plan to control predation and combat theft from nests, and carried out substantial awareness-raising activities to increase support for conservation actions among local residents.

The Balearic shearwater *(Puffinus mauretanicus)* is a critically endangered species endemic to the Balearic Islands. After spending autumn along the French Atlantic, the shearwater returns to the Mediterranean in November to mate and nest. The seabird nests in burrows or caves in the cliffs along the northern coasts of the archipelago. The main threats affecting the species on the islands are predation by rats and introduced mammals, and competition for burrows with rabbits. Even in recent times, locals have made use of the bird as a food source. As a consequence, a decline of its population has been observed since the mid-20th century and some nesting colonies have even disappeared altogether from the Balearic Islands. At present, 70% of the total breeding population is found on the island of Formentera.

What did LIFE do?

The project was implemented by the regional governing body for the Balearic Islands (Conselleria de Medio Ambiente). Its aim was to implement the Balearic shearwater *(Puffinus p. mauretanicus)* Action Plan within the Special Protection Areas designated in the Balearic Islands. Its overall objective was to ensure the viability of existing colonies, as well as to increase the numbers of their colonies and the subspecies' distribution range. The project also carried out various awareness-raising activities aimed at making local residents aware of the importance of the subspecies and of the value of its conservation. In particular, the awareness campaign aimed to put an end to the traditional practice of catching the birds for food.

In order to meet these objectives, Can Marroig, a 130-hectare estate located in the northern coast of Formentera, was purchased. This area, classified as a Strict Protection Area has been incorporated in the Natural Park of Ses Salines of Ibiza and Formentera.

Puffinus mauretanicus*: a critically endangered seabird*

Life after LIFE

The main legacy of the project is the monitoring of shearwater numbers. This work has included population counts, which will be continued on a regular basis. It is difficult to determine whether the population in the islands has increased or decreased since the beginning of the project. However, it is clear that the situation remains critical, and the biggest colonies have already been lost in Formentera. The monitoring work will be supported by surveys of other species in the area. Measures to control cats and rats are also planned. The LIFE project has played a vital role in increasing the knowledge of the ecology and distribution of the species.

LIFE in action

Restoring terns and petrels colonies on the islands of Brittany

Populations of terns in Brittany are declining and endangered. As a result of changes to their habitats, successful breeding has become more difficult and the threat of predators greater. A LIFE project aimed to improve breeding conditions for the threatened bird species.

The huge number of islets off the coast of Brittany are rich in rare wildlife. Many of the coast's marine habitats are listed for special protection under the Habitats Directive and are home to the nesting sites of several species of tern, including the rare Roseate tern *(Sterna dougalii)*, and petrels *(Hydrobates pelagicus)*. Despite enjoying legal protection, however, the island habitats are threatened by environmental changes, mounting human pressures and introduced species such as rats and rabbits. The biodiversity of the region is further affected by the increasing presence of herring gulls *(Larus argentatus)* and people.

Photo: Arnaud Le Nevé, Bretagne Vivante - SEPNB

Young Roseate tern (above)
Project awareness campaign leaflet (left)

The LIFE project aimed to promote the preservation of Brittany's marine areas through pilot conservation measures on five groups of islets. The first and largest group, Trégor-Goèlo, contains 80 islets ranging in size from 0.1 to 18.8 hectares. The Natura 2000 management plan had already been adopted in this group, and the project aimed to assess its success, in addition to a series of activities including securing management contracts, cleaning up and regulating access to the inter-tidal zone, and the restoration of a lagoon.

The second group was made up of privately owned islets. For this group, the project aimed to draw up conservation contracts with landowners. On Béniguet Island, the third area, the focus was on habitat restoration, while the fourth and fifth groups targeted specific measures for terns and petrels. On three of the groups, the most visited islets, people's movements were analysed as a basis for possible future management. Increasing public awareness and safeguarding nesting sites would lead to an improved chance of successful breeding.

SEPNB and construction of nest shelters for terns

Surveying and preserving

On Trégor-Goèlo, the project raised awareness of the importance of preserving the biodiversity of the tidal zone, particularly through good fishing practices. To support this goal, an educational kit containing different tools, including an aquarium, a CD-ROM, a video and models was created. The awareness-raising campaign was continued after the end of the LIFE project. However, only one agreement with an island owner for the management of land was signed. (The other owners were unwilling to accept the terms of the proposed conservation contracts.) Nevertheless, natural heritage inventories of 10 private islands were drawn up. These reports, called *bilan patrimonial*, were often the first surveys to have been made of the small islands and contain vital information for their ecological management.

New equipment including a boat helped improve the quality of the surveillance of the four species of tern that breed on the Brittany islands. In order to make their breeding sites more secure, it was necessary to control the populations of gulls and invasive species such as American mink *(Mustela vison)* and rats. Vegetation was also cut back before the breeding season to maintain favourable conditions for the terns. For three species – the sandwich tern, the common tern and the little tern – results were positive: the project achieved an overall increase in their populations. The threatened population of the fourth species, the Roseate tern, remains stable. The colony in Brittany is the only one in France and is still endangered due its small size (about 70-80 pairs on a small island).

Restoring habitats

Artificial nest burrows for the storm petrel were tested in the Sept-Iles and Molène archipelagos. The results were encouraging in the Molène natural reserve at the start of the bird colonisation. Agricultural activity on Béniguet Island has been largely abandoned leading to an expansion of wasteland to the detriment of natural habitats. Thanks to the tractor bought by the project, it was possible to restore dune grassland by mowing bracken *(Pteridium aquilinum)*. Poor diet has resulted in the low breeding success of terns on the island in the past.

Finally, the project organised a three-day workshop on Island Management in Ouessant and Molène in February 2001. More than a hundred participants attended this symposium, which brought together scientists, stakeholders, managers, NGOs, and Balearic and Scottish experts.

Recovering the Audouin's Gull population in Spain

While numbers of Audouin's Gull have increased slightly in recent years, this native Mediterranean bird is threatened by rival species and the scarcity of nesting sites. A LIFE project was set up on a Spanish island to monitor populations of the gull and draw up a recovery plan.

The project took place on Isla Grosa, a Natura 2000 site off the southeast coast of Spain that hosts a colony of 900 pairs of Audouin's Gull *(Larus audouinii)*. Ninety percent of the world's population of the species can be found in the EU, though they migrate south in the winter, particular to the Atlantic coast of Africa.

The fish-eating birds feed on waste from fishing boats and compete with the yellow-legged gull *(Larus cachinnans)* for that. The species is also threatened as a result of the lack of suitable nesting sites and its concentration in just a few locations.

To combat these threats, a LIFE project was set up with the Ministry of Environment, Water and Agriculture of the region of Murcia, in particular, the Directorate General for Nature Conservation, which is responsible for species and habitats conservation at the regional level. The project's activities were coordinated with the regional administrations of Catalonia and Valencia, which are also conducting LIFE projects on the species.

The Murcia project restored an abandoned military installation to use as a surveillance and research centre. It also sought to control competitor species, in particular the yellow-legged gull *(Larus cachinnans)*. Restoration of the Audouin's Gull population was also attempted by encouraging the species to breed. This was done by creating artificial nests and using artificial calls. The same methods were used to enhance the breeding of the European storm petrel *(Hidrobates pelagicus)*.

Audouin's Gull (Larus audouinii)*: 90% of the world's population can be found in the EU*

This ongoing project features a widespread public information campaign, and the recovery plan for the species on the island, based on the results of the monitoring programme, will be approved during the project.

Ensuring prudent utilisation of marine goods and services

Many Natura 2000 marine sites are also economically important. Activities such as transport, tourism and temporarily fishing, or constantly impact on the marine environment. Many LIFE-Nature projects have established management plans and national action plans for marine species and sites. The development of these plans is complex and delicate, involving a wide range of interests. Moreover, many stakeholders had limited previous management experience and incomplete base-line information on the marine environment. The projects helped to change practices and attitudes through awareness-raising campaigns and demonstration activities that fulfil both Natura 2000 conservation requirements and socio-economic objectives. These goals included the regulatory control of financial activities, incentive schemes for implementing appropriate management practices, limiting of activities to defined zones, and establishing sustainability objectives.

LIFE in action

Threatened Cetaceans: Aiding the recovery of Black Sea dolphins

The overwhelming majority of stranded dolphins on the Romanian Black Sea coast were found to have been caught up in gillnets, and either drowned or died from their injuries after escaping. A LIFE-Nature project reduced the number of dolphin fatalities and addressed the problems of habitat loss and degradation, and the depletion of food resources. The success of this project was mostly due to intensive awareness-raising campaigns that targeted local fishermen, tourists and schoolchildren. Some of the project's actions have served as a model for other dolphin programmes in the Black Sea.

Three dolphin species live in the Romanian Black Sea waters: the harbour porpoise (*Phocoena phocoena*, between 400-600 individuals), the bottle-nosed dolphin *(Tursiops truncatus*, 500-1,000 individuals) and the common dolphin (*Delphinus delphis*, 600-800 individuals). Today's population in the Black Sea is estimated to be a mere 4% of what it once was. After a period of killing for soap production between the1930s and the early 1980s, a hunting ban was declared (in 1966 in the former USSR, Bulgaria and Romania; and in 1983 in Turkey). In spite of the ban, stocks continued to decline, primarily due to dolphins getting caught in large fishing nets.

Urban development and industrialisation along the coast have also taken a toll. Pollution and over-fishing have resulted in the destruction of fish nurseries and the accumulation of toxic compounds in the cetaceans. Habitat degradation and maritime traffic is also affecting the dolphins. These threats have raised the level of stress and incidence of disease among Black Sea dolphins.

Romania has signed up to several international agreements to undertake measures for improving the conservation status of cetaceans in the Romanian Black Sea. The LIFE-Nature project, however, proposed a national action plan for dolphin conservation. The project was implemented by the National Institute for Marine Research and Development in collaboration with the NGO, Mare Nostrum, and Dolphinarium Constanta.

A group of Black Sea bottlenose dolphins (Tursiops truncatus)

LIFE funding made possible the implementation of an ambitious conservation project that also led to the creation of the first protected marine site on the Romanian coast. (The site now extends across the border to Bulgaria.)

What did LIFE do?

The main goal of the project was to develop the technical and legal bases for conservation of the three endangered dolphin species in the Romanian Black Sea. It aimed to find out more about the accidental catching of dolphins and to impose restrictions on fishing methods known to have adverse impacts on them. The project also prepared and adopted a national action plan, proposing measures for the conservation of the habitat, including the designation of new marine reserves.

What was the outcome?

Knowledge about the Black Sea dolphin populations has greatly increased as a result of the project. Years after the project, dolphin sightings, strandings and unintended captures continue to be systematically recorded. Furthermore, the project cooperated with a leading oil company to obtain data on population distributions and conducted a survey on the adverse impact of marine and land-based economic activities. A marine database was created that allows dolphin scientists to monitor the effects of management plans. Initial results show that the decline of the dolphin populations has stopped.

Cooperation was found to be important. The support of ACCOBAMS (Agreement on the Conservation of Cetaceans of the Black Sea, Mediterranean Sea and contiguous Atlantic Area) and international experts[1] as well as the cooperation of the main stakeholders and authorities involved in dolphin conservation, made possible the adoption of a national action plan for dolphin conservation. The action plan has served as a valuable model for Bulgarian waters and the Mediterranean. Moreover, a suitable monitoring system has been designed and implemented to assess the change in cetacean populations and their habitats in this marine area.

Little was known about the Black Sea's fish stocks, and it was important to make an assessment of the main fish species that make up the dolphins' diet. Data collected can also be used to mitigate the effects of possible over-fishing in the Black Sea. Romanian fishermen do not see dolphins as serious competitors in their fishing areas. Dolphin by-catch happens mostly incidentally and creates financial losses, and fishermen are legally obliged to notify the authorities of each caught dolphin. The same authorities are responsible for issuing fishing licences and fishing associations receive a small grant for valuable information about stranded dolphins.

Surveys conducted as part of the project have identified the best areas for dolphin protection in the Romanian littoral zone. These have helped flesh out a management plan for one of the priority areas, the Danube Delta Biosphere Reserve. Together with the Ministry of Environment, the beneficiary is implementing measures for considerably reducing fishing pressure in this reserve. Two key measures were the suspension of fishing licences for the 1,200 km^2 Danube Delta marine area; and the reduction of the diameter of existing gillnets to reduce the risk of dolphins being caught in the nets.

The second priority area is the marine reserve of Vama Veche - 2 Mai, which the LIFE beneficiary was authorised to manage. Actions included the removal of fishing gear in the reserve area and the cross-border matching extension of the reserve into Bulgarian waters.

Key to the success of the project is the support of the public, and numerous awareness-raising activities were held with the participation of local institutions (the dolphinarium, schools, children's clubs, etc.). During the project, a dolphin week was organised every year featuring exhibitions, theatre performances, and drawing contests, among other activities. Moreover, the project widely publicised its activities through the mass media, including TV broadcasts on several channels, and the production of eye-catching communications.

Dead dolphins as a result of illegal fishing

The project also presented its results at scientific meetings in the Black Sea region and in scientific publications. In addition, scientists from the neighbouring countries Bulgaria, Turkey and Ukraine, in cooperation with the ACCOBAMS secretariat, were trained in dolphin protection.

Around 50 people cooperated with the project on a voluntary basis: students, border police and even the Romanian navy were trained by the NGO, Mare Nostrum, in monitoring stranded dolphins on beaches. Fishermen, meanwhile, are registering the dolphin by-catches. Young people have been especially positive towards dolphin protection, and local stakeholders (fishermen, sailors, frontier policemen) have changed their attitudes towards environmental protection.

Dolphin awareness-raising campaign logo

1 ACCOBAMS website: http://www.accobams.mc/

Stranded dolphins on a Black Sea beach

Analysing the impact of fishing gear on dolphins and stock assessments of the main migrating fish species are now common exercises, which the project plans to intensify in the future. In cooperation with Turkey, several marine resource management and conservation measures have been implemented on the south coast of the Black Sea. International cooperation on projects has the added benefit of prompting local authorities in Romania to intensify their nature protection efforts.

A model project

One of the main achievements of the project has been to include relevant national and international stakeholders in drawing up and implementing a national action plan for dolphins. The project has promoted a consensus about the protection and suitable management of these species in the Romanian Black Sea among scientists, nature conservationists, authorities, fishermen and international organisations. Such a consensus is quite an achievement for Romania, which had little experience of the management of marine species and areas before the LIFE project.

Life after LIFE

LIFE has given an enormous boost to dolphin protection in Romanian waters, but they are still far from being entirely dolphin-friendly. The beneficiary was aware that the work of the three-year EU-funded project needed to continue. Along with the project partners, it has managed to maintain the high profile of dolphin protection along the Black Sea coast.

Monitoring the incidental catches of dolphins and strandings continues, along with the surveys and behaviour observations at sea. The school projects in Constanta are also ongoing, as is the yearly dolphin week. Scientific studies are still urgently needed in several areas, including fishing gear management and acoustic deterrents (which are believed to disturb dolphins' orientation).

Furthermore, both marine areas, as well as almost 50% of the Romanian Black Sea coastline, have been included in the Natura 2000 site nomination process. It is also proposed that the marine reserve, Vama-Veche - 2 Mai, should be included in this list along with the other priority area for dolphin protection, the Danube Delta biosphere reserve (marine zone). Such measures ensure that Romania meets the EU's target for designating Special Conservation Areas that assure the protection and conservation of the three dolphin species included in the Habitats Directive.

The future

Future measures include the creation of a tissue bank for aiding research into the causes of diseases affecting the dolphin population and closer monitoring of Black Sea pollution. In addition, the introduction of a dolphin-safe label should popularise dolphin-friendly fishing products. Surveys on pollutant sources from the Romanian coast that have harmful effects on dolphins and studies on the incidence of diseases will also be carried out.

LIFE in action

Greece: Protecting the endangered monk seal in fishing areas

The Mediterranean monk seal *(Monachus monachus)* is one of the most endangered marine mammals in the world. The main threats come from accidental or deliberate killing by fishermen, reduction in food sources (mainly because of over-fishing), human disturbance, and the deterioration and destruction of their habitats. Greece has a special responsibility for this species, as its waters host the largest European populations (200-250 individuals). One of three LIFE projects to protect the monk seal focused on the study and protection of the species at two Natura 2000 sites. Surveillance with regular boat patrols was central to the success of the project. It highlighted the effect of tourist boats and amateur fishing boats in one area. Surveillance findings helped secure funding for a follow-up LIFE project that aims to mitigate the conflicts between protecting the seals and the fisheries sector.

What did LIFE do?

Over the past nine years, the project beneficiary, the Hellenic Society for the study and protection of the monk seal (MOm) in Greece, has run three consecutive LIFE-Nature projects concerned with the monk seal. The first project in 1996 (LIFE96 NAT/GR/003225) set out to discover more about the species' distribution.

Awareness-raising campaign

The monk seal - one of the most endangered marine animals in the world

Photos: P.Dendrinos/MOm

Having helped to establish a network of protected sites for the seals in Greece under Natura 2000, the second project sought to implement some of the main actions proposed in the management plans on the islands of the Polyaigos-Kimolos and the Karpathos-Saria complex, which host around 40 and 20 seals respectively.

To achieve this objective, the beneficiary first established regular surveillance activities of the monk seal sites and caves; and secondly implemented a major awareness-raising programme aimed at fishermen, local inhabitants and tourists.

The project targeted in particular the problem of deliberate killings of seals by fishermen and illegal fishing. For decades, monk seals have been persecuted by local fishermen for stealing fish and damaging nets.

A dedicated team of local wardens was recruited at both of the Natura 2000 sites and provided training in surveillance techniques at the National Marine Park of Alonissos-Northern Sporades. The teams were responsible for implementing a protection scheme in cooperation with the port authorities. This involved collecting information on various aspects of the species' behaviour and monitoring illegal activities.

The teams talked to local people about the plight of the monk seal and built up support and acceptance for conservation. The awareness-raising campaign was supported by dissemination tools, such as a website and information leaflets, posters, stickers and newsletters. These were aimed at tourists, local authorities and, in particular, fishermen. Schoolchildren were

The impact of human activities was studied by the project

Preparing to monitor the monk seal populations

Dimitris an orphaned monk seal found in December 2003

targeted via a programme of environmental education, and the general public via information centres. The project team also worked closely with local, regional and national authorities in order to promote the two management plans.

What was the outcome?

The project made significant progress in implementing conservation measures at the two sites. By the end of the project, 32 seal pups had been born in the Kimolos-Polyaigos area – a breeding rate of eight pups per year had been achieved in the Natura 2000 site. According to the beneficiary, "It is the second highest number of pups ever recorded – in such a period – in a single area within the Mediterranean." Based on available data, the beneficiary estimated that the area contained at least 43 seals (not including the pups). The project also highlighted the potential threat to the marine environment posed by tourist boats and amateur fishing boats in the area of Kimolos.

For the Karpathos area, over the same four-year period, 19 newborn pups were recorded – an average birth rate of just under five pups per year. The beneficiary estimated that a minimum of 23 adult and juvenile seals inhabit the area.

The local element of the project was fundamental to its success. As well as aiding conservation, teams located on the ground helped to change local attitudes. Rather than viewing the monk seal as a threat, local people are now realising the potential of eco-tourism for the islands.

Conclusions

A third LIFE project (LIFE05 NAT/GR/000083) is building on the experience of the project by aiming to mitigate the conflicts between monk seals and fishermen in Greece. Seven hotspots will be selected in which the scale of the problem will be assessed and measures to combat it will be proposed. A monk seal fisheries action plan is expected to be adopted by 2009 that will cover the monk seal's range in Greece[1].

Building partnerships for the seas

Another key issue addressed by many LIFE-Nature projects concerns the interactions between fisheries and threatened marine habitats and species. Numerous surveys have shown the extent of the problem and the types of fishing practices that are most damaging in specific marine areas. This knowledge has been used to open a dialogue with the fishermen and authorities concerned.

LIFE in action

Portugal: Sustaining coastal and marine zones in the Azores

The coastal and maritime environments of the Azores archipelago boast a natural heritage of national and Community-wide importance. The Portuguese islands contain a range of important marine species and habitats. With the active support and participation of regional environment and fisheries' authorities, tourism operators and the local population – the MARÉ project was able to complete management plans for 12 Natura 2000 sites and to introduce key measures for the conservation of four marine species – including the priority loggerhead sea turtle *(Caretta caretta)*, the bottlenose dolphin *(Tursiops truncates)*, the Madeiran storm-petrel (*Oceanodroma castro)* and the Roseate tern *(Sterna dougallii)* seabirds.

Photo: IFAW

Sperm whales (Physeter macrocephalus) *in the Atlantic*

Over the past 20 years, an increase in human activities (fishing, tourism, scuba-diving etc.) has started to damage the marine species and habitats of the region's coastal and marine environments. Several measures to reduce this environmental damage were introduced during this period, including the legal protection of loggerhead seas turtles and bottle-nosed dolphins. But these measures did not address broader issues such as the management of activities already going on in nature reserves or the surveillance of these areas. The application of the Birds and Habitats Directives to the Azores had resulted in the designation of 31 proposed Natura 2000 sites.

What did LIFE do?

The four-year project sought to draw up a range of integrated measures for 12 of the 31 proposed sites, targeting the sustainability of fishing and tourism activities, including whale watching. The project was implemented by the project beneficiary, the University of the Azores, through its Department

Photos: ImagDOP©JFontes

Common dolphin (Delphinus delphis).

of Oceanography and Fisheries *(Universidade dos Açores - Dep. de Oceanografia e Pescas).*

When the project began there was little data on the impact of socio-economic activities on the targeted marine species notably on loggerhead sea turtles and bottlenose dolphins in the region. The first phase of the project was therefore dedicated to the collection of such data and included a marine species census. On the basis of this information management plans were drawn up and implemented in conjunction with local environment and fisheries authorities. They were adopted following public consultation.

Management actions were also developed for whale watching. These resulted in the adoption of a new regional regulation. Measures to be adopted by fishermen to reduce the amount of by-catch of sea turtles were also defined.

What was the outcome?

Management plans for 12 Natura 2000 sites were completed. An important achievement was the establishment of good cooperation between the scientific community and the tourism and fisheries' sectors. Awareness-raising activities were also successful both in the Azores and on mainland Portugal, as shown by the continuing high demand for the project's awareness-raising educational kit. This project involved the whole Azores community (fishermen, students, scientific community and local population) together with the economic agents (tourism operators) and the regional authorities responsible for the Natura 2000 coastal and marine sites management.

Life after LIFE

A post-project follow-up study of the project was carried out in March 2006 by the LIFE external monitoring team. It showed that a permanent warden post had been created. Moreover, four other people hired under the LIFE project are continuing to work on some of the actions initiated by LIFE but now funded by Interreg, the European Regional Development Fund, and the Portuguese Science and Technology Foundation.

Management plans are being drawn up for a further 18 Azores Natura 2000 sites. This task is now overseen by the regional authorities and financed through structural funds for the Azores region and also with an Interreg project with Spanish partners. Two other projects have been launched to continue research into biological and ecological aspects of cetaceans of the

Photos: ImagDOP©JFontes

Diver with pilot whales (Globicephala melaena)

Azores. These should prove useful in monitoring the effectiveness of the proposed actions and possibly in improving existing management measures. A test on turtle by-catch in long line fishing activities is still ongoing. So are the majority of the awareness-raising measures through schoolteachers and NGOs that were involved with the project, and also through a visitors' centre established during the LIFE phase and now managed by an NGO.

Conclusions

The project made a major contribution to the establishment of the Natura 2000 Network; its management plan preparation and implementation strategies can be used as a model for other important marine sites both in mainland Portugal and elsewhere in the EU.

LIFE in action

Bothnian Bay: Conserving through partnership

Human activities pose a threat to the marine environment of Bothnian Bay in the Baltic Sea. To meet this challenge, a LIFE project brought together various governmental bodies to develop a joint database for the exchange of information about the bay's water quality and to introduce a plan for the sustainable management of the area.

Located between Finland and Sweden, Bothnian Bay is the most northern basin of the Baltic Sea. The bay, which freezes over for several months of the year, is particularly vulnerable due to the scarcity of the species living in it, its arctic conditions and the shallowness of its waters (average depth 40 metres). Moreover, the bay is exposed to pollution from the local steel, pulp and paper industries as well as from sewage treatment plants. Perhaps even more importantly, the bay is affected by agricultural and forestry practices, peat mining, and to some extent construction work related to sea transport.

Tools for managing the sea area

Many different national and regional bodies monitor environmental conditions in the bay, and the beneficiary identified the need to pool various information sources. To achieve this, the project built up an extensive online database under the guidance of the beneficiary, the North Ostrobothnia Regional Environment Centre (NOREC) in Finland. The database features various indicators of water quality in the bay:

- Physical and chemical data from 62 observation points.
- Results of automatic water quality monitoring and samples collected by the system.
- Data on the material transport and water discharges of 31 rivers, and use of the land in their catchment area.
- Information about the 52 industrial plants and wastewater treatment plants, including annual loading data.
- Top ten lists for rivers, industries and wastewater treatment plants.

In addition to the database, the project also developed a web-based BAT (Best Available Technology) information exchange system for the metal industry and produced a versatile exhibition for dissemination purposes.

The project, which began at the end of 2001, also developed a model for estimating the impact of human actions in the coastal areas. The Bothnian Bay Water Quality and Ecosystem Model allows experts working in the area to assess the impact of loading on water quality. Assessments are made by calculating likely changes to the concentration of soluble nutrients and algae. Human activity has caused eutrophication (the addition of nutrients that promote the growth of algae) that disrupts the coastal ecosystems.

Photo: Anne Laine

Bothnian Bay: the most northern basin of the Baltic Sea

The project canvassed the views of a wide range of experts and stakeholders to produce an action plan for Bothnian Bay. The plan outlines targets and priorities for sustainable development and sets guidelines for monitoring and for status assessments. It also aims to meet EU and national environmental requirements and to improve information exchange and cooperation in the Bothnian Bay area. NOREC continues to cooperate with the project partners to implement the action plan and maintain databases.

Improving environmental quality of our seas

Despite the many conventions and measures taken at national and international levels, the environmental status of our seas is still not satisfactory and in some areas can be considered critical. However, there are also positive signs. The reinforcement of effluent limits, waste recycling, and alternative solutions for treating dangerous substances are on their way. Some legislation sets best practice standards, and LIFE can contribute substantially to the improvement of best available techniques and methods.

LIFE in action

Treating TBT-rich sediment from the Port of Antwerp

As one of the largest ports in the world, the Port of Antwerp is particularly affected by TBT-contamination from ship paints. A LIFE project attempted to remove affected sediments from Antwerp's harbours and to treat the material for eventual reuse.

The use of tributyltin (TBT) in ship paints has been banned in the EU since the beginning of 2003. TBT is a toxic biocide that was used since the 1970s to prevent the growth of algae, barnacles and other organisms on ships' hulls. The toxic substance, however, leaches from the paint into marine waters and eventually accumulates in sediments on the beds of harbours and ports. The removal of these sediments is vital to prevent TBT being reabsorbed into the water.

The project, which was carried out by the Antwerp Port Authority (Gemeentelijk Havenbedrijf Antwerpen), aimed to demonstrate an integrated approach to the elimination of TBT from the marine environment: prevention, removal, treatment and finally reuse. Specific objectives included the following:

- Assess the environmental impact of available alternatives for TBT.
- Evaluate the release of TBT from sediments into the aquatic environment during dredging operations.
- Test on a pilot-scale several treatment technologies for TBT contaminated sediments.
- Identify possibilities for the reuse of treated sediments.

The port teamed up with the Environmental Research Centre (ERC) in Hofstade, (Aalst) to carry out the chemical analyses and perform lab-scale feasibility experiments for the different sediment and water remediation techniques.

Dredging craft in the port of Antwerp

Five-point plan

The project was expected to produce a list of environmentally friendly alternatives to TBT in anti-fouling (that is, the prevention of growth of organisms) systems. It was also expected to determine limits and best practice for dredging operations in order to minimise the release of TBT from sediments. To achieve its aims, the project focused on five main action areas:

1) The drawing up of a questionnaire on alternatives for TBT to be sent to interested parties in the EU including coating producers, ship-repair yards, ship-owners etc. From the answers received, the project would be able to assess the impact of the alternatives based on their characteristics, active compounds, methods of application, energy use, waste generation and ease of maintenance.

2) Simulation of dredging operations on a pilot-scale and analysis of TBT concentrations in the aqueous phase. TBT concentrations would be correlated with turbidity measurements taken simultaneously.

Removal of TBT contaminated sediments

3) The dredging of about 2000 m^3 of TBT contaminated sediments form the Port of Antwerp and elsewhere in Flanders and its treatment in pilot-scale installations, on-site or off-site, using thermal treatment, bioremediation, washing and separation, phyto-remediation and electrochemical treatment. An evaluation of TBT removal rates for each technique was to be performed.
4) The construction of a pilot-scale treatment plant for the purification of TBT contaminated waters created during dredging or treatment operations. An evaluation of the removal efficiency of this plant for TBT was planned.
5) The reuse of cleaned sediments in landscaping, dike reinforcement and construction.

Results

While a standard practice for the reuse or application of sediment on land has yet to be reached, geotechnical and chemical requirements were developed. Chemical criteria were developed by the Flemish Institute for Technological Research (VITO) in accordance with Flemish legislation on reuse of soil and treated mineral waste for construction purposes.

The project provided a general framework for quantifying the effects of toxic materials that can be used in discussions with the Flemish authorities and for the development of European quality controls on the reuse of sediments.

Deposition of extracted sediments following TBT removal

Disseminating the project results and experiences

Some results of the project could also be used to formulate recommendations and restrictions on dredging activities. The project demonstrated that the amount of TBT released during dredging activities is mainly determined by conditions in the harbour (for example acidity, salinity and temperature).These environmental conditions are more important than the dredging technique.

The project also determined that dredging of highly contaminated sediments in the Port of Antwerp is best performed during the winter when the pH of the water is below 8.0. A new time schedule for dredging operations now dramatically reduces the release of TBT in the port. Such a recommendation could also apply to other ports.

Another important aspect of the project was the construction of a mechanical water extraction installation. The installation should be operational by the end of 2008 and will cost an estimated € 65 million.

The project worked in consultation with the Flemish government to carry out the mechanical extraction of water from dredged material and to develop acceptable TBT-concentrations in dewatered sludge and discharge limits for effluent water. Dumping sites in Antwerp are expensive and limited in number and size. However, prospects for the port are very encouraging. Once recycled, for example, sediments can now be reused for creating dikes and other constructions.

LIFE in action

OSIS: Improving oil-spill detection in the North Sea

Ships and offshore installations are the most common sources of more than 500,000 tonnes of oil that is spilt in the marine environment every year. The OSIS (Oil Spill Identification System), developed and tested with LIFE-Environment co-funding, is aiding identification of oil discharges from offshore installations in the North Sea. This permanently-mounted 'real-time' sensor – together with a new mobile sensor being adapted for ships in a follow-up LIFE project – will allow decision-makers to take corrective action rapidly.

New OSIS sensor on board Cunnar Seidenfaden

Every day large amounts of oil are deliberately pumped into the sea by ships along the coastline of Europe. Together with large oil spills, such pollution constitutes a major threat to the environment and places enormous demands on national authorities responsible for rapid response and clean-up operations. The 1992 OSPAR Convention[1] for the protection of the marine environment of the northeast Atlantic tackles this environmental threat.

Effectively controlling oil pollution has, however, proved difficult. Airborne surveillance systems currently used to control oil outlets are too expensive to be utilised efficiently against the large number of offshore

1 The OSPAR Convention http://www.ospar.org/eng/html/welcome.html, which entered into force in March 1998 and includes the participation of the EU, develops new programmes and measures required to identify, prioritise and monitor the emissions, discharges and losses of substances to the marine environment.

'Real-time' OSIS sensor at the front of an oil rig

installations. Along with ships, such installations are the most common sources for the more than 500,000 tons of oil spilt annually into the marine environment[2]. The lack of monitoring systems means that offshore installations have not yet been included in the strict OSPAR rules governing oil pollution in 'special areas' designated by the International Maritime Organisation (IMO).

OSPAR call for technologies

Peter Moeller-Jensen, project manager at OSIS International, a privately owned Danish SME says: "In the late 1990s, OSPAR called for technologies, such as OSIS to be developed so that they could enforce a new type of regulation in those special areas." The OSIS team thus sought to demonstrate a potential solution to this widespread problem of international concern by developing online remote monitoring of offshore installations in any location based on new sensor technology. The system would use a new generation of communication satellites and the internet.

The project has fully achieved its objective, posting impressive results from tests for the detection of spills surrounding oils rigs in the North Sea. Data gathered by OSIS is also transferred via satellite to onshore decision-makers and can be used in conjunction with a Geographical Information System (GIS). This provides further information about leaks and helps the planning of corrective actions. "This will enhance the information for decision-making concerning corrective action and also provide opportunities for efficient clean-up operations," says Mr Moeller-Jensen.

Conclusions

The OSIS technology, designed for fixed offshore structures such as oil platforms, is also proving attractive for maritime transport. A second LIFE project (LIFE04 ENV/DK/00076) launched in 2004 by the same beneficiary is currently adapting the fixed OSIS sensor and transmission system for ships.

The LIFE programme's online database features all LIFE projects since 1992, including LIFE-Nature projects specifically addressing marine environment issues. Many of the LIFE-Environment and LIFE-Third Country projects registered are also relevant to the marine environment.

Search the database by year, country or keyword, to find information and contact details of successful projects and good practices relevant to your work.

Available LIFE publications

LIFE-Focus brochures

A number of LIFE publications are available on the LIFE website:

LIFE and European forests (2006 - 68pp. ISBN 92-79-02255-5 - ISSN 1725-5619) *http://ec.europa.eu/environment/life/infoproducts/forests/forest_lr.pdf*

LIFE in the City – Innovative solutions for Europe's urban environment (2006, 64pp. - ISBN 92-79-02254-7 – ISSN 1725-5619) *http://ec.europa.eu/environment/life/infoproducts/urban/urban_lr.pdf*

Integrated management of Natura 2000 sites (2005 - 48 pp. – ISBN 92-79-00388-7) *http://ec.europa.eu/environment/life/infoproducts/managingnatura_highres.pdf*

LIFE, Natura 2000 and the military (2005 - 86 pp. – ISBN 92-894-9213-9 – ISSN 1725-5619) *http://ec.europa.eu/environment/life/infoproducts/lifeandmilitary_en.pdf*

LIFE for birds - 25 years of the Birds Directive: the contribution of LIFE-Nature projects (2004 - 48 pp. – ISBN 92-894-7452-1 – ISSN 1725-5619) *http://ec.europa.eu/environment/life/infoproducts/lifeforbirds_en.pdf*

The air we breathe - LIFE and the European Union clean air policy (2004 - 32 pp. – ISBN 92-894-7899-3 – ISSN 1725-5619) *http://ec.europa.eu/environment/life/infoproducts/focusair/lifeair_hr_en.pdf*

LIFE-Nature: communicating with stakeholders and the general public - Best practice examples for Natura 2000 (2004 - 72 pp. – ISBN 92-894-7898-5 – ISSN 1725-5619) *http://ec.europa.eu/environment/life/infoproducts/naturecommunicating_lowres_en.pdf*

A cleaner, greener Europe - LIFE and the European Union waste policy (2004 - 28 pp. – ISBN 92-894-6018-0 – ISSN 1725-5619) *http://ec.europa.eu/environment/life/infoproducts/lifewaste_en.pdf*

Alien species and nature conservation in the EU - The role of the LIFE programme (2004 - 56 pp. – ISBN 92-894-6022-9 – ISSN 1725-5619) *http://ec.europa.eu/environment/life/infoproducts/alienspecies_en.pdf*

Industrial pollution, European solutions: clean technologies - LIFE and the Directive on integrated pollution prevention and control (IPPC Directive) (2003 - 32 pp. – ISBN 92-894-6020-2 – ISSN 1725-5619) *http://ec.europa.eu/environment/life/infoproducts/cleantechnologies_en.pdf*

LIFE and agri-environment supporting Natura 2000 - Experience from the LIFE programme (2003 - 72 pp. – ISBN 92-894-6023-7 – ISSN N° 1725-5619) *http://ec.europa.eu/environment/life/infoproducts/agrienvironmentreport_en.pdf*

LIFE for Natura 2000 - 10 years implementing the regulation (2003 - 108 pp. – ISBN 92-894-4337-5) *http://ec.europa.eu/environment/life/infoproducts/lifepournatura2000_en.pdf*

A sustainable approach for the environment - LIFE and the Community Eco-Management and Audit Scheme (EMAS) (2003 - 32 pp. – ISBN 92-894-0543-0) *http://ec.europa.eu/environment/life/infoproducts/emas_en.pdf*

Water, an essential resource - LIFE and the new European water policy (2002 - 28 pp. – ISBN 92-894-0538-4) *http://ec.europa.eu/environment/life/infoproducts/water_en.pdf*

A number of printed copies of certain LIFE publications are available and can be ordered free-of-charge at: *http://ec.europa.eu/environment/env-informa/*

Other publications

Best LIFE-Environment Projects 2005-2006 (2006, 40 pp. – ISBN 92-79-02123-0) *http://ec.europa.eu/environment/life/infoproducts/bestlifeenv/bestenv_0506_lr.pdf*

The programme

Name LIFE ("L'Instrument Financier pour l'Environnement" / The financial instrument for the environment)

Type of intervention co-financing of actions in favour of the environment in the twenty-five Member States of the European Union, in the candidate countries who are associated to LIFE and in certain third countries bordering the Mediterranean and the Baltic Sea.

LIFE is made up of three thematic components: "LIFE-Nature", "LIFE-Environment" and "LIFE-Third countries".

Objectives

> with a view to sustainable development in the European Union, contribute to the drawing up, implementation and updating of Community policy and legislation in the area of the environment;
> explore new solutions to environmental problems on a Community scale.

Beneficiaries any natural or legal person, provided that the projects financed meet the following general criteria:

> they are of Community interest and make a significant contribution to the general objectives;
> they are carried out by technically and financially sound participants;
> they are feasible in terms of technical proposals, timetable, budget and value for money.

Types of project

> Eligible for LIFE-Environment are innovative pilot and demonstration projects which bring environment-related and sustainable development considerations together in land management, which promote sustainable water and waste management or which minimise the environmental impact of economic activities, products and services. LIFE-Environment also finances preparatory projects aiming at the development or updating of Community environmental actions, instruments, legislation or policies.
> Eligible for LIFE-Nature are nature conservation projects which contribute to maintaining or restoring natural habitats and/or populations of species in a favourable state of conservation within the meaning of the "Birds" (79/409/EEC) and "Habitats" (92/43/EEC) Community Directives and which contribute to the establishment of the European network of protected areas – NATURA 2000. LIFE-Nature also finances "co-op" projects aiming to develop the exchange of experiences between projects.
> Eligible for LIFE-Third countries are projects which contribute to the establishment of capacities and administrative structures needed in the environmental sector and in the development of environmental policy and action programmes in some countries bordering the Mediterranean and the Baltic Sea.

Implementation National authorities in the Member States or third countries send the Commission the proposals of projects to be co-financed (for LIFE-Environment preparatory projects, the applicants send their proposals directly to the Commission). The Commission sets the date for sending the proposals annually. It monitors the projects financed and supports the dissemination of their results. Accompanying measures enable the projects to be monitored on the ground.

Period covered (LIFE III) 2000-2006.

Funds from the Community approximately EUR 638 million for 2000-2004 and EUR 317 million for 2005-2006.

JUDGMENT OF THE COURT (Third Chamber)

11 April 2013 (*)

(Environment – Directive 92/43/EEC – Article 6 – Conservation of natural habitats – Special areas of conservation – Assessment of the implications for a protected site of a plan or project – Criteria to be applied when assessing the likelihood that such a plan or project will adversely affect the integrity of the site concerned – Lough Corrib site – N6 Galway City Outer Bypass road scheme)

In Case C-258/11,

REQUEST for a preliminary ruling under Article 267 TFEU from the Supreme Court (Ireland), made by decision of 13 May 2011, received at the Court on 26 May 2011, in the proceedings

Peter Sweetman,

Ireland,

Attorney General,

Minister for the Environment, Heritage and Local Government

v

An Bord Pleanála,

notice parties:

Galway County Council,

Galway City Council,

THE COURT (Third Chamber),

composed of R. Silva de Lapuerta, acting as the President of the Third Chamber, K. Lenaerts, G. Arestis (Rapporteur), J. Malenovský and T. von Danwitz, Judges,

Advocate General: E. Sharpston,

Registrar: K. Malacek, Administrator,

having regard to the written procedure and further to the hearing on 12 September 2012,

after considering the observations submitted on behalf of:

– Mr Sweetman, by B. Harrington, Solicitor, and R. Lyons SC,

– Ireland, the Attorney General and the Minister for the Environment, Heritage and Local Government, by D. O'Hagan and G. Simons, acting as Agents, and M. Gray BL,

– An Bord Pleanála, by A. Doyle and O. Doyle, Solicitors, and N. Butler SC,

– Galway County Council and Galway City Council, by V. Raine and A. Casey, acting as Agents, E. Keane SC and B. Kennedy BL,

– the Greek Government, by G. Karipsiades, acting as Agent,

– the United Kingdom Government, by H. Walker, acting as Agent, and K. Smith, Barrister,

– the European Commission, by S. Petrova and K. Mifsud-Bonnici, acting as Agents,

after hearing the Opinion of the Advocate General at the sitting on 22 November 2012,

gives the following

Judgment

1 This request for a preliminary ruling concerns the interpretation of Article 6 of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7; 'the Habitats Directive').

2 The request has been made in proceedings between (i) Mr Sweetman, Ireland, the Attorney General and the Minister for the Environment, Heritage and Local Government and (ii) An Bord Pleanála (the Irish Planning Board), supported by Galway County Council and Galway City Council, concerning An Bord Pleanála's decision to grant development consent for the N6 Galway City Outer Bypass road scheme.

Legal context

European Union law

3 The third recital in the preamble to the Habitats Directive states:

'… the main aim of this Directive being to promote the maintenance of biodiversity, taking account of economic, social, cultural and regional requirements, this Directive makes a contribution to the general objective of sustainable development; … the maintenance of such biodiversity may in certain cases require the maintenance, or indeed the encouragement, of human activities'.

4 Article 1(d), (e), (k) and (l) of the Habitats Directive provide:

'For the purpose of this Directive:

…

(d) *priority natural habitat types* means natural habitat types in danger of disappearance, which are present on the territory referred to in Article 2 and for the conservation of which the Community has particular responsibility in view of the proportion of their natural range which falls within the territory referred to in Article 2; these priority natural habitat types are indicated by an asterisk (*) in Annex I;

(e) *conservation status of a natural habitat* means the sum of the influences acting on a natural habitat and its typical species that may affect its long-term natural distribution, structure and functions as well as the long-term survival of its typical species within the territory referred to in Article 2.

The conservative status of a natural habitat will be taken as "favourable" when:

– its natural range and areas it covers within that range are stable or increasing, and

– the specific structure and functions which are necessary for its long-term maintenance exist and are likely to continue to exist for the foreseeable future, and

– the conservation status of its typical species is favourable as defined in (i);

...

(k) *site of Community importance* ["SCI"] means a site which, in the biogeographical region or regions to which is belongs, contributes significantly to the maintenance or restoration at a favourable conservation status of a natural habitat type in Annex I or of a species in Annex II and may also contribute significantly to the coherence of Natura 2000 referred to in Article 3, and/or contributes significantly to the maintenance of biological diversity within the biogeographic region or regions concerned.

...

(l) *special area of conservation* means a site of Community importance designated by the Member States through a statutory, administrative and/or contractual act where the necessary conservation measures are applied for the maintenance or restoration, at a favourable conservation status, of the natural habitats and/or the populations of the species for which the site is designated'.

5 Article 2 of the Habitats Directive is worded as follows:

'1. The aim of this Directive shall be to contribute towards ensuring bio-diversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the Treaty applies.

2. Measures taken pursuant to this Directive shall be designed to maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora of Community interest.

3. Measures taken pursuant to this Directive shall take account of economic, social and cultural requirements and regional and local characteristics.'

6 Article 3(1) of the Habitats Directive states:

'A coherent European ecological network of special areas of conservation shall be set up under the title Natura 2000. This network … shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range.

The Natura 2000 network shall include the special protection areas classified by the Member States pursuant to [Council] Directive 79/409/EEC [of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1)].'

7 Article 6(2) to (4) of the Habitats Directive provide:

'2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

8 Annex I to the Habitats Directive, entitled 'Natural habitat types of Community interest whose conservation requires the designation of special areas of conservation', designates '[l]imestone pavements' as a priority habitat type, under code 8240.

Irish law

9 The European Communities (Natural Habitats) Regulations, 1997, in the version applicable at the material time ('the 1997 Regulations'), implement the obligations of the Habitats Directive in Irish law.

10 Regulation 30 of the 1997 Regulations, which transposed the requirements of Article 6 of the Habitats Directive, provides:

'(1) Where a proposed road development in respect of which an application for the approval of the [competent authority] has been made in accordance with section 51 of the Roads Act, 1993, is neither directly connected with nor necessary to the management of a European site but likely to have a significant effect thereon either individually or in combination with other developments, the [competent authority] shall ensure that an appropriate assessment of the implications for the site in view of the site's conservation objectives is undertaken.

(2) An environmental impact assessment as required under subsection (2) of section 51 of the Roads Act, 1993, in respect of a proposed road development referred to in paragraph (1) shall be an appropriate assessment for the purposes of this Regulation.

(3) [The competent authority] shall, having regard to the conclusions of the assessment undertaken under paragraph (1), agree to the proposed road development only after having ascertained that it will not adversely affect the integrity of the European site concerned.

(4) In considering whether the proposed road development will adversely affect the integrity of the European site concerned, the [competent authority] shall have regard to the manner in which the proposed development is being carried out or to any conditions or restrictions subject to which the approval is given.

(5) [The competent authority] may, notwithstanding a negative assessment and where [it] is satisfied that there are no alternative solutions, decide to agree to the proposed road development where the proposed road development has to be carried out for imperative reasons of overriding public interest.

(6) (a) Subject to paragraph (b) imperative reasons of overriding public interest shall include reasons of a social or economic nature;

(b) If the site concerned hosts a priority natural habitat type or a priority species, the only considerations of overriding public interest shall be –

(i) those relating to human health or public safety,

(ii) beneficial consequences of primary importance for the environment, or

(iii) further to an opinion from the Commission to other imperative reasons of overriding public interest.'

The dispute in the main proceedings and the questions referred for a preliminary ruling

11 By decision of 20 November 2008, An Bord Pleanála decided to grant development consent for the N6 Galway City Outer Bypass road scheme. Part of the proposed road was planned to cross the Lough Corrib SCI. Following an enlargement of the extent of the SCI, it hosts a total of 14 habitats referred to in Annex I to the Habitats Directive, of which six are priority habitat types, including karstic limestone pavement, the specific protected habitat forming the subject-matter of the main proceedings.

12 The road scheme involves the permanent loss within the Lough Corrib SCI of approximately 1.47 hectares of that limestone pavement. Those 1.47 hectares will be lost from an area which was described by An Bord Pleanála's inspector as constituting a 'distinct sub-area and an area having the particular characteristic of possessing substantial areas of a priority habitat', and which contains a total of 85 hectares of limestone pavement. That surface of 85 hectares itself forms part of a total of 270 hectares of such limestone pavement – which constitutes a priority habitat type referred to in Annex I to the Habitats Directive – in the entire SCI.

13 At the time when An Bord Pleanála's decision was taken, that area had already been included as a potential SCI on a list of sites transmitted by Ireland to the Commission. The extended Lough Corrib site was formally classified as an SCI by a Commission decision of 12 December 2008. According to the referring court, although the extended Lough Corrib site was not formally classified by the Commission as an SCI before that date, An Bord Pleanála was required under national law to apply legal protections equivalent to those under Article 6(2) to (4) of the Habitats Directive to that site from December 2006.

14 In its decision of 20 November 2008, An Bord Pleanála stated, inter alia, that 'it is considered that the part of the road development being approved would be an appropriate solution to the identified traffic needs of the city and surrounding area … and, while having a localised severe impact on the Lough Corrib candidate Special Area of Conservation, would not adversely affect the integrity of this candidate special Area of Conservation. The development, hereby approved, would not, therefore, have unacceptable effects on the environment and would be in accordance with the proper planning and sustainable development of the area.'

15 Mr Sweetman applied to the High Court for leave to issue judicial review proceedings against, in particular, An Bord Pleanála's decision of 20 November 2008. He submitted that An Bord Pleanála had erred in its interpretation of Article 6 of the Habitats Directive in concluding, in particular, that the effect of the road scheme on the Lough Corrib protected site would not constitute an 'adverse effect on the integrity of the site'.

16 By decision of 9 October 2009, the High Court dismissed the application for leave to issue judicial review proceedings and upheld An Bord Pleanála's decision. On 6 November 2009 Mr Sweetman was granted leave to appeal to the Supreme Court against the decision of 9 October 2009.

17 The Supreme Court observes that it has doubts as to when and in what circumstances, where an appropriate assessment of a plan or project is carried out pursuant to Article

6(3) of the Habitats Directive, such a plan or project is likely to have 'an adverse effect on the integrity of the site'. In that regard, the Supreme Court states that the judgment in Case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging* [2004] ECR I-7405 has not fully dispelled its doubts.

18 It is in those circumstances that the Supreme Court decided to stay the proceedings and to refer the following questions to the Court for a preliminary ruling:

'1. What are the criteria in law to be applied by a competent authority to an assessment of the likelihood of a plan or project the subject of Article 6(3) of the Habitats Directive, having "an adverse effect on the integrity of the site"?

2. Does the application of the precautionary principle have as its consequence that such a plan or project cannot be authorised if it would result in the permanent non-renewable loss of the whole or any part of the habitat in question?

3. What is the relationship, if any, between Article 6(4) and the making of the decision under Article 6(3) that the plan or project will not adversely affect the integrity of the site?'

Consideration of the questions referred

Jurisdiction of the Court

19 Galway County Council and Galway City Council plead, in essence, that the Court lacks jurisdiction to answer the questions referred for a preliminary ruling given that Article 6(3) of the Habitats Directive is not applicable to the main proceedings because An Bord Pleanála's decision approving the N6 Galway City Outer Bypass road scheme was adopted before the Commission decision to classify as an SCI the Lough Corrib site extension which is affected by the scheme.

20 It is indeed apparent from the order for reference that, on the date of An Bord Pleanála's decision, 20 November 2008, the extension of the Lough Corrib site had been notified within Ireland, under Regulation 4 of the 1997 Regulations, but had not yet been designated as an SCI in the list of sites adopted by the Commission. Such a decision was adopted by the Commission on 12 December 2008, that is to say, three weeks after An Bord Pleanála's decision.

21 In the main proceedings, as the referring court itself states, Regulation 30 of the 1997 Regulations largely replicates the wording of Article 6 of the Habitats Directive. It follows, furthermore, from the title of the 1997 Regulations that the Irish legislature intended by their adoption to transpose that directive into domestic law. Finally, as the referring court observes, by according a notified site protection equivalent to that under Article 6(2) to (4) of the Habitats Directive before its designation as an SCI in the list adopted by the Commission, Ireland considered itself to have complied with its obligation to take appropriate protective measures pending designation of a site as an SCI.

22 On that last point, it should be recalled that the Court has already held that, whilst the protective measures prescribed in Article 6(2) to (4) of the Habitats Directive are

required only as regards sites which are placed on the list of sites selected as SCIs drawn up by the Commission, this does not mean that the Member States do not have to protect sites as soon as they propose them, under Article 4(1) of the directive, as sites eligible for identification as SCIs on the national list transmitted to the Commission (see Case C-117/03 *Dragaggi and Others* [2005] ECR I-167, paragraphs 25 and 26, and Case C-244/05 *Bund Naturschutz in Bayern and Others* [2006] ECR I-8445, paragraphs 36 and 37).

23 Therefore, as soon as a site is proposed by a Member State, pursuant to Article 4(1) of the Habitats Directive, on the national list transmitted to the Commission as a site eligible for identification as an SCI, and at least until the Commission adopts a decision in that regard, that Member State is, by virtue of the Habitats Directive, required to take protective measures of such a kind as to safeguard the ecological interest referred to (see, to this effect, *Dragaggi and Others*, paragraph 29, and *Bund Naturschutz in Bayern and Others*, paragraph 38). The situation of such a site thus cannot be categorised as a situation not falling within the scope of European Union law.

24 It accordingly follows from the foregoing considerations that the Court has jurisdiction to answer the questions referred for a preliminary ruling by the Supreme Court.

Substance

25 By its questions, which it is appropriate to deal with together, the referring court asks, in essence, whether Article 6(3) of the Habitats Directive must be interpreted as meaning that in a situation such as that in the main proceedings a plan or project not directly connected with or necessary to the management of a site adversely affects the integrity of that site. For the purposes of such an interpretation, the referring court raises the question of the possible effect of the precautionary principle and the question of the relationship between Article 6(3) and Article 6(4) of the Habitats Directive.

26 It is apparent from the order for reference that the implementation of the N6 Galway City Outer Bypass road scheme would result in the permanent and irreparable loss of part of the Lough Corrib SCI's limestone pavement, which is a priority natural habitat type specially protected by the Habitats Directive. Following assessment of the impact of the road scheme on the Lough Corrib SCI, An Bord Pleanála established that it would have a locally significant negative impact on the SCI, but decided that such an impact did not adversely affect the integrity of that site.

27 According to Mr Sweetman, Ireland, the Attorney General, the Minister for the Environment, Heritage and Local Government and the Commission, a negative impact of that kind on the site caused by that road scheme necessarily entails an adverse effect on the site's integrity. By contrast, An Bord Pleanála, Galway County Council and Galway City Council and the United Kingdom Government submit that the finding of damage to that site is not necessarily incompatible with there being no adverse effects on its integrity.

28 Article 6(3) of the Habitats Directive establishes an assessment procedure intended to ensure, by means of a prior examination, that a plan or project not directly connected with or necessary to the management of the site concerned but likely to have a significant effect on it is authorised only to the extent that it will not adversely affect the

integrity of that site (*Waddenvereniging and Vogelbeschermingsvereniging*, paragraph 34, and Case C-182/10 *Solvay and Others* [2012] ECR I-0000, paragraph 66).

29 That provision thus prescribes two stages. The first, envisaged in the provision's first sentence, requires the Member States to carry out an appropriate assessment of the implications for a protected site of a plan or project when there is a likelihood that the plan or project will have a significant effect on that site (see, to this effect, *Waddenvereniging and Vogelbeschermingsvereniging*, paragraphs 41 and 43).

30 Where a plan or project not directly connected with or necessary to the management of a site is likely to undermine the site's conservation objectives, it must be considered likely to have a significant effect on that site. The assessment of that risk must be made in the light of, in particular, the characteristics and specific environmental conditions of the site concerned by such a plan or project (see, to this effect, *Waddenvereniging and Vogelbeschermingsvereniging*, paragraph 49).

31 The second stage, which is envisaged in the second sentence of Article 6(3) of the Habitats Directive and occurs following the aforesaid appropriate assessment, allows such a plan or project to be authorised on condition that it will not adversely affect the integrity of the site concerned, subject to the provisions of Article 6(4).

32 In appraising the scope of the expression 'adversely affect the integrity of the site' in its overall context, it should be made clear that, as the Advocate General has noted in point 43 of her Opinion, the provisions of Article 6 of the Habitats Directive must be construed as a coherent whole in the light of the conservation objectives pursued by the directive. Indeed, Article 6(2) and Article 6(3) are designed to ensure the same level of protection of natural habitats and habitats of species (see, to this effect, Case C-404/09 *Commission* v *Spain* [2011] ECR I-0000, paragraph 142), whilst Article 6(4) merely derogates from the second sentence of Article 6(3).

33 The Court has already held that Article 6(2) of the Habitats Directive makes it possible to comply with the fundamental objective of preservation and protection of the quality of the environment, including the conservation of natural habitats and of wild fauna and flora, and establishes a general obligation of protection consisting in avoiding deterioration as well as disturbance which could have significant effects in the light of the directive's objectives (Case C-226/08 *Stadt Papenburg* [2010] ECR I-131, paragraph 49 and the case-law cited).

34 Article 6(4) of the Habitats Directive provides that if, in spite of a negative assessment carried out in accordance with the first sentence of Article 6(3) of the directive, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, and there are no alternative solutions, the Member State is to take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected (see Case C-304/05 *Commission* v *Italy* [2007] ECR I-7495, paragraph 81, and *Solvay and Others*, paragraph 72).

35 As an exception to the authorisation criterion laid down in the second sentence of Article 6(3) of the Habitats Directive, Article 6(4) can apply only after the implications of a plan or project have been analysed in accordance with Article 6(3) (see *Solvay and Others*, paragraphs 73 and 74).

36 It follows that Article 6(2) to (4) of the Habitats Directive impose upon the Member States a series of specific obligations and procedures designed, as is clear from Article 2(2) of the directive, to maintain, or as the case may be restore, at a favourable conservation status natural habitats and, in particular, special areas of conservation.

37 In this regard, according to Article 1(e) of the Habitats Directive, the conservation status of a natural habitat is taken as 'favourable' when, in particular, its natural range and areas it covers within that range are stable or increasing and the specific structure and functions which are necessary for its long-term maintenance exist and are likely to continue to exist for the foreseeable future.

38 In this context, the Court has already held that the Habitats Directive has the aim that the Member States take appropriate protective measures to preserve the ecological characteristics of sites which host natural habitat types (see Case C-308/08 *Commission* v *Spain* [2010] ECR I-4281, paragraph 21, and Case C-404/09 *Commission* v *Spain*, paragraph 163).

39 Consequently, it should be inferred that in order for the integrity of a site as a natural habitat not to be adversely affected for the purposes of the second sentence of Article 6(3) of the Habitats Directive the site needs to be preserved at a favourable conservation status; this entails, as the Advocate General has observed in points 54 to 56 of her Opinion, the lasting preservation of the constitutive characteristics of the site concerned that are connected to the presence of a natural habitat type whose preservation was the objective justifying the designation of that site in the list of SCIs, in accordance with the directive.

40 Authorisation for a plan or project, as referred to in Article 6(3) of the Habitats Directive, may therefore be given only on condition that the competent authorities – once all aspects of the plan or project have been identified which can, by themselves or in combination with other plans or projects, affect the conservation objectives of the site concerned, and in the light of the best scientific knowledge in the field – are certain that the plan or project will not have lasting adverse effects on the integrity of that site. That is so where no reasonable scientific doubt remains as to the absence of such effects (see, to this effect, Case C-404/09 *Commission* v *Spain*, paragraph 99, and *Solvay and Others*, paragraph 67).

41 It is to be noted that, since the authority must refuse to authorise the plan or project being considered where uncertainty remains as to the absence of adverse effects on the integrity of the site, the authorisation criterion laid down in the second sentence of Article 6(3) of the Habitats Directive integrates the precautionary principle and makes it possible to prevent in an effective manner adverse effects on the integrity of protected sites as a result of the plans or projects being considered. A less stringent authorisation criterion than that in question could not ensure as effectively the fulfilment of the objective of site protection intended under that provision (*Waddenvereniging and Vogelbeschermingsvereniging*, paragraphs 57 and 58).

42 Such an appraisal applies all the more in the main proceedings, since the natural habitat affected by the proposed road scheme is among the priority natural habitat types, which Article 1(d) of the Habitats Directive defines as 'natural habitat types in danger of

disappearance' for whose conservation the European Union has 'particular responsibility'.

43 The competent national authorities cannot therefore authorise interventions where there is a risk of lasting harm to the ecological characteristics of sites which host priority natural habitat types. That would particularly be so where there is a risk that an intervention of a particular kind will bring about the disappearance or the partial and irreparable destruction of a priority natural habitat type present on the site concerned (see, as regards the disappearance of priority species, Case C-308/08 *Commission* v *Spain*, paragraph 21, and Case C-404/09 *Commission* v *Spain*, paragraph 163).

44 So far as concerns the assessment carried out under Article 6(3) of the Habitats Directive, it should be pointed out that it cannot have lacunae and must contain complete, precise and definitive findings and conclusions capable of removing all reasonable scientific doubt as to the effects of the works proposed on the protected site concerned (see, to this effect, Case C-404/09 *Commission* v *Spain*, paragraph 100 and the case-law cited). It is for the national court to establish whether the assessment of the implications for the site meets these requirements.

45 In the main proceedings, the Lough Corrib SCI was designated as a site hosting a priority habitat type because, in particular, of the presence in that site of limestone pavement, a natural resource which, once destroyed, cannot be replaced. Having regard to the criteria referred to above, the conservation objective thus corresponds to maintenance at a favourable conservation status of that site's constitutive characteristics, namely the presence of limestone pavement.

46 Consequently, if, after an appropriate assessment of a plan or project's implications for a site, carried out on the basis of the first sentence of Article 6(3) of the Habitats Directive, the competent national authority concludes that that plan or project will lead to the lasting and irreparable loss of the whole or part of a priority natural habitat type whose conservation was the objective that justified the designation of the site concerned as an SCI, the view should be taken that such a plan or project will adversely affect the integrity of that site.

47 In those circumstances, that plan or project cannot be authorised on the basis of Article 6(3) of the Habitats Directive. Nevertheless, in such a situation, the competent national authority could, where appropriate, grant authorisation under Article 6(4) of the directive, provided that the conditions set out therein are satisfied (see, to this effect, *Waddenvereniging and Vogelbeschermingsvereniging*, paragraph 60).

48 It follows from the foregoing considerations that the answer to the questions referred is that Article 6(3) of the Habitats Directive must be interpreted as meaning that a plan or project not directly connected with or necessary to the management of a site will adversely affect the integrity of that site if it is liable to prevent the lasting preservation of the constitutive characteristics of the site that are connected to the presence of a priority natural habitat whose conservation was the objective justifying the designation of the site in the list of SCIs, in accordance with the directive. The precautionary principle should be applied for the purposes of that appraisal.

Costs

49 Since these proceedings are, for the parties to the main proceedings, a step in the action pending before the referring court, the decision on costs is a matter for that court. Costs incurred in submitting observations to the Court, other than the costs of those parties, are not recoverable.

On those grounds, the Court (Third Chamber) hereby rules:

Article 6(3) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora must be interpreted as meaning that a plan or project not directly connected with or necessary to the management of a site will adversely affect the integrity of that site if it is liable to prevent the lasting preservation of the constitutive characteristics of the site that are connected to the presence of a priority natural habitat whose conservation was the objective justifying the designation of the site in the list of sites of Community importance, in accordance with the directive. The precautionary principle should be applied for the purposes of that appraisal.

after hearing the Opinion of the Advocate General at the sitting on 15 September 2011,

gives the following

Judgment

1 This reference for a preliminary ruling concerns the interpretation of Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy (OJ 2000 L 327, p. 1), of Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment (OJ 1985 L 175, p. 40), as amended by Directive 2003/35/EC of the European Parliament and of the Council of 26 May 2003 (OJ 2003 L 156, p. 17) ('Directive 85/337'), of Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment (OJ 2001 L 197, p. 30) and of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7).

2 The reference has been made in legal proceedings brought by the Nomarchiaki Aftodioikisi Aitoloakarnanias (Prefectural Authority of Aitoloakarnania) and other legal persons against the Ipourgos Perivallontos, Khorotaxias kai Dimosion Ergon (Minister for the Environment, Regional Planning and Public Works) and other ministers, seeking the annulment of measures relating to the project for the partial diversion of the upper waters of the river Acheloos (Western Greece) to the river Pinios, in Thessaly.

Legal context

European Union law

Directive 2000/60

3 Recitals 19, 20, 25 and 32 in the preamble to Directive 2000/60 are worded as follows:

‘(19) This Directive aims at maintaining and improving the aquatic environment in the Community. This purpose is primarily concerned with the quality of the waters concerned. Control of quantity is an ancillary element in securing good water quality and therefore measures on quantity, serving the objective of ensuring good quality, should also be established.

(20) The quantitative status of a body of groundwater may have an impact on the ecological quality of surface waters and terrestrial ecosystems associated with that groundwater body.

...

(25) Common definitions of the status of water in terms of quality and, where relevant for the purpose of the environmental protection, quantity should be established. Environmental objectives should be set to ensure that good status of surface water and groundwater is achieved throughout the Community and that deterioration in the status of waters is prevented at Community level.

...

(32) There may be grounds for exemptions from the requirement to prevent further deterioration or to achieve good status under specific conditions, if the failure is the result of unforeseen or exceptional circumstances, in particular floods and droughts, or, for reasons of overriding public interest, of new modifications to the physical characteristics of a surface water body or alterations to the level of bodies of groundwater, provided that all practicable steps are taken to mitigate the adverse impact on the status of the body of water.’

4 Article 2 of that directive provides the following definitions:

‘…

(10) “Body of surface water” means a discrete and significant element of surface water such as a lake, a reservoir, a stream, river or canal, part of a stream, river or canal, a transitional water or a stretch of coastal water.

…

(13) “River basin” means the area of land from which all surface run-off flows through a sequence of streams, rivers and, possibly, lakes into the sea at a single river mouth, estuary or delta.

(14) “Sub-basin” means the area of land from which all surface run-off flows through a series of streams, rivers and, possibly, lakes to a particular point in a water course (normally a lake or a river confluence).

(15) “River basin district” means the area of land and sea, made up of one or more neighbouring river basins together with their associated groundwaters and coastal waters, which is identified under Article 3(1) as the main unit for management of river basins.

…

(17) “Surface water status” is the general expression of the status of a body of surface water, determined by the poorer of its ecological status and its chemical status.

(18) “Good surface water status” means the status achieved by a surface water body when both its ecological status and its chemical status are at least “good”.

(19) “Groundwater status” is the general expression of the status of a body of groundwater, determined by the poorer of its quantitative status and its chemical status.

(20) “Good groundwater status” means the status achieved by a groundwater body when both its quantitative status and its chemical status are at least “good”.

(21) “Ecological status” is an expression of the quality of the structure and functioning of aquatic ecosystems associated with surface waters, classified in accordance with Annex V.

(22) “Good ecological status” is the status of a body of surface water, so classified in accordance with Annex V.

…

(24) “Good surface water chemical status” means the chemical status required to meet the environmental objectives for surface waters established in Article 4(1)(a), that is the chemical status achieved by a body of surface water in which concentrations of pollutants do not exceed the environmental quality standards established in Annex IX and under Article 16(7), and under other relevant Community legislation setting environmental quality standards at Community level.

(25) “Good groundwater chemical status” is the chemical status of a body of groundwater, which meets all the conditions set out in table 2.3.2 of Annex V.

(26) “Quantitative status” is an expression of the degree to which a body of groundwater is affected by direct and indirect abstractions.

…

(28) “Good quantitative status” is the status defined in table 2.1.2 of Annex V.

…’

5 Article 3(1) and (4) of that directive provide:

‘1. Member States shall identify the individual river basins lying within their national territory and, for the purposes of this Directive, shall assign them to individual river basin districts. Small river basins may be combined with larger river basins or joined with neighbouring small basins to form individual river basin districts where appropriate. Where groundwaters do not fully follow a particular river basin, they shall be identified and assigned to the nearest or most appropriate river basin district. Coastal waters shall be identified and assigned to the nearest or most appropriate river basin district or districts.

…

4. Member States shall ensure that the requirements of this Directive for the achievement of the environmental objectives established under Article 4, and in particular all programmes of measures are coordinated for the whole of the river basin district. …’

6 Article 4 of Directive 2000/60 is worded as follows:

‘1. In making operational the programmes of measures specified in the river basin management plans:

(a) for surface waters

(i) Member States shall implement the necessary measures to prevent deterioration of the status of all bodies of surface water, subject to the application of paragraphs 6 and 7 and without prejudice to paragraph 8;

(ii) Member States shall protect, enhance and restore all bodies of surface water, subject to the application of subparagraph (iii) for artificial and heavily modified bodies of water, with the aim of achieving good surface water status at the latest 15 years after the date of entry into force of this Directive, in accordance with the provisions laid down in Annex V, subject to the application of extensions determined in accordance with paragraph 4 and to the application of paragraphs 5, 6 and 7 without prejudice to paragraph 8;

…

(b) for groundwater

(i) Member States shall implement the measures necessary to prevent or limit the input of pollutants into groundwater and to prevent the deterioration of the status of all bodies of groundwater, subject to the application of paragraphs 6 and 7 and without prejudice to paragraph 8 of this Article and subject to the application of Article 11(3)(j);

(ii) Member States shall protect, enhance and restore all bodies of groundwater, ensure a balance between abstraction and recharge of groundwater, with the aim of achieving good groundwater status at the latest 15 years after the date of entry into force of this Directive, in accordance with the provisions laid down in Annex V, subject to the application of extensions determined in accordance with paragraph 4 and to the application

of paragraphs 5, 6 and 7 without prejudice to paragraph 8 of this Article and subject to the application of Article 11(3)(j);

…

…

4. The deadlines established under paragraph 1 may be extended for the purposes of phased achievement of the objectives for bodies of water, provided that no further deterioration occurs in the status of the affected body of water when all of the following conditions are met:

(a) Member States determine that all necessary improvements in the status of bodies of water cannot reasonably be achieved within the timescales set out in that paragraph for at least one of the following reasons:

(i) the scale of improvements required can only be achieved in phases exceeding the timescale, for reasons of technical feasibility;

(ii) completing the improvements within the timescale would be disproportionately expensive;

(iii) natural conditions do not allow timely improvement in the status of the body of water.

(b) Extension of the deadline, and the reasons for it, are specifically set out and explained in the river basin management plan required under Article 13.

(c) Extensions shall be limited to a maximum of two further updates of the river basin management plan except in cases where the natural conditions are such that the objectives cannot be achieved within this period.

(d) A summary of the measures required under Article 11 which are envisaged as necessary to bring the bodies of water progressively to the required status by the extended deadline, the reasons for any significant delay in making these measures operational, and the expected timetable for their implementation are set out in the river basin management plan. A review of the implementation of these measures and a summary of any additional measures shall be included in updates of the river basin management plan.

5. Member States may aim to achieve less stringent environmental objectives than those required under paragraph 1 for specific bodies of water when they are so affected by human activity, as determined in accordance with Article 5(1), or their natural condition is such that the achievement of these objectives would be infeasible or disproportionately expensive, and all the following conditions are met:

(a) the environmental and socioeconomic needs served by such human activity cannot be achieved by other means, which are a significantly better environmental option not entailing disproportionate costs;

(b) Member States ensure:

– for surface water, the highest ecological and chemical status possible is achieved, given impacts that could not reasonably have been avoided due to the nature of the human activity or pollution,

– for groundwater, the least possible changes to good groundwater status, given impacts that could not reasonably have been avoided due to the nature of the human activity or pollution;

(c) no further deterioration occurs in the status of the affected body of water;

(d) the establishment of less stringent environmental objectives, and the reasons for it, are specifically mentioned in the river basin management plan required under Article 13 and those objectives are reviewed every six years.

6. Temporary deterioration in the status of bodies of water shall not be in breach of the requirements of this Directive if this is the result of circumstances of natural cause or *force majeure* which are exceptional or could not reasonably have been foreseen, in particular extreme floods and prolonged droughts, or the result of circumstances due to accidents which could not reasonably have been foreseen, when all of the following conditions have been met:

(a) all practicable steps are taken to prevent further deterioration in status and in order not to compromise the achievement of the objectives of this Directive in other bodies of water not affected by those circumstances;

(b) the conditions under which circumstances that are exceptional or that could not reasonably have been foreseen may be declared, including the adoption of the appropriate indicators, are stated in the river basin management plan;

(c) the measures to be taken under such exceptional circumstances are included in the programme of measures and will not compromise the recovery of the quality of the body of water once the circumstances are over;

(d) the effects of the circumstances that are exceptional or that could not reasonably have been foreseen are reviewed annually and, subject to the reasons set out in paragraph 4(a), all practicable measures are taken with the aim of restoring the body of water to its status prior to the effects of those circumstances as soon as reasonably practicable, and

(e) a summary of the effects of the circumstances and of such measures taken or to be taken in accordance with paragraphs (a) and (d) are included in the next update of the river basin management plan.

7. Member States will not be in breach of this Directive when:

– failure to achieve good groundwater status, good ecological status or, where relevant, good ecological potential or to prevent deterioration in the status of a body of surface water or groundwater is the result of new modifications to the physical characteristics of a surface water body or alterations to the level of bodies of groundwater, or

– failure to prevent deterioration from high status to good status of a body of surface water is the result of new sustainable human development activities

and all the following conditions are met:

(a) all practicable steps are taken to mitigate the adverse impact on the status of the body of water;

(b) the reasons for those modifications or alterations are specifically set out and explained in the river basin management plan required under Article 13 and the objectives are reviewed every six years;

(c) the reasons for those modifications or alterations are of overriding public interest and/or the benefits to the environment and to society of achieving the objectives set out in paragraph 1 are outweighed by the benefits of the new modifications or alterations to human health, to the maintenance of human safety or to sustainable development, and

(d) the beneficial objectives served by those modifications or alterations of the water body cannot for reasons of technical feasibility or disproportionate cost be achieved by other means which are a significantly better environmental option.

8. When applying paragraphs 3, 4, 5, 6 and 7, a Member State shall ensure that the application does not permanently exclude or compromise the achievement of the objectives of this Directive in other bodies of water within the same river basin district and is consistent with the implementation of other Community environmental legislation.

9. Steps must be taken to ensure that the application of the new provisions, including the application of paragraphs 3, 4, 5, 6 and 7, guarantees at least the same level of protection as the existing Community legislation.'

7 Article 5(1) of Directive 2000/60 provides:

'Each Member State shall ensure that for each river basin district or for the portion of an international river basin district falling within its territory:

– an analysis of its characteristics,

– a review of the impact of human activity on the status of surface waters and on groundwater, and

– an economic analysis of water use

is undertaken according to the technical specifications set out in Annexes II and III and that it is completed at the latest four years after the date of entry into force of this Directive.'

8 Article 6(1) of that directive states:

‘Member States shall ensure the establishment of a register or registers of all areas lying within each river basin district which have been designated as requiring special protection under specific Community legislation for the protection of their surface water and groundwater or for the conservation of habitats and species directly depending on water. They shall ensure that the register is completed at the latest four years after the date of entry into force of this Directive.’

9 Under the first subparagraph of Article 9(1) of that directive:

‘Member States shall take account of the principle of recovery of the costs of water services, including environmental and resource costs, having regard to the economic analysis conducted according to Annex III, and in accordance in particular with the polluter pays principle.’

10 Article 11(7) of Directive 2000/60 is worded as follows:

‘The programmes of measures shall be established at the latest nine years after the date of entry into force of this Directive and all the measures shall be made operational at the latest 12 years after that date.’

11 Article 13 of that directive provides:

‘1. Member States shall ensure that a river basin management plan is produced for each river basin district lying entirely within their territory.

…

4. The river basin management plan shall include the information detailed in Annex VII.

5. River basin management plans may be supplemented by the production of more detailed programmes and management plans for sub-basin, sector, issue, or water type, to deal with particular aspects of water management. Implementation of these measures shall not exempt Member States from any of their obligations under the rest of this Directive.

6. River basin management plans shall be published at the latest nine years after the date of entry into force of this Directive.

7. River basin management plans shall be reviewed and updated at the latest 15 years after the date of entry into force of this Directive and every six years thereafter.’

12 Article 14 of that directive is worded as follows:

‘1. Member States shall encourage the active involvement of all interested parties in the implementation of this Directive, in particular in the production, review and updating of the river basin management plans. Member States shall ensure that, for each river basin district, they publish and make available for comments to the public, including users:

(a) a timetable and work programme for the production of the plan, including a statement of the consultation measures to be taken, at least three years before the beginning of the period to which the plan refers;

(b) an interim overview of the significant water management issues identified in the river basin, at least two years before the beginning of the period to which the plan refers;

(c) draft copies of the river basin management plan, at least one year before the beginning of the period to which the plan refers.

On request, access shall be given to background documents and information used for the development of the draft river basin management plan.

2. Member States shall allow at least six months to comment in writing on those documents in order to allow active involvement and consultation.

3. Paragraphs 1 and 2 shall apply equally to updated river basin management plans.'

13 Article 15 of the directive states:

'1. Member States shall send copies of the river basin management plans and all subsequent updates to the Commission and to any other Member State concerned within three months of their publication:

(a) for river basin districts falling entirely within the territory of a Member State, all river management plans covering that national territory and published pursuant to Article 13;

(b) for international river basin districts, at least the part of the river basin management plans covering the territory of the Member State.

2. Member States shall submit summary reports of:

– the analyses required under Article 5, and

– the monitoring programmes designed under Article 8,

undertaken for the purposes of the first river basin management plan within three months of their completion.

3. Member States shall, within three years of the publication of each river basin management plan or update under Article 13, submit an interim report describing progress in the implementation of the planned programme of measures.'

14 Under the first subparagraph of Article 24(1) of Directive 2000/60, Member States were to bring into force the laws, regulations and administrative provisions necessary to comply with that directive at the latest by 22 December 2003 and forthwith to inform the Commission thereof.

15 Article 1 of Directive 85/337 is worded as follows:

‘1. This Directive shall apply to the assessment of the environmental effects of those public and private projects which are likely to have significant effects on the environment.

2. For the purposes of this Directive:

“project” means:

– the execution of construction works or of other installations or schemes,

– other interventions in the natural surroundings and landscape including those involving the extraction of mineral resources;

“developer” means:

the applicant for authorisation for a private project or the public authority which initiates a project;

“development consent” means:

the decision of the competent authority or authorities which entitles the developer to proceed with the project.

“public” means:

one or more natural or legal persons and, in accordance with national legislation or practice, their associations, organisations or groups;

“public concerned” means:

the public affected or likely to be affected by, or having an interest in, the environmental decision-making procedures referred to in Article 2(2); for the purposes of this definition, non-governmental organisations promoting environmental protection and meeting any requirements under national law shall be deemed to have an interest;

…

5. This Directive shall not apply to projects the details of which are adopted by a specific act of national legislation, since the objectives of this Directive, including that of supplying information, are achieved through the legislative process.’

16 Article 2(1) of that directive provides:

‘Member States shall adopt all measures necessary to ensure that, before consent is given, projects likely to have significant effects on the environment by virtue, inter alia, of their nature, size or location are made subject to a requirement for development consent and an assessment with regard to their effects. ...’

17 Article 5(3) of that directive provides:

‘The information to be provided by the developer in accordance with paragraph 1 shall include at least:

– a description of the project comprising information on the site, design and size of the project,

– a description of the measures envisaged in order to avoid, reduce and, if possible, remedy significant adverse effects,

– the data required to identify and assess the main effects which the project is likely to have on the environment,

– an outline of the main alternatives studied by the developer and an indication of the main reasons for his choice, taking into account the environmental effects,

– a non-technical summary of the information mentioned in the previous indents.’

18 Under Article 6 of Directive 85/337:

‘1. Member States shall take the measures necessary to ensure that the authorities likely to be concerned by the project by reason of their specific environmental responsibilities are given an opportunity to express their opinion on the information supplied by the developer and on the request for development consent. To this end, Member States shall designate the authorities to be consulted, either in general terms or on a case-by-case basis. The information gathered pursuant to Article 5 shall be forwarded to those authorities. Detailed arrangements for consultation shall be laid down by the Member States.

2. The public shall be informed, whether by public notices or other appropriate means such as electronic media where available, of the following matters early in the environmental decision-making procedures referred to in Article 2(2) and, at the latest, as soon as information can reasonably be provided:

(a) the request for development consent;

(b) the fact that the project is subject to an environmental impact assessment procedure and, where relevant, the fact that Article 7 applies;

(c) details of the competent authorities responsible for taking the decision, those from which relevant information can be obtained, those to which comments or questions can be submitted, and details of the time schedule for transmitting comments or questions;

(d) the nature of possible decisions or, where there is one, the draft decision;

(e) an indication of the availability of the information gathered pursuant to Article 5;

(f) an indication of the times and places where and means by which the relevant information will be made available;

(g) details of the arrangements for public participation made pursuant to paragraph 5 of this Article.

3. Member States shall ensure that, within reasonable time-frames, the following is made available to the public concerned:

(a) any information gathered pursuant to Article 5;

(b) in accordance with national legislation, the main reports and advice issued to the competent authority or authorities at the time when the public concerned is informed in accordance with paragraph 2 of this Article;

(c) in accordance with the provisions of Directive 2003/4/EC of the European Parliament and of the Council of 28 January 2003 on public access to environmental information [(OJ 2003 L 41, p. 26)], information other than that referred to in paragraph 2 of this Article which is relevant for the decision in accordance with Article 8 and which only becomes available after the time the public concerned was informed in accordance with paragraph 2 of this Article.

…'

19 Article 8 of that directive states:

'The results of consultations and the information gathered pursuant to Articles 5, 6 and 7 must be taken into consideration in the development consent procedure.'

20 Article 9(1) of that directive is worded as follows:

'When a decision to grant or refuse development consent has been taken, the competent authority or authorities shall inform the public thereof in accordance with the appropriate procedures and shall make available to the public the following information:

– the content of the decision and any conditions attached thereto,

– having examined the concerns and opinions expressed by the public concerned, the main reasons and considerations on which the decision is based, including information about the public participation process,

– a description, where necessary, of the main measures to avoid, reduce and, if possible, offset the major adverse effects.'

Directive 2001/42

21 Article 2 of Directive 2001/42 provides:

'For the purposes of this Directive:

(a) "plans and programmes" shall mean plans and programmes, including those co-financed by the European Community, as well as any modifications to them:

– which are subject to preparation and/or adoption by an authority at national, regional or local level or which are prepared by an authority for adoption, through a legislative procedure by Parliament or Government, and

– which are required by legislative, regulatory or administrative provisions;

…'

22 Article 3(2) of that directive provides:

'Subject to paragraph 3, an environmental assessment shall be carried out for all plans and programmes:

(a) which are prepared for agriculture, forestry, fisheries, energy, industry, transport, waste management, water management, telecommunications, tourism, town and country planning or land use and which set the framework for future development consent of projects listed in Annexes I and II to Directive 85/337/EEC, or

(b) which, in view of the likely effect on sites, have been determined to require an assessment pursuant to Article 6 or 7 of Directive 92/43/EEC.'

Directive 92/43

23 According to the third recital in the preamble to Directive 92/43, 'the main aim of this Directive being to promote the maintenance of biodiversity, taking account of economic, social, cultural and regional requirements, this Directive makes a contribution to the general objective of sustainable development; … the maintenance of such biodiversity may in certain cases require the maintenance, or indeed the encouragement, of human activities'.

24 Article 2(3) of that directive provides:

'Measures taken pursuant to this Directive shall take account of economic, social and cultural requirements and regional and local characteristics.'

25 Article 3(1) of that directive is worded as follows:

'A coherent European ecological network of special areas of conservation shall be set up under the title Natura 2000. This network, composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range.

The Natura 2000 network shall include the special protection areas ["SPAs"] classified by the Member States pursuant to [Council] Directive 79/409/EEC [of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1)].'

26 Article 4 of Directive 92/43 states:

'1. On the basis of the criteria set out in Annex III (Stage 1) and relevant scientific information, each Member State shall propose a list of sites indicating which natural

habitat types in Annex I and which species in Annex II that are native to its territory the sites host. …

The list shall be transmitted to the Commission, within three years of the notification of this Directive, together with information on each site. That information shall include a map of the site, its name, location, extent and the data resulting from application of the criteria specified in Annex III (Stage 1) provided in a format established by the Commission in accordance with the procedure laid down in Article 21.

2. On the basis of the criteria set out in Annex III (Stage 2) and in the framework both of each of the five biogeographical regions referred to in Article 1(c)(iii) and of the whole of the territory referred to in Article 2(1), the Commission shall establish, in agreement with each Member State, a draft list of sites of Community importance ["SCIs"] drawn from the Member States' lists identifying those which host one or more priority natural habitat types or priority species.

…

The list of sites selected as [SCIs], identifying those which host one or more priority natural habitat types or priority species, shall be adopted by the Commission in accordance with the procedure laid down in Article 21.

3. The list referred to in paragraph 2 shall be established within six years of the notification of this Directive.

4. Once a [SCI] has been adopted in accordance with the procedure laid down in paragraph 2, the Member State concerned shall designate that site as a special area of conservation as soon as possible and within six years at most, establishing priorities in the light of the importance of the sites for the maintenance or restoration, at a favourable conservation status, of a natural habitat type in Annex I or a species in Annex II and for the coherence of Natura 2000, and in the light of the threats of degradation or destruction to which those sites are exposed.

5. As soon as a site is placed on the list referred to in the third subparagraph of paragraph 2 it shall be subject to Article 6(2), (3) and (4).'

27 Under Article 6(2) to (4) of that directive:

'2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the

site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

28 Article 7 of that directive is worded as follows:

'Obligations arising under Article 6(2), (3) and (4) of this Directive shall replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this Directive or the date of classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later.'

Directive 79/409

29 Under Article 4(1) and (2) of Directive 79/409:

'1. The species mentioned in Annex I shall be the subject of special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution.

…

Member States shall classify in particular the most suitable territories in number and size as [SPAs] for the conservation of these species, taking into account their protection requirements in the geographical sea and land area where this Directive applies.

2. Member States shall take similar measures for regularly occurring migratory species not listed in Annex I, bearing in mind their need for protection in the geographical sea and land area where this Directive applies, as regards their breeding, moulting and wintering areas and staging posts along their migration routes. To this end, Member States shall pay particular attention to the protection of wetlands and particularly to wetlands of international importance.'

The dispute in the main proceedings and the questions referred for a preliminary ruling

30 The dispute in the main proceedings concerns a project for the partial diversion of the upper waters of the river Acheloos to Thessaly ('the project at issue in the main

proceedings'). That major project, intended to serve not only the irrigation needs of the region of Thessaly and electricity production but also the supply of water to towns and cities in that region, has long been the subject of litigation. A number of actions, seeking the annulment of the ministerial decrees approving successive versions of that project, have been brought by environmental organisations, international non-governmental organisations and local authorities concerned.

31 The environmental parameters in respect of certain individual technical works forming part of that project were initially approved by two decisions of 9 October 1991 and 21 April 1992 of the competent ministers. They concerned a tunnel of 18.5 kilometres channelling the waters of the river Acheloos to Thessaly and dams and reservoirs, together with works associated with that project.

32 Both those ministerial decisions were annulled, by judgments No 2759/1994 and No 760/1994 respectively of the Simvoulio tis Epikratias (Council of State), on the ground that they were not based on a comprehensive study of the environmental impact of the project at issue in the main proceedings. That court held that the diversion of a proportion of the waters of the river Acheloos to the plain of Thessaly constituted a technically complex and large-scale project whose overall effect on the environment of the areas concerned was not confined to the sum of the strictly local consequences of each of the works considered in isolation. Consequently, it was not sufficient, in order to measure and assess the consequences of that project, to identify the environmental effects of each of the works taken separately, but it was on the contrary necessary to prepare an overall study in which the various distinct consequences and the subsequent environmental impact of that project would be considered and assessed together, in accordance with an appropriate scientific method.

33 Following those judgments, a single assessment was drawn up which related to all the works to be carried out as part of the project at issue in the main proceedings. Consequently, by joint decision of 15 December 1995, the competent ministers approved the environmental parameters relating to the partial diversion to Thessaly of the upper waters of the river Acheloos and the construction and operation of the works associated with that diversion, which included, inter alia, hydroelectric power stations. Further, by another ministerial decision, the maximum volume of water which could be diverted was reduced from 1 100 million to 600 million cubic metres per annum.

34 A further action for the annulment of those decisions was upheld by judgment No 3478/2000 of the Simvoulio tis Epikratias. The court held that, taking into account the findings and evaluations contained in the environmental impact assessment ('the EIA'), it was apparent that the assessment contained a thorough and informed evaluation which balanced the impact of those works against the needs which they were to meet and, in particular, the maintenance and strengthening of productivity in the plain of Thessaly. However, the court also held that that assessment did not consider any alternative solution capable of avoiding the destruction of most of the important monuments in the region concerned. Consequently, those decisions were annulled in their entirety.

35 After the Simvoulio tis Epikratias delivered that judgment, the Minister of the Environment and Public Works decided to commission a 'supplementary environmental impact assessment on the partial diversion to Thessaly of the waters of the river

Acheloos'. It is apparent from that assessment, produced in 2002, that its aim was, in particular, to explore projects which were full alternatives to that diversion, to present new environmental data which had in the interim become available on the areas affected by the works and to clarify the environmental impact and the remedial measures, taking into account the specific technical studies carried out in those affected areas since completion of the environmental impact assessment produced in 1995. That supplementary assessment was approved by a decision of the Minister of Culture of 13 March 2003.

36 Thereafter, the competent ministers issued their joint decision of 19 March 2003 which approved the environmental parameters applicable to the construction and operation of the works partially to divert the upper waters of the Acheloos to Thessaly.

37 That decision was annulled by judgment No 1688/2005 of the Simvoulio tis Epikratias. In that judgment, the court held that, taking into account the provisions then in force of Law 1739/1987 (FEK A' 201/20.11.1987) and in the light both of Directive 2000/60 and of the principle of sustainable water management, the execution of works exploiting water resources was permitted only if such works were part of a programme of sustainable development of those resources. The work relating to the project at issue in the main proceedings had never been incorporated into such a programme, which, moreover, had never been implemented. As a consequence of that decision to annul, the Simvoulio tis Epikratias also annulled, by judgment No 1186/2006, a decision of 18 March 2005, whereby the Minister of the Environment approved the award of the contract for the 'completion of the Sikia dam'.

38 On 2 August 2006, Law 3481/2006 (FEK A' 162/2.8.2006) was adopted; Articles 9 and 13 thereof, approving the project at issue in the main proceedings, were submitted to the Greek Parliament, in the form of an amendment, on 6 July 2006. Article 9 of that law provided that, until the ratification of the national programme for management and protection of the water resources of the country and the regional management plans, it was possible to approve management plans for the waters of specific river basins and to transfer water to other basins, and that projects relating to such plans had to be approved by legislation where they were large-scale projects or projects of national importance. Under Article 13 of that law, the works associated with the project at issue in the main proceedings were defined as large-scale works and works in the public interest and the management plan for the Acheloos and Pinios river basins was approved, as were the environmental specifications applicable to the construction and operation of the works associated with that project.

39 Article 13(4) of Law 3481/2006 provided that it was possible, in accordance with the management plan and the environmental parameters ratified in Article 13(3), to bring into service or complete construction of the public works and the works of Dimosia Epikhirisi Ilektrismou (DEI (the Public Power Corporation of Greece)) relating to the diversion of the upper waters of the river Acheloos to Thessaly or the production of electrical energy which had been subject to a public procurement procedure and which were constructed or under construction. On the basis of that provision the company awarded the contract was instructed to continue the work which it had suspended following the judgment which annulled the award of the contract.

40 The applicants in the main proceedings seek the annulment of the project at issue in the main proceedings in its entirety. The actions are directed against both Article 13 of Law 3481/2006 and the related administrative measures. The Simvoulio tis Epikratias states that both the measures approving the environmental parameters and the measures pursuant to which the works associated with that project were to be carried out had previously been annulled by judgments of that court delivered prior to the entry into force of Law 3481/2006. In the opinion of the referring court, there is therefore an attempt to adopt those measures anew by means of the abovementioned management plan, which was approved on the basis of Article 9 of that law. The main question at issue in the main proceedings is the compatibility of the provisions of Articles 9 and 13 of that law with European Union law.

41 In those circumstances, the Simvoulio tis Epikratias decided to stay the proceedings and refer the following questions to the Court of Justice for a preliminary ruling:

‘1. Does Article 13(6) of Directive 2000/60/EC … merely set an ultimate temporal limit (22 December 2009) for the drawing up of management plans for water resources or does it lay down, up until that date, a special time-limit for transposition of the relevant provisions of Articles 3, 4, 5, 6, 9, 13 and 15 of that directive?

2. Should the Court of Justice hold that the foregoing provision of that directive merely sets an ultimate temporal limit (22 December 2009) for the drawing up of management plans for water resources:

Is national legislation that permits the transfer of water from a particular river basin to another river basin, without the plans having yet been drawn up for the river basin districts within which the river basins from and towards which water will be transferred are located, consistent with Articles 2, 3, 4, 5, 6, 9, 13 and 15 of Directive 2000/60, given that, under Article 2(15) of that directive, the main unit for management of a river basin is the river basin district to which it belongs?

3. Should the preceding question be answered in the affirmative:

For the purpose of Articles 2, 3, 5, 6, 9, 13 and 15 of Directive 2000/60, is the transfer of water from a river basin district to a neighbouring river basin district permitted? Should the answer be in the affirmative, can the purpose of that transfer be only to meet water-supply needs or can irrigation and power generation also be served? Is it in any event a requirement, for the purpose of those provisions of that directive, that the administrative authorities have decided, stating reasons and on the basis of the necessary scientific study, that the receiving river basin district cannot meet with its own water resources the needs which it has in respect of water supply, irrigation and so forth?

4. Should the Court of Justice hold, as regards Question 1, that Article 13(6) of Directive 2000/60 does not merely set an ultimate temporal limit (22 December 2009) for the drawing up of management plans for water resources, but lays down a special time-limit for transposition of the relevant provisions of Articles 3, 4, 5, 6, 9, 13 and 15 of that directive:

Does national legislation, enacted within that special time-limit for transposition, that permits the transfer of water from a particular river basin to another river basin, without the plans having yet been drawn up for the river basin districts within which the river basins from and towards which water will be transferred are located, place, without more, the practical effect of that directive at risk, or is it necessary, in order to assess whether the practical effect of the directive is placed at risk, to take account of criteria such as the scale of the interventions provided for and the objectives of the transfer of the water?

5. Is a legislative provision which is enacted by a national parliament and which approves river basin management plans without the relevant national rules providing for a public consultation stage in the procedure before the national parliament, and without it being apparent from the case-file that the consultation procedure before the administrative authorities that is provided for in Directive 2000/60 was observed, compatible with Articles 13, 14 and 15 of that directive which concern the procedures for informing and consulting the public and for public participation?

6. For the purpose of … Directive 85/337/EEC …, does an [EIA] which relates to the construction of dams and the transfer of water and which was placed for approval before the national parliament after the annulment by a judicial decision of the measure by which it had previously been approved and in respect of which the publicity procedure had previously been observed, without that procedure being observed anew, meet the requirements of Articles 1, 2, 5, 6, 8 and 9 of that directive regarding informing the public and public participation?

7. Does a project to divert a river fall within the field of application of Directive 2001/42/EC … where that plan:

   (a) concerns the construction of dams and the transfer of water from one river basin district to another (from those of western mainland Greece and Epirus to those of Thessaly),

   (b) falls within the field of application of Directive 2000/60 …,

   (c) concerns works under … Directive 85/337 …,

   (d) may have environmental effects on areas covered by … Directive 92/43/EEC ...?

8. Should the preceding question be answered in the affirmative:

   For the purpose of Article 13(1) of Directive 2001/42, can acts which concerned the project at issue and which have been annulled with retroactive effect by judicial decisions be considered to be formal preparatory acts which were issued before 21 July 2004 so that there is no obligation to prepare a strategic environmental report?

9. Should the preceding question be answered in the negative:

   For the purpose of Article 11(2) of Directive 2001/42, if a plan simultaneously falls within the field of application of that directive and within that of Directives

2000/60 and 85/337 which also require the environmental effects of that scheme to be assessed, are the assessments which have been drawn up on the basis of the provisions of Directives 2000/60 and 85/337 sufficient for observance of the requirements of Directive 2001/42, or will an autonomous strategic environmental report have to be prepared?

10. For the purpose of Articles 3, 4 and 6 of … Directive 92/43 …, were the areas which were included in the national lists of [SCIs] and, ultimately, were included in the Community list of SCIs covered by the protection afforded by Directive 92/43 before the publication of Commission Decision 2006/613/EC of 19 July 2006 adopting [, pursuant to Council Directive 92/43,] the list of sites of Community importance for the Mediterranean biogeographical region [(OJ 2006 L 259, p. 1)]?

11. Is it possible, for the purpose of Articles 3, 4 and 6 of Directive 92/43, for the competent national authorities to grant consent authorising the carrying out of a project for the diversion of waters which is not directly connected with or necessary to the conservation of a district included within a special protection area when all the studies that are contained in the file for that project record a complete lack of information or an absence of reliable and updated data regarding the birds in that district?

12. For the purpose of Articles 3, 4 and 6 of Directive 92/43, can reasons for which a project to divert waters is undertaken that relate principally to irrigation and secondarily to water supply constitute the imperative public interest which that directive requires in order for that scheme to be permitted to be carried out notwithstanding its adverse effects on areas protected by that directive?

13. Should the preceding question be answered in the affirmative:

In determining the sufficiency of the compensatory measures which are necessary to ensure that the overall coherence of the Natura 2000 network, where that is harmed by a project to divert waters, is protected, for the purpose of Articles 3, 4 and 6 of Directive 92/43 should criteria such as the scale of that diversion and the extent of the works which the diversion entails be taken into account?

14. For the purpose of Articles 3, 4 and 6 of Directive 92/43, interpreted in the light of the principle of sustainable development as enshrined in Article 6 of the EC Treaty, may the competent national authorities grant consent for the carrying out of a project to divert waters within a Natura 2000 area that is not directly connected with or necessary to the preservation of the coherence of that area, when it is apparent from the [EIA] for that project that the project will result in the conversion of a natural fluvial ecosystem into a man-made fluvial and lacustrine ecosystem?'

Consideration of the questions referred for a preliminary ruling

The first question

42 By its first question, the referring court seeks, in essence, to ascertain whether Article 13(6) of Directive 2000/60 fixes solely a time-limit for the production of river basin management plans or whether it also establishes a special transposition time-limit in respect of certain provisions of Articles 3 to 6, 9, 13 and 15 of that directive.

43 Under the first subparagraph of Article 24(1) of Directive 2000/60, the Member States were to bring into force the laws, regulations and administrative provisions necessary to comply with that directive at the latest by 22 December 2003.

44 The fact that Article 13(6) of Directive 2000/60 states that river basin management plans must be published at the latest nine years after the date of entry into force of that directive, in other words by 22 December 2009, cannot call into question the time-limit laid down for the transposition of that directive in Article 24(1) thereof.

45 Article 13(6) of Directive 2000/60 does not concern the time-limit for the transposition of the directive, but merely fixes a final date for the implementation of one of the measures which the Member States must take pursuant to that directive after its transposition.

46 The Court has indeed already ruled that, by excluding from national legislation in force in September 2004 the definitions of the terms in Article 2 of Directive 2000/60 and the timescales within which the standards of water quality are to be met, as set out in Articles 4 to 6 and 8 of that directive, the obligations under Article 2, read in conjunction with those latter provisions, were not implemented with the binding force required (see, to that effect, Case C-32/05 *Commission* v *Luxembourg* [2006] ECR I-11323, paragraphs 16, 17 and 65).

47 In the light of the foregoing, the answer to the first question is that Articles 13(6) and 24(1) of Directive 2000/60 must be interpreted as respectively fixing 22 December 2009 as the date of expiry of the period allowed to Member States for the publication of river basin management plans and 22 December 2003 as the date of expiry of the maximum period available to the Member States for the transposition of that directive, in particular Articles 3 to 6, 9, 13 and 15 thereof.

The second, third and fourth questions

48 By its second, third and fourth questions, which should be examined together, the referring court seeks first to ascertain whether Directive 2000/60 must be interpreted as precluding a provision of national law whereby consent is given, prior to 22 December 2009, to a transfer of water from one river basin to another or from one river basin district to another where the river basin management plans concerned were not yet adopted by the competent national authorities. If the answer is in the negative, the referring court then asks whether such a transfer can take place solely to meet the objective of supplying drinking water or also for purposes of irrigation and energy production. Lastly, the referring court asks whether the compatibility of such a transfer with that directive is dependent on whether it is impossible for the receiving river basin or river basin district to meet from its own water resources its needs in respect of the supply of drinking water, electricity production or irrigation.

49 It must first be recalled that the project at issue in the main proceedings, in so far as it concerns the transfer of water from one river basin to another or from one river basin district to another, is liable, as observed by the Advocate General in points 66 and 67 of her Opinion, to be incompatible with the environmental objectives stated in Article 4(1) of Directive 2000/60.

50 It must next be recalled that the project at issue in the main proceedings was adopted by the Greek legislature on 2 August 2006.

51 As regards whether the Member State concerned was already bound to comply with the environmental objectives stated in Article 4(1) of Directive 2000/60 at the time when that project was adopted, it must be observed that Article 4(1) provides that, in respect of surface waters and groundwater, Member States are to adopt appropriate measures of conservation in making operational the programmes of measures specified in river basin management plans.

52 Article 4(1) of Directive 2000/60 thereby establishes a link between the appropriate measures of conservation which the Member States are bound to adopt under that provision and the prior existence of a management plan for the river basin district concerned.

53 Consequently, Directive 2000/60 does not prohibit a priori the transfer of water from one river basin to another or from one river basin district to another before the publication of management plans for the river basin districts concerned, that publication being however required, in accordance with Article 13(6) of that directive, by no later than 22 December 2009.

54 It is common ground that, at the time when the project at issue in the main proceedings was adopted, the river basin management plans for the river basins affected by that project did not exist (see judgment of 19 April 2012 in Case C-297/11 *Commission* v *Greece*, paragraph 17).

55 Thus, on the date when the project at issue in the main proceedings was adopted, the Hellenic Republic was not obliged to have produced the management plans for the river basin districts affected by that project. Even though the time-limit for the transposition of Directive 2000/60, as fixed in the first subparagraph of Article 24(1) thereof, had expired, the time-limit laid down in Article 13(6) of the directive for the publication of river basin management plans had not yet been reached.

56 Consequently, the project at issue in the main proceedings, as adopted by the Greek legislature on 2 August 2006, without prior production of river basin management plans for the river basins affected by that project, was not subject to Article 4 of Directive 2000/60.

57 However, it must be recalled that, in accordance with the Court's settled case-law, during the period prescribed for transposition of a directive, the Member States to which it is addressed must refrain from taking any measures liable seriously to compromise the attainment of the result prescribed by that directive. Such an obligation to refrain owed by all the national authorities must be understood as referring to the adoption of any measure, general or specific, liable to produce such a compromising effect (see Case

C-129/96 *Inter-Environment Wallonie* [1997] ECR I-7411, paragraph 45, and Joined Cases C-165/09 to C-167/09 *Stichting Natuur en Milieu and Others* [2011] ECR I-0000, paragraph 78 and the case-law cited).

58 That obligation to refrain from taking measures is also owed by the Member States, by virtue of the application of the second paragraph of Article 10 EC in conjunction with the third paragraph of Article 249 EC, during a transitional period in which they are authorised to continue to apply their national systems, even though those systems do not comply with the directive in question (see, to that effect, *Stichting Natuur en Milieu and Others*, paragraph 79 and the case-law cited).

59 The same holds true where a directive such as Directive 2000/60 establishes a transitional period within which the Member States are not required to adopt all the measures prescribed by the directive.

60 Accordingly, even before 22 December 2009, the date on which the period imposed on the Member States, under Article 13(6) of Directive 2000/60, for the publication of river basin management plans expired, the Member States had to refrain from taking any measures liable seriously to compromise the attainment of the result prescribed by Article 4 of that directive.

61 In particular, as regards the environmental objectives set by Article 4 of Directive 2000/60, it should be noted that, under Article 4(1)(a)(ii), Member States are to 'protect, enhance and restore all bodies of surface water, … with the aim of achieving good surface water status at the latest 15 years after the date of entry into force of this Directive, in accordance with the provisions laid down in Annex V, subject to the application of extensions determined in accordance with paragraph 4 and to the application of paragraphs 5, 6 and 7 without prejudice to paragraph 8'.

62 The realisation of such an objective cannot, subject to certain qualifications, be jeopardised by a national measure, even where that measure was adopted before 22 December 2009.

63 In the absence, in the documents submitted to the Court, of any factor indicative of the situations provided for in Article 4(4) to (6) of Directive 2000/60, it must be observed that, under Article 4(7):

'Member States will not be in breach of this Directive when:

– failure to achieve good groundwater status, good ecological status … or to prevent deterioration in the status of a body of surface water or groundwater is the result of new modifications to the physical characteristics of a surface water body or alterations to the level of bodies of groundwater, or

– failure to prevent deterioration from high status to good status of a body of surface water is the result of new sustainable human development activities

and all the following conditions are met:

(a) all practicable steps are taken to mitigate the adverse impact on the status of the body of water;

(b) the reasons for those modifications or alterations are specifically set out and explained in the river basin management plan required under Article 13 and the objectives are reviewed every six years;

(c) the reasons for those modifications or alterations are of overriding public interest and/or the benefits to the environment and to society of achieving the objectives set out in paragraph 1 are outweighed by the benefits of the new modifications or alterations to human health, to the maintenance of human safety or to sustainable development, and

(d) the beneficial objectives served by those modifications or alterations of the water body cannot for reasons of technical feasibility or disproportionate cost be achieved by other means which are a significantly better environmental option.'

64 While it is true that, as stated in paragraph 56 of this judgment, Article 4(7) is not applicable, as such, to a works project adopted on 2 August 2006, without prior production of river basin management plans for the river basins affected by that project, the conditions governing the project cannot be more rigorous than those pertaining if it had been adopted subsequent to Article 4 of Directive 2000/60 having become applicable to it.

65 In the case of such a project, the criteria and conditions laid down in Article 4(7) of Directive 2000/60 may, in essence, be applied by analogy and, where necessary, *mutatis mutandis*, as setting the upper limit for restrictions on the project.

66 As stated in recital 15 of the preamble to that directive, the supply of water is a service of general interest. As regards the production of electricity and irrigation, it is clear from Article 4(3)(a)(iii) of the directive that they also in principle serve a general interest.

67 Consequently, consent was capable of being given to a project such as that at issue in the main proceedings, which is not subject to Article 4 of Directive 2000/60 and which would have been liable to have adverse effects on water of the kind stated in Article 4(7), at the very least if:

– all practicable steps were taken to mitigate the adverse impact of the project on the status of the body of water;

– the reasons why that project had to be carried out were specifically set out and explained;

– that project served a general interest which might consist in, inter alia, the supply of water, electricity production or irrigation, and/or the benefits to the environment and society linked to the achievement of the objectives set out in Article 4(1) were outweighed by the benefits to human health, to the maintenance of human safety or to sustainable development resulting from that project, and

– lastly, the beneficial objectives pursued by that project could not for reasons of technical feasibility or disproportionate cost be achieved by other means which would have been a significantly better environmental option.

68 While the fact that it is impossible for a river basin or river basin district to meet from its own water resources its needs in terms of drinking water, electricity production or irrigation may indeed be capable of justifying, in the light of Directive 2000/60, a transfer of water such as that in the project at issue in the main proceedings, it is not the case that such a transfer can be justified only by reason of such an impossibility. It cannot be ruled out that, even where there is no such impossibility, the transfer of water may be regarded as satisfying the conditions mentioned in the preceding paragraph and, in particular, (i) the condition that it serves a general interest and/or the benefits to the environment and society linked to the achievement of the objectives set out in Article 4(1) of that directive are outweighed by the benefits to human health, to the maintenance of human safety or to sustainable development resulting from the transfer of water and (ii) the condition that the beneficial objectives pursued by that transfer cannot, for reasons of technical feasibility or disproportionate cost, be achieved by other means which would be a significantly better environmental option.

69 In the light of the foregoing, the answer to the second, third and fourth questions is that Directive 2000/60 must be interpreted as meaning that:

– it does not preclude, in principle, a provision of national law whereby consent is given, prior to 22 December 2009, to a transfer of water from one river basin to another or from one river basin district to another where the management plans for the river basin districts concerned were not yet adopted by the competent national authorities;

– such a transfer must not be such as seriously to jeopardise the realisation of the objectives laid down by that directive;

– however, to the extent that that transfer is liable to have adverse effects on water of the kind stated in Article 4(7) of that directive, consent may be given to it, at the very least if the conditions set out in Article 4(7)(a) to (d) are satisfied, and

– the fact that it is impossible for the receiving river basin or river basin district to meet from its own water resources its needs in terms of drinking water, electricity production or irrigation is not a *sine qua non* for such a transfer of water to be compatible with that directive provided that the conditions listed above are satisfied.

The fifth question

70 By its fifth question, the referring court asks whether Articles 13 to 15 of Directive 2000/60 must be interpreted as precluding the approval by a national parliament of management plans for river basins, such as the plans at issue in the main proceedings, where no procedure for public information, consultation or participation has been implemented.

71 Since Articles 13 and 15 of Directive 2000/60 do not lay down any obligation relating to public information, consultation or participation when river basin management plans are produced, this question must be examined solely in the light of Article 14 of that directive, which does lay down such obligations.

72 In that regard, it must be recalled that Article 14(1) of Directive 2000/60 provides that 'Member States shall encourage the active involvement of all interested parties in the implementation of this Directive, in particular in the production, review and updating of the river basin management plans. Member States shall ensure that, for each river basin district, they publish and make available for comments to the public, including users … draft copies of the river basin management plan, at least one year before the beginning of the period to which the plan refers'.

73 Further, the Court declared in Case C-297/11 *Commission* v *Greece*, paragraph 17, that the Hellenic Republic, by not having produced, by 22 December 2009, river basin management plans, both for those river basin districts falling wholly within its territory and for international river basin districts, had failed to fulfil its obligations under Article 13(1) to (3) and (6) and Article 15(1) of Directive 2000/60. In the course of those infringement proceedings, the Hellenic Republic did not maintain that it had, by that date, produced a river basin management plan within the meaning of Directive 2000/60. In particular, it made no mention of the law at issue in the main proceedings.

74 Accordingly, the management plans for river basins, such as the plans at issue in the main proceedings, adopted on 2 August 2006, cannot be regarded as management plans falling within Articles 13 to 15 of Directive 2000/60. The obligation stemming from Article 14(1) of that directive therefore does not apply to such plans.

75 Consequently, the answer to the fifth question is that the fact that a national parliament approves management plans for river basins, such as the plans at issue in the main proceedings, where no procedure for public information, consultation or participation has been implemented does not fall within the scope of Article 14 of Directive 2000/60, and in particular the scope of Article 14(1) thereof.

The sixth question

76 By its sixth question, the referring court asks, in essence, whether Directive 85/337 must be interpreted as precluding legislation such as Law 3481/2006, adopted by the Greek Parliament on 2 August 2006, which approves a project for the partial diversion of the waters of a river such as that at issue in the main proceedings on the basis of an EIA for that project which had served as the basis of an administrative decision adopted at the conclusion of a procedure which complied with the obligations in terms of public information and participation laid down by that directive, even though that decision was annulled by a court order.

77 Article 1(5) of Directive 85/337 provides that that directive 'shall not apply to projects the details of which are adopted by a specific act of national legislation, since the objectives of this Directive, including that of supplying information, are achieved through the legislative process'.

78 It follows from that provision that, where the objectives of Directive 85/337, including that of supplying information, are achieved through a legislative process, that directive does not apply to the project in question (see Case C-287/98 *Linster* [2000] ECR I-6917, paragraph 51; Joined Cases C-128/09 to C-131/09, C-134/09 and C-135/09 *Boxus and Others* [2011] ECR I-0000, paragraph 36; and Case C-182/10 *Solvay and Others* [2012] ECR I-0000, paragraph 30).

79 That provision lays down two conditions for the exclusion of a project from the scope of Directive 85/337. The first requires the details of the project to be adopted by a specific legislative act. Under the second, the objectives of the directive, including that of supplying information, must be achieved through the legislative process (see Case C-435/97 *WWF and Others* [1999] ECR I-5613, paragraph 57; *Boxus and Others*, paragraph 37; and *Solvay and Others*, paragraph 31).

80 The first condition entails, first of all, adoption of the project by a specific legislative act. It should be pointed out in this regard that the terms 'project' and 'development consent' are defined in Article 1(2) of Directive 85/337. Thus, a legislative act adopting a project must, if it is to come within the scope of Article 1(5) of the directive, be specific and display the same characteristics as a development consent of that kind. It must in particular grant the developer the right to carry out the project (see *WWF and Others*, paragraph 58; *Boxus and Others*, paragraph 38; and *Solvay and Others*, paragraph 32).

81 The project must also be adopted in detail, that is to say, in a sufficiently precise and definitive manner, so that the legislative act adopting the project must include, like a development consent, following their consideration by the legislature, all the elements of the project relevant to the environmental impact assessment (see *WWF and Others*, paragraph 59; *Boxus and Others*, paragraph 39; and *Solvay and Others*, paragraph 33). The legislative act must therefore demonstrate that the objectives of Directive 85/337 have been achieved as regards the project in question (see *Linster*, paragraph 56; *Boxus and Others*, paragraph 39; and *Solvay and Others*, paragraph 33).

82 It follows that the details of a project cannot be considered to be adopted by a legislative act, for the purposes of Article 1(5) of Directive 85/337, if that act does not include the elements necessary to assess the environmental impact of the project or if the adoption of other measures is needed in order for the developer to be entitled to proceed with the project (see *WWF and Others*, paragraph 62; *Linster*, paragraph 57; *Boxus and Others*, paragraph 40; and *Solvay and Others*, paragraph 34).

83 As regards the second condition, it is clear from Article 2(1) of Directive 85/337 that the fundamental objective of the directive is to ensure that projects likely to have significant effects on the environment by virtue, inter alia, of their nature, size or location are made subject to an assessment with regard to their environmental effects before consent is given (see *Linster*, paragraph 52; *Boxus and Others*, paragraph 41; and *Solvay and Others*, paragraph 35).

84 In addition, the sixth recital in the preamble to Directive 85/337 states that the assessment must be conducted on the basis of the appropriate information supplied by the developer, which may be supplemented by the authorities and by the people who may be concerned by the project in question (see *WWF and Others*, paragraph 61; *Linster*, paragraph 53; *Boxus and Others*, paragraph 42; and *Solvay and Others*, paragraph 36).

85 Consequently, the national legislature must have sufficient information at its disposal at the time when the project is adopted. In accordance with Article 5(3) of Directive 85/337 and Annex IV thereto, the minimum information to be supplied by the developer is to include a description of the project comprising information on the site, design and

size of the project, a description of the measures envisaged in order to avoid, reduce and, if possible, remedy significant adverse effects, and the data required to identify and assess the main effects which the project is likely to have on the environment (see *Boxus and Others*, paragraph 43, and *Solvay and Others*, paragraph 37).

86 There is however nothing to prevent the national legislature, when adopting a project, from using information gathered as part of an earlier administrative procedure and the EIA produced in that connection, provided that the EIA is based on information and knowledge that are not out of date. The EIA, which must be carried out before the decision-making process, involves an examination of the substance of the information gathered as well as a consideration of the expediency of supplementing it, if appropriate, with additional data (see Case C-50/09 *Commission* v *Ireland* [2011] ECR I-0000, paragraph 40).

87 In that regard, the fact that the EIA was produced as part of an administrative procedure which led to the adoption of a decision which was ultimately annulled by court order is, as such, of no relevance.

88 However, a legislative act which does no more than simply 'ratify' a pre-existing administrative act, by merely referring to overriding reasons in the public interest, without the prior initiation of a substantive legislative process enabling the conditions stated in paragraph 79 of this judgment to be fulfilled, cannot be regarded as a specific legislative act within the meaning of Article 1(5) of Directive 85/337 and is not therefore sufficient to exclude a project from the scope of that directive (see *Boxus and Others*, paragraph 45, and *Solvay and Others*, paragraph 39).

89 In particular, a legislative act adopted without the members of the legislative body having had available to them the information mentioned in paragraph 85 of this judgment cannot fall within the scope of Article 1(5) of Directive 85/337 (see *Boxus and Others*, paragraph 46, and *Solvay and Others*, paragraph 40).

90 It is for the national court to determine whether those conditions have been satisfied. For that purpose, it must take account of both the content of the legislative act adopted and the entire legislative process which led to its adoption, in particular the preparatory documents and parliamentary debates (see *Boxus and Others*, paragraph 47, and *Solvay and Others*, paragraph 41).

91 The answer to the sixth question therefore is that Directive 85/337, and in particular Article 1(5) thereof, must be interpreted as not precluding legislation such as Law 3481/2006, adopted by the Greek Parliament on 2 August 2006, which approves a project for the partial diversion of the waters of a river such as that at issue in the main proceedings on the basis of an EIA for that project which had served as the basis for an administrative decision adopted on the conclusion of a procedure which complied with the obligations in terms of public information and participation laid down by that directive, even where that decision was annulled by court order, provided that that legislation constitutes a specific legislative act, so that the objectives of that directive can be achieved through the legislative process. It is for the national court to determine whether those two conditions have been complied with.

The seventh question

92 By its seventh question, the referring court seeks, in essence, to ascertain whether a project for the partial diversion of the waters of a river, such as that at issue in the main proceedings, must be regarded as a plan or programme falling within the scope of Directive 2001/42.

93 In that regard, it must be observed that, in order to establish whether a project falls within the scope of Directive 2001/42, it is necessary to consider whether that project is a plan or a programme within the meaning of Article 2(a) of that directive.

94 Under the second indent of Article 2(a) of Directive 2001/42, only plans and programmes required by legislative, regulatory or administrative provisions are to be regarded as 'plans and programmes' within the meaning of that directive.

95 It is not evident that the project concerned constitutes a measure which defines criteria and detailed rules for the development of land and which subjects implementation of one or more projects to rules and procedures for scrutiny (see, to that effect, Case C-567/10 *Inter-Environment Bruxelles and Others* [2012] ECR I-0000, paragraph 30).

96 Consequently, the answer to the seventh question is that a project for the partial diversion of the waters of a river, such as that at issue in the main proceedings, is not to be regarded as a plan or programme falling within the scope of Directive 2001/42.

The eighth and ninth questions

97 Having regard to the answer given to the seventh question, there is no need to answer the eighth and ninth questions of the referring court.

The tenth question

98 By its tenth question, the referring court asks whether the areas which were listed in the national list of SCIs transmitted to the Commission pursuant to the second subparagraph of Article 4(1) of Directive 92/43 and were then included in the list of SCIs adopted by Decision 2006/613 were entitled to the protection of that directive before that decision was published.

99 Decision 2006/613, whereby the Commission adopted the list of SCIs for the Mediterranean biogeographical region, took effect, pursuant to Article 254(3) EC, upon its notification to the Member States.

100 As the Commission has stated, without being contradicted, that decision was in fact notified to the Hellenic Republic on 19 July 2006, in other words prior to the adoption, on 2 August 2006, of Law 3481/2006 approving the project for the partial diversion of the waters of the river Acheloos.

101 Under Article 4(5) of Directive 92/43, the protective measures prescribed in Article 6(2) to (4) of that directive are required only as regards sites which, in accordance with the third subparagraph of Article 4(2) thereof, are on the list of sites selected as SCIs which has been adopted by the Commission in accordance with the procedure laid down in Article 21 of that directive (see Case C-117/03 *Dragaggi and Others* [2005] ECR I-167, paragraph 25).

102 It follows that, after notification of Decision 2006/613 to the Member State concerned, it was obliged to take the protective measures laid down in Article 6(2) to (4) of Directive 92/43.

103 That conclusion cannot be called into question by the fact that, following the annulment, in 2005, of the administrative decisions giving consent to the project at issue in the main proceedings, the legislative provisions contained in Law 3481/2006 giving consent to that project were submitted to the Greek Parliament in the form of an amendment on 6 July 2006, while Decision 2006/613 was notified to the Hellenic Republic on 19 July of that year. In such circumstances, the application of Article 6(2) to (4) of Directive 92/43 relates, in any event, to a situation which cannot be regarded as already established.

104 That said, it must, in any event, be recalled that, even before the entry into force of Decision 2006/613, the Member States are to protect sites as soon as they propose them, under Article 4(1) of Directive 94/43, as sites eligible for identification as SCIs on the national list transmitted to the Commission (see, to that effect, *Dragaggi and Others*, paragraph 26). The Member States are required, under that directive, to take protective measures that are appropriate, having regard to the directive's conservation objective, for the purpose of safeguarding the relevant ecological interest which those sites have at national level (see *Dragaggi and Others*, paragraph 30) and cannot therefore consent to interventions which may create the risk of seriously compromising the ecological characteristics of those sites, for example interventions which create the risk of significantly reducing the surface area of a site, of leading to the disappearance of priority species present on that site, or, finally, of having as an outcome the destruction of the site or the eradication of its representative characteristics (see Case C-244/05 *Bund Naturschutz in Bayern and Others* [2006] ECR I-8445, paragraph 46, and Case C-340/10 *Commission* v *Cyprus* [2012] ECR I-0000, paragraph 44).

105 In the light of the foregoing, the answer to the tenth question is that the areas which were listed in the national list of SCIs transmitted to the Commission pursuant to the second subparagraph of Article 4(1) of Directive 92/43 and were then included in the list of SCIs adopted by Decision 2006/613 were entitled, after notification of Decision 2006/613 to the Member State concerned, to the protection of that directive before that decision was published. In particular, after that notification, the Member State concerned also had to take the protective measures laid down in Article 6(2) to (4) of the directive.

The eleventh question

106 By its eleventh question, the referring court seeks, in essence, to ascertain whether Directive 92/43 must be interpreted as precluding consent being given to a project for the diversion of water not directly connected with or necessary to the conservation of a SPA, but likely to have a significant effect on that SPA, in the absence of information or of reliable and updated data concerning the birds in that area.

107 According to the Court's settled case-law, under Article 4(1) and (2) of Directive 79/409 the Member States are required to classify as SPAs the territories meeting the ornithological criteria specified by those provisions (see, inter alia, Case C-418/04 *Commission* v *Ireland* [2007] ECR I-10947, paragraph 36).

108 It follows from Article 7 of Directive 92/43 that Article 6(2) to (4) of that directive replaces the first sentence of Article 4(4) of Directive 79/409 as from the date of implementation of Directive 92/43 or the date of classification by a Member State under Directive 79/409, where the latter date is later (see, in particular, Case C-418/04 *Commission* v *Ireland*, paragraph 173, and Case C-404/09 *Commission* v *Spain* [2011] ECR I-0000, paragraph 97).

109 It is clear from the order for reference and from the oral submissions of the Commission that the SPAs affected by the project at issue in the main proceedings had already been classified prior to the adoption of Law 3481/2006. Consequently, the obligations stemming from Article 6(2) to (4) of Directive 92/43 were applicable to those SPAs at the date when that project was approved.

110 In that regard, it must be recalled that Article 6(3) of Directive 92/43 provides for an assessment procedure intended to ensure, by means of a prior examination, that a plan or project which is not directly connected with or necessary to the management of the site concerned but likely to have a significant effect on it is authorised only to the extent that it will not adversely affect the integrity of that site (see Case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging* [2004] ECR I-7405, paragraph 34, and Case C-304/05 *Commission* v *Italy* [2007] ECR I-7495, paragraph 56).

111 With regard to the concept of 'appropriate assessment' within the meaning of Article 6(3) of Directive 92/43, it should be noted that the directive does not define any particular method for the carrying out of such an assessment (*Commission* v *Italy*, paragraph 57).

112 The Court has, however, held that that assessment must be organised in such a manner that the competent national authorities can be certain that a plan or project will not have adverse effects on the integrity of the site concerned, given that, where doubt remains as to the absence of such effects, the competent authority will have to refuse development consent (see *Commission* v *Italy*, paragraph 58).

113 With regard to the factors on the basis of which the competent authorities may gain the necessary level of certainty, the Court has stated that it must be ensured that no reasonable scientific doubt remains, and those authorities must rely on the best scientific knowledge in the field (see *Waddenvereniging and Vogelbeschermingsvereniging*, paragraphs 59 and 61, and *Commission* v *Italy*, paragraph 59).

114 Furthermore, knowledge of the effects of a plan or a project in the light of the conservation objectives relating to a given site is an essential prerequisite for the application of Article 6(4) of Directive 92/43, since, in the absence thereof, no condition for application of that derogating provision can be assessed. The assessment of any imperative reasons of overriding public interest and that of the existence of less harmful alternatives require a weighing up against the damage caused to the site by the plan or project under consideration. In addition, in order to determine the nature of any compensatory measures, the damage to the site must be precisely identified (see, to that effect, *Commission* v *Italy*, paragraph 83, and *Solvay and Others*, paragraph 74).

115 In the light of the foregoing, it cannot be held that an assessment is appropriate where information and reliable and updated data concerning the birds in that SPA are lacking.

116 That said, where the development consent given to a project is annulled or revoked because that assessment was not appropriate, it cannot be ruled out that the competent national authorities may gather *a posteriori* reliable and updated data on the birds in the SPA concerned and that they may appraise, on the basis of that data and an assessment thereby supplemented, whether the project for the diversion of water adversely affects the integrity of that SPA and, where necessary, what compensatory measures must be taken to ensure that the execution of the project will not jeopardise protection of the overall coherence of Natura 2000.

117 Consequently, the answer to the eleventh question is that Directive 92/43, and in particular Article 6(3) and (4) thereof, must be interpreted as precluding development consent being given to a project for the diversion of water which is not directly connected with or necessary to the conservation of a SPA, but likely to have a significant effect on that SPA, in the absence of information or of reliable and updated data concerning the birds in that area.

The twelfth question

118 By its twelfth question, the referring court seeks, in essence, to ascertain whether Directive 92/43 must be interpreted as meaning that grounds linked, on the one hand, to irrigation and, on the other, to the supply of drinking water, relied on in support of a project for the diversion of water, may constitute imperative reasons of overriding public interest capable of justifying the implementation of a project which adversely affects the integrity of the sites concerned.

119 Article 6(4) of Directive 92/43 provides that if, in spite of a negative assessment carried out in accordance with the first sentence of Article 6(3) thereof, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, and there are no alternative solutions, the Member State is to take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected (see *Commission* v *Italy*, paragraph 81, and *Solvay and Others*, paragraph 72).

120 As is clear from paragraphs 100, 101, 107 and 108 of this judgment, such a provision applies both to SPAs and to SCIs in the list adopted by the Commission in accordance with the third subparagraph of Article 4(2) of Directive 92/43.

121 An interest capable of justifying, for the purposes of Article 6(4) of Directive 92/43, the implementation of a plan or project must be both 'public' and 'overriding', which means that it must be of such an importance that it can be weighed against that directive's objective of the conservation of natural habitats and wild fauna, including birds, and flora (see, to that effect, *Solvay and Others*, paragraph 75).

122 Irrigation and the supply of drinking water meet, in principle, those conditions and are therefore capable of justifying the implementation of a project for the diversion of water in the absence of alternative solutions.

123 However, where the SCI concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised, under the second subparagraph of Article 6(4) of Directive 92/43, are those relating to human health or

public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.

124 Since the Commission has not, in the present case, been asked to give an opinion, the Court must examine whether irrigation and the supply of drinking water may fall within the considerations stated in the preceding paragraph.

125 As regards irrigation, it is evident that it cannot in principle qualify as a consideration relating to human health or public safety. On the other hand, it appears more plausible that irrigation may, in some circumstances, have beneficial consequences of primary importance for the environment.

126 In contrast, the supply of drinking water is, in principle, to be included within considerations relating to human health.

127 In any event, it is for the referring court to assess whether the project at issue in the main proceedings does in fact adversely affect the integrity of one or more SCIs hosting a priority natural habitat type and/or a priority species.

128 In the light of the foregoing, the answer to the twelfth question is that Directive 92/43, and in particular Article 6(4) thereof, must be interpreted as meaning that grounds linked, on the one hand, to irrigation and, on the other, to the supply of drinking water, relied on in support of a project for the diversion of water, may constitute imperative reasons of overriding public interest capable of justifying the implementation of a project which adversely affects the integrity of the sites concerned. Where such a project adversely affects the integrity of a SCI hosting a priority natural habitat type and/or a priority species, its implementation may, in principle, be justified by grounds linked with the supply of drinking water. In some circumstances, it might be justified by reference to beneficial consequences of primary importance which irrigation has for the environment. On the other hand, irrigation cannot, in principle, qualify as a consideration relating to human health or public safety, justifying the implementation of a project such as that at issue in the main proceedings.

The thirteenth question

129 By its thirteenth question, the referring court seeks, in essence to ascertain whether, under Directive 92/43, for the purposes of determining the adequacy of compensatory measures account should be taken of the extent of the diversion of water and the scale of the works involved in that diversion.

130 The first sentence of the first subparagraph of Article 6(4) of Directive 92/43 provides that if, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State is to take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected.

131 As stated in paragraph 114 of this judgment, in order to determine the nature of any compensatory measures, the adverse impact of the project on the site concerned must be precisely identified.

132 The extent of the diversion of water and the scale of the works involved in that diversion are factors which must necessarily be taken into account in order to identify with precision the adverse impact of the project on the site concerned and, therefore, to determine the nature of the necessary compensatory measures in order to ensure the protection of the overall coherence of Natura 2000.

133 Consequently, the answer to the thirteenth question is that, under Directive 92/43, and in particular the first sentence of the first subparagraph of Article 6(4) thereof, for the purposes of determining the adequacy of compensatory measures account should be taken of the extent of the diversion of water and the scale of the work involved in that diversion.

The fourteenth question

134 By its fourteenth question, the referring court seeks, in essence to ascertain whether Directive 92/43, interpreted in the light of the objective of sustainable development, as enshrined in Article 6 EC, permits, in relation to sites which are part of the Natura 2000 network, the conversion of a natural fluvial ecosystem into a largely man-made fluvial and lacustrine ecosystem.

135 Even if the conversion of a natural fluvial ecosystem into a largely man-made fluvial and lacustrine ecosystem were to have a negative impact on the integrity of sites which are part of the Natura 2000 network, it does not necessarily follow that consent may not be given to the project which causes that conversion.

136 As stated in paragraph 119 of this judgment, under Article 6(4) of Directive 92/43, which concerns sites which are part of the Natura 2000 network, consent might be given to that project provided that the conditions referred to in that provision are satisfied.

137 According to the third recital in the preamble to Directive 92/43, as the main aim of that directive is to promote the maintenance of biodiversity, taking account of economic, social, cultural and regional requirements, the directive makes a contribution to the general objective of sustainable development. The maintenance of such biodiversity may in certain cases require the maintenance, or indeed the encouragement, of human activities.

138 Accordingly, the first subparagraph of Article 6(4) of Directive 92/43, and in particular the condition that the Member State is to take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected, must be applied in the light of the objective of sustainable development as referred to in the third recital in the preamble to that directive and enshrined in Article 6 EC.

139 Consequently, the answer to the fourteenth question is that Directive 92/43, and in particular the first subparagraph of Article 6(4) thereof, interpreted in the light of the objective of sustainable development, as enshrined in Article 6 EC, permits, in relation to sites which are part of the Natura 2000 network, the conversion of a natural fluvial

ecosystem into a largely man-made fluvial and lacustrine ecosystem provided that the conditions referred to in that provision of the directive are satisfied.

Costs

140 Since these proceedings are, for the parties to the main proceedings, a step in the action pending before the referring court, the decision on costs is a matter for that court. Costs incurred in submitting observations to the Court, other than the costs of those parties, are not recoverable.

On those grounds, the Court (Grand Chamber) hereby rules:

1. Articles 13(6) and 24(1) of Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy must be interpreted as respectively fixing 22 December 2009 as the date of expiry of the period allowed to Member States for the publication of river basin management plans and 22 December 2003 as the date of expiry of the maximum period available to the Member States for the transposition of that directive, in particular Articles 3 to 6, 9, 13 and 15 thereof.

2. Directive 2000/60 must be interpreted as meaning that:

– it does not preclude, in principle, a provision of national law whereby consent is given, prior to 22 December 2009, to a transfer of water from one river basin to another or from one river basin district to another where the managements plans for the river basin districts concerned were not yet adopted by the competent national authorities;

– such a transfer must not be such as seriously to jeopardise the realisation of the objectives laid down by that directive;

– however, to the extent that that transfer is liable to have adverse effects on water of the kind stated in Article 4(7) of that directive, consent may be given to it, at the very least if the conditions set out in Article 4(7)(a) to (d) are satisfied, and

– the fact that it is impossible for the receiving river basin or river basin district to meet from its own water resources its needs in terms of drinking water, electricity production or irrigation is not a *sine qua non* for such a transfer of water to be compatible with that directive provided that the conditions listed above are satisfied.

3. The fact that a national parliament approves management plans for river basins, such as the plans at issue in the main proceedings, where no procedure for public information, consultation or participation has been implemented does not fall within the scope of Article 14 of Directive 2000/60, and in particular the scope of Article 14(1) thereof.

4. **Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment, as amended by Directive 2003/35/EC of the European Parliament and of the Council of 26 May 2003, and in particular Article 1(5) thereof, must be interpreted as not precluding legislation such as Law 3481/2006, adopted by the Greek Parliament on 2 August 2006, which approves a project for the partial diversion of the waters of a river such as that at issue in the main proceedings on the basis of an environmental impact assessment for that project which had served as the basis for an administrative decision adopted on the conclusion of a procedure which complied with the obligations in terms of public information and participation laid down by that directive, even where that decision was annulled by court order, provided that that legislation constitutes a specific legislative act, so that the objectives of that directive can be achieved through the legislative process. It is for the national court to determine whether those two conditions have been complied with.**

5. **A project for the partial diversion of the waters of a river, such as that at issue in the main proceedings, is not to be regarded as a plan or programme falling within the scope of Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment.**

6. **The areas which were listed in the national list of sites of Community importance transmitted to the European Commission pursuant to the second subparagraph of Article 4(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora and were then included in the list of SCIs adopted by Commission Decision 2006/613/EC of 19 July 2006 adopting, pursuant to Council Directive 92/43/EEC, the list of sites of Community importance for the Mediterranean biogeographical region were entitled, after notification of Decision 2006/613 to the Member State concerned, to the protection of that directive before that decision was published. In particular, after that notification, the Member State concerned also had to take the protective measures laid down in Article 6(2) to (4) of the directive.**

7. **Directive 92/43, and in particular Article 6(3) and (4) thereof, must be interpreted as precluding development consent being given to a project for the diversion of water which is not directly connected with or necessary to the conservation of a special protection area, but likely to have a significant effect on that special protection area, in the absence of information or of reliable and updated data concerning the birds in that area.**

8. **Directive 92/43, and in particular Article 6(4) thereof, must be interpreted as meaning that grounds linked, on the one hand, to irrigation and, on the other, to the supply of drinking water, relied on in support of a project for the diversion of water, may constitute imperative reasons of overriding public interest capable of justifying the implementation of a project which adversely affects the integrity of the sites concerned. Where such a project adversely affects the integrity of a site of Community importance hosting a priority natural habitat type and/or a priority species, its implementation**

may, in principle, be justified by grounds linked with the supply of drinking water. In some circumstances, it might be justified by reference to beneficial consequences of primary importance which irrigation has for the environment. On the other hand, irrigation cannot, in principle, qualify as a consideration relating to human health and public safety, justifying the implementation of a project such as that at issue in the main proceedings.

9. **Under Directive 92/43, and in particular the first sentence of the first subparagraph of Article 6(4) thereof, for the purposes of determining the adequacy of compensatory measures account should be taken of the extent of the diversion of water and the scale of the works involved in that diversion.**

10. **Directive 92/43, and in particular the first subparagraph of Article 6(4) thereof, interpreted in the light of the objective of sustainable development, as enshrined in Article 6 EC, permits, in relation to sites which are part of the Natura 2000 network, the conversion of a natural fluvial ecosystem into a largely man-made fluvial and lacustrine ecosystem provided that the conditions referred to in that provision of the directive are satisfied.**

JUDGMENT OF THE COURT (Fourth Chamber)

15 March 2012 (*)

(Failure of a Member State to fulfil obligations – Directive 92/43/EEC – Articles 4(1) and 12(1) – Failure to include Paralimni Lake as a site of Community importance within the time-limit laid down – System of protection for the species Natrix natrix cypriaca (Cypriot grass snake))

In Case C-340/10,

ACTION under Article 258 TFEU for failure to fulfil obligations, brought on 7 July 2010,

European Commission, represented by G. Zavvos and D. Recchia, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Republic of Cyprus, represented by K. Lykourgos and M. Chatzigeorgiou, acting as Agents,

defendant,

THE COURT (Fourth Chamber),

composed of J.-C. Bonichot, President of the Chamber, A. Prechal, K. Schiemann, L. Bay Larsen (Rapporteur) and C. Toader, Judges,

Advocate General: J. Kokott,

Registrar: A. Calot Escobar,

having regard to the written procedure,

having decided, after hearing the Advocate General, to proceed to judgment without an Opinion,

gives the following

Judgment

1 By its application, the European Commission requests the Court to declare that,

– by not having included the site of Paralimni Lake in the national list of proposed sites of Community importance ('SCIs'),

– by tolerating activities which seriously compromise the ecological characteristics of Paralimni Lake and by not having taken the protective measures necessary to maintain the

population of Natrix natrix cypriaca (Cypriot grass snake), the species which constitutes the ecological interest of the lake and Xyliatos Dam, and

– by not having taken the requisite measures to establish and apply a system of strict protection for that species,

the Republic of Cyprus has failed to fulfil its obligations under Article 4(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7), as amended by Council Directive 2006/105/EC of 20 November 2006 (OJ 2006 L 363, p. 368, 'the Habitats Directive'), under the Habitats Directive as interpreted by the judgments in Case C-117/03 *Dragaggi and Others* [2005] ECR I-167 and Case C-244/05 *Bund Naturschutz in Bayern and Others* [2006] ECR I-8445, and under Article 12(1) of that directive respectively.

Legal context

2 Under the first subparagraph of Article 3(1) of the Habitats Directive, '[a] coherent European ecological network of special areas of conservation shall be set up under the title Natura 2000. This network, composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range'.

3 Article 4(1) and (2) of the Habitats Directive provides:

'1. On the basis of the criteria set out in Annex III (Stage 1) and relevant scientific information, each Member State shall propose a list of sites indicating which natural habitat types in Annex I and which species in Annex II that are native to its territory the sites host. For animal species ranging over wide areas these sites shall correspond to the places within the natural range of such species which present the physical or biological factors essential to their life and reproduction. …

The list shall be transmitted to the Commission, within three years of the notification of this Directive, together with information on each site. …

2. On the basis of the criteria set out in Annex III (Stage 2) … , the Commission shall establish, in agreement with each Member State, a draft list of sites of Community importance drawn from the Member States' lists identifying those which host one or more priority natural habitat types or priority species.

…

The list of sites selected as sites of Community importance, identifying those which host one or more priority natural habitat types or priority species, shall be adopted by the Commission in accordance with the procedure laid down in Article 21.'

4 Article 5 of that directive provides:

'1. In exceptional cases where the Commission finds that a national list as referred to in Article 4(1) fails to mention a site hosting a priority natural habitat type or priority species

which, on the basis of relevant and reliable scientific information, it considers to be essential for the maintenance of that priority natural habitat type or for the survival of that priority species, a bilateral consultation procedure shall be initiated between that Member State and the Commission for the purpose of comparing the scientific data used by each.

2. If, on expiry of a consultation period not exceeding six months, the dispute remains unresolved, the Commission shall forward to the Council a proposal relating to the selection of the site as a site of Community importance.

3. The Council, acting unanimously, shall take a decision within three months of the date of referral.

4. During the consultation period and pending a Council decision, the site concerned shall be subject to Article 6(2).'

5 Article 12(1) of the Habitats Directive is worded as follows:

'Member States shall take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) in their natural range, prohibiting:

(a) all forms of deliberate capture or killing of specimens of these species in the wild;

(b) deliberate disturbance of these species, particularly during the period of breeding, rearing, hibernation and migration;

(c) deliberate destruction or taking of eggs from the wild;

(d) deterioration or destruction of breeding sites or resting places.'

6 The Cypriot grass snake is a priority species referred to in Annex II and Annex IV(a) of the Habitats Directive.

The facts of the dispute and the pre-litigation procedure

7 On 16 May 2006 the Commission received a complaint from the Federation of environmental and ecological organisations of Cyprus regarding the inadequate protection of the Cypriot grass snake. According to that complaint, the Republic of Cyprus had wrongly failed, inter alia, to include the area of Paralimni Lake in the national list of SCIs.

8 In the light of the information it had available to it, the Commission, on 23 March 2007, sent to the Republic of Cyprus a letter of formal notice by which it drew the latter's attention to the inadequate protection of that species because of the failure to include the site of Paralimni Lake in the national list of SCIs and the failure to protect that site as well as Xyliatos Dam.

9 By letter of 18 May 2007, the Republic of Cyprus replied to the letter of formal notice indicating that the competent authority was in discussion with the relevant parties in order to arrive at a commonly accepted proposition to include the site of Paralimni Lake in the national list of SCIs before the end of 2007. That Member State also set out the different measures which had been taken to reinforce the protection of that site and the Xyliatos Dam.

Finally, it claimed that sending the letter of formal notice had been premature and unlawful because the Commission should have followed the procedure laid down in Article 5 of the Habitats Directive and not the procedure in Article 258 TFEU.

10 By letter of 6 June 2008, the Commission issued a reasoned opinion in which it stated that, by not adopting the laws, regulations and administrative provisions necessary to comply with the Habitats Directive, the Republic of Cyprus had failed to fulfil its obligations under that directive. As a consequence, the Commission requested the Republic of Cyprus to take the measures necessary to comply with that reasoned opinion within two months of its receipt.

11 By letter of 21 November 2008, the Republic of Cyprus responded to the reasoned opinion and set out the measures which had been taken to protect the Cypriot grass snake and the progress made in relation to the inclusion of the site of Paralimni Lake in the national list of SCIs.

12 By letter of 18 December 2009, the Commission referred in particular to the complaints relating to the property development in the northern part of the site of Paralimni Lake.

13 By letter of 23 December 2009, the Republic of Cyprus informed the Commission that the site had been officially included in the national list of SCIs on 24 November 2009. However, that Member State had not included the northern end of the lake in that list.

14 Subsequently, the Republic of Cyprus rejected the complaints referred to by the Commission in relation to the property development of the northern part of that lake.

The action

Failure to include the site of Paralimni Lake in the national list of SCIs

Arguments of the parties

15 The Commission takes the view that, by not having included the site of Paralimni Lake in the national list of SCIs before expiry of the period set in the reasoned opinion, the Republic of Cyprus has failed to fulfil its obligations under Article 4(1) of the Habitats Directive.

16 As regards Article 5(1) of the Habitats Directive, which the Republic of Cyprus claimed, during the pre-litigation stage, should have been applied where the Commission found that there was a failure to include a site which appears to be essential to the survival of the Cypriot grass snake in the national list of SCIs, the Commission claims that that provision presupposes the existence of a scientific disagreement between it and the Member State concerned, which, in this case, is lacking. In the present case, the information used by each party was the same and was not disputed. In its letters of 12 August and 21 November 2008, the Republic of Cyprus undertook to include the site of Paralimni Lake in the national list of SCIs. Consequently, the question of a scientific disagreement and a comparison of data does not arise.

17 In the alternative, the Commission claims that there are strong indications that the site boundaries which were finally disclosed to it concerning the designation of the SCIs, in so far as they do not include the important area situated at the northern end of Paralimni Lake,

which was transformed into a residential area during 2009, are not sufficient for the protection and conservation of the Cypriot grass snake and, therefore, that the infringement is ongoing.

18 The Republic of Cyprus reiterates that it has never disputed that the site of Paralimni Lake should constitute an SCI. It contends, however, that the boundary of the current area as an SCI is sufficient for the protection and conservation of the species at issue. That species is to be found only in the southern and eastern parts of the SCI. Moreover, the study carried out by the Austrian expert, to which the Commission refers, does not contain clear guidance regarding the demarcation of the SCI which she considers necessary for sufficient protection of the Cypriot grass snake.

19 Since the Republic of Cyprus is claiming, citing scientific data in support, that the demarcation of the SCI is sufficient for the preservation of the Cypriot grass snake and its habitats, which is called in question by the Commission, there is a scientific disagreement relating to the evaluation of the scientific data. That disagreement justifies the application of the bilateral consultation procedure provided for in Article 5 of the Habitats Directive.

Findings of the Court

20 As regards the subject-matter of the action, it must be remembered that under Article 92(2) of the Rules of Procedure of the Court the Court may at any time of its own motion consider whether there exists any absolute bar to proceeding with a case.

21 It is settled case-law that the purpose of the pre-litigation procedure is to give the Member State concerned an opportunity, on the one hand, to comply with its obligations under European Union law and, on the other, to avail itself of its right to defend itself against the objections formulated by the Commission. The subject-matter of the action brought under Article 258 TFEU is, therefore, delimited by the pre-litigation procedure provided for by that article. Accordingly, the action cannot be founded on any objections other than those stated in the pre-litigation procedure (see, inter alia, Case C-152/98 *Commission* v *Netherlands* [2001] ECR I-3463, paragraph 23).

22 In the present case, it should be noted that it is not apparent from the documents before the Court that, during the pre-litigation stage, whether at the stage of the formal notice or that of the reasoned opinion, the question of demarcation of the site of Paralimni Lake was addressed by the parties, nor that the Commission raised any argument specifically relating to the northern part of the site. As regards the failure to include the site of Paralimni Lake in the national list of SCIs, the Commission merely called for the inclusion of that site, identified in general terms and without any indication as regards its demarcation, in the national list of SCIs, and the Republic of Cyprus undertook to include it in that list, which it did, more than 17 months after the reasoned opinion was issued.

23 Since the pre-litigation procedure in no way related to the demarcation of the site of Paralimni Lake nor, in particular, to the question of inclusion of the northern part of the site in it, the action is inadmissible in so far as it refers to that subject.

24 As regards the complaint alleging failure to include the site of Paralimni Lake in the national list of SCIs, the Court notes that it has never been disputed that, in general, that site should have been included in that list.

25 Therefore, it must be held, first, that the conditions for the application of Article 5 of the Habitats Directive were not, in any event, met for either of the two complaints.

26 Second, as regards the complaint alleging failure to include the site of Paralimni Lake in the national list of SCIs, it is not disputed that it was not included in the list before expiry of the period set in the reasoned opinion.

27 Since the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation prevailing in that Member State at the end of the period laid down in the reasoned opinion and the Court cannot take account of any subsequent changes (see, inter alia, Case C-183/05 *Commission* v *Ireland* [2007] ECR I-137, paragraph 17, and judgment of 11 November 2010 in Case C-164/09 *Commission* v *Italy*, paragraph 19), it must be held that the Commission's action is well founded as regards that complaint.

Tolerance of activities which degrade or damage the habitat of the species concerned

Admissibility

– Arguments of the parties

28 The Republic of Cyprus claims that neither the letter of formal notice nor the reasoned opinion refer to the operation of a firing range and excavation works. Therefore, the Commission extended the subject-matter of the dispute by referring, in its action, to the firing range and excavation works as activities which degrade or damage the habitat of the species concerned.

29 The Republic of Cyprus claims that, since it was unable to make comments in response to those arguments they cannot be taken into account by the Court during the consideration of the Commission's complaints. The subject-matter of the dispute may be extended to events which took place after the reasoned opinion was delivered only if they are of the same kind as the events to which the opinion referred and constitute the same conduct, which is not the situation in the present case.

30 As regards the residential development of the 'northern part of the lake', the reasoned opinion did not clearly identify the arguments relied upon more generally in the letter of formal notice. Specifically, the residential development at the location in question was mentioned for the first time in the Commission's letter of 18 December 2009. The 'northern part of the lake' was mentioned neither in the letter of formal notice nor in the reasoned opinion.

31 Consequently, the Republic of Cyprus considers that the Commission's arguments regarding the operation of a firing range, excavation works and residential development in the northern part of Paralimni Lake must be rejected as inadmissible.

32 The Commission points out that, both in its letter of formal notice and its reasoned opinion, it criticises the conduct of the Republic of Cyprus, which tolerates activities seriously compromising the ecological characteristics of the lake as well as the fact that it has not taken the protective measures necessary to maintain the population of the Cypriot grass snake, in breach of European Union law. In that context, and in support of that complaint, the

Commission refers more specifically to the excessive extraction of water, residential development and moto-cross racing.

33 Even if the operation of the firing range and the excavation works took place after the reasoned opinion, the Commission submits that the subject-matter of the dispute may be extended to events which took place after that opinion if they are of the same kind as the events to which the opinion referred and constitute the same conduct. The events at issue are of the same kind as the events to which the opinion referred and constitute the same conduct.

34 As regards the alleged failure to set out arguments clearly in relation to the property development, the Commission points out that it defined the general concept as property development 'beside the lake but also within its boundaries'. That definition manifestly also encompasses the northern part of the lake, given that it is situated 'within the boundaries' of the lake. In any event, the Commission did not have any real possibility of including the issue of the recent property development affecting the northern part of the lake in its letter of formal notice or its reasoned opinion given that the Republic of Cyprus did not include that area in the urban development plan until March 2009, that is to say well after expiry of the period for replying to the reasoned opinion.

– Findings of the Court

35 As regards the excavation works, it must be noted that they are among the matters which the Commission raised, in its letter of formal notice and in its reasoned opinion, against the Republic of Cyprus.

36 Accordingly, the argument regarding tolerance of the excavation works is admissible.

37 As regards the operation of the firing range, it should be noted that, as the Commission itself accepts, that matter was not mentioned during the pre-litigation procedure. While it is true that even events which took place after the reasoned opinion, but of the same kind as the events to which the opinion referred and constitute the same conduct, may be taken into account in the context of infringement proceedings (see, to that effect, Case 42/82 *Commission* v *France* [1983] ECR 1013, paragraph 20, and Case 113/86 *Commission* v *Italy* [1986] ECR 607, paragraph 11), that is not the case with the operation of a firing range when compared with excessive extraction of water, residential development, excavation works or the organisation of moto-cross racing.

38 Therefore, the argument regarding the operation of the firing range is not admissible.

39 As regards the argument concerning the residential development in the northern part of Paralimni Lake and its effects in that area, it should be noted that, in view of what is stated at paragraph 23 of this judgment and the fact that the argument was not, in any event, invoked by the Commission in its letter of formal notice or its reasoned opinion, it is also inadmissible.

Substance

– Arguments of the parties

40 The Commission takes the view that the case-law of the Court, which accepts the necessity of protecting SCIs and safeguarding the objectives of the Habitats Directive, in

particular regarding the formation of a coherent European ecological network, also applies to sites which satisfy the necessary ecological criteria to be included in the list of SCIs.

41 The Commission states that the Republic of Cyprus tolerates the unlawful excessive extraction of water, which is the cause, in particular, of destruction of the habitat of the species concerned or the elimination of its representative characteristics. In addition, the residential development on the site at issue reduces the surface of that habitat and has, therefore, very substantial adverse effects on the conservation of the site and the species concerned. Furthermore, the organisation of moto-cross racing is particularly harmful to the Cypriot grass snake because of the continuous disturbance caused and is a hazard because it leads to injury and even death of the animals.

42 The Republic of Cyprus states that it has stopped the removal of water from where the Cypriot grass snake has its habitat, and that, therefore, the concerns regarding a drop in water level in the habitat of that species and the destruction of that habitat through the extraction of water are no longer justified. As regards the construction of residential buildings 'beside the lake', the defendant Member State states that there is no residential development within the SCI at issue and that the residential development on the outskirts of that site does not restrict the habitat of the Cypriot grass snake and will not have harmful consequences, contrary to what the Commission claims. As for the operation of a moto-cross track, the Republic of Cyprus notes that it has been terminated and the track has been demolished.

– Findings of the Court

43 It should be noted that, in the case of sites eligible for identification as sites of Community importance which are included in the national lists transmitted to the Commission and, in particular, sites hosting priority natural habitat types or priority species, the Member States are, by virtue of the Habitats Directive, required to take protective measures that are appropriate, from the point of view of the Directive's conservation objective, for the purpose of safeguarding the relevant ecological interest which those sites have at national level (see *Draggagi and Others*, paragraph 30).

44 The appropriate protection scheme applicable to the sites which appear on a national list transmitted to the Commission under Article 4(1) of the Habitats Directive requires Member States not to authorise interventions which incur the risk of seriously compromising the ecological characteristics of those sites. This is particularly the case when an intervention poses the risk either of significantly reducing the area of a site, or of leading to the disappearance of priority species present on the site, or, finally, of having as an outcome the destruction of the site or the destruction of its representative characteristics (see *Bund Naturschutz in Bayern and Others*, paragraphs 46 and 47).

45 If that were not the case, the European Union decision-making process, which is not only based on the integrity of the sites as notified by the Member States, but is also characterised by the ecological comparisons between the different sites proposed by the Member States, would run the risk of being distorted and the Commission would no longer be in a position to fulfil its duties in the area concerned, namely, in particular, to draw up the list of selected sites as sites of Community importance in order to form a coherent European ecological network (see *Bund Naturschutz in Bayern and Others*, paragraphs 41 and 42).

46 The above considerations also apply, in any event, mutatis mutandis, to the sites which the Member State at issue does not dispute satisfy the ecological criteria in Article 4(1) of the Habitats Directive and which, therefore, should have been included in the national list of SCIs sent to the Commission.

47 It cannot be permitted, under the Habitats Directive and the objectives which it pursues, that a site such as that at issue in the present case, which the Member State concerned does not dispute must be included in that list, does not enjoy any protection.

48 As regards the conduct of the Republic of Cyprus of which the Commission complains and which it claims is the cause of destruction of the habitat of the Cypriot grass snake in the site of Paralimni Lake and of the endangerment, on the same site, of the maintenance of the population of that species, it is not disputed that the organisation of moto-cross racing on the site at issue, which the defendant Member State claims to have terminated after expiry of the period set in the reasoned opinion, constitutes conduct likely to seriously compromise the ecological characteristics of the site.

49 In that respect, the complaint is therefore well founded.

50 As regards the excessive extraction of water on the site at issue, it is apparent from the documents before the Court that it had not terminated upon the expiry of the two month period set in the reasoned opinion. It is clear that, in the present case, that type of operation is capable of having a considerable negative impact on the habitat of the Cypriot grass snake and on the conservation of that species, particularly during years of drought.

51 Accordingly, the complaint must also be upheld in that respect.

52 As regards the property development other than in the northern part of the SCI at issue, which allegedly causes a reduction of the area of habitat of the species concerned and which the Commission raised against the Republic of Cyprus, the latter accepts that such a development took place around the SCI but not within it and disputes the harmful effects alleged by the Commission.

53 In that regard, it is established case-law that, in proceedings for failure to fulfil obligations, it is for the Commission to prove the existence of the alleged infringement and to provide the Court with the information necessary for it to determine whether the infringement is made out, and the Commission may not rely on any presumption for that purpose (see, inter alia, *Commission* v *Ireland*, paragraph 39, and judgment of 22 September 2011 in Case C-90/10 *Commission* v *Spain*, paragraph 25).

54 In the absence of any evidence of the impact of that property development on the area of habitat of the Cypriot grass snake in the part of the SCI concerned, such an argument, like the related argument on the tolerance of excavation works, cannot, in any event, be considered well founded.

55 Therefore, the complaint alleging infringement of the Habitats Directive, due to the tolerance of activities which degrade and damage the habitat of the species concerned in respect of the site of Paralimni Lake, must be upheld, subject to what is stated at paragraph 54 of the present judgment.

Failure to establish and apply a system of strict protection for the Cypriot grass snake

Arguments of the parties

56 The Commission takes the view that, by tolerating the abovementioned activities such as, in particular, the excessive extraction of water and the organisation of moto-cross racing, and by not applying protective measures, the Republic of Cyprus has failed to fulfil its obligations under Article 12(1) of the Habitats Directive. As a consequence of those activities the area of habitat of the Cypriot grass snake and the population of that species have declined at the site of Paralimni Lake.

57 The Commission is of the opinion that the building projects on that site have serious consequences as a result of the earthworks and the debris which damage the habitat of that species. The division of the northern part of Paralimni Lake also infringes Article 12(1)(a) and (b) of the Habitats Directive.

58 Except for the illegal operation of a racing circuit, the Republic of Cyprus claims to have taken the necessary measures to implement a system of strict protection of the Cypriot grass snake and to have not therefore breached its obligations under Article 12(1) of the Habitats Directive.

Findings of the Court

59 It should be remembered that Article 12(1) of the Habitats Directive requires Member States to take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) of the same directive, in their natural range, prohibiting all forms of deliberate capture or killing of specimens of these species in the wild, deliberate disturbance of those species, particularly during the period of breeding, rearing, hibernation and migration, deliberate destruction or taking of eggs from the wild as well as deterioration or destruction of breeding sites or resting places.

60 The transposition of that provision requires the Member States not only to adopt a comprehensive legislative framework but also to implement concrete and specific protection measures (*Commission* v *Ireland*, paragraph 29).

61 Similarly, the system of strict protection presupposes the adoption of coherent and coordinated measures of a preventive nature (judgment of 16 March 2006 in Case C-518/04 *Commission* v *Greece*, paragraph 16, and *Commission* v *Ireland*, paragraph 30).

62 Such a system of strict protection must therefore enable the effective avoidance of all forms of deliberate capture or killing of specimens of animal species listed in Annex IV(a) of the Habitats Directive in the wild, deliberate disturbance of the species, particularly during the period of breeding, rearing, hibernation and migration, deliberate destruction or taking of eggs from the wild as well as deterioration or destruction of breeding sites or resting places of those species (see, to that effect, Case C-383/09 *Commission* v *France* [2011] ECR I-0000).

63 In this case the defendant Member State accepts that, by tolerating the organisation of moto-cross racing, it infringed Article 12(1) of the Habitats Directive.

64 Regarding the excessive extraction of water, having regard to paragraph 50 of this judgment and the fact that the presence of the Cypriot grass snake on the site of Paralimni Lake was well known, the inevitable conclusion is that it constitutes, in any event, a deliberate disturbance in accordance with Article 12(1) of the Habitats Directive.

65 As regards the argument alleging harmful consequences for the Cypriot grass snake linked to the property development on the site of Paralimni Lake, it is apparent from the evidence in the documents before the Court that the property development and the construction in or near the site of Paralimni Lake, in particular in or near its northern part, which are associated with excavation works, is likely to lead to disturbances affecting that protected species in the whole ecosystem of that site.

66 In those circumstances, it is therefore apparent that the Republic of Cyprus did not put a system of strict protection in place to enable the effective avoidance of all matters set out at paragraph 62 of this judgment.

67 Consequently, the complaint alleging infringement of Article 12(1) of the Habitats Directive is well founded.

68 Having regard to the foregoing, the Commission's action must be upheld, subject to the reservation made at paragraph 55 of this judgment.

69 Accordingly, it must be held that the Republic of Cyprus,

– by not having included the site of Paralimni Lake in the national list of SCIs,

– by tolerating activities which seriously compromise the ecological characteristics of Paralimni Lake and by not having taken the protective measures necessary to maintain the population of Natrix natrix cypriaca (Cypriot grass snake), the species which constitutes the ecological interest of the lake and Xyliatos Dam, and

– by not having taken the requisite measures to establish and apply a system of strict protection for that species,

has failed to fulfil its obligations under Article 4(1) of the Habitats Directive, under the Habitats Directive and under Article 12(1) of that directive respectively.

Costs

70 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission has applied for costs and the Republic of Cyprus has been essentially unsuccessful, the latter must be ordered to pay the costs.

On those grounds, the Court (Fourth Chamber) hereby:

1. **Declares that the Republic of Cyprus,**

– **by not having included the site of Paralimni Lake in the national list of proposed sites of Community importance,**

– **by tolerating activities which seriously compromise the ecological characteristics of Paralimni Lake and by not having taken the protective measures necessary to maintain the population of Natrix natrix cypriaca (Cypriot grass snake), the species which constitutes the ecological interest of the lake and Xyliatos Dam, and**

– **by not having taken the requisite measures to establish and apply a system of strict protection for that species,**

has failed to fulfil its obligations under Article 4(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, as amended by Council Directive 2006/105/EC of 20 November 2006, under Directive 92/43, as amended, and under Article 12(1) of Directive 92/43, as amended, respectively;

2. **Orders the Republic of Cyprus to pay the costs.**

[Signatures]

JUDGMENT OF THE COURT (Fourth Chamber)

16 February 2012 (*)

(Assessment of the effects of projects on the environment – Concept of legislative act – Force and effect of the guidance in the Aarhus Convention Implementation Guide – Consent for a project given without an appropriate assessment of its effects on the environment – Access to justice in environmental matters – Extent of the right to a review procedure – Habitats Directive – Plan or project affecting the integrity of the site – Imperative reason of overriding public interest)

In Case C-182/10,

REFERENCE for a preliminary ruling under Article 267 TFEU from the Cour constitutionnelle (Belgium), made by decision of 30 March 2010, received at the Court on 9 April 2010, in the proceedings

Marie-Noëlle Solvay and Others

v

Région wallonne,

intervening parties:

Infrabel SA,

Codic Belgique SA,

Federal Express European Services Inc. (FEDEX),

Société wallonne des aéroports (Sowaer),

Société régionale wallonne du transport (SRWT),

Société Intercommunale du Brabant wallon (IBW),

THE COURT (Fourth Chamber),

composed of J.-C. Bonichot (Rapporteur), President of the Chamber, K. Schiemann, L. Bay Larsen, C. Toader and E. Jarašiūnas, Judges,

Advocate General: E. Sharpston,

Registrar: R. Şereş, Administrator,

having regard to the written procedure and further to the hearing on 24 November 2011,

after considering the observations submitted on behalf of:

– Ms Solvay and Others, by T. Vandenput and M.-L. Giovannelli, avocats,

– Association des riverains et habitants des communes proches de l'aéroport BSCA (Brussels South Charleroi Airport) (ARACh), by A. Lebrun, avocat,

– Association Inter-Environnement Wallonie and Others, by J. Sambon, avocat,

– Association Charleroi South Air Pur and Others, by D. Brusselmans, avocat,

– Mr Boxus and Others, by L. Misson and A. Kettels, avocats,

– Ms Laloux and Others, by L. Dehin, avocat,

– Région wallonne, by F. Haumont, avocat,

– the European Commission, by O. Beynet, J.-B. Laignelot and D. Recchia, acting as Agents,

having decided, after hearing the Advocate General, to proceed to judgment without an Opinion,

gives the following

Judgment

1 This reference for a preliminary ruling concerns the interpretation of Articles 2, 3, 6 and 9 of the Convention on access to information, public participation in decision-making and access to justice in environmental matters, concluded on 25 June 1998 and approved on behalf of the European Community by Council Decision 2005/370/EC of 17 February 2005 (OJ 2005 L 124, p. 1) ('the Aarhus Convention'), Articles 1, 9 and 10a of Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment (OJ 1985 L 175, p. 40), as amended by Directive 2003/35/EC of the European Parliament and of the Council of 26 May 2003 (OJ 2003 L 156, p. 17) ('Directive 85/337'), and Article 6(3) and (4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7, 'the Habitats Directive').

2 The reference has been made in proceedings brought by persons residing near Liège-Bierset and Brussels South Charleroi airports and the Brussels-Charleroi railway against the Région wallonne (Region of Wallonia) concerning development consents for works relating to those airports and railway.

Legal context

International law

3 Under Article 2(2) of the Aarhus Convention, the definition of 'public authority' 'does not include bodies or institutions acting in a … legislative capacity'.

4 Article 3(9) of the Aarhus Convention provides:

‘Within the scope of the relevant provisions of this Convention, the public shall have access to information, have the possibility to participate in decision-making and have access to justice in environmental matters without discrimination as to citizenship, nationality or domicile and, in the case of a legal person, without discrimination as to where it has its registered seat or an effective centre of its activities.’

5 Article 6(9) of the Aarhus Convention provides:

‘Each Party shall ensure that, when the decision has been taken by the public authority, the public is promptly informed of the decision in accordance with the appropriate procedures. Each Party shall make accessible to the public the text of the decision along with the reasons and considerations on which the decision is based.’

6 Under Article 9(2) to (4) of the Aarhus Convention:

‘2. Each Party shall, within the framework of its national legislation, ensure that members of the public concerned:

(a) having a sufficient interest or, alternatively,

(b) maintaining impairment of a right, where the administrative procedural law of a Party requires this as a precondition, have access to a review procedure before a court of law and/or another independent and impartial body established by law, to challenge the substantive and procedural legality of any decision, act or omission subject to the provisions of Article 6 and, where so provided for under national law and without prejudice to paragraph 3 below, of other relevant provisions of this Convention.

What constitutes a sufficient interest and impairment of a right shall be determined in accordance with the requirements of national law and consistently with the objective of giving the public concerned wide access to justice within the scope of this Convention. To this end, the interest of any non-governmental organisation meeting the requirements referred to in Article 2(5), shall be deemed sufficient for the purpose of subparagraph (a) above. Such organisations shall also be deemed to have rights capable of being impaired for the purpose of subparagraph (b) above.

The provisions of this paragraph 2 shall not exclude the possibility of a preliminary review procedure before an administrative authority and shall not affect the requirement of exhaustion of administrative review procedures prior to recourse to judicial review procedures, where such a requirement exists under national law.

3. In addition and without prejudice to the review procedures referred to in paragraphs 1 and 2 above, each Party shall ensure that, where they meet the criteria, if any, laid down in its national law, members of the public have access to administrative or judicial procedures to challenge acts and omissions by private persons and public authorities which contravene provisions of its national law relating to the environment.

4. In addition and without prejudice to paragraph 1 above, the procedures referred to in paragraphs 1, 2 and 3 above shall provide adequate and effective remedies, including injunctive relief as appropriate, and be fair, equitable, timely and not prohibitively expensive.

Decisions under this Article shall be given or recorded in writing. Decisions of courts, and whenever possible of other bodies, shall be publicly accessible.'

European Union law

Directive 85/337

7 In Article 1(2) of Directive 85/337 the term 'project' is defined as 'the execution of construction works or of other installations or schemes' or 'other interventions in the natural surroundings and landscape including those involving the extraction of mineral resources'. The term 'development consent' is defined as 'the decision of the competent authority or authorities which entitles the developer to proceed with the project'. The terms 'public' and 'public concerned' are defined as follows:

'"public" means:

one or more natural or legal persons and, in accordance with national legislation or practice, their associations, organisations or groups;

"public concerned" means:

the public affected or likely to be affected by, or having an interest in, the environmental decision-making procedures referred to in Article 2(2); for the purposes of this definition, non-governmental organisations promoting environmental protection and meeting any requirements under national law shall be deemed to have an interest.'

8 Article 1(5) of Directive 85/337 states:

'This Directive shall not apply to projects the details of which are adopted by a specific act of national legislation, since the objectives of this Directive, including that of supplying information, are achieved through the legislative process.'

9 Article 2(1) of Directive 85/337 provides:

'Member States shall adopt all measures necessary to ensure that, before consent is given, projects likely to have significant effects on the environment by virtue, inter alia, of their nature, size or location are made subject to a requirement for development consent and an assessment with regard to their effects. …'

10 Article 5(4) of Directive 85/337 provides:

'Member States shall, if necessary, ensure that any authorities holding relevant information … shall make this information available to the developer.'

11 Article 9(1) of Directive 85/337 states:

'When a decision to grant or refuse development consent has been taken, the competent authority or authorities shall inform the public thereof in accordance with the appropriate procedures and shall make available to the public the following information:

– the content of the decision and any conditions attached thereto,

– having examined the concerns and opinions expressed by the public concerned, the main reasons and considerations on which the decision is based, including information about the public participation process,

– a description, where necessary, of the main measures to avoid, reduce and, if possible, offset the major adverse effects.'

12 Article 10a of Directive 85/337 provides:

'Member States shall ensure that, in accordance with the relevant national legal system, members of the public concerned:

(a) having a sufficient interest, or alternatively,

(b) maintaining the impairment of a right, where administrative procedural law of a Member State requires this as a precondition,

have access to a review procedure before a court of law or another independent and impartial body established by law to challenge the substantive or procedural legality of decisions, acts or omissions subject to the public participation provisions of this Directive.

Member States shall determine at what stage the decisions, acts or omissions may be challenged.

What constitutes a sufficient interest and impairment of a right shall be determined by the Member States, consistently with the objective of giving the public concerned wide access to justice. To this end, the interest of any nongovernmental organisation meeting the requirements referred to in Article 1(2), shall be deemed sufficient for the purpose of subparagraph (a) of this Article. Such organisations shall also be deemed to have rights capable of being impaired for the purpose of subparagraph (b) of this Article.

The provisions of this Article shall not exclude the possibility of a preliminary review procedure before an administrative authority and shall not affect the requirement of exhaustion of administrative review procedures prior to recourse to judicial review procedures, where such a requirement exists under national law.

Any such procedure shall be fair, equitable, timely and not prohibitively expensive.

In order to further the effectiveness of the provisions of this article, Member States shall ensure that practical information is made available to the public on access to administrative and judicial review procedures.'

The Habitats Directive

13 In accordance with Article 6(3) and (4) of the Habitats Directive:

'3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with

other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

National law

14 Articles 1 to 4 of the Decree of the Walloon Parliament of 17 July 2008 on certain consents for which there are overriding reasons in the public interest (Décret du Parlement wallon du 17 juillet 2008 relatif à quelques permis pour lesquels il existe des motifs impérieux d'intérêt général) (*Moniteur belge*, 25 July 2008, p. 38900), in their original version, provide:

'Article 1. Overriding reasons in the public interest have been established for the grant of town-planning consents, environmental consents and combined consents relating to the following acts and works:

1. Acts and works for the improvement of the infrastructure and public buildings of the regional airports of Liège-Bierset and Brussels South Charleroi, as follows:

(a) as regards Liège-Bierset airport:

– the extension of the north freight zone for aircraft parking positions and future freight buildings;

– the orbital road and the south taxiway;

– the installation of a fourth tank for the fuel storage area;

– the TGV freight station;

– the extension of the car park south of the motorway;

– the future office building;

(b) as regards Brussels South Charleroi airport:

– the extension of the runway, including the construction of access ways and the extension of the north taxiway between the access ways;

– the control tower and radar;

– the extension of aircraft parking positions;

– the installation of de-icing areas;

– the R3-airport road link;

– the perimeter road and the south taxiway;

– the extension of the terminal;

– the extension of the car parks;

– the railway station and infrastructure;

2. Pursuant to the cooperation agreement of 11 October 2001 between the Federal State and the Flemish, Walloon and Brussels Capital Regions relating to the Belgian Railways investment plan for the years 2001-2012, the acts and works in the Region of Wallonia relating to the RER rail network;

3. In connection with the implementation of the regional development scheme (Part 3, point 1.4) adopted by the Walloon Government on 27 May 1999, the acts and works relating to structural modes of public transport for Charleroi, Liège, Namur and Mons;

4. The missing road and waterway links in the Region of Wallonia of the trans-European transport network referred to in Decision No 884/2004/EC of the European Parliament and of the Council of 29 April 2004 amending Decision No 1692/96/EC on Community guidelines for the development of the trans-European transport network.

Article 2. Where the acts and works listed in Article 1 are referred to in Article 84 of the Walloon Code of rural planning, urban planning, heritage and energy (Code wallon de l'Aménagement du Territoire, de l'Urbanisme, du Patrimoine et de l'Énergie), the consent shall be granted by the Government or the person designated by it in accordance with the detailed conditions laid down in Article 127 of that code, including those in Article 127(3).

Where the acts and works listed in Article 1 concern an establishment within the meaning of the Decree of 11 March 1999 on environment consents (Décret du 11 mars 1999 relatif au permis d'environnement), Article 13(2) of that decree shall be applied.

By way of exception to the first and second paragraphs, an application for consent whose receipt was acknowledged or which was lodged before the entry into force of this decree shall continue to be examined in accordance with the provisions in force at that date.

Article 3. Within 45 days of their being granted the Government shall submit planning consents, environmental consents and combined consents relating to the acts and works referred to in Article 1 to the Walloon Parliament. The consents referred to in the third

paragraph of Article 2 shall be submitted to the Parliament within 45 days of their receipt by the Government.

The Walloon Parliament shall ratify the consents submitted to it within 60 days of the lodging of the file relating to the consents at its Bureau. Where no ratifying decree is approved within that time-limit, the consent shall be deemed not to have been granted.

The time-limits referred to in the first and second paragraphs are suspended between 16 July and 15 August.

A consent ratified by the Walloon Parliament shall be enforceable from the publication of the decree in the *Moniteur belge* and the consent shall be sent by the Government in accordance with the provisions of the code or the decree of 11 March 1999.

Article 4. Where an application for a consent relates to a minor alteration to a consent ratified by the Walloon Parliament, the application shall follow the general rules of the code or the decree.'

15 Articles 5 to 9 of the Decree of the Walloon Parliament of 17 July 2008 provide:

'Article 5. The following consent, for which overriding reasons in the public interest have been established, is ratified:

– as regards acts and works for development of the infrastructure and public buildings of regional airports, the Ministerial Order of 25 August 2005 on the environmental consent granted to SAB SA for Liège-Bierset airport.

Article 6. The following consent, for which overriding reasons in the public interest have been established, is ratified:

– as regards acts and works for development of the infrastructure and public buildings of regional airports, the Ministerial Order of 13 September 2006 granting planning consent to Société régionale wallonne des Transports for the extension of the runway of Liège-Bierset airport.

Article 7. The following consent, for which overriding reasons in the public interest have been established, is ratified:

– as regards acts and works for development of the infrastructure and public buildings of regional airports, the planning consent of 16 September 2003 issued by the designated official of the Charleroi Directorate General for Town and Country Planning, Housing and Heritage to SOWAER SA for the implementation of works to culvert the Tintia stream and alteration of the ground relief in the north-eastern part of the airport area.

Article 8. The following consent, for which overriding reasons in the public interest have been established, is ratified:

– as regards acts and works for development of the infrastructure and public buildings of regional airports, the Ministerial Order of 25 July 2005 on the combined consent issued to SOWAER SA for Brussels South Charleroi Airport (terminal: 3 000 000 passengers per year),

car parks (1 600 spaces at ground level and 1 000 in multi-storey car parks), car park access roads, aircraft traffic surfaces, aircraft parking positions linked to the terminal, water treatment plant, technical buildings, fuel storage area (storage of 2 420m^3 of kerosene and 30m^3 of motor vehicle fuel) and opening of new local roads.

Article 9. The following consent, for which overriding reasons in the public interest have been established, is ratified:

– as regards acts and works for development of the infrastructure and public buildings of regional airports, the Ministerial Order of 27 July 2005 relating to the environmental consent issued to SOWAER SA for the operation of Brussels South Charleroi Airport.'

16 Article 14 to 17 of the decree provide:

'Article 14. The following consent, for which overriding reasons in the public interest have been established, is ratified:

– as regards the RER network and the associated structures, access ways and connecting ways, the Ministerial Order of 9 February 2006 relating to the combined consent issued to SNCB (Belgian National Railways) for the construction and operation of the third and fourth tracks on Infrabel line 124 Brussels-Charleroi in the municipalities of Waterloo, Braine-l'Alleud and Nivelles.

Article 15. The following consent, for which overriding reasons in the public interest have been established, is ratified:

– the Ministerial Order of 19 June 2008 relating to the combined consent issued to IBW for the construction and operation of the Hain treatment plant of 92 000 population equivalent in the municipality of Braine-le-Château.

Article 16. The following consent, for which overriding reasons in the public interest have been established, is ratified:

– the Ministerial Order of 7 July 2008 relating to the environmental consent issued to Codic Belgique SA for the operation of a management and training centre consisting of various technical installations on land situated at Chaussée de Bruxelles 135, La Hulpe.

Article 17. The following consent, for which overriding reasons in the public interest have been established, is ratified:

– the Ministerial Order of 4 June 2008 relating to the planning consent issued to Codic Belgique SA for the construction of a management and training centre consisting of various technical installations on land situated at Chaussée de Bruxelles 135, La Hulpe.'

17 According to the documents submitted to the Court, the Conseil d'État (Council of State) essentially has jurisdiction to rule on actions for annulment brought against administrative acts and regulations of the administrative authorities and against administrative acts of the legislative assemblies or their organs.

18 It does not, on the other hand, have jurisdiction to hear actions brought against acts of a legislative character.

19 The ratification by decree of the Walloon Parliament of building consents and consents for works gives those acts legislative status. The Conseil d'État consequently ceases to have jurisdiction to hear actions for annulment brought against the acts thus ratified, which can now be challenged only before the Cour constitutionnelle (Constitutional Court), before which, however, only certain grounds may be pleaded.

The actions in the main proceedings and the questions referred for a preliminary ruling

20 The Cour constitutionelle has before it a number of actions seeking annulment of the decree of the Walloon Parliament of 17 July 2008 which 'ratified' the building consents for various works relating to Liège-Bierset airport, Brussels South Charleroi airport and the Brussels-Charleroi railway, that is to say, authorised them in view of 'overriding reasons in the public interest'.

21 The Cour constitutionelle further has before it questions referred by the Conseil d'État for a ruling on the lawfulness of that decree. The Conseil d'État had previously itself raised the question of the compatibility of the decree with European Union law and the Aarhus Convention and referred questions on that point to the Court for a preliminary ruling, on which the Court gave judgment on 18 October 2011 in Joined Cases C-128/09 to C-131/09, C-134/09 and C-135/09 *Boxus and Others* [2011] ECR I-0000.

22 The effect of that legislative act is that those building consents may no longer be contested before the Conseil d'État, but only before the Cour constitutionelle, and only on grounds of their failure to comply with the rules whose observance it is for the Cour constitutionelle to review.

23 Thus in each of the cases in the main proceedings, the referring court is asked inter alia to rule on whether it was possible for the contested decree to withdraw the consents in question from review by the Conseil d'État and subject them to review by the Cour constitutionelle, even though the possibilities of review before that court are less extensive than before the Conseil d'État. By so doing, the legislature is said to have infringed the Belgian Constitution, read in conjunction with Article 9(2) to (4) of the Aarhus Convention and Article 10a of Directive 85/337.

24 In those circumstances, the Constitutional Court decided to stay the proceedings and to refer the following questions to the Court for a preliminary ruling:

'1. Must Articles 2(2) and 9(4) of the Aarhus Convention … be interpreted in accordance with the guidance provided in the Aarhus Convention Implementation Guide?

2. (a) Must Article 2(2) of the Aarhus Convention be interpreted as excluding from the scope of the convention legislative acts such as the planning or environmental consents granted in accordance with the procedure established by Articles 1 to 4 of the Decree of the Walloon [Parliament] of 17 July 2008 …?

(b) Must Article 2(2) of the Aarhus Convention be interpreted as excluding from the scope of the convention legislative acts such as the ratifications of planning or environmental consents contained in Articles 5 to 9 and 14 to 17 of that decree?

(c) Must Article 1(5) of Directive 85/337 … be interpreted as excluding from the scope of the directive legislative acts such as the planning or environmental consents granted in accordance with the procedure established by Articles 1 to 4 of that decree?

(d) Must Article 1(5) of Directive 85/337 … be interpreted as excluding from the scope of the directive legislative acts such as the ratifications of planning or environmental consents contained in Articles 5 to 9 and 14 to 17 of that decree?

3. (a) Must Articles 3(9) and 9(2), (3) and (4) of the Aarhus Convention and Article 10a of Directive 85/337 … be interpreted as precluding a procedure such as that established by Articles 1 to 4 of that decree, under which the legislature adopting the decree grants planning and environmental consents which have been prepared by an administrative authority and which can be contested only by the actions mentioned in [the order for reference] before the Constitutional Court and the ordinary courts?

(b) Must Articles 3(9) and 9(2), (3) and (4) of the Aarhus Convention and Article 10a of Directive 85/337 … be interpreted as precluding the adoption of legislative acts such as the retroactive ratifications contained in Articles 5 to 9 and 14 to 17 of that decree, which can be contested only by the actions mentioned in [the order for reference] before the Constitutional Court and the ordinary courts?

4. (a) Must Article 6(9) of the Aarhus Convention and Article 9(1) of Directive 85/337 … be interpreted as precluding a procedure such as that established by Articles 1 to 4 of that decree, under which a decree granting planning or environmental consents need not itself contain all the information necessary to establish whether those consents are based on an adequate prior evaluation carried out in accordance with the requirements of the Aarhus Convention and Directive 85/337 …?

(b) Must Article 6(9) of the Aarhus Convention and Article 9(1) of Directive 85/337 … be interpreted as precluding the adoption of legislative acts such as the ratifications contained in Articles 5 to 9 and 14 to 17 of that decree, which do not themselves contain all the information necessary to establish whether those consents are based on an adequate prior evaluation carried out in accordance with the requirements of the Aarhus Convention and Directive 85/337 …?

5. Must Article 6(3) of [the Habitats] Directive … be interpreted as permitting a legislative authority to authorise projects such as those referred to in Articles 16 and 17 of that decree, even though the impact assessment carried out in that connection has been held by the Conseil d'État, in a judgment given under the emergency procedure, to be incomplete and has been contradicted in an opinion of the authority of the Walloon Region responsible for the ecological management of the natural environment?

6. In the event of a negative reply to Question 5, must Article 6(4) of [the Habitats] Directive … be interpreted as permitting the creation of infrastructure designed to accommodate the management centre of a private company and a large number of employees to be regarded as an imperative reason of overriding public interest?'

Consideration of the questions referred

Question 1

25 By its first question the referring court asks whether Articles 2(2) and 9(4) of the Aarhus Convention must be interpreted in accordance with the guidance in the Aarhus Convention Implementation Guide.

26 It is apparent from the wording of that Guide, in particular the observations in the section headed 'How to use this Guide', that the aim of the document, drawn up by international experts, is solely to provide an analysis of the Aarhus Convention which 'introduces the reader to the Convention and to what it can mean in practice'.

27 While the Aarhus Convention Implementation Guide may thus be regarded as an explanatory document, capable of being taken into consideration if appropriate among other relevant material for the purpose of interpreting the Convention, the observations in the Guide have no binding force and do not have the normative effect of the provisions of the Aarhus Convention.

28 The answer to Question 1 is therefore that, for the interpretation of Articles 2(2) and 9(4) of the Aarhus Convention, it is permissible to take the Aarhus Convention Implementation Guide into consideration, but that Guide has no binding force and does not have the normative effect of the provisions of the Aarhus Convention.

Question 2

29 By its second question, the various subdivisions of which should be examined together, the referring court asks essentially whether Article 2(2) of the Aarhus Convention and Article 1(5) of Directive 85/337 must be interpreted as meaning that an act such as the Decree of the Walloon Parliament of 17 July 2008 which 'ratifies', by giving them legislative status, planning, environmental or works consents previously granted by the administrative authorities, in respect of which it is declared that 'overriding reasons in the public interest have been established', is excluded from the scope of that convention and that directive.

30 It follows from Article 1(5) of Directive 85/337 that, where the objectives of that directive, including that of supplying information, are achieved through a legislative process, the directive does not apply to the project in question (see Case C-287/98 *Linster* [2000] ECR I-6917, paragraph 51, and *Boxus and Others*, paragraph 36).

31 That provision lays down two conditions for the exclusion of a project from the scope of Directive 85/337. The first requires the details of the project to be adopted by a specific act of legislation. Under the second, the objectives of the directive, including that of supplying information, must be achieved through the legislative process (see Case C-435/97 *WWF and Others* [1999] ECR I-5613, paragraph 57, and *Boxus and Others*, paragraph 37).

32 As regards the first condition, it entails, first, the adoption of the project by a specific act of legislation. It should be observed here that the terms 'project' and 'consent' are defined in Article 1(2) of Directive 85/337. A legislative act adopting a project must therefore, if it is to come within the scope of Article 1(5) of the directive, be specific and display the same characteristics as a consent of that kind. In particular, it must grant the developer the right to

carry out the project (see *WWF and Others*, paragraph 58, and *Boxus and Others*, paragraph 38).

33 The project must also be adopted in detail, that is to say, in a sufficiently precise and definitive manner, so that the legislative act adopting the project must include, like a development consent, following their consideration by the legislature, all the elements of the project relevant to the environmental impact assessment (see *WWF and Others*, paragraph 59, and *Boxus and Others*, paragraph 39). The legislative act must therefore demonstrate that the objectives of Directive 85/337 have been achieved as regards the project in question (see *Linster*, paragraph 56, and *Boxus and Others*, paragraph 39).

34 It follows that the details of a project cannot be considered to be adopted by a legislative act within the meaning of Article 1(5) of Directive 85/337 if that act does not include the elements necessary to assess the environmental impact of the project or if the adoption of other measures is needed in order for the developer to be entitled to carry out the project (see *WWF and Others*, paragraph 62; *Linster*, paragraph 57; and *Boxus and Others*, paragraph 41).

35 As regards the second condition, Article 2(1) of Directive 85/337 shows that the essential objective of the directive is to ensure that projects likely to have significant effects on the environment by virtue, inter alia, of their nature, size or location are made subject to an assessment of their effects on the environment before consent is given (see *Linster*, paragraph 52, and *Boxus and Others*, paragraph 41).

36 In addition, the sixth recital in the preamble to Directive 85/337 states that the assessment must be conducted on the basis of the appropriate information supplied by the developer, which may be supplemented by the authorities and by the people who may be concerned by the project in question (see *WWF and Others*, paragraph 61; *Linster*, paragraph 53; and *Boxus and Others*, paragraph 42).

37 Consequently, the legislature must have sufficient information at its disposal at the time when the project is adopted. It is apparent from Article 5(3) of and Annex IV to Directive 85/337 that the minimum information to be supplied by the developer is to include a description of the project comprising information on the site, design and size of the project, a description of the measures envisaged in order to avoid, reduce and, if possible, remedy significant adverse effects, and the data required to identify and assess the main effects which the project is likely to have on the environment (see *Linster*, paragraph 55, and *Boxus and Others*, paragraph 43).

38 Having regard to the characteristics of procedures for the approval of a plan in more than one phase, Directive 85/337 does not preclude a single project from being approved by two acts of national law which are considered, as a whole, to be a development consent within the meaning of Article 1(2) of the directive (see, to that effect, Case C-508/03 *Commission* v *United Kingdom* [2006] ECR I-3969, paragraph 102). Consequently, the legislature can, when adopting the final act authorising a project, take advantage of the information gathered during a prior administrative procedure (see *Boxus and Others*, paragraph 44).

39 The existence of such an administrative procedure cannot, however, have the effect of enabling a project to be regarded as a project the details of which are adopted by a specific legislative act in accordance with Article 1(5) of Directive 85/337 if that legislative act does

not fulfil the two conditions set out in paragraph 31 above. As the Court held in *Boxus and Others*, paragraph 45, a legislative act which does no more than simply 'ratify' a pre-existing administrative act, by merely referring to overriding reasons in the public interest without a substantive legislative process enabling those conditions to be fulfilled having first been commenced, cannot be regarded as a specific legislative act within the meaning of that provision and is not therefore sufficient to exclude a project from the scope of Directive 85/337.

40 In particular, a legislative act adopted without the members of the legislative body having had available to them the information mentioned in paragraph 37 above cannot fall within the scope of Article 1(5) of Directive 85/337 (see *Boxus and Others*, paragraph 46).

41 It is for the national court to determine whether those conditions have been satisfied. For that purpose, it must take account both of the content of the legislative act adopted and of the entire legislative process which led to its adoption, in particular the preparatory documents and parliamentary debates (see *Boxus and Others*, paragraph 47).

42 That interpretation arrived at in *Boxus and Others* in relation to Article 1(5) of Directive 85/337 may be applied in the case of Article 2(2) of the Aarhus Convention. First, Article 2(2) of the Convention has substantially the same content as Article 1(5) of the directive. Secondly, there is nothing that could be deduced from the object or scope of the Aarhus Convention that would preclude the Court from applying, for the interpretation of the provisions of that convention, its interpretation of the similar provisions of Directive 85/337.

43 The answer to Question 2 is therefore that Article 2(2) of the Aarhus Convention and Article 1(5) of Directive 85/337 must be interpreted as meaning that only projects the details of which have been adopted by a specific legislative act, in such a way that the objectives of the Convention and the directive have been achieved by the legislative process, are excluded from the scope of those instruments. It is for the national court to verify that those two conditions have been satisfied, taking account both of the content of the legislative act adopted and of the entire legislative process which led to its adoption, in particular the preparatory documents and parliamentary debates. In that regard, a legislative act which does no more than simply 'ratify' a pre-existing administrative act, by merely referring to overriding reasons in the public interest without a substantive legislative process enabling those conditions to be fulfilled having first been commenced, cannot be regarded as a specific act of legislation within the meaning of the latter provision and is therefore not sufficient to exclude a project from the scope of the Convention and the directive.

Question 3

44 By its third question, the various subdivisions of which should be examined together, the referring court asks essentially whether Article 9(2) and (4) of the Aarhus Convention and Article 10a of Directive 85/337 must be interpreted as precluding the right to implement a project which falls within their scope from being granted by a legislative act against which, under national law, no review procedure is available before a court of law or another independent and impartial body established by law that enables that act to be challenged as to the substance and the procedure.

45 It follows from Article 2(2) of the Aarhus Convention, read together with Articles 6 and 9 of the Convention, and from Article 1(5) of Directive 85/337 that neither the Convention

nor the directive applies to projects adopted by a legislative act satisfying the conditions set out in paragraph 31 above (see *Boxus and Others*, paragraph 50).

46 For other projects, that is to say, those adopted either by an act which is not legislative in nature or by a legislative act which does not fulfil those conditions, it follows from the very terms of Article 9(2) of the Aarhus Convention and Article 10a of Directive 85/337 that the Member States must provide for a review procedure before a court of law or another independent and impartial body established by law for challenging the substantive or procedural lawfulness of decisions, acts or omissions subject respectively to Article 6 of the Aarhus Convention or to Directive 85/337 (see *Boxus and Others*, paragraph 51).

47 The Member States, by virtue of their procedural autonomy and subject to compliance with the principles of equivalence and effectiveness, have a discretion in implementing Article 9(2) of the Aarhus Convention and Article 10a of Directive 85/337. It is for them, in particular, to determine, in so far as the abovementioned provisions are complied with, which court of law or which independent and impartial body established by law is to have jurisdiction in respect of the review procedures referred to in those provisions and what procedural rules are applicable (see *Boxus and Others*, paragraph 52).

48 Article 9 of the Aarhus Convention and Article 10a of Directive 85/337 would lose all effectiveness, however, if the mere fact that a project is adopted by a legislative act which does not satisfy the conditions set out in paragraph 31 above were to make it immune to any review procedure for challenging its substantive or procedural lawfulness within the meaning of those provisions (see *Boxus and Others*, paragraph 53).

49 The requirements flowing from Article 9 of the Aarhus Convention and Article 10a of Directive 85/337 presuppose in this regard that, when a project falling within the scope of Article 6 of the Aarhus Convention or of Directive 85/337 is adopted by a legislative act, the question whether that legislative act satisfies the conditions laid down in Article 1(5) of that directive and set out in paragraph 31 above must be amenable to review, under the national procedural rules, by a court of law or an independent and impartial body established by law (see *Boxus and Others*, paragraph 54).

50 If no review procedure of the nature and scope set out above were available in respect of such an act, any national court before which an action falling within its jurisdiction is brought would have the task of carrying out the review described in the previous paragraph and, as the case may be, drawing the necessary conclusions by disapplying that legislative act (see *Boxus and Others*, paragraph 55).

51 In the present case, if the referring court finds that the Decree of the Walloon Parliament of 17 July 2008 does not satisfy the conditions laid down in Article 1(5) of Directive 85/337 and set out in paragraph 31 above, and if it turns out that, under the applicable national rules, no court of law or independent and impartial body established by law has jurisdiction to review the substantive or procedural validity of that decree, the decree must then be regarded as incompatible with the requirements flowing from Article 9 of the Aarhus Convention and Article 10a of Directive 85/337. The referring court must then disapply it (see *Boxus and Others*, paragraph 56).

52 The answer to Question 3 is therefore that Article 9(2) to (4) of the Aarhus Convention and Article 10a of Directive 85/337 must be interpreted as meaning that:

– when a project falling within the scope of those provisions is adopted by a legislative act, the question whether that legislative act satisfies the conditions laid down in Article 1(5) of that directive must be capable of being submitted, under the national procedural rules, to a court of law or an independent and impartial body established by law, and

– if no review procedure of the nature and scope set out above were available in respect of such an act, any national court before which an action falling within its jurisdiction is brought would have the task of carrying out the review described in the previous indent and, as the case may be, drawing the necessary conclusions by disapplying that legislative act.

Question 4

53 By its fourth question, the various subdivisions of which should be examined together, the referring court asks essentially whether Article 6(9) of the Aarhus Convention and Article 9(1) of Directive 85/337 must be interpreted as precluding the adoption of legislative acts which do not themselves contain all the reasons for their adoption, reasons which make it possible to review whether the acts were adopted after an adequate prior evaluation carried out in accordance with the requirements of the Convention and the directive.

54 It has been held that Article 4 of Directive 85/337 must be interpreted as not requiring that a decision not to subject a project falling within Annex II to that directive to an assessment should itself contain the reasons for the competent authority's decision that an assessment was unnecessary; if, however, an interested party so requests, the competent administrative authority is obliged to communicate to him the reasons for the decision or the relevant information and documents in response to the request made (see Case C-75/08 *Mellor* [2009] ECR I-3799, paragraph 61).

55 That interpretation can be applied to Article 9(1) of Directive 85/337.

56 Thus, although Article 9(1) of Directive 85/337 requires that the public must be informed, in accordance with the appropriate procedures, of the decision taken by the competent authority and the reasons on which the decision is based, it does not follow that the decision must itself contain the competent authority's reasons for deciding that it was necessary (see, by analogy, *Mellor*, paragraph 56).

57 It follows from that provision, however, that third parties, as well as the administrative authorities concerned, must be able to satisfy themselves that the competent authority was aware, in accordance with the rules laid down by national law, that an adequate prior evaluation had been carried out in accordance with the requirements of Directive 85/337 (see *Mellor*, paragraph 57).

58 Moreover, interested parties, as well as the other national authorities concerned, must be able to ensure, if necessary through legal action, compliance with that obligation of the competent authority as to an evaluation (see *Mellor*, paragraph 58).

59 In that regard, effective judicial review, which must be able to extend to the lawfulness of the reasons for the decision being challenged, presupposes in general that the court before which the matter is brought may require the competent authority to communicate those reasons. However, where it is more particularly a question of securing the effective protection of a right conferred by European Union law, interested parties must also be able to defend that

right under the best possible conditions and have the possibility of deciding, with a full knowledge of the relevant facts, whether there is any point in applying to the courts. Consequently, in such circumstances, the competent national authority is under a duty to inform them of the reasons on which its decision is based, either in the decision itself or in a subsequent communication made at their request (see Case 222/86 *Heylens and Others* [1987] ECR 4097, paragraph 15, and *Mellor*, paragraph 59).

60 That subsequent communication may take the form not only of an express statement of the reasons but also of the making available of relevant information and documents in response to the request made (see *Mellor*, paragraph 60).

61 While the reasons need not necessarily be contained in the decision itself, the competent authority may none the less, pursuant to the applicable national legislation or of its own motion, indicate in the decision the reasons on which it is based (see *Mellor*, paragraph 63).

62 In that case, the decision must enable interested parties to decide whether to make use of a review procedure to contest it, taking into account any factors which might subsequently be brought to their attention (see *Mellor*, paragraph 64).

63 That interpretation may be applied in the case of Article 6(9) of the Aarhus Convention. First, that provision has substantially the same content as Article 9(1) of Directive 85/337. Secondly, there is nothing that could be deduced from the object or scope of the Aarhus Convention that would preclude the Court from applying, for the interpretation of the provisions of that convention, its interpretation of the similar provisions of Directive 85/337.

64 The answer to Question 4 is therefore that Article 6(9) of the Aarhus Convention and Article 9(1) of Directive 85/337 must be interpreted as not requiring that the decision should itself contain the reasons for the competent authority's decision that it was necessary. However, if an interested party so requests, the competent authority is obliged to communicate to him the reasons for that decision or the relevant information and documents in response to the request made.

Question 5

65 By its fifth question, the referring court asks essentially whether Article 6(3) of the Habitats Directive must be interpreted as allowing a legislative authority to authorise a plan or project without having ascertained that it will not adversely affect the integrity of the site concerned.

66 Article 6(3) of the Habitats Directive establishes an evaluation procedure intended to ensure, by means of a preliminary examination, that a plan or project which is not directly connected with or necessary for the management of the site concerned but likely to have a significant effect on it is authorised only to the extent that it will not adversely affect the integrity of that site (see Case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging* [2004] ECR I-7405, paragraph 34).

67 A plan or project may be authorised only on condition that the competent national authorities are certain that it will not have adverse effects on the integrity of the site concerned. That is so where no reasonable scientific doubt remains as to the absence of such

effects (see Case C-239/04 *Commission* v *Portugal* [2006] ECR I-10183, paragraph 20). Moreover, it is at the time of adoption of the decision authorising implementation of the project that there must be no reasonable scientific doubt remaining as to the absence of adverse effects on the integrity of the site in question (see *Commission* v *Portugal*, paragraph 24).

68 Furthermore, in the case of sites eligible for identification as sites of Community importance, in particular sites hosting priority natural habitat types, the Member States are, by virtue of the Habitats Directive, required to take protective measures that are appropriate, from the point of view of that directive's objective of conservation, for safeguarding the ecological interest which those sites have at national level (see Case C-117/03 *Dragaggi and Others* [2005] ECR I-167, paragraph 30, and Case C-491/08 *Commission* v *Italy*, paragraph 30).

69 Those obligations are incumbent on the Member States by virtue of the Habitats Directive regardless of the nature of the national authority with competence to authorise the plan or project concerned. Article 6(3) of the Habitats Directive, which refers to the 'competent national authorities', does not lay down any special rule for plans or projects approved by a legislative authority. That status consequently has no effect on the extent or scope of the obligations imposed on the Member States by Article 6(3) of the Habitats Directive.

70 The answer to Question 5 is therefore that Article 6(3) of the Habitats Directive must be interpreted as not allowing a national authority, even if it is a legislative authority, to authorise a plan or project without having ascertained that it will not adversely affect the integrity of the site concerned.

Question 6

71 By its sixth question, the referring court essentially asks whether Article 6(4) of the Habitats Directive must be interpreted as meaning that the creation of infrastructure intended to accommodate the management centre of a private company may be regarded as an imperative reason of overriding public interest, such reasons including those of a social or economic nature, within the meaning of that provision, capable of justifying the implementation of a plan or project that will adversely affect the integrity of the site concerned.

72 Article 6(4) of the Habitats Directive provides that if, in spite of a negative assessment carried out in accordance with the first sentence of Article 6(3) of the directive, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, and there are no alternative solutions, the Member State is to take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected (see Case C-304/05 *Commission* v *Italy* [2007] ECR I-7495, paragraph 81).

73 Article 6(4) of that directive must, as an exception to the criterion for authorisation laid down in the second sentence of Article 6(3), be interpreted strictly (see Case C-304/05 *Commission* v *Italy*, paragraph 82).

74 Moreover, it can apply only after the implications of a plan or project have been studied in accordance with Article 6(3) of the Habitats Directive. Knowledge of those implications in the light of the conservation objectives relating to the site in question is a necessary prerequisite for the application of Article 6(4), since, in the absence of those elements, no condition for the application of that derogating provision can be assessed. The assessment of any imperative reasons of overriding public interest and that of the existence of less harmful alternatives require a weighing up against the damage caused to the site by the plan or project under consideration. In addition, in order to determine the nature of any compensatory measures, the damage to the site must be precisely identified (see Case C-304/05 *Commission* v *Italy*, paragraph 83).

75 An interest capable of justifying, within the meaning of Article 6(4) of the Habitats Directive, the implementation of a plan or project must be both 'public' and 'overriding', which means that it must be of such an importance that it can be weighed up against that directive's objective of the conservation of natural habitats and wild fauna and flora.

76 Works intended for the location or expansion of an undertaking satisfy those conditions only in exceptional circumstances.

77 It cannot be ruled out that that is the case where a project, although of a private character, in fact by its very nature and by its economic and social context presents an overriding public interest and it has been shown that there are no alternative solutions.

78 In the light of those criteria, the mere construction of infrastructure designed to accommodate a management centre cannot constitute an imperative reason of overriding public interest within the meaning of Article 6(4) of the Habitats Directive.

79 The answer to Question 6 is therefore that Article 6(4) of the Habitats Directive must be interpreted as meaning that the creation of infrastructure intended to accommodate a management centre cannot be regarded as an imperative reason of overriding public interest, such reasons including those of a social or economic nature, within the meaning of that provision, capable of justifying the implementation of a plan or project that will adversely affect the integrity of the site concerned.

Costs

80 Since these proceedings are, for the parties to the main proceedings, a step in the action pending before the national court, the decision on costs is a matter for that court. Costs incurred in submitting observations to the Court, other than the costs of those parties, are not recoverable.

On those grounds, the Court (Fourth Chamber) hereby rules:

1. **For the interpretation of Articles 2(2) and 9(4) of the Convention on access to information, public participation in decision-making and access to justice in environmental matters, concluded on 25 June 1998 and approved on behalf of the European Community by Council Decision 2005/370/EC of 17 February 2005, it is permissible to take the Implementation Guide for that Convention into consideration, but that Guide has no binding force and does not have the normative effect of the provisions of that Convention.**

2. **Article 2(2) of the Convention on access to information, public participation in decision-making and access to justice in environmental matters and Article 1(5) of Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment, as amended by Directive 2003/35/EC of the European Parliament and of the Council of 26 May 2003, must be interpreted as meaning that only projects the details of which have been adopted by a specific legislative act, in such a way that the objectives of the Convention and the directive have been achieved by the legislative process, are excluded from the scope of those instruments. It is for the national court to verify that those two conditions have been satisfied, taking account both of the content of the legislative act adopted and of the entire legislative process which led to its adoption, in particular the preparatory documents and parliamentary debates. In that regard, a legislative act which does no more than simply 'ratify' a pre-existing administrative act, by merely referring to overriding reasons in the public interest without a substantive legislative process enabling those conditions to be fulfilled having first been commenced, cannot be regarded as a specific act of legislation within the meaning of the latter provision and is therefore not sufficient to exclude a project from the scope of that Convention and that directive as amended.**

3. **Articles 3(9) and 9(2) to (4) of the Convention on access to information, public participation in decision-making and access to justice in environmental matters and Article 10a of Directive 85/337, as amended by Directive 2003/35, must be interpreted as meaning that:**

– **when a project falling within the scope of those provisions is adopted by a legislative act, the question whether that legislative act satisfies the conditions laid down in Article 1(5) of that directive as amended must be capable of being submitted, under the national procedural rules, to a court of law or an independent and impartial body established by law, and**

– **if no review procedure of the nature and scope set out above were available in respect of such an act, any national court before which an action falling within its jurisdiction is brought would have the task of carrying out the review described in the previous indent and, as the case may be, drawing the necessary conclusions by disapplying that legislative act.**

4. **Article 6(9) of the Convention on access to information, public participation in decision-making and access to justice in environmental matters and Article 9(1) of Directive 85/337, as amended by Directive 2003/35, must be interpreted as not requiring that the decision should itself contain the reasons for the competent authority's decision that it was necessary. However, if an interested party so requests, the competent authority is obliged to communicate to him the reasons for that decision or the relevant information and documents in response to the request made.**

5. **Article 6(3) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora must be interpreted as not allowing a national authority, even if it is a legislative authority, to authorise a plan or project without having ascertained that it will not adversely affect the integrity of the site concerned.**

6. **Article 6(4) of Directive 92/43 must be interpreted as meaning that the creation of infrastructure intended to accommodate a management centre cannot be regarded as an imperative reason of overriding public interest, such reasons including those of a social or economic nature, within the meaning of that provision, capable of justifying the implementation of a plan or project that will adversely affect the integrity of the site concerned.**

[Signatures]

JUDGMENT OF THE COURT (Fourth Chamber)

24 November 2011 (*)

(Failure of a Member State to fulfil obligations – Directive 85/337/EEC – Assessment of the effects of certain projects on the environment – Directive 92/43/EEC – Conservation of natural habitats – Wild fauna and flora – Open-cast coal mines – 'Alto Sil' site – Special protection area – Site of Community importance – Brown bear (Ursus arctos) – Capercaillie (Tetrao urogallus))

In Case C-404/09,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 20 October 2009,

European Commission, represented by D. Recchia and by F. Castillo de la Torre and J.-B. Laignelot, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Kingdom of Spain, represented by N. Díaz Abad, acting as Agent, with an address for service in Luxembourg,

defendant,

THE COURT (Fourth Chamber),

composed of J.-C. Bonichot, President of the Chamber, A. Prechal (Rapporteur), K. Schiemann, C. Toader and E. Jarašiūnas, Judges,

Advocate General: J. Kokott,

Registrar: A. Calot Escobar,

having regard to the written procedure,

after hearing the Opinion of the Advocate General at the sitting on 28 June 2011

gives the following

Judgment

1 By its action the European Commission seeks a declaration from the Court that:

– by authorising the open-cast mines 'Fonfría', 'Nueva Julia' and 'Ladrones' but failing to subject that authorisation to an assessment in order to identify, describe and assess in an appropriate manner the direct, indirect and cumulative effects of the existing open-cast mining projects,

the Kingdom of Spain has failed to fulfil its obligations under Articles 2, 3 and 5(1) and (3) of Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment (OJ 1985 L 175, p. 40), as amended by Council Directive 97/11/EC of 3 March 1997 (OJ 1997 L 73, p. 5, 'Directive 85/337, as amended'),

– from 2000, the date of designation of the 'Alto Sil' as a special protection area ('SPA') under Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1) as amended by Commission Directive 97/49/EC of 29 July 1997 (OJ 1997 L 223, p. 9, 'the Birds Directive'),

– by authorising the 'Nueva Julia' and 'Ladrones' open-cast mining operations but failing to subject that authorisation to an appropriate assessment of the possible effects of those projects; and in any event failing to comply with the conditions under which the execution of a project is permitted, in spite of the risk which those projects represented for the capercaillie, which is one of the natural assets which justified the classification of the 'Alto Sil' SPA, namely that there are no alternative solutions, that there are imperative reasons of overriding public interest and only after having notified the Commission of the necessary compensatory measures to ensure that the overall coherence of the Natura 2000 network is protected, and

– by failing to adopt the necessary measures to prevent the deterioration of habitats, including the habitats of species, and to prevent significant disturbance of the capercaillie, the presence of which on the 'Alto Sil' site was the reason for the designation of that area as an SPA, caused by the 'Feixolín', 'Salguero-Prégame-Valdesegadas', 'Fonfría', 'Ampliación de Feixolín' and 'Nueva Julia' mines,

the Kingdom of Spain has failed to fulfil its obligations in relation to the 'Alto Sil' SPA under Article 6(2) to (4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7, 'the Habitats Directive') in conjunction with Article 7 of that directive;

– from January 1998, by failing in relation to the mining operations at the 'Feixolín', 'Salguero-Prégame-Valdesegadas', 'Fonfría' and 'Nueva Julia' mines to adopt the necessary measures to safeguard the ecological interest which the proposed 'Alto Sil' site had at national level, and which was proposed as a site of Community importance ('the SCI') under the Habitats Directive, the Kingdom of Spain has, in relation to that site, failed to fulfil its obligations under that directive, as interpreted in Case C-117/03 *Dragaggi and Others* [2005] ECR I-167 and Case C-244/05 *Bund Naturschutz in Bayern and Others* [2006] ECR I-8445;

– from December 2004,

– by permitting open-cast mining (in the case of the 'Feixolín', 'Salguero-Prégame-Valdesegadas', 'Fonfría' and 'Nueva Julia' mines) likely to have a significant impact on the natural assets which determined the designation of the 'Alto Sil' area as an SCI but failing to make an appropriate assessment of the possible impact of those mines, and in any event failing to comply with the conditions under which the execution of those projects would be permitted, in spite of the risk which they represented to those natural assets, namely that there are no alternative solutions, that there are imperative reasons of overriding public interest and only after having notified the Commission of the necessary compensatory measures to ensure that the overall coherence of the Natura 2000 network is protected, and

– by having failed to adopt, in relation to the above projects, the necessary measures to prevent the deterioration of natural habitats and the habitats of species, and the disturbances of species caused by the 'Feixolín', 'Salguero-Prégame-Valdesegadas', 'Fonfría', 'Nueva Julia' and 'Ampliación de Feixolín' mines,

the Kingdom of Spain has failed to fulfil its obligations in relation to the 'Alto Sil' SCI under Article 6(2), (3) and (4) of the Habitats Directive.

Legal context

Directive 85/337, as amended

2 Under Article 2(1) of Directive 85/337, as amended:

'Member States shall adopt all measures necessary to ensure that, before consent is given, projects likely to have significant effects on the environment by virtue, inter alia, of their nature, size or location are made subject to a requirement for development consent and an assessment with regard to their effects. These projects are defined in Article 4.'

3 Article 3 of that directive provides:

'The environmental impact assessment shall identify, describe and assess in an appropriate manner, in the light of each individual case and in accordance with Articles 4 to 11, the direct and indirect effects of a project on the following factors:

– human beings, fauna and flora;

– soil, water, air, climate and the landscape;

– material assets and the cultural heritage;

– the interaction between the factors mentioned in the first, second and third indents.'

4 Article 4(1) of Directive 85/337, as amended, states that '[s]ubject to Article 2(3), projects listed in Annex I shall be made subject to an assessment in accordance with Articles 5 to 10'.

5 Annex I to Directive 85/337, as amended, contains the list of projects referred to in Article 4(1). Accordingly, paragraph 19 of that annex refers to 'quarries and open-cast mining where the surface of the site exceeds 25 hectares, or peat extraction, where the surface of the site exceeds 150 hectares'.

6 With regard to other types of projects, Article 4(2) of that directive, as amended, provides:

'Subject to Article 2(3), for projects listed in Annex II, the Member States shall determine through:

(a) a case-by-case examination,

or

(b) thresholds or criteria set by the Member State, whether the project shall be made subject to an assessment in accordance with Articles 5 to 10.

Member States may decide to apply both procedures referred to in (a) and (b).

...'

7 In respect of the projects covered by Article 4(2) of that directive, paragraph 13 of Annex II thereto refers to 'any change or extension of projects listed in Annex I or Annex II, already authorised, executed or in the process of being executed, which may have significant adverse effects on the environment'.

8 Article 5 of Directive 85/337, as amended, provides:

'1. In the case of projects which, pursuant to Article 4, must be subjected to an environmental impact assessment in accordance with Articles 5 to 10, Member States shall adopt the necessary measures to ensure that the developer supplies in an appropriate form the information specified in Annex IV inasmuch as:

(a) the Member States consider that the information is relevant to a given stage of the consent procedure and to the specific characteristics of a particular project or type of project and of the environmental features likely to be affected;

(b) the Member States consider that a developer may reasonably be required to compile this information having regard inter alia to current knowledge and methods of assessment.

...

3. The information to be provided by the developer in accordance with paragraph 1 shall include at least:

– a description of the project comprising information on the site, design and size of the project,

– a description of the measures envisaged in order to avoid, reduce and, if possible, remedy significant adverse effects,

– the data required to identify and assess the main effects which the project is likely to have on the environment,

– an outline of the main alternatives studied by the developer and an indication of the main reasons for his choice, taking into account the environmental effects,

– a non-technical summary of the information mentioned in the previous indents.

...'

9 Annex IV to Directive 85/337, as amended, sets out the information that must be supplied pursuant to Article 5(1) of that directive:

‘1. Description of the project, including in particular:

– a description of the physical characteristics of the whole project and the land-use requirements during the construction and operational phases,

– a description of the main characteristics of the production processes, for instance, nature and quantity of the materials used,

– an estimate, by type and quantity, of expected residues and emissions (water, air and soil pollution, noise, vibration, light, heat, radiation, etc.) resulting from the operation of the proposed project.

2. An outline of the main alternatives studied by the developer and an indication of the main reasons for this choice, taking into account the environmental effects.

3. A description of the aspects of the environment likely to be significantly affected by the proposed project, including, in particular, population, fauna, flora, soil, water, air, climatic factors, material assets, including the architectural and archaeological heritage, landscape and the inter-relationship between the above factors.

4. A description of the likely significant effects of the proposed project on the environment resulting from:

– the existence of the project,

– the use of natural resources,

– the emission of pollutants, the creation of nuisances and the elimination of waste,

and the description by the developer of the forecasting methods used to assess the effects on the environment.

5. A description of the measures envisaged to prevent, reduce and where possible offset any significant adverse effects on the environment.

6. A non-technical summary of the information provided under the above headings.

7. An indication of any difficulties (technical deficiencies or lack of know-how) encountered by the developer in compiling the required information.’

10 With regard to the term ‘description’ appearing in paragraph 4 of Annex IV, that paragraph states that ‘[this] description should cover the direct effects and any indirect, secondary, cumulative, short, medium and long-term, permanent and temporary, positive and negative effects of the project.’

The Birds Directive

11 Article 4(1) and (2) of the Birds Directive provides that Member States shall classify as SPAs those territories that are most suitable for the conservation of the bird species referred to in Annex I to that directive and of migratory birds.

12 Annex I to the Birds Directive refers in particular to the capercaillie (*Tetrao urogallus*).

13 Article 4(4), first sentence, of the Birds Directive specifies the protection enjoyed by SPAs:

'In respect of the protection areas referred to in paragraphs 1 and 2 above, Member States shall take appropriate steps to avoid pollution or deterioration of habitats or any disturbances affecting the birds, in so far as these would be significant having regard to the objectives of this Article.'

The Habitats Directive

14 In accordance with the sixth recital in the preamble to the Habitats Directive 'in order to ensure the restoration or maintenance of natural habitats and species of Community interest at a favourable conservation status, it is necessary to designate special areas of conservation in order to create a coherent European ecological network according to a specified timetable'.

15 The seventh recital of that directive reads as follows:

'... all the areas designated, including those classified now or in the future as special protection areas pursuant to [the Birds Directive] will have to be incorporated into the coherent European ecological network'.

16 The 10th recital in the preamble to the Habitats Directive notes that 'an appropriate assessment must be made of any plan or programme likely to have a significant effect on the conservation objectives of a site which has been designated or is designated in future'.

17 Article 3 of the Habitats Directive provides:

'1. A coherent European ecological network of special areas of conservation shall be set up under the title Natura 2000. This network, composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range.

The Natura 2000 network shall include the special protection areas classified by the Member States pursuant to [the Birds Directive].

2. Each Member State shall contribute to the creation of Natura 2000 in proportion to the representation within its territory of the natural habitat types and the habitats of species referred to in paragraph 1. To that effect each Member State shall designate, in accordance with Article 4, sites as special areas of conservation taking account of the objectives set out in paragraph 1.

...'

18 Article 4 of that directive states:

‘1. On the basis of the criteria set out in Annex III (Stage 1) and relevant scientific information, each Member State shall propose a list of sites indicating which natural habitat types in Annex I and which species in Annex II that are native to its territory the sites host. ...

The list shall be transmitted to the Commission, within three years of the notification of this Directive, together with information on each site. ...

2. On the basis of the criteria set out in Annex III (Stage 2) and in the framework both of each of the five biogeographical regions referred to in Article 1(c)(iii) and of the whole of the territory referred to in Article 2(1), the Commission shall establish, in agreement with each Member State, a draft list of [the SCIs] drawn from the Member States’ lists identifying those which host one or more priority natural habitat types or priority species.

...

The list of sites selected as [SCIs], identifying those which host one or more priority natural habitat types or priority species, shall be adopted by the Commission in accordance with the procedure laid down in Article 21.

...

4. Once [an SCI] has been adopted in accordance with the procedure laid down in paragraph 2, the Member State concerned shall designate that site as a special area of conservation as soon as possible ...

As soon as a site is placed on the list referred to in the third subparagraph of paragraph 2 it shall be subject to Article 6(2), (3) and (4).’

19 Paragraphs 2, 3 and 4 of Article 6 of the Habitats Directive provide as follows:

‘2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site’s conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State

shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

20 Article 7 of the Habitats Directive provides:

'Obligations arising under Article 6(2), (3) and (4) of this Directive shall replace any obligations arising under the first sentence of Article 4(4) of [the Birds Directive] in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this Directive or the date of classification or recognition by a Member State under [the Birds Directive] where the latter date is later.'

21 Annex IV to the Habitats Directive, entitled 'animal and plant species of Community interest in need of strict protection', mentions under subparagraph (a) the brown bear (*Ursus arctos*) as a priority species.

Facts of the dispute and pre-litigation procedure

22 The 'Alto Sil' site, located in the north-west of the region of Castile- León, close to the regions of Galicia and Asturias, covers an area of over 43 000 hectares situated at the upper reaches of the river Sil.

23 In January 1998, the Kingdom of Spain proposed that site as an SCI under Article 4(1) of the Habitats Directive.

24 With effect from 1 January 2000, that Member State also designated that site as an SPA under the Birds Directive, due to the presence there of several bird species referred to in Annex I to that directive, including a breeding population of the capercaillie species.

25 On 7 December 2004, the Commission, by Decision 2004/813/EC adopting, pursuant to Directive 92/43, the list of sites of Community importance for the Atlantic biogeographical region (OJ 2004 L 387, p. 1), included the 'Alto Sil' site in that list under the code ES 0000210.

26 The standard data form relating to that site, sent by the Kingdom of Spain to the Commission when proposing the site as a SCI, makes reference, inter alia, to the presence of 10 to 15 specimens of the brown bear and 42 to 47 male specimens of the Cantabrian subspecies of the capercaillie (*Tetrao urogallus cantabricus*).

27 That form also mentions, in particular, the following habitat types:

– 4030 – European dry heaths (50% of the site),

– 4090 – Endemic oro-Mediterranean heaths with gorse (6% of the site),

– 6160 – Oro-Iberian *Festuca indigesta* grasslands (1% of the site),

– 8230 – Siliceous rock with pioneer vegetation of the *Sedo Scleranthion* or of the *Sedo albi Veronicion dillenii* (13% of the site) and

– 9230 – Galicio-Portuguese oak woods with *Quercus robur* and *Quercus pyrenaica* (6% of the site).

28 It is also indicated in the form that the population of the capercaillie species present on the site is of regional importance (50% of the male specimens of the Autonomous Community of Castile-León) and of national importance (2% of the male specimens present on Spanish territory).

29 According to the same form, the vulnerability of the site 'is due essentially to open-cast mining'.

30 In 2001, the Commission was informed of the existence of several open-cast coal mining projects managed by the company Minero Siderúrgica de Ponferrada SA, now called Coto Minero Cantábrico SA, located in or in the immediate vicinity of the 'Alto Sil' site.

31 It is clear from the documents before the Court that the open-cast mining operations involved in these proceedings can be divided into two groups.

32 The first group of operations is located north of the river Sil and the municipality of Villablino (together, 'the northern mines'). They all fall within the 'Alto Sil' SCI.

33 The first of these is the open-cast mine called 'Feixolín' which was authorised on 1 January 1986 in respect of an area of 95.86 hectares and which was operational between 2000 and 2008. It is currently undergoing 'renaturation'.

34 The open-cast mine known as 'Ampliación de Feixolín', a project covering a total area of 93.9 hectares, is also one of the northern mines.

35 In relation to that mine, on 9 November 2009 the Spanish authorities imposed a fine and ordered that specific measures be adopted as mining had already taken place on 35.24 hectares even though that mine had not yet been authorised.

36 However, authorisation to operate that mine over part of the project area, namely 39.62 hectares, had been given on 11 June 2009. On 7 October 2009, specific measures to limit and offset the mine's effects on the environment were ordered.

37 The third northern mine is called 'Fonfría'. It extends over 350 hectares and was authorised on 21 July 1999. Extraction of coal at this site began in January 2001 and ended in December 2010.

38 The other open-cast coal mines that are the subject of these proceedings are located to the south of the river Sil, south-west of the municipality of Villaseca de Laciana ('the southern mines').

39 The first of these is the group of mines called 'Salguero-Prégame-Valdesegadas', which covers 196 hectares. Those mines were authorised between 1984 and 2002. Most of them have ceased activity since 2002. They are now largely undergoing 'renaturation'.

40 Mention should also be made of the mine called 'Nueva Julia' which was authorised on 16 September 2003 in respect of a total area of 405 hectares and which has been operated since 2006.

41 Finally, the mine known as 'Ladrones' was authorised on 24 December 2003 in respect of a total area of 117 hectares. It is not yet operational.

42 Those southern mines are all adjacent to each other. Of those mines, only the 'Ladrones' mine falls within the limits of the 'Alto Sil' SIC, the others being located on the external border of that SCI.

43 Believing that, in relation to those mines, the Spanish authorities had failed to fulfil their obligations under Directive 85/337, as amended, and under the Habitats Directive, the Commission, after examining the information forwarded by those authorities, sent a letter of formal notice to the Kingdom of Spain on 18 July 2003.

44 Taking the view, in particular, that the environmental impact assessment did not give sufficient consideration to the possible disturbances caused to the brown bear and that the cumulative effects of the mining were not sufficiently taken into account, the Commission, having examined the observations made by the Kingdom of Spain in reply to the letter of formal notice, sent a reasoned opinion to that Member State on 22 December 2004.

45 In reply, the Kingdom of Spain submitted, inter alia, a report examining the impact of the various projects and proposing measures to protect the site ('the 2005 report').

46 In order to take account, in particular, of the judgments in *Dragaggi and Others* and in *Bund Naturschutz in Bayern and Others*, the Commission sent a supplementary letter of formal notice to the Kingdom of Spain on 29 February 2008.

47 The Kingdom of Spain replied by letter of 7 May 2008 invoking, in particular, the absence of significant disturbances to the environment attributable to the open-cast mining, while declaring its intention to draw up a strategic plan to make the open-cast mining activity within the 'Alto Sil' area compatible with the system of protecting natural assets established by Community law.

48 On 1 December 2008 the Commission issued a supplementary reasoned opinion in which it reiterated the complaints set out in its supplementary letter of formal notice and called upon the Kingdom of Spain to comply with the reasoned opinion within two months of receipt thereof.

49 Having taken account, in particular, of the observations and documents provided by the Kingdom of Spain in reply to that supplementary reasoned opinion, and taking the view that the situation remained unsatisfactory, the Commission brought the present action.

The request for the adoption of a measure of inquiry and, alternatively, to have the oral procedure reopened

50 By act lodged at the Court Registry on 15 July 2011, the Kingdom of Spain requested the Court to order a measure of inquiry in accordance with Article 60 of the Rules of

Procedure of the Court and, alternatively, to have the oral procedure reopened under Article 61 of those rules.

51 In support of its request, the Kingdom of Spain argues that, contrary to the view taken by the Advocate General in her Opinion, it is not clear from the documents before the Court, as that Member State has already indicated, moreover, in its defence and in its rejoinder, that the open-cast coal mines 'Ampliación de Feixolín' and 'Ladrones' have already been the subject of mining activities.

52 According to the Kingdom of Spain, the analysis of the Advocate General is based on inaccurate factual premises.

53 The Kingdom of Spain applies to the Court seeking leave to produce new evidence concerning the factual situation of the open-cast mines 'Ampliación de Feixolín' and 'Ladrones' and, alternatively, to have the oral procedure reopened.

54 In that regard, it should be noted, first, that it is clear from the documents before the Court, and in particular from the table entitled 'Active mines' which appears on page 50 of the 2005 report, that the open-cast mine 'Ampliación de Feixolín' had indeed been the subject of certain mining activities that had led to the destruction of habitats, and particularly 19.9 hectares of habitat 9230 – Galicio-Portuguese oak woods with *Quercus robur* and *Quercus pyrenaica*. Although it is clear from the documents before the Court that, by a decision of 9 November 2009, the operator of that mine was required to cease operations there and was sanctioned for having commenced without obtaining prior authorisation to that effect, nevertheless those operations actually took place in an area of 35.24 hectares. That is confirmed, moreover, by a site visit report produced by the Kingdom of Spain in the annex to its reply which confirms that, although coal extraction activities do not seem to have taken place on that site, other activities have led to the destruction of vegetation there.

55 Second, contrary to what the Kingdom of Spain maintains, it is not apparent from the Opinion of the Advocate General that this Opinion is based on the premise that the open-cast mine 'Ladrones' has already been operated. On the contrary, the complaints made by the Commission with regard to that mine, examined by the Advocate General, concern the shortcomings that undermine the environmental impact assessment of the mining project. Unlike other complaints, those complaints relate, therefore, to the authorisation procedure for that mine and not to any mining activity on the site of that mine carried out after it was authorised.

56 Consequently, there is no need to order the measure of inquiry requested by the Kingdom of Spain.

57 With regard to the request, which is framed in the alternative, to have the oral procedure reopened, it is appropriate to note that the Court may of its own motion, or on a proposal from the Advocate General, or at the request of the parties, order the reopening of the oral procedure in accordance with Article 61 of the Rules of Procedure if it considers that it lacks sufficient information, or that the case must be dealt with on the basis of an argument which has not been debated between the parties (see, in particular, Case C-210/06 *Cartesio* [2008] ECR I-9641, paragraph 46, and Case C-306/08 *Commission* v *Spain* [2011] ECR I-0000, paragraph 60).

58 However, neither the Statute of the Court of Justice of the European Union nor its Rules of Procedure make provision for the parties to submit observations in response to the Advocate General's Opinion (see, in particular, *Commission* v *Spain*, paragraph 61).

59 In the present case, the Court considers, having heard the Advocate General, that it has all the material necessary for it to decide the dispute before it and that the case does not have to be examined in the light of arguments that have not been the subject of discussion before it. Therefore, there is no need to order the reopening of the oral procedure.

The action

The first complaint, alleging non-compliance with Articles 2, 3 and 5(1) and (3) of Directive 85/337 as amended in respect of the assessments of the environmental impacts of the 'Fonfría', 'Nueva Julia' and 'Ladrones' open-cast mining projects

Arguments of the parties

60 By its first complaint, the Commission maintains that the assessments of the environmental impacts of the 'Fonfría', 'Nueva Julia' and 'Ladrones' projects contained major omissions, rendering them inadequate assessments not complying with Directive 85/337 as amended.

61 In that regard, the Commission refers to point 4 of Annex IV to that directive, and in particular to a note concerning the term 'description' appearing in that point, which implies that projects falling within the scope of the directive must be accompanied by a description of their significant effects on the environment, setting out their 'direct effects and any indirect, secondary, cumulative, short, medium and long-term, permanent and temporary ... effects'.

62 It infers that, in this case, the assessments of the environmental impacts of the mining projects concerned should have included an analysis of the significant cumulative impacts which the proximity of several open-cast coal mines simultaneously operated in the Laciana valley were likely to have. The 2005 report confirms that no such analysis was carried out prior to the authorisation of the three projects in question.

63 In addition, the Commission cites the following specific deficiencies of the environmental impact assessments for the three mines forming the subject-matter of this complaint:

– concerning the 'Fonfría' project, there is nothing in the initial assessment to indicate that an assessment was made of the possible disturbances for the capercaillie, even though the authorities were aware of the presence of that species on a breeding ground situated close to the extraction area of the mine. Moreover, the 2005 report stated without further explanation that that project is situated inside the recovery plan of the brown bear;

– although the 'Ladrones' project is very close to the breeding grounds of the capercaillie, justifying the designation of a critical area in the recovery plan for that species, there is nothing to indicate that that presence was taken into account in the initial assessment of that project. With regard to the brown bear, that assessment merely stated that the project is located within the recovery plan for that species, but that there would be no significant

disturbances for the latter since the mining extraction 'does not affect any critical area and does not involve any barrier effect between the various pockets';

– concerning the 'Nueva Julia' project, the assessment contains no information on the two most problematic species, namely the capercaillie and the brown bear. The effects of that project situated outside the SCI are obviously likely to be felt at a distance of several kilometres and could therefore affect habitats and species within the SCI. That eventuality does not appear to have been taken into account.

64 The Kingdom of Spain argues, first, concerning the interpretation of the term 'description' in point 4 of Annex IV to Directive 85/337 as amended, that the use of the conditional in the note concerning that point to the effect that '[t]his description should cover', indicates that the required description does not necessarily have to mention the cumulative effects of the various projects on the environment, but that it is merely desirable that it should contain such a description. The formulation used in other language versions of the directive confirms that interpretation.

65 Moreover, that Member State argues, such a description of the cumulative effects was not necessary in this case, since the mines in question were authorised in very different periods and the areas of the SCI which they affect are also different.

66 In any event, the 2005 report contains a detailed assessment of the potential effects of each of the projects in question and the potential cumulative effects which they might produce in combination with other projects.

67 As regards the 'Fonfría' project, the 2005 report concluded, at the end of a description of the cumulative effects, that the protected species were not significantly disturbed in the SCI.

68 That is also the case with the 'Nueva Julia' project. Concerning the brown bear, it was concluded in the 2005 report, following an assessment of the cumulative environmental effects of the mines and projects concerned, that no critical area or transit route was disturbed, so that the effect of that project on that species was not significant.

69 With regard to the bird species protected under the SPA and thus the 'Alto Sil' SCI, the Kingdom of Spain argues that no species has been significantly disturbed. As regards the 'Ladrones' project, the 2005 report concluded that there was no significant impact on habitat 4020, identified as a priority habitat of the capercaillie in the recovery plan for that species.

Findings of the Court

70 Concerning, first, the Commission's first complaint regarding the 'Fonfria' open-cast coal mining project, it should be noted that, according to Article 3(2) of Directive 97/11, the provisions of Directive 85/337, in its version prior to the amendments introduced by Directive 97/11, continue to apply to applications for authorisation submitted before the time-limit laid down in Article 3(1), namely 14 March 1999.

71 In this case, it is apparent from the documents before the Court that the application for authorisation for the 'Fonfría' mine project was submitted on 11 March 1998.

72 The Court cannot therefore uphold the Commission's application for a declaration that the provisions of Directive 85/337 have been infringed in relation to this project.

73 Moreover, the Commission's complaint concerning this project cannot be understood as seeking a finding of an infringement of Directive 85/337 in its version prior to the amendments introduced by Directive 97/11.

74 That is all the more so as certain amendments introduced by Directive 97/11 are directly relevant for assessing whether this complaint is well founded. That applies in particular to the insertion, in point 19 of Annex I to Directive 85/337, of the reference to open-cast mining projects with a surface area larger than 25 hectares, which implies that the latter do not have to form the subject-matter of an assessment pursuant to Article 4(1) of Directive 85/337 as amended unless they concern applications for authorisation submitted after 14 March 1999.

75 Therefore, the first complaint must be dismissed in so far as it concerns the 'Fonfría' project.

76 It needs to be examined, secondly, whether, in this case the environmental impact assessments carried out in accordance with Directive 85/337 as amended of the 'Nueva Julia' and 'Ladrones' mining projects are inadequate, as the Commission argues, because they do not include an analysis of the cumulative environmental effects capable of being produced by those projects and other operations, such as open-cast coal mines in operation or the commencement in operation of which is authorised or in the course of authorisation.

77 In that regard, contrary to what the Kingdom of Spain argues, it cannot be inferred from the use of the conditional, in the note concerning point 4 of Annex IV to Directive 85/337 as amended, to the effect that '[t]his description should cover ... any ... cumulative ... effects of the project', that the assessment of the environmental impacts does not necessarily have to cover the cumulative effects of the various projects on the environment, but that such an analysis is merely desirable.

78 The scope of that obligation to assess impacts on the environment follows from the provision contained in Article 3 of Directive 85/337 as amended, according to which the environmental impact assessment is to identify, describe and assess in an appropriate manner, in the light of each individual case and in accordance with Articles 4 to 11 of that directive, the direct and indirect effects of a project on human beings, fauna and flora, soil, water, air, climate and the landscape, material assets and the cultural heritage, and the interaction between those factors.

79 Given the extended scope and very broad objective of Directive 85/337 as amended, which are apparent from Articles 1(2), 2(1) and 3 of the latter (see, to that effect, Case C-72/95 *Kraaijeveld and Others* [1996] ECR I-5403, paragraphs 30 and 31), the mere fact that there may have been uncertainty as to the exact meaning of the use of the conditional in the expression '[t]his description should cover' used in a note to point 4 of Annex IV to Directive 85/337 as amended, even if that also appears in other language versions of that directive, cannot prevent a broad interpretation from being given to Article 3 of the latter.

80 Therefore, that provision should be taken as meaning that, where the assessment of the environmental impacts must, in particular, identify, describe and assess in an appropriate

manner the indirect effects of a project, that assessment must also include an analysis of the cumulative effects on the environment which that project may produce if considered jointly with other projects, in so far as such an analysis is necessary in order to ensure that the assessment covers examination of all the notable impacts on the environment of the project in question.

81 The Kingdom of Spain argues that, in this case, such a cumulative assessment was not necessary, since the mines concerned are distant from each other and were authorised in very different periods.

82 However, the documents before the Court do not show that to be the case with, in particular, the 'Nueva Julia' and 'Ladrones' projects, since those southern mines are situated in proximity to each other and the procedures for authorising them were carried out in parallel.

83 Moreover, even if, as the Kingdom of Spain argues, the 2005 report contained such an analysis, that report cannot remedy the lack of that analysis in the context of the initial assessment, since Article 2(1) of Directive 85/337 as amended requires that the assessment be a preliminary to the authorisation of the project.

84 Thirdly, it needs to be examined whether, as the Commission maintains, the possible and specific impacts of the 'Nueva Julia' and 'Ladrones' open-cast coal mining projects on the capercaillie and the brown bear have not been adequately examined in the environmental impact assessments for those projects.

85 Concerning, first, the 'Nueva Julia' mining project, the environmental impact assessment of 25 August 2003 refers only to the impact of that project on certain amphibians. That assessment contains no indication that an assessment was actually carried out as to the impacts of that project on the brown bear and the capercaillie.

86 An analysis of the impacts of that project on those species was, however, necessary, first, because the Spanish authorities could not have been unaware of the presence of those species on the territory of the 'Alto Sil' site. Indeed, during 1998, the Kingdom of Spain had proposed the classification of the 'Alto Sil' site and an SCI by reason, in particular, of the presence on that site of those two species, and that same Member State had, with effect from the year 2000, classified that site as an SPA by reason of the presence of the capercaillie.

87 Moreover, even if that operation is situated outside the SCI, it is undisputed that it is immediately adjacent to that site, so that it is possible that it may have impacts on the latter.

88 Such an analysis was all the more needed since, in the standard data formula for the 'Alto Sil' site, sent by the Kingdom of Spain to the Commission when it was proposed to classify that site as an SCI, that Member State had stated that the vulnerability of that site was fundamentally due to the open-cast coal mining operations.

89 Concerning, next, the 'Ladrones' open-cast coal mining project, it should be noted that the environmental impact statement of 9 October 2003 refers to the presence of the brown bear on the 'Alto Sil' site proposed as an SCI, but concludes that, as follows from a report of 5 June 2001, the operation causes only a small loss of habitat favourable to that species, does

not affect any area critical for the species and does not create any barrier effect between the various pockets.

90 In that respect, it must be held that, as regards the brown bear, the Commission has not produced any document capable of throwing doubt on the adequacy of that assessment of the project's environmental impact.

91 Concerning the capercaillie, it is mentioned in that environmental impact statement that a representative of an environmental organisation had referred in particular to the possible impact of the project on that species, that that claim was challenged by the promoter, and that the latter was examined and assessed in a satisfactory manner. However, it is not apparent from that statement or from other documents produced by the Kingdom of Spain that the assessment of the impacts of the project on the capercaillie was actually made. For the reasons already set out in paragraphs 86 and 88 of this judgment, an analysis of the impacts of that project on that species was clearly necessary.

92 Consequently, that assessment must be held to be inadequate as regards the capercaillie.

93 Finally, the defects thus identified in the environmental impact assessments for the 'Nueva Julia' and 'Ladrones' mining projects cannot be regarded as being compensated for by the 2005 report since, as has already been pointed out in paragraph 83 of this judgment, Article 2(1) of Directive 85/337 as amended requires the assessment to be a preliminary to the authorisation of the project.

94 Accordingly, the first complaint, in so far as it seeks a declaration of failure to fulfil obligations under Articles 2, 3 and 5(1) and (3) of Directive 85/337 as amended, as regards the environmental impact assessments for the 'Nueva Julia' and 'Ladrones' open-cast mining projects, must, save for the latter project in respect of the brown bear, be upheld.

The second complaint, alleging non-compliance with Article 6(2) to (4) of the Habitats Directive as regards the capercaillie as protected since the classification of the 'Alto Sil' site as an SPA from the year 2000 onwards

The first part of the second complaint

– Arguments of the parties

95 The Commission argues that, by authorising the 'Nueva Julia' and 'Ladrones' operations, the Kingdom of Spain infringed Article 6(3) and (4) of the Habitats Directive, having regard to the protection which the capercaillie has enjoyed since the classification of the 'Alto Sil' site as an SPA since 2000.

96 The Kingdom of Spain argues that the assessments of the projected operations contain a sufficient assessment of the possible impacts of those projects on that species.

– Findings of the Court

97 It follows from Article 7 of the Habitats Directive that Article 6(2) to (4) of that directive replaces the first sentence of Article 4(4) of the Birds Directive as from the date of implementation of the Habitats Directive or the date of classification by a Member State

under the Birds Directive, where the latter date is later (see, in particular, Case C-418/04 *Commission* v *Ireland* [2007] ECR I-10947, paragraph 173).

98 In this case, the complaint concerning the assessment of the impacts on the 'Nueva Julia' and 'Ladrones' projects on the species protected by virtue of the 'Alto Sil' SPA, particularly on the capercaillie, must therefore be examined having regard to the provisions of Article 6(3) and (4) of the Habitats Directive as regards these projects, in relation to which it is undisputed that the applications for authorisation relating thereto were brought after the 'Alto Sil' site was classified as an SPA.

99 Under Article 6(3) of the Habitats Directive, an appropriate assessment of the implications for the site concerned of the plan or project implies that, prior to its approval, all aspects of the plan or project which can, by themselves or in combination with other plans or projects, affect the site's conservation objectives must be identified in the light of the best scientific knowledge in the field. The competent national authorities are to authorise an activity on the protected site only if they have made certain that it will not adversely affect the integrity of that site. That is the case where no reasonable scientific doubt remains as to the absence of such effects (see, in particular, *Commission* v *Ireland*, at paragraph 243).

100 An assessment made under Article 6(3) of the Habitats Directive cannot be regarded as appropriate if it contains gaps and lacks complete, precise and definitive findings and conclusions capable of removing all reasonable scientific doubt as to the effects of the works proposed on the SPA concerned (see, to that effect, Case C-304/05 *Commission* v *Italy* [2007] ECR I-7495, paragraph 69).

101 In this case, protection of the capercaillie clearly constitutes a conservation objective which led the Kingdom of Spain to classify the 'Alto Sil' site as an SPA in 2000.

102 Moreover, it should be remembered that the national authorities had indicated, at the time of the proposal, formulated in 1998, to classify that site as an SCI, that the capercaillie population present on that site was of regional and even national importance and that the vulnerability of that same site was fundamentally due to the open-cast mining operations.

103 As has already been held in the consideration of the first complaint concerning Directive 85/337 as amended, particularly in paragraphs 76 to 93 of this judgment, the environmental impact assessments carried out before the approval of the 'Nueva Julia' and 'Ladrones' projects do not contain any analysis of the possible cumulative effects of the various operations on the capercaillie, whereas, in this case, such an analysis was necessary. Similarly, nor do those assessments contain sufficient indications to allow verification that the impacts of those operations on the capercaillie population present in the 'Alto Sil' SPA have actually been assessed.

104 Moreover, the 2005 report cannot make up for those deficiencies, since it was drawn up after the authorisation of those projects and cannot therefore be regarded as relevant in the context of Article 6(3) of the Habitats Directive (see, to that effect, *Commission* v *Italy*, paragraph 72).

105 It follows that the assessments concerning the 'Nueva Julia' and 'Ladrones' open-cast mining projects cannot be regarded as appropriate since they are characterised by gaps and by the lack of complete, precise and definitive findings and conclusions capable of removing all

reasonable scientific doubt as to the effects of those projects on the 'Alto Sil' SPA, and in particular on the capercaillie population, the protection of which constitutes one of the objectives of that area.

106 It cannot therefore be maintained that, before the authorisation of those operations, all the aspects of the plan or project capable, by themselves or in combination with other plans or projects, of affecting the conservation objectives of the 'Alto Sil' site were identified, taking into account the best scientific knowledge on the matter.

107 In those circumstances, the said assessments do not demonstrate that the competent national authorities could have acquired the certainty that those operations would be free of damaging effects for the integrity of the said site.

108 It follows that the authorisations for the said projects did not comply with Article 6(3) of the Habitats Directive.

109 The Kingdom of Spain, which has invoked the importance of mining activities for the local economy, needs to be reminded that, whilst that consideration is capable of constituting an imperative reason of overriding public interest within the meaning of Article 6(4) of the Habitats Directive, that provision can apply only after the implications of a plan or project have been studied in accordance with Article 6(3) of that directive. Knowledge of those implications in the light of the conservation objectives relating to the site in question is a necessary prerequisite for application of Article 6(4) since, in the absence thereof, no condition for application of that derogating provision can be assessed. The assessment of any imperative reasons of overriding public interest and that of the existence of less harmful alternatives require a weighing up against the damage caused to the site by the plan or project under consideration. In addition, in order to determine the nature of any compensatory measures, the damage to the site must be precisely identified (*Commission* v *Italy*, paragraph 83).

110 It is clear from the considerations above that the national authorities did not have those data at the time the decisions to grant the authorisations in question were taken. It follows that those authorisations cannot be based on Article 6(4) of the Habitats Directive.

111 Consequently, those authorisations did not comply with Article 6(4) of the Habitats Directive.

112 In those circumstances, the first part of the second complaint must be regarded as well founded.

The second part of the second complaint

– Arguments of the parties

113 The Commission accuses the Kingdom of Spain of infringing Article 6(2) of the Habitats Directive by failing to take the necessary measures to prevent the operation of the 'Feixolín', 'Fonfría', 'Salguero-Prégame-Valdesesgadas', 'Ampliación de Feixolín' and 'Nueva Julia' open-cast mines after January 2000, the date from which classification of the 'Alto Sil' site as an SPA became effective, from affecting that site and in particular the capercaillie species protected by virtue of that SPA.

114 It refers to the recovery plan for the Cantabrian capercaillie, approved by Decree 4/2009, of 15 January 2009, of the Junta de Castilla y León (B.O.C. y L. n° 13, p. 1540). The latter states that, in 1982, the population of the Cantabrian capercaillie still amounted to about 1 000 specimens and that the occupation rate of the breeding grounds amounted to 85%. In 2002, however, that population did not exceed 500 to 600 specimens, spread between two sides of a mountain range, and the occupation rate of the breeding grounds was 45%. During that 20-year period, half of that population was located in the autonomous community of Castile-León. According to the said recovery plan, in 2005, the population present in that autonomous community amounted to about 164 adult specimens and risked becoming extinct in about 20 years.

115 The Commission argues, in particular, that certain breeding grounds of the capercaillie are close to the mining operations in question. That applies to the 'Robledo El Chano' breeding ground, situated close to the 'Fonfría' mine and still occupied in 1999.

116 As for the 2005 report, the Commission argues, inter alia, that the conclusion that the impact of open-cast mining operations on the capercaillie must be regarded as insignificant is incoherent. That report confirmed the risk of 'supra-local' effects being engendered by mining operations and the exclusion of the possibility, important for the conservation of the species, that an abandoned habitat might once again be used if its quality permitted.

117 The Commission also argues that scientific studies show that the fragmentation of forest enclaves available for the capercaillie in the 'Alto Sil' area has been made manifestly worse by the possibility of a barrier effect caused by the simultaneous and uninterrupted entry into operation of several mines.

118 The Kingdom of Spain acknowledges that the Cantabrian capercaillie has undergone a major decline, but argues that the populations suffering the greatest decline in the Castile-León region are those located in the areas with the highest levels of protection, such as national parks, whereas the capercaillie population present on the 'Alto Sil' site is the largest of the region and has undergone only a modest decline. It is moreover significant that the decline of the species on that site has been much greater in areas distant from the mining basin.

119 The Kingdom of Spain also maintains that, in the areas affected by the open-cast mining operations concerned by this complaint, the presence of the capercaillie is ancient and marginal. In those areas, there is only one known breeding ground, namely 'Robledo El Chano' which, in accordance with the national strategy for conservation of the species, forms part of a critical area for the safeguarding of the Cantabrian capercaillie. However, that breeding ground has been abandoned since the end of the 1980's and cannot, therefore, have been affected by the operation of 'Fonfría'.

– Findings of the Court

120 It needs first to be examined whether Article 6(2) of the Habitats Directive is applicable to the operations of the 'Feixolín', 'Fonfría', 'Salguero-Prégame-Valdesesgadas', 'Ampliación de Feixolín' and 'Nueva Julia' open-cast mines which took place subsequently to the classification of the 'Alto Sil' site as an SPA, effective from the year 2000.

121 In that regard, concerning first the 'Nueva Julia' operation, since it has been held in the context of the first part of the second complaint that authorisation for that project was granted without complying with Article 6(3) of the Habitats Directive, the case-law shows that a breach of Article 6(2) may be found where deterioration of a habitat or disturbance of the species for which the area in question was designated has been established (*Commission* v *Italy*, paragraph 94).

122 Next, as regards the 'Ampliación de Feixolín' operation, it should be recalled that the fact that a plan or project has been authorised according to the procedure laid down in Article 6(3) of the Habitats Directive renders superfluous, as regards the action to be taken on the protected site under the plan or project, a concomitant application of the rule of general protection laid down in Article 6(2) (*Commission* v *Ireland*, paragraph 250).

123 It follows that, in so far as the operation of the 'Ampliación de Feixolín' mine which the Commission criticises took place at a time when the latter had not yet been authorised, as has been pointed out in paragraph 35 of this judgment, the latter may constitute an infringement of Article 6(2) of the Habitats Directive.

124 Finally, it should be noted that Article 6(2) of the Habitats Directive applies to the 'Feixolín', 'Fonfría' and 'Salguero-Prégame-Valdesesgadas' open-cast mines, notwithstanding the fact that operation of the latter was authorised before the system of protection laid down by the Habitats Directive became applicable to the 'Alto Sil' site by reason of its classification as an SPA.

125 The Court has already held that, although such projects are not subject to the requirements relating to the procedure for prior assessment of the implications of the project for the site concerned, laid down by the Habitats Directive, their implementation nevertheless falls within the scope of Article 6(2) of that directive (see, to that effect, Case C-226/08 *Stadt Papenburg* [2010] ECR I-131, paragraphs 48 and 49).

126 Concerning, secondly, the complaint that, in relation to the operational activities of the open-cast mines in question, the Kingdom of Spain did not comply with Article 6(2) of the Habitats Directive, it should be recalled that an activity complies with that provision only if it is guaranteed that it will not cause any disturbance likely significantly to affect the objectives of that directive, particularly its conservation objectives (see, to that effect, Case C-241/08 *Commission* v *France* [2010] ECR I-1697, paragraph 32).

127 Moreover, by virtue of Article 6(2) of the Habitats Directive, the protective legal status of SPAs must guarantee the avoidance therein of the deterioration of natural habitats and the habitats of species as well as significant disturbance of the species for which those areas have been classified (see, in particular, Case C-535/07 *Commission* v *Austria* [2010] ECR I-0000, paragraph 58 and case-law cited).

128 It follows that this complaint is well founded only if the Commission demonstrates to a sufficient legal standard that the Kingdom of Spain has not taken the appropriate protective measures, consisting in preventing the operational activities of the 'Feixolín', 'Fonfría', 'Salguero-Prégame-Valdesegadas', 'Ampliación de Feixolín' and 'Nueva Julia' mines, in so far as they took place after the classification of the 'Alto Sil' site as an SPA from the year 2000 onwards, from producing deteriorations of the habitats of the capercaillie and

disturbances of that species likely to have significant effects having regard to the objective of that directive consisting in ensuring the conservation of that species.

129 In that respect, is needs to be examined, first, whether the mines in question occupy surfaces which constitute appropriate habitats for the capercaillie but cannot be used by that species during the operation of those mines, or during their subsequent 'renaturation'.

130 The Commission maintains that that is the case in particular with habitat 9230, constituted by Galicia-Portuguese oak woods with *Quercus robur* and *Quercus pyrenaica*.

131 In that respect, as the Advocate General states in points 81 and 82 of her Opinion, the Commission provides evidence of the destruction of that habitat after the classification of the 'Alto Sil' site as an SPA only as regards the 'Fonfría' mine. The 2005 report shows that, in the context of that operation, which took place from 2001 onwards, an area of 17.92 hectares of habitat type 9230 has in fact been destroyed.

132 The Kingdom of Spain argues that that loss of habitat is unimportant for the conservation of the capercaillie species, since the area concerned did not contain any breeding ground.

133 That argument cannot be accepted, because, even if that area were not usable as a breeding ground, it could conceivably be used by that species as a habitat for other purposes, such as a living or hibernating area.

134 Moreover, if that operation had not taken place in that area, the possibility cannot be excluded that, following measures taken by the authorities for that purpose, that area could have become usable as a breeding ground.

135 In that respect, it should be recalled that the protection of SPAs is not to be limited to measures intended to avoid external anthropogenic impairment and disturbance but must also, according to the situation that presents itself, include positive measures to preserve or improve the state of the site (*Commission* v *Austria*, paragraph 59 and case-law cited).

136 The Commission argues, secondly, that the mining operations concerned are, by reason of the noise and vibrations which they produce and which are felt within the 'Alto Sil' SPA, likely significantly to disturb the capercaillie population protected by virtue of that SPA.

137 In that regard, it is apparent from the documents before the Court that, as the Advocate General has stated in point 88 of her Opinion, bearing in mind the relatively short distances between various areas critical for the capercaillie and the open-cast mines in question, noise and vibrations caused by those operations are likely to be felt in those areas.

138 It follows that those nuisances are capable of causing disturbances likely significantly to affect the objectives of the said directive, particularly the objectives of conserving the capercaillie.

139 That is all the more so as it is undisputed that the capercaillie is a sensitive species and particularly demanding as to the tranquillity and quality of its habitats. It is further apparent from the documents before the Court that the degree of isolation and tranquillity required by

that species constitutes a factor of the very first order as it has a considerable impact on the ability of that species to reproduce.

140 The Kingdom of Spain expresses doubts in that regard by objecting that the decline in the populations of that species, including on the 'Alto Sil' site, has also been observed outside the mining basin and is even more marked there. That was confirmed by the 2005 report, which indicates that there is no relation of cause and effect between the existence of mining operations and the abandonment of breeding grounds by the Cantabrian capercaillie, that latter phenomenon being more significant in areas beyond those neighbouring the operations.

141 However, that circumstance in itself does not prevent the said nuisances produced inside the SPA by the mining operations in question from being capable of having had significant impacts on that species, even if the decline of that species may have been greater yet for populations relatively distant from those operations.

142 Moreover, in order to establish a failure to fulfil obligations within the meaning of Article 6(2) of the Habitats Directive, the Commission does not have to prove a cause and effect relationship between a mining operation and significant disturbance to the capercaillie. Since Article 6(2) and (3) of the Habitats Directive are designed to ensure the same level of protection, it is sufficient for the Commission to establish the existence of a probability or risk that that operation might cause significant disturbances for that species (see, to that effect, *Commission* v *France*, paragraph 32, and Case C-2/10 *Azienda Agro-Zootecnica Franchini and Eolica di Altamura* [2011] ECR I-0000, paragraph 41).

143 In any event, as the Advocate General has pointed out in points 90 to 92 of her Opinion, the documents before the Court show that the abandonment of the 'Robledo El Chano' breeding ground, still occupied by the capercaillie in 1999, results from the operation of the 'Fonfría' open-cast mine as from 2001.

144 That finding confirms that the operation of the mines in question, particularly the noises and vibrations produced, is capable of causing significant disturbances for that species.

145 Therefore, it must be held that the open-cast operations of the 'Feixolín', 'Fonfría', 'Salguero-Prégame-Valdesesgadas', 'Ampliación de Feixolín' and 'Nueva Julia' mines are contrary to Article 6(2) of the Habitats Directive by reason of the noises and vibrations which they produce and which are capable of significantly affecting the conservation of the capercaillie.

146 The Commission maintains, thirdly, that the open-cast mining operations contribute to isolating sub-populations of capercaillie by blocking communication corridors linking those sub-populations with other populations. It refers to the report of December 2004 on the impact of mining operations on the Cantabrian capercaillie, drawn up by the Ministry of the Environment and by the coordinators of the strategy for conserving the Cantabrian capercaillie in Spain.

147 In that respect, it must be held that that expert report, drawn up by recognised experts on the Cantabrian capercaillie of the national Ministry of the Environment and the Ministry of the Environment of the autonomous community of Castile- León, concludes that there is a risk that operations currently being carried out, including the 'Feixolín' and 'Fonfría' mines, in conjunction with projects the implementation of which is imminent, such as the 'Ampliación

de Feixolín' mine, form a continuous east-west barrier for the capercaillie, capable of leading to the isolation of population pockets of that species, and, over time, to the disappearance of pockets located to the south of that barrier.

148 Since the Kingdom of Spain does not produce evidence refuting the conclusions of that report, the scientific value of which is undisputed, it must be held that the 'Feixolín', 'Fonfría' and 'Ampliación de Feixolín' operations are capable of producing a barrier effect likely to contribute to the fragmentation of the habitat of the capercaillie and the isolation of certain sub-populations of that species.

149 The question arises, however, whether the Kingdom of Spain can be accused of the failures to fulfil obligations under Article 6(2) of the Habitats Directive thus determined in so far as they concern the 'Ampliación de Feixolín' open-cast mine.

150 Unlike the other mines concerned by this complaint, the 'Ampliación de Feixolín' open-cast mine was not authorised at the time when the operations criticised by the Commission took place. Moreover, the authorities penalised the operator of that mine for operating it without prior authorisation and ordered him to cease that operation.

151 However, as the Advocate General points out in point 105 of her Opinion, whereas the authorities were informed of the actual operation of that mine at least since 2005, the documents before the Court show that they did not prohibit it until November 2009, following an inspection carried out during September the same year.

152 Thus, by allowing a situation which caused significant disturbances in the 'Alto Sil' SPA to continue for at least four years, the Kingdom of Spain omitted to take, in good time, the measures necessary to bring those disturbances to an end. Thus, the Kingdom of Spain can be accused of the failures to fulfil obligations under Article 6(2) of the Habitats Directive in so far as they concern the 'Ampliación de Feixolín' mine.

153 Finally, the further question arises whether the failures to fulfil obligations under Article 6(2) of the Habitats Directive thus established can be justified by reason of the importance of mining activities for the local economy, as the Kingdom of Spain has pleaded.

154 Such a ground can in fact be relied upon by a Member State under the procedure laid down by Article 6(4) of the Habitats Directive. If the conditions laid down by that provision are met, its application may lead to the authorisation of activities which, as has already been held in paragraph 122 of this judgment, can no longer be halted having regard to Article 6(2).

155 However, as is apparent from the case-law referred to in paragraph 125 of this judgment, the procedures for prior assessment laid down by the Habitats Directive do not apply to projects such as 'Feixolín' and 'Fonfría', since they were authorised before the system of protection provided for by the Habitats Directive became applicable to the 'Alto Sil' site by reason of its classification as an SPA.

156 Concerning those projects, the possibility cannot be excluded that a Member State, by analogy with the procedure in derogation provided for in Article 6(4) of the Habitats Directive, may, in a procedure under domestic law for assessing the environmental impacts of a plan or project capable of significantly affecting the interests of conserving a site, invoke a

reason of public interest and, if the conditions laid down by that provision are essentially satisfied, authorise an activity which, subsequently, is no longer prohibited by Article 6(2).

157 However, as already stated in paragraph 109 of this judgment, in order to be able to verify whether the conditions laid down by Article 6(4) of the Habitats Directive have been met, the impacts of the plan or project must first have been analysed in accordance with Article 6(3) of that directive.

158 In this case, the documents before the Court show that, at the time of the assessment of the environmental impacts of the 'Feixolín' and 'Fonfría' projects carried out under the authorisation procedure of national law, the significant disturbances which those projects are capable of causing for the capercaillie, and which have been established in paragraphs 131, 145 and 148 of this judgment, could not be analysed because the Kingdom of Spain had not identified them and even denied their existence, including in the procedure before the Court.

159 In those circumstances, it appears that, in the context of the authorisation procedure under national law, the conditions laid down by Article 6(4) of the Habitats Directive have not been capable of verification.

160 Therefore, the failures to fulfil obligations under Article 6(2) of the Habitats Directive which have been established cannot be justified by reference to the importance of mining activities for the local economy.

The third complaint, alleging infringement of the obligations arising under the Habitats Directive from the proposal of the 'Alto Sil' site as an SCI in relation to the operation of the 'Fonfría', 'Feixolín', 'Salguero-Prégame-Valdesegadas' and 'Nueva Julia' open-cast mines

– Arguments of the parties

161 By its third complaint, the Commission accuses the Kingdom of Spain of failing, from January 1998 onwards, to take the necessary measures in relation to the extraction of coal from the 'Feixolín', 'Salguero-Prégame-Valdesegadas', 'Fonfría' and 'Nueva Julia' mines, to preserve the national ecological interest represented by the proposed 'Alto Sil' site, particularly in relation to the brown bear, and did not therefore comply with its obligations under the Habitats Directive as described in the abovementioned judgments in *Dragaggi and Others* and *Bund Naturschutz in Bayern and Others*.

162 The Kingdom of Spain replies that it complied with the said obligations and observes in that respect that, according to official census data, the brown bear population, particularly in the western pocket of which the 'Alto Sil' site forms part, has experienced remarkable growth during the past 10 years.

– Findings of the Court

163 Under the Habitats Directive, Member States must take appropriate protective measures to preserve the characteristics of sites which host priority natural habitat types and/or priority species and which have been identified by Member States with a view to their inclusion on the Community list. Member States cannot therefore authorise intervention where there is a risk that the ecological characteristics of those sites will be seriously compromised as a result. That is particularly so where there is a risk that intervention of a particular kind will bring

about the extinction of priority species present on the sites concerned (Case C-308/08 *Commission* v *Spain* [2010] ECR I-0000, paragraph 21 and case-law cited).

164 In this case, it is undisputed that the brown bear is a priority species which is present on the 'Alto Sil' site and that its conservation was an objective envisaged by the Kingdom of Spain at the time of the proposal of that site as an SCI.

165 The question therefore arises whether, as the Commission argues, the operations of the 'Fonfría', 'Feixolín', 'Salguero-Prégame-Valdesegadas' and 'Nueva Julia' open-cast mines, in so far as they took place during the provisional period of protection between January 1998, when it was proposed to classify that site as an SCI, and December 2004, when the said site was in fact classified as an SCI, may be regarded as being interventions which risked seriously compromising the ecological characteristics of that site and, with regard in particular to the brown bear priority species, risked resulting in the disappearance of that species on that site.

166 In that respect, it is apparent from the documents before the Court, and in particular from the documents to which the Advocate General refers in point 130 of her Opinion, that the mining operations north of the River Sil, particularly 'Fonfría' and 'Feixolín', caused disturbances for the brown bear, especially by creating or aggravating a 'barrier effect' which risked preventing or severely impeding access to the Leitariegos corridor, whereas the latter is a north-south transit route of great importance for the western population of Cantabrian brown bears, of which the pocket of brown bears present on the 'Alto Sil' forms part.

167 However, having regard to the evidence produced by the Commission, it cannot be held that that 'barrier effect' seriously compromised the ecological characteristics of the said site as regards in particular the state of conservation of the brown bear.

168 As the Kingdom of Spain has argued without being contradicted by the Commission, between 1998 and 2004, the demographic evolution of the western population of Cantabrian brown bears, of which the pocket of bears present on the 'Alto Sil' site forms part, reveals a clearly positive trend.

169 As the file confirms, even if, between 1982 and 1995 that population regressed in the order of 4 to 5% per year, it has since experienced an annual and uninterrupted growth of 7.5%, causing it to rise from an estimated total of 50 to 65 specimens at the beginning of the 1990s to a total of about 100 to 130 specimens in 2008. It is currently regarded as a threatened, but viable, population. By contrast, according to the studies, the eastern population of Cantabrian brown bears remains precarious by reason primarily of its isolation in relation to the western population. It has not yet been able to re-establish itself at a level considered viable, the number of individuals belonging to that population having increased only from an estimated total of 20 to 25 specimens to a total of 30 during the said period.

170 It follows from these considerations that, bearing in mind the scientific studies submitted to the Court in the context of the present procedure concerning the western population of Cantabrian brown bears of which the population of brown bears present on the 'Alto Sil' site forms part, there is insufficient evidence that the operations of the 'Fonfría', 'Feixolín', 'Salguero-Prégame-Valdesegadas' and 'Nueva Julia' open-cast mines, in so far as they took place between January 1998, when it was proposed to classify that site as an SCI, and December 2004, when the said site was in fact classified as an SCI, risked seriously

compromising the ecological characteristics of that site and, with regard in particular to the brown bear priority species, risked resulting in the disappearance of that species on that site.

171 The third complaint must therefore be dismissed.

The fourth complaint, alleging non-compliance, as from the registration of the 'Alto Sil' site as an SCI in December 2004, with Article 6(2) to (4) of the Habitats Directive

The first part of the fourth complaint

172 The Commission argues that the Kingdom of Spain has failed to fulfil its obligations under Article 6(3) and (4) of the Habitats Directive in that it authorised the 'Feixolín', 'Salguero-Prégame-Valdesegadas', 'Fonfría' and 'Nueva Julia' open-cast mining projects without first assessing the impacts which those projects were capable of having, and, in any event, without complying with the conditions in accordance with which those projects might be realised despite their negative impacts.

173 In that regard, it should be held that the mining operations concerned by this complaint were all authorised before December 2004, and thus before the 'Alto Sil' site was classified as an SCI.

174 As is apparent from the case-law referred to in paragraph 125 of this judgment, projects which were authorised before the system of protection provided for by the Habitats Directive become applicable to a site are not subject to the requirements concerning the procedure for prior assessment of the impacts of the project on the site concerned, laid down by the Habitats Directive.

175 Therefore, Article 6(3) and (4) of the Habitats Directive was not applicable to the 'Feixolín', 'Salguero-Prégame-Valdesegadas', 'Fonfría' and 'Nueva Julia' open-cast mining projects, so that the Commission cannot accuse the Kingdom of Spain of failing to fulfil its obligations under those provisions.

176 Therefore, the first part of the fourth complaint must be dismissed.

The second part of the fourth complaint

– Arguments of the parties

177 The Commission also accuses the Kingdom of Spain of not taking, in regard to the operation of the 'Feixolín', 'Salguero-Prégame-Valdesegadas', 'Fonfría', 'Nueva Julia' and 'Ampliación de Feixolín' open-cast mines after the classification of he 'Alto Sil' site as an SCI in December 2004, the measures which were necessary in application of Article 6(2) of the Habitats Directive.

178 It argues that those operations destroyed habitats protected by virtue of that SCI, including that of type 9230 – Galicia-Portuguese oak woods with *Quercus robur* and *Quercus pyrenaica* which is of particular importance for the brown bear as it is frequently used by that species as a transit route.

179 It also argues that the operations in question produced a 'barrier effect' which has contributed to the closing of the Leitariegos corridor which is a very important transit route for the western population of Cantabrian brown bears of which the pocket of brown bears present on the 'Alto Sil' site forms part, resulting in the fragmentation of the habitat of that population and the isolation of some of its pockets.

180 It argues that the barrier effect created by those operations makes exchanges between the western and eastern populations of Cantabrian brown bears even more difficult, causing the fragmentation of the species to continue and not allowing the eastern population of the species to re-establish itself in sufficient numbers to ensure its viability.

181 The Kingdom of Spain replies that the mining operations are situated in non-wooded areas, composed mainly of heathland, where females have never come to rear their young, not because of the operations but rather because of the lack of a habitat favourable to rearing, that having no connection to the potential disturbances which the operations might cause to the rearing of young.

182 The autonomous community of Castile- León has, moreover, adopted numerous measures for improving the habitat of the brown bear, including the re-establishment of the habitat of the latter in the Leitariegos corridor area.

183 The Kingdom of Spain considers that, whilst the northern part of the 'Alto Sil' site is important for the brown bear, it is however an area situated well to the north of the mining operations, at altitudes of over 1 800 metres, which is enclaved between the provinces of Asturias and Léon, and where bears feed in spring and autumn. The latter do not go to the southern part where the mines are situated, because the habitat there is completely different.

184 Finally, concerning the Commission's allegations concerning losses of habitat type 9230 – Galicia-Portuguese oak woods with *Quercus robur* and *Quercus pyrenaica*, those losses represent an area of 17.92 hectares for the 'Fonfría' operation and 19.90 hectares for the 'Ampliación de Feixolín' operation. Since the total area of that habitat on the 'Alto Sil' site amounts, according to the latest studies, to 4 000 hectares, or even 8 000 hectares, and not to 2 600 hectares as initially indicated when classification of the site as an SCI was proposed, those losses are, the Kingdom of Spain submits, negligible in relative terms.

– Findings of the Court

185 It is necessary first to examine the Commission's claim that, in breach of Article 6(2) of the Habitats Directive, habitats protected by virtue of the 'Alto Sil' SCI have been destroyed since the 'Alto Sil' site was classified as an SCI in December 2004.

186 In that respect, as the Advocate General has pointed out in points 144 and 145 of her Opinion, it is apparent from the documents before the Court, particularly from the table of current operations in the 2005 study, that, while operation of the 'Fonfría' and 'Ampliación de Feixolín' mines has affected that site in such a way, the effects, as regards the latter mine, arose after December 2004 and affected an area of at least 19 hectares.

187 The Commission argues, secondly, that, in areas adjacent to the mines concerned, noise and vibrations produced by mining activities have caused significant disturbances to the brown bear, a priority species protected by virtue of the classification as an SCI.

188 In that respect, it is apparent from the environmental report of 7 November 2008 on the 'Feixolín' open-cast coal-mining project in the Orallo mountains (Villablino, Léon), promoted by Minero Siderúrgica de Ponferrada, produced as an annex to the Commission's application, that the loss of habitats for the Cantabrian brown bear caused by the 'Feixolín' operation has been significant within what is called the 'Leitariegos corridor', that the bears move 3.5 to 5 kilometres from the areas of impact of the noise and vibrations caused by mining operations, and that that operation will prevent access for the brown bear to that corridor, or make it much more difficult, whereas that corridor is a north-south transit route of critical importance for the western population of that species.

189 That is confirmed by the 2005 study, in which it is indicated, in the context of an analysis of the impacts of the northern mines including 'Feixolín' and 'Fonfría', that the Leitariegos corridor, with a width of 10 kilometres, is a transit route of great importance for the western population of the said species, allowing in particular communication between two very important pockets of reproduction.

190 That report states that the risk of deterioration and closure of that corridor constitutes one of the main threats hanging over the re-establishment of the Cantabrian brown bear, in that it might result in the western population being fragmented into two sub-populations and even in the species finally being divided into three populations.

191 Consequently, the noise and vibrations caused by the 'Feixolín', 'Fonfría' and 'Ampliación de Feixolín' open-cast mines, and the closure of the Leitariegos corridor by reason of those mines, constitute disturbances of the 'Alto Sil' SCI, which are significant having regard to the conservation of the brown bear.

192 Since the 'Feixolín' and 'Fonfría' open-cast mines were authorised before the system of protection under the Habitats Directive became applicable to the 'Alto Sil' site by reason of its classification as an SCI in December 2004, the question arises whether, analogously with what has been stated in paragraph 156 of this judgment as regards the adverse effects suffered by the capercaillie by reason of the operations authorised before the site was classified as an SPA in the year 2000, it is possible to justify those disturbances by an application by analogy of Article 6(4) of the Habitats Directive in the context of the national procedure, from which it would follow that the Member State cannot be accused of an infringement of Article 6(2).

193 The Kingdom of Spain, basing its argument on the analysis contained in the 2005 report, invokes in that respect imperative reasons of major public interest in maintaining the mining operations, namely security of supply, the maintenance of employment and the definitive character of the authorisations, and proposals for measures to improve the habitat of the brown bear, in particular vegetation measures in the Leitariegos corridor.

194 However, it is apparent from the second subparagraph of Article 6(4) of the Habitats Directive that, where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.

195 It follows that, since this complaint concerns the brown bear as a priority species protected by virtue of the 'Alto Sil' SCI since 2004, and since the Kingdom of Spain has not

invoked considerations of the same nature as those referred to in the second subparagraph of Article 6(4) of the Habitats Directive, the disturbances noted in paragraph 191 of this judgment cannot be justified by virtue of a national procedure in derogation analogous to that provided for in that provision.

196 Consequently, the second part of the fourth complaint must be upheld as regards the northern mines concerned by that part of the complaint, namely 'Feixolín', 'Fonfría' and 'Ampliación de Feixolín'.

197 Having regard to the whole of the above considerations, it must be held that:

– by authorising the 'Nueva Julia' and 'Ladrones' open-cast mines but failing to subject that authorisation to an assessment in order to identify, describe and assess in an appropriate manner the direct, indirect and cumulative effects of the existing open-cast mining projects, save, in relation to the 'Ladrones' mine, as regards the brown bear,

the Kingdom of Spain has failed to fulfil its obligations under Articles 2, 3 and 5(1) and (3) of Directive 85/337 as amended,

– from 2000, the date of designation of the 'Alto Sil' area as an SPA under the Birds Directive,

– by authorising the 'Nueva Julia' and 'Ladrones' open-cast mining operations, without making the grant of the authorisations relating thereto subject to the carrying out of an appropriate assessment of the possible impacts of those projects, and, in any event, without complying with the conditions in which a project might be realised despite the risk posed by that project for the capercaillie, which constitutes one of the natural assets which motivated the classification of the 'Alto Sil' site as an SPA, namely the absence of alternative solutions, the existence of imperative reasons of major public interest and communication to the Commission of the necessary compensatory measures to ensure the overall coherence of the Natura 2000 network, and

– by failing to adopt the necessary measures to prevent the deterioration of habitats including the habitats of species, and to prevent significant disturbance of the capercaillie, the presence of which on the 'Alto Sil' site was the reason for the designation of that area as an SPA, caused by the 'Feixolín', 'Salguero-Prégame-Valdesegadas', 'Fonfría', 'Ampliación de Feixolín' and 'Nueva Julia' mines,

the Kingdom of Spain has failed to fulfil its obligations in relation to the 'Alto Sil' SPA under Article 6(2) to (4) of the Habitats Directive in conjunction with Article 7 thereof, and

– from December 2004, by failing to adopt the necessary measures to prevent the deterioration of habitats, including the habitats of species, and the disturbances caused to species by the 'Feixolín', 'Fonfría' and 'Ampliación de Feixolín' operations, the Kingdom of Spain has failed, in relation to the 'Alto Sil' SCI to fulfil its obligations under Article 6(2) of the Habitats Directive.

Costs

198 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Under Article 69(3) of the Rules of Procedure, the Court may order that the costs be shared or that the parties bear their own costs, inter alia, where each party succeeds on some and fails on other heads.

199 In this case, account must be taken of the fact that some of the Commission's complaints have not been upheld.

200 Therefore, the Kingdom of Spain must be ordered to pay, in addition to its own costs, two thirds of the Commission's costs. The Commission must pay one third of its own costs.

On those grounds, the Court (Fourth Chamber) hereby:

1. **Declares that, by authorising the 'Nueva Julia' and 'Ladrones' open-cast mines but failing to subject that authorisation to an assessment in order to identify, describe and assess in an appropriate manner the direct, indirect and cumulative effects of the existing open-cast mining projects, save, in relation to the 'Ladrones' mine, as regards the brown bear (Ursus arctos), the Kingdom of Spain has failed to fulfil its obligations under Articles 2, 3 and 5(1) and (3) of Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment, as amended by Council Directive 97/11/EC of 3 March 1997;**

2. **Declares that, from 2000, the date of designation of the 'Alto Sil' area as a special protection area under Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds, as amended by Commission Directive 97/49/EC of 29 July 1997,**

– **by authorising the 'Nueva Julia' and 'Ladrones' open-cast mining operations, without making the grant of the authorisations relating thereto subject to the carrying out of an appropriate assessment of the possible impacts of those projects, and, in any event, without complying with the conditions in which a project might be realised despite the risk posed by that project for the capercaillie, (Tetrao urogallus), which constitutes one of the natural assets which motivated the classification of the 'Alto Sil' site as a special protection area, namely the absence of alternative solutions, the existence of imperative reasons of major public interest and communication to the European Commission of the necessary compensatory measures to ensure the overall coherence of the Natura 2000 network, and**

– **by failing to adopt the necessary measures to prevent the deterioration of habitats including the habitats of species, and to prevent significant disturbance of the capercaillie, the presence of which on the 'Alto Sil' site was the reason for the designation of that area as a special protection area, caused by the 'Feixolín', 'Salguero-Prégame-Valdesegadas', 'Fonfría', 'Ampliación de Feixolín' and 'Nueva Julia' mines,**

the Kingdom of Spain has failed to fulfil its obligations in relation to the 'Alto Sil' special protection area under Article 6(2) to (4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, in conjunction with Article 7 thereof;

3. **Declares that, from December 2004, by failing to adopt the necessary measures to prevent the deterioration of habitats, including the habitats of species, and the disturbances caused to species by the 'Feixolín', 'Fonfría' and 'Ampliación de Feixolín' operations, the Kingdom of Spain has failed, in relation to the 'Alto Sil' site of Community importance, to fulfil its obligations under Article 6(2) of Directive 92/43;**

4. **Dismisses the action as to the remainder;**

5. **Orders the Kingdom of Spain to pay, in addition to its own costs, two thirds of the Commission's costs. The Commission is ordered to pay one third of its own costs.**

JUDGMENT OF THE COURT (Fourth Chamber)

9 June 2011 (*)

(Failure of a Member State to fulfil obligations – Habitats Directive – Inadequacy of measures taken to protect the species Cricetus cricetus (European hamster) – Deterioration of habitats)

In Case C-383/09,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 25 September 2009,

European Commission, represented by O. Beynet and D. Recchia, acting as Agents, with an address for service in Luxembourg,

applicant,

v

French Republic, represented by G. de Bergues and S. Menez, acting as Agents,

defendant,

THE COURT (Fourth Chamber),

composed of J.-C. Bonichot, President of the Chamber, K. Schiemann, L. Bay Larsen (Rapporteur), A. Prechal and E. Jarašiūnas, Judges,

Advocate General: J. Kokott,

Registrar: C. Strömholm, Administrator,

having regard to the written procedure and further to the hearing on 21 October 2010,

after hearing the Opinion of the Advocate General at the sitting on 20 January 2011,

gives the following

Judgment

1 By its application, the European Commission requests the Court to declare that, by failing to establish a programme of measures to ensure strict protection of the species *Cricetus cricetus* (the European hamster), the French Republic has failed to fulfil its obligations under Article 12(1)(d) of Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7), as amended by Council Directive 2006/105/EC of 20 November 2006 (OJ 2006 L 363, p. 368) ('the Habitats Directive').

Legal context

2 The main aim of the Habitats Directive, as stated in the third recital in the preamble thereto, is to promote the maintenance of biodiversity.

3 Article 1(a) to (i) of the directive provides:

'For the purpose of this Directive:

(a) conservation means a series of measures required to maintain or restore the natural habitats and the populations of species of wild fauna and flora at a favourable status as defined in (e) and (i);

…

(g) species of Community interest means species which, within the territory referred to in Article 2, are:

(i) endangered, except those species whose natural range is marginal in that territory and which are not endangered or vulnerable in the western palearctic region; or

(ii) vulnerable, i.e. believed likely to move into the endangered category in the near future if the causal factors continue operating; or

(iii) rare, i.e. with small populations that are not at present endangered or vulnerable, but are at risk. The species are located within restricted geographical areas or are thinly scattered over a more extensive range; or

(iv) endemic and requiring particular attention by reason of the specific nature of their habitat and/or the potential impact of their exploitation on their habitat and/or the potential impact of their exploitation on their conservation status.

Such species are listed or may be listed in Annex II and/or Annex IV or V;

…

(i) conservation status of a species means the sum of the influences acting on the species concerned that may affect the long-term distribution and abundance of its populations within the territory referred to in Article 2;

The conservation status will be taken as "favourable" when:

– population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats, and

– the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future, and

– there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis.'

4 Article 2(2) of the Habitats Directive states that measures taken pursuant to that directive are to be designed to maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora of Community interest.

5 The European hamster (*Cricetus cricetus*) is one of the species listed in Annex IV(a) to the Habitats Directive. That annex concerns, inter alia, animal species 'of Community interest in need of strict protection'.

6 Article 12(1) of the Habitats Directive provides:

'Member States shall take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) in their natural range, prohibiting:

(a) all forms of deliberate capture or killing of specimens of these species in the wild;

(b) deliberate disturbance of these species, particularly during the period of breeding, rearing, hibernation and migration;

(c) deliberate destruction or taking of eggs from the wild;

(d) deterioration or destruction of breeding sites or resting places.'

The facts of the dispute and the pre-litigation procedure

7 The Commission was alerted to the conservation status of the European hamster in Alsace by a complaint, of which it informed the French authorities at a meeting held on 15 January 2007.

8 The French authorities submitted their observations thereon by notes of 15 February and 14 September 2007, by which they informed the Commission of the measures adopted in the context of the action plan for the conservation of the species concerned for 2007 to 2011.

9 By letter of formal notice of 23 October 2007 the Commission, firstly, stated that the results of the count of the European hamster made it clear that that species was threatened with complete extinction in the very near future and, secondly, requested the French Republic to submit its observations in that regard.

10 By letters of 24 December 2007 and 11 March 2008, the French authorities gave details of the protection measures already taken and those which were to be taken in order to safeguard that species.

11 By letter of 5 June 2008, the Commission sent a reasoned opinion to the French Republic, in which it stated that, by not adopting a programme of measures enabling strict protection of the European hamster, that Member State had failed to fulfil its obligations under Article 12(1)(d) of the Habitats Directive. As a consequence, the Commission requested the French Republic to take the measures necessary to comply with that reasoned opinion within two months of its notification.

12 The French Republic replied to the reasoned opinion by referring to the geographical constraints restricting opportunities to protect the European hamster, but also stating that it

had been observed in part of the territory of Alsace that the stock of that species had ceased to fall in 2008. In addition, that Member State informed the Commission of the progress of measures implemented in the context of the action plan for 2007 to 2011 for the conservation of that species.

13 Taking the view that the methods for conservation of the species implemented by the French Republic remained unsatisfactory, the Commission brought the present action.

The action

Arguments of the parties

14 The Commission submits that the species of European hamster is threatened with extinction in Alsace. The result of the stock counts shows a significant decrease in the species between 2001 and 2007. The causes of that deterioration are urbanisation and the changes in agricultural practices.

15 The measures adopted by the French Republic are inadequate and have not prevented the deterioration of the breeding sites or resting places of the species. One of the basic reasons for that inadequacy, which concerns both urbanisation and agricultural measures, is the over-restricted nature of the territory, in particular of the priority action areas ('PAAs') and the 'repopulation areas' subject to those measures. In addition, the latter are themselves inadequate. Thus, the objective of 22% of crops favourable to the European hamster within the PAAs has been achieved only in one of the three existing PAAs. Furthermore, the action plan for limiting pollution caused by nitrates for 2008 to 2010 is inadequate. Finally, urbanisation in the 'repopulation area' is not sufficiently restricted.

16 The French Republic contends that the measures which it has adopted constitute a coherent whole, which is proportionate and appropriate to the objective of strict protection of the European hamster, in accordance with the requirements of the Habitats Directive. In particular, the action plan for 2007 to 2011 enabled the particular habitat of that species to be precisely defined and three separate territories to be designated, namely the three PAAs, where all changes of use of land, other than those connected with agriculture, were abandoned, the 'repopulation area' to be delineated, in which, for any project covering an area of a hectare or more, there will be a requirement to prove its lack of harmful effect on the species by way of a specific study and the historic range to be determined, where all municipalities must, when renewing their town and country planning measures, provide for a specific study on the European hamster.

17 The French Republic states that, since the implementation of that action plan, the trend of the abundance index of the stock of the species in question in the 'main areas' is likely to show that the fall in stock numbers has ceased, and even that there is a slight increase therein. However, it is necessary to wait a number of years before it is possible to assess, with a sufficient degree of certainty, the impact of the measures taken by the French Republic on the conservation status of populations of that species. In any event, the Commission does not establish that the habitat of that species continued to deteriorate in the PAAs after 2007, nor does it show that pollution caused by nitrates is harmful to the species. Finally, the French Republic submits that, in the 'repopulation area', the requirement to submit any project for its impact on specimens, breeding sites or resting places of the European hamster to be checked is supplemented by the need to carry out a specific study, which must be done for all projects

involving an area greater than a hectare, with a view to ascertaining any damage caused to that species by such a project.

Findings of the Court

18 It must be borne in mind that Article 12(1)(d) of the Habitats Directive requires Member States to take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) to that directive in their natural range, prohibiting deterioration or destruction of breeding sites or resting places.

19 The transposition of that provision requires the Member States not only to adopt a comprehensive legislative framework but also to implement concrete and specific protection measures (see, to that effect, Case C-183/05 *Commission* v *Ireland* [2007] ECR I-137, paragraph 29).

20 Similarly, the system of strict protection presupposes the adoption of coherent and coordinated measures of a preventive nature (judgment of 16 March 2006 in Case C-518/04 *Commission* v *Greece*, paragraph 16, and *Commission* v *Ireland*, paragraph 30).

21 Such a system of strict protection must therefore enable the effective avoidance of deterioration or destruction of breeding sites or resting places of the animal species listed in Annex IV(a) to the Habitats Directive (see, to that effect, Case C-103/00 *Commission* v *Greece* [2002] ECR I-1147, paragraph 39).

22 Finally, it must be recalled that it is settled case-law that the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation prevailing in the Member State at the end of the period laid down in the reasoned opinion and that the Court cannot take account of any subsequent changes (see, inter alia, Case C-103/00 *Commission* v *Greece*, paragraph 23, and Case C-531/06 *Commission* v *Italy* [2009] ECR I-4103, paragraph 98).

23 It is established that the time-limit of two months set by the Commission in the reasoned opinion to enable the French Republic to comply therewith expired on 5 August 2008.

24 In that regard, it is apparent from the file that, between 2001 and 2007, the number of burrows of the European hamster in the 'main areas' which served as a reference for observation of the population of that species fell from more than 1 160 to less than 180. Furthermore, according to the result of the counts for 2009, drawn up by the Office national de la chasse et de la faune sauvage (National Authority for Hunting and Wildlife), the content of which is not disputed by the French Republic, there were no populations of the species in Alsace which reached its minimum viable population threshold, which is estimated at 1 500 individuals spread over an area of contiguous suitable land of 600 hectares.

25 In a letter of 28 August 2009, sent by the Secretary of State for Ecology to the Prefect of the Region of Alsace ('the letter of 28 August 2009'), it is stated that 'despite the application of the measures set out in the [European hamster] recovery plan (2007-2011) and the mutual obligations of the parties involved in the safeguarding of the species, the biological results obtained to date are insufficient to safeguard that species in France' and that, accordingly, 'it is vital that the measures in favour of the European hamster are markedly and

rapidly improved so as to obtain biological results in the short term which show the recovery of the species'.

26 The French Republic accepts that the development of maize crops, which has been carried out to the detriment of crop diversity, has been harmful to the European hamster, which depends on artificial grasslands, particularly those planted with lucerne, and has constituted one of the significant factors behind the decline in the population of that species. It is established that, even during recent years, such development has not been entirely halted in Alsace which is, in France, the only region where the species is present.

27 The measures intended to remedy this situation include, inter alia, the creation of three PAAs, which are areas where any changes of use of land, other than those connected with agriculture, have been abandoned and for which an objective of 22% of crops favourable to the European hamster, namely 2% of lucerne and 20% of standing cereals, has been established with a view to achieving, eventually, a viable population of approximately 1 200 to 1 500 specimens per area.

28 In that regard, according to the scientific data used to define the objective of 22% of favourable crops in the PAAs which have been submitted by the French Republic, 'during a study carried out in 1997 by the [National Authority for Hunting and Wildlife], on 12 sample squares of 25 hectares in loess terrain, … it was observed that the three squares on which more than 2 to 4% of lucerne and 20 to 30% of standing cereals was grown had the most significant populations of the European hamster. An increase in the number of burrows had been seen there between spring and summer, which permits the assumption that the environment was favourable to the maintenance and reproduction of the species. That was not the case of the remaining nine squares, in which there was little or no lucerne and standing cereals were very scarce'.

29 Although the Commission does not dispute that the so-called agro-environmental measures adopted with a view to achieving the objective of 22% of crops favourable to the species in question, in particular the financial support given to farmers to encourage the cultivation of lucerne and winter cereals, are such as to guide agricultural practices in a way favourable to the species, it is apparent from the file that, on 5 August 2008, that objective of 22% of crops favourable to the species had been achieved in only one of the three PAAs, which represent, moreover, only 2% of all the land favourable to the European hamster.

30 Furthermore, it must be noted in that respect that the French authorities were aware of the inadequacy of those measures since, firstly, in the letter of 28 August 2009, the Secretary of State for Ecology requested the Prefect of the Region of Alsace to prepare, for the following month of September, a proposal for changes to the perimeters of the PAAs, in particular to cover the sectors located near thereto which contained hamsters.

31 Secondly, with regard to the 'repopulation area', the French authorities stated, in letters sent to the Commission following notification of the reasoned opinion, that the dynamic of change to agricultural practices, which has contributed to the positive stabilisation of the numbers of the European hamster in the municipalities where its historical presence was abundant, was to be extended and widened, particularly by the implementation of localised agro-environmental measures intended to achieve, during 2011, 22% of crops favourable to the species over its entire living area.

32 The French Republic also accepts that the development of urbanisation and the infrastructures inherent thereto, by causing the disappearance and partition of agricultural land, constituted another decisive factor behind the decline in the population of the European hamster.

33 As regards the measures adopted by that Member State in the field of urbanisation with a view to halting the deterioration or destruction of the breeding sites or resting places of that species, it must be stated, firstly, that the prohibition of all new urbanisation in PAAs, even if it is truly binding, affects only 2% of all the land favourable to the European hamster, as pointed out in paragraph 29 of this judgment.

34 Secondly, it must be noted that although, in the 'repopulation area' which covers, according to the French Republic, 49% of the land favourable to the species, any urbanisation project of a hectare or more must prove its lack of harmful effect on that species by a specific study and, if that evidence is not adduced, can be carried out only provided a ministerial exemption is obtained, the documents in the file do not permit contradiction of the assertions of the Commission that, firstly, the conditions for the grant of such an exemption are not precisely specified and, secondly, there is no requirement for compensatory measures where such an exemption is granted.

35 Thirdly, it is common ground that, on 5 August 2008, urbanisation projects covering an area of less than a hectare were not subject to any formalities enabling their lack of impact on the conservation of the species in question to be ascertained. In any event, it is apparent from the letter of 28 August 2009 that the Secretary of State for Ecology requested the Prefect of the Region of Alsace to institute a system enabling the comprehensive monitoring and analysis of those projects with a view to confirming that they do not have such an impact. He also ordered that it be borne in mind that the presence of the hamsters in the sites covered by those projects 'justifies avoidance or an application for an exemption', whatever the surface area covered by the project.

36 Moreover, in that letter, it was stated that a supplementary decree concerning the conditions for making an application for an exemption to the strict protection of the European hamster and repeating the terms of the framework agreement on the management of the particular habitat of the species was being finalised and was to be published during September 2009.

37 It follows from the foregoing that the measures implemented on expiry of the period set in the reasoned opinion were not adequate to enable effective avoidance of deterioration or destruction of the breeding sites or resting places of the European hamster.

38 That being said, with regard to the alleged inadequacy of the action programme for 2008 to 2010 concerning the limitation of pollution caused by nitrates, the Commission has not, in any event, demonstrated to the requisite legal standard that there is a link between the use of nitrates in agriculture and the deterioration or destruction of the breeding sites or resting places of that species.

39 Having regard to the foregoing, the Commission's action must be upheld, subject to the reservation made in the preceding paragraph of this judgment.

40 Consequently, it must be held that, by failing to establish a programme of measures to ensure strict protection of the European hamster (*Cricetus cricetus*), the French Republic has failed to fulfil its obligations under Article 12(1)(d) of the Habitats Directive.

Costs

41 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission has applied for costs and the French Republic has been essentially unsuccessful, the latter must be ordered to pay the costs.

On those grounds, the Court (Fourth Chamber) hereby:

1. **Declares that, by failing to establish a programme of measures to ensure strict protection of the European hamster (*Cricetus cricetus*), the French Republic has failed to fulfil its obligations under Article 12(1)(d) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, as amended by Council Directive 2006/105/EC of 20 November 2006;**

2. **Orders the French Republic to pay the costs.**

[Signatures]

JUDGMENT OF THE COURT (Fourth Chamber)

20 May 2010 (*)

(Failure of a Member State to fulfil obligations – Directive 92/43/EEC – Conservation of natural habitats – Wild fauna and flora – Protection arrangements before a habitat is placed on the list of sites of Community importance – Article 12(4) – Project for upgrading a country road)

In Case C-308/08,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 10 July 2008,

European Commission, represented by S. Pardo Quintillán and D. Recchia, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Kingdom of Spain, represented by N. Díaz Abad, acting as Agent, with an address for service in Luxembourg,

defendant,

THE COURT (Fourth Chamber),

composed of J.-C. Bonichot, President of the Chamber, C.W.A. Timmermans, K. Schiemann, P. Kūris and L. Bay Larsen (Rapporteur), Judges,

Advocate General: E. Sharpston,

Registrar: R. Grass,

having regard to the written procedure,

having decided, after hearing the Advocate General, to proceed to judgment without an Opinion,

gives the following

Judgment

1 By its application, the European Commission (formerly 'Commission of the European Communities') claims that the Court should declare that, in relation to the project for upgrading the country road between Villamanrique de la Condesa (Seville) and El Rocio (Huelva), the Kingdom of Spain has failed to fulfil its obligations under Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7; 'the Habitats Directive'), as interpreted by the judgments in Case

C-117/03 *Dragaggi and Others* [2005] ECR I-167 and Case C-244/05 *Bund Naturschutz in Bayern and Others* [2006] ECR I-8445, and under Article 12(4) of that directive.

Legal context

European Union law ('EU law')

2 According to the sixth recital in the preamble to the Habitats Directive, 'in order to ensure the restoration or maintenance of natural habitats and species of Community interest at a favourable conservation status, it is necessary to designate special areas of conservation in order to create a coherent European ecological network according to a specified timetable'.

3 Under Article 3(1) of the Habitats Directive, '[a] coherent European ecological network of special areas of conservation shall be set up under the title Natura 2000. This network, composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range'.

4 Article 4 of the Habitats Directive is worded as follows:

'1. On the basis of the criteria set out in Annex III (Stage 1) and relevant scientific information, each Member State shall propose a list of sites indicating which natural habitat types in Annex I and which species in Annex II that are native to its territory the sites host. ...

The list shall be transmitted to the Commission, within three years of the notification of this Directive, together with information on each site. …

2. On the basis of the criteria set out in Annex III (Stage 2) and in the framework both of each of the five biogeographical regions referred to in Article 1(c)(iii) and of the whole of the territory referred to in Article 2(1), the Commission shall establish, in agreement with each Member State, a draft list of sites of Community importance [('SCIs')] drawn from the Member States' lists identifying those which host one or more priority natural habitat types or priority species.

…

The list of sites selected as [SCIs], identifying those which host one or more priority natural habitat types or priority species, shall be adopted by the Commission in accordance with the procedure laid down in Article 21.

…

5. As soon as a site is placed on the list referred to in the third subparagraph of paragraph 2 it shall be subject to Article 6(2), (3) and (4).'

5 The Lynx pardina ('Iberian lynx') is among the species of Community interest listed in Annex II to the Habitats Directive as a priority species. Article 1(h) of that directive defines 'priority species' as 'species referred to in [Article 1(g)(i)] for the conservation of which the

Community has particular responsibility in view of the proportion of their natural range which falls within the territory referred to in Article 2'.

6 In Article 6 of the Habitats Directive, which lays down protection arrangements for SCIs, paragraph 2 provides:

'Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.'

7 Article 12(4) of the Habitats Directive is worded as follows:

'Member States shall establish a system to monitor the incidental capture and killing of the animal species listed in Annex IV(a). In the light of the information gathered, Member States shall take further research or conservation measures as required to ensure that incidental capture and killing does not have a significant negative impact on the species concerned.'

8 The Iberian lynx is among the species listed in Annex IV(a) to the Habitats Directive.

The facts underlying the dispute and the pre-litigation procedure

9 In December 1997, the Kingdom of Spain proposed the Doñana natural park as a SCI because of the presence there, inter alia, of Iberian lynx.

10 In November 1999 – that is to say, between the time when that site was proposed and when it was actually placed on the list of SCIs by the Commission – a project was adopted for the upgrading of the country road which runs alongside the edge of the Doñana natural park and cuts through a section of it.

11 On the view that the upgrading of the road had been carried out without all necessary measures being taken to prevent a negative impact on the environment and, in particular, on the Iberian lynx, the Commission sent a letter of formal notice to the Kingdom of Spain on 1 April 2004, alleging that it had failed to fulfil, inter alia, its obligations under Articles 6 and 12 of the Habitats Directive.

12 In order to take account of *Dragaggi and Others*, the Commission sent the Kingdom of Spain a supplementary letter of formal notice on 4 July 2006. In that letter, the Commission stated that the Kingdom of Spain had failed to fulfil its obligations under the Habitats Directive, as interpreted in that judgment, and under Article 12(4) of that directive. In that regard, the Commission referred to the importance of the presence of Iberian lynx in the area where the project for upgrading the road had been carried out and stated that the conversion of that byroad into a regional road led the natural habitat of that species to be fragmented and exposed the animals to the risk of fatal accidents, since the protective measures could not be regarded as appropriate.

13 On 19 July 2006, by Decision 2006/613/EC adopting, pursuant to Council Directive 92/43, the list of sites of Community importance for the Mediterranean biogeographical region (OJ 2006 L 259, p. 1), the Commission placed the Doñana natural park on that list.

14 By letter of 25 September 2006, the Kingdom of Spain replied that, after corrective measures had been taken, there had been no more cases of animals being struck by vehicles and that it appeared that, while not eliminating that risk, the protective measures reduced it enormously.

15 On 18 October 2006, on the view that the infringement of EU law was ongoing, the Commission delivered a reasoned opinion in which it reiterated its complaints and requested the Kingdom of Spain to comply with that opinion within a period of two months from its receipt.

16 On 18 December 2006, the Kingdom of Spain sent in reply a report from the Junta de Andalucía (Region of Andalucía), which restated the fact that, ever since corrective measures had been taken, there had been no more cases of Iberian lynx being struck by vehicles.

17 On the view that the situation remained unsatisfactory, the Commission brought the present action on 10 July 2008.

The action

The first plea in law, alleging failure to fulfil the obligation, binding on the defendant Member State under the Habitats Directive, not to authorise intervention of a kind which would seriously endanger the ecological characteristics of the site concerned

Arguments of the parties

18 The Commission claims that, in upgrading the country road at issue without at the same time taking appropriate protective measures, the Kingdom of Spain had intervened in a way which seriously altered the ecological characteristics of the SCI as proposed, a site considered to be essential for the Iberian lynx.

19 Despite the corrective measures adopted by the Spanish authorities, intervention of such a kind – in an area of particular sensitivity in relation to the survival of the Iberian lynx – leads to the fragmentation of the habitat of that species, making it difficult for the young lynx to disperse and for the connection between the various 'territorial nuclei' to be maintained and, above all, exposing young animals to the risk of being struck by a vehicle and killed. The result is that, contrary to the obligations imposed by the Habitats Directive as interpreted by the case-law of the Court, that priority species is in danger of becoming extinct.

20 The Kingdom of Spain contends that the regional transport link between Villamanrique de la Condesa and El Rocío was – and still is – an asphalt road which the Andalusian authorities have merely maintained in an appropriate manner. It cannot be said, therefore, that the ecological characteristics of the site have been seriously compromised because of intervention. Even if that were to be the case, the Kingdom of Spain has, in any event, adopted measures to prevent harm to the environment.

Findings of the Court

21 Under the Habitats Directive, Member States must take appropriate protective measures to preserve the characteristics of sites which host priority natural habitat types and/or priority species and which have been identified by Member States with a view to their inclusion on

the Community list. Member States cannot therefore authorise intervention where there is a risk that the ecological characteristics of those sites will be seriously compromised as a result. That is particularly so where there is a risk that intervention of a particular kind will bring about the extinction of priority species present on the sites concerned (see, to that effect, *Bund Naturschutz in Bayern and Others*, paragraphs 44 and 46).

22 However, the Commission criticises the Kingdom of Spain for authorising intervention of just such a kind, which has seriously altered the ecological characteristics of the SCI proposed and which risks bringing about the extinction of the Iberian lynx, a priority species the presence of which on the site at issue was one of the justifications for the Doñana natural park being proposed as a SCI by the defendant Member State.

23 According to established case-law, it is for the Commission to prove the alleged failure to fulfil obligations. It is the responsibility of the Commission to place before the Court the information needed to enable the Court to establish that the obligation has not been fulfilled, and in so doing the Commission may not rely on any presumption (see Case C-179/06 *Commission* v *Italy* [2007] ECR I-8131, paragraph 37, and Case C-416/07 *Commission* v *Greece* [2009] ECR I-0000, paragraph 32).

24 It is not contested that the track between Villamanrique de la Condesa and El Rocío was first asphalted in 1989. As regards the upgrading project at issue, its implementation was authorised in February 2000, subject to the taking of measures such as the construction of wildlife crossings, the provision of appropriate road signs and the erection of animal fencing along the length of the section crossing the forest area, which is the area most favourable for the conservation of the Iberian lynx. Upgrading of the road was completed in July 2001. However, a number of additional corrective measures were gradually carried out, and finalised in November 2004. It is apparent from the case-file that, although the asphalting works have not altered either the route or the dimensions of the transport link at issue, they have brought about a change in use by converting a byroad into a regional road. That upgrading has led to an increase in traffic, particularly private cars, travelling at higher speeds.

25 It is common ground that, in general, linear transport infrastructures may constitute a real barrier for certain species referred to in the Habitats Directive and, by thus fragmenting their natural range, promote endogamy and genetic drift within those species. It does not appear, however, that the upgrading at issue has actually had a real impact on the habitat fragmentation of the Iberian lynx.

26 In that regard, it is necessary to state the following.

27 It follows from the study on the census of Iberian lynx populations in Spain and in Portugal (El Lince ibérico (Lynx pardinas) en España y Portugal – Censo – diagnóstico de sus poblaciones, J.N. Guzmán and Others, Ministerio de Medio Ambiente, 2004) that approximately half the population of Iberian lynx living in the Doñana natural park remain concentrated in 20% of the surface area of that park – precisely where the most abundant populations of rabbits, their main food source, are to be found.

28 Moreover, because of the lack of rabbits on 75% of the area on which Iberian lynx is present, the number of mating territories has dropped from approximately 12 to a maximum of 8.

29 In addition, it emerges from the summary of the final activity report drawn up by the Spanish authorities concerning the period from 1 July 2002 to 30 June 2006 (Recuperación de poblaciones de Lince ibérico en Andalucía, Proyecto Life No 02NAT/E/8609, Consejería de Medio Ambiente, Septiembre 2006) that it is important to promote the interconnection of the various territories which host the Iberian lynx population of the Doñana region, given that that population is composed of small 'territorial nuclei' between which the animals move when they are dispersing.

30 In particular, it emerges from the case-file that the most important original nucleus of small Iberian lynx is to be found in the forested areas of de Coto del Rey and Matasgordas, both of which are in the Doñana national park. From that nucleus, young Iberian lynx have two basic lines of dispersal, one towards the north, which leads across the asphalt road between Villamanrique de la Condesa and El Rocío, and the other towards the west.

31 In November 2006, however, eight wildlife crossings and two bridges were built in order to make sure that it was possible to cross the road at issue and thus to avoid the barrier effect resulting from its upgrading to a regional road.

32 Admittedly, according to a report of WWF/Adena of September 2007 (Informe sobre el camino agricola asfaltado Villamanrique de la Condesa (Seville) – El Rocío (Huelva)), the wildlife crossings built have proved to be unusable and useless because of design faults and lack of maintenance or failure to implement additional corrective measures.

33 However, the technical report drawn up in November 2006 by Inerco, a consultancy, at the request of the municipality of Villamanrique de la Condesa (Informe Técnico sobre las medidas correctoras adoptadas en las obras de adecuación del firme de la via Villamanrique – El Rocío (Sevilla – Huelva)), indicates that the number of wildlife crossings across the road at issue, as well as their design, were considered to be well adapted to the characteristics of the transport link which they are intended to make safe to cross. Their usefulness was limited only in the event of exceptionally heavy rainfall.

34 As the Commission observed when quoting the follow-up report on the effectiveness of the corrective measures implemented on the asphalt road between Villamanrique de la Condesa and El Rocío (Informe de seguimiento de la eficacia de las medidas correctoras establecidas en el camino agrícola asfaltado Villamanrique de la Condesa – El Rocío, Junta de Andalucía Consejería de Medio Ambiente, 16 March 2008), although proof that Iberian lynx had used the crossings between March 2006 and February 2007 was confined to only four occasions over a period of a year, it is also true that, at that time, the total estimated population of Iberian lynx in the Doñana parks did not even amount to 50 individual animals. Moreover, according to the final activity report referred to in paragraph 29 above, it has been established that individual specimens of Iberian lynx wander between the various territories of the Doñana region. In that regard, according to the follow-up report, the wildlife crossings have a sufficient covering of vegetation to encourage the animals to use them and the access slopes make the crossings perfectly accessible for lynx.

35 Moreover, as the final activity report states, thanks to the capture of 13 specimens and to the breeding in captivity programme, two cubs were born to broodstock originating respectively from the populations of the Andujar-Cardeña and the Doñana regions. That represents a step forward in the preservation of current genetic variability.

36 In the light of the foregoing, it cannot be regarded as established to the requisite legal standard that the upgrading of the road, as such, has had a real impact on the habitat fragmentation of the Iberian lynx in the Doñana region.

37 As regards the allegedly high risk of being struck by a vehicle to which Iberian lynx in that region are exposed following completion of the project for upgrading the road, it is necessary to state the following.

38 The Commission referred to the pilot study for the document entitled 'Sustainable mobility, road safety and conservation of wildlife in the Doñana region (Borrador, Movilidad sostenible, seguridad vial y conservación de la faune silvestre en la comarca de Doñana), forwarded by the Spanish authorities on 18 December 2006, which indicates that, for the Iberian lynx of the Doñana region, being struck by a vehicle has become one of the main causes of death and, accordingly, a determining factor for the future viability of the Iberian lynx population. According to that pilot study, the situation has been made worse by two main factors, namely, the increase in the number of asphalt roads, particularly in the final decade of the 20th century, and the growth of road traffic throughout the region, owing to the increase in tourist and commercial use of the main roads and the more frequent use of the asphalt country roads.

39 According to the study referred to in paragraph 27 above, during the period between 2000 and 2003, 10 Iberian lynx died because of being struck by a vehicle in the Doñana region. It is not contested that, during that period, only one Iberian lynx was killed on the country road between Villamanrique de la Condesa and El Rocío.

40 In 2004, another Iberian lynx was killed on that road.

41 However, it is common ground that, since implementation of the additional corrective measures was completed in November 2004, no Iberian lynx has been run over on that road, at least not before the end of the written procedure before the Court, which closed on 23 February 2009.

42 In that regard, it should be pointed out that the corrective measures consist in the adoption of measures to deter speeding; the provision of road signs; the erection of animal fencing; and in the improvement of wildlife crossings, bridges and drainage.

43 Thus, as regards the measures to deter speeding and the provision of road signs, it emerges from the Inerco report, referred to in paragraph 33 above, that the measures adopted by the Spanish authorities to discourage speeding have brought about a significant reduction in traffic speed on the road at issue as compared with that recorded a number of years earlier.

44 Nevertheless, it is apparent from the study of the Doñana natural park carried out in 2006 (Estudio de 2006 del Parque Natural de Doñana) that the average speeds recorded on that road exceed the authorised speed limits.

45 Against that background, the report referred to in paragraph 34 above concludes that, although the measures taken appear at the moment to yield good results, all the measures adopted could be improved by speed checks and more intensive maintenance of infrastructure, or even the adoption of new measures.

46 As regards the animal fencing, the WWF/Adena report referred to in paragraph 32 above indicates that this has not been erected along the entire length of the road between Villamanrique de la Condesa and El Rocío, one side of that road remaining unfenced for a section of approximately three kilometres. Thus, along that section, the Iberian lynx had unrestricted access to the road. According to the Inerco report, referred to in paragraphs 33 and 43 above, the road has been fully fenced off and the measures adopted in that connection must be considered appropriate in relation to the objectives pursued, even though it is necessary to check the fencing to ensure that it remains secure. Moreover, accidental gaps in certain fences have exceptionally allowed wildlife to pass through.

47 The follow-up report, referred to in paragraphs 34 and 45 above, indicates that, with regard to the 11 000 metre section of the country road which crosses the Doñana natural park, the first 9 300 metres – which correspond to the forested area constituting a favourable habitat for the Iberian lynx – are entirely bordered by animal fencing on both sides of the road. The remaining 1 700 metres are unfenced, since the road crosses a floodplain and serves as a ford during heavy floods. Moreover, there are no trees or bushes, the land being intended for grazing.

48 Furthermore, it emerges from the document drawn up on the initiative of the National Commission for nature protection of the Kingdom of Spain and entitled 'Technical specifications for the design of wildlife crossings and perimeter fencing' ('Prescripciones técnicas para el diseño de pasos de fauna y vallados perimetrales') – to which the Commission referred – that, for the Iberian lynx, twisted wire or soldered fences are recommended, which should reach two metres above the ground. However, it is undisputed that the animal fencing at issue in the present case complies with the recommended specifications, which – contrary to the Commission's assertions in its reply – are not prohibited for roads with the same characteristics as the road at issue.

49 Furthermore, it is indicated in the follow-up report that, by way of corrective measure in relation to the animal fencing and in order to facilitate escape if an Iberian lynx were to break through on to the road at issue, a sufficient number of escape points have been set up along the entire length of the fence, concentrated in the vicinity of possible points of access, such as crossroads or the places where the fencing ends. However, it has not yet been possible to test the effectiveness of those escape points, since the fences have fulfilled their function well and no Iberian lynx has been able to pass through them.

50 As for the wildlife crossings, bridges and drainage, reference should be made to paragraphs 32 to 34 above.

51 In the light of all of the foregoing, considered as a whole, it is clear that the Commission has failed to prove that the implementation of the project for upgrading the country road placed the Iberian lynx in great danger of being struck by vehicles.

52 Thus, although certain elements in the case-file appear to indicate that the overall situation of the Doñana site might not be satisfactory in the light of the requirements relating to conservation of the Iberian lynx – in particular, because of the relatively high number of cases in which animals of that priority species have died because of being struck by a vehicle – the evidence before the Court is not sufficient for it to find that the project for upgrading the country road, accompanied by the corrective measures, constitutes in itself intervention of a

kind which places the Iberian lynx on the site concerned in danger of extinction and which, accordingly, risks seriously compromising the ecological characteristics of that site.

53 The first plea in law must therefore be rejected.

The second plea, alleging failure to fulfil the obligations incumbent on the defendant Member State under Article 12(4) of the Habitats Directive

Arguments of the parties

54 The Commission claims that, although the Spanish authorities have acknowledged the accidental deaths of three Iberian lynx, in 1996, 2002 and 2004 respectively, on the country road between Villamanrique de la Condesa and El Rocío, they have not established a system for monitoring closely the incidental killing of Iberian lynx on the asphalt road at issue and have failed to take the conservation measures necessary to ensure that those accidental deaths do not have a significant negative impact on that protected species.

55 The Kingdom of Spain contends that it has adopted measures which are suitable and which drastically reduce the risk of incidental killing. In addition, the Spanish authorities are making sure that the measures adopted are satisfactorily monitored and continue to study new measures which may be even more appropriate with respect to the conservation and improvement of the species.

Findings of the Court

56 Under Article 12(4) of the Habitats Directive, read together with Annex IV(a) thereto, Member States are to establish a system to monitor, inter alia, the incidental killing of Iberian lynx. In the light of the information gathered, Member States are to undertake further research, or take the conservation measures required, to ensure inter alia that incidental killing does not have a significant negative impact on the species concerned.

57 As regards the establishment of a system for monitoring the incidental killing of Iberian lynx, it should be pointed out that, according to the summary of the final activity report, referred to in paragraph 29 above, a database has been created, according to geographical criteria, on deaths of Iberian lynx attributable to non-natural causes, such as being struck by a vehicle. This means that it has been possible to determine the areas within the natural range of the Iberian lynx where it is most at risk.

58 As regards the conservation measures needed to ensure that the incidental killing of Iberian lynx does not have a significant negative impact on the species, the findings made in relation to the first plea and on the basis of which it fell to be rejected may, in essence, be applied again in this connection.

59 In the present case, as the Kingdom of Spain has contended, the fact that the Spanish authorities continue to study new measures capable of further improving the conditions for conservation and improvement of the species cannot in itself lead to a finding that the measures adopted are inappropriate in relation to the aim underlying Article 12(4) of the Habitats Directive, specified in paragraph 58 above.

60 The second plea in law must therefore be rejected.

61 In the light of all the foregoing and there being no need now to rule on the plea of inadmissibility raised by the Kingdom of Spain in its rejoinder, on the ground that the first plea is vague and imprecise, the action brought by the Commission must be dismissed.

Costs

62 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Kingdom of Spain has applied for costs to be awarded against the Commission and the latter has been unsuccessful, the Commission must be ordered to pay the costs.

On those grounds, the Court (Fourth Chamber) hereby:

1. **Dismisses the action;**

2. **Orders the European Commission to pay the costs.**

[Signatures]

JUDGMENT OF THE COURT (Second Chamber)

4 March 2010 (*)

(Failure of a Member State to fulfil obligations – Directive 92/43/EEC – Article 6(2) and (3) – Incorrect transposition – Special areas of conservation – Significant effect of a project on the environment – 'Non-disturbing' nature of certain activities – Assessment of the effects on the environment)

In Case C-241/08,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 2 June 2008,

European Commission, represented by D. Recchia and J.-B. Laignelot, acting as Agents, with an address for service in Luxembourg,

applicant,

v

French Republic, represented by G. de Bergues and A.-L. During, acting as Agents,

defendant,

THE COURT (Second Chamber),

composed of J.-C. Bonichot, President of the Fourth Chamber, acting as President of the Second Chamber, C.W.A. Timmermans, K. Schiemann, P. Kūris and L. Bay Larsen (Rapporteur), Judges,

Advocate General: J. Kokott,

Registrar: R. Grass,

having regard to the written procedure,

after hearing the Opinion of the Advocate General at the sitting on 25 June 2009,

gives the following

Judgment

1 By its application, the Commission of the European Communities requests the Court to declare that, by failing to adopt all the laws and regulations necessary to transpose correctly Article 6(2) and (3) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7; 'the Habitats Directive'), the French Republic has failed to fulfil its obligations under that directive.

Legal context

Community legislation

2 Article 2(3) of the Habitats Directive provides that measures taken pursuant to that directive are to take account of economic, social and cultural requirements and regional and local characteristics.

3 Article 6(2) to (4) of the Habitats Directive provides:

'2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

…'

National legislation

4 Article L. 414-1(V) of the Code de l'environnement (Environmental Code) provides:

'Natura 2000 sites shall be the subject of measures intended to conserve or restore, in a state favourable to their long-term maintenance, the natural habitats and populations of species of wild fauna and flora which have justified the designation of those sites. Natura 2000 sites shall also be subject to appropriate preventive measures to avoid deterioration of those natural habitats and disturbances likely significantly to affect those species.

Those measures shall be defined in consultation with, inter alia, the local authorities and groupings concerned, and with the representatives of the owners, operators and users of the lands and spaces within the site.

They shall take account of economic, social, cultural and defence requirements and of regional and local characteristics. They shall be adapted to the specific dangers which threaten those natural habitats and those species. They shall not result in human activities being prohibited, where those activities do not have a significant effect on the maintenance or restoration of those natural habitats

and those species at a favourable conservation status. Fishing, aquaculture, hunting and other hunting-related activities practised under the conditions and in the areas authorised by the laws and regulations in force shall not constitute activities causing disturbance or having such an effect.

The measures shall be taken in the context of the contracts or agreements provided for in Article L. 414-3 or in implementation of legislative and regulatory provisions, in particular those concerning national parks, natural marine parks, nature reserves, biotopes or listed sites.'

5 The first subparagraph of Article L. 414-2(I) of the Code de l'environnement provides that, for each Natura 2000 site, a statement of objectives is to establish the management policies, the measures provided for in Article L. 414-1, the means of implementing them and the accompanying financial provisions.

6 Article L. 414-3(I) of the code states:

'To implement the statement of objectives, the owners of rights in rem and personal rights over the lands within the site and professionals and users of the marine spaces within the site may conclude contracts with the administrative authority, called "Natura 2000 contracts". …

A Natura 2000 contract shall contain a series of commitments consistent with the policies and measures established in the statement of objectives, concerning the conservation and, if necessary, the restoration of the natural habitats and species which justified the creation of the Natura 2000 site. …

…'

7 Article L. 414-4(I) of the code states:

'Programmes and projects for works and developments which are subject to administrative authorisation or approval, the completion of which is likely significantly to affect a Natura 2000 site, shall be subject to an assessment of their implications in view of the site's conservation objectives. For any of those programmes which are provided for in legislative or regulatory provisions and are not subject to an impact study, the assessment shall be carried out in accordance with the procedure laid down in Article L. 122-4 et seq. of this code.

The works and developments provided for in Natura 2000 contracts shall be exempt from the assessment procedure referred to in the foregoing paragraph.'

8 Pursuant to point 1 of Article R. 414-21(III) of the Code de l'environnement, the person making the application must indicate the reasons for which there are no other satisfactory solutions for the completion of the plan or project, where that plan or project may have significant injurious effects on the conservation status of natural habitats and of species.

Pre-litigation procedure

9 On 18 October 2005, the Commission sent a letter of formal notice to the French Republic in which the Commission expressed its doubts as to whether the French legislation complied with Article 6(2) and (3) of the Habitats Directive.

10 As the Commission found the French Republic's reply of 7 February 2006 unconvincing, it sent a reasoned opinion to the French Republic on 15 December 2006, calling on it to take the measures necessary to comply with that opinion within a period of two months of receipt. The French authorities replied to that reasoned opinion by letter of 28 February 2007.

11 On 2 June 2008, the Commission brought the present action.

The action

Article 6(2) of the Habitats Directive

Admissibility

12 It must be noted that, while Law No 2006-1772 of 30 December 2006 on water and aquatic areas (JORF, 31 December 2006, p. 20285) amended the national provisions at issue, the amendments, as the Commission has pointed out without being contradicted by the French Republic, make no substantial change to those provisions and have no effect on the Commission's complaints set out in the letter of formal notice and in the reasoned opinion.

13 It follows that the complaints alleging that the third and fourth sentences of the third subparagraph of Article L. 414‑1(V) of the Code de l'environnement do not comply with the Habitats Directive are admissible.

The first complaint: application of the 'significant effect' criterion indifferently to the deterioration of habitats and the disturbance of species.

– Arguments of the parties

14 The Commission claims that, by providing that human activities are prohibited in Natura 2000 sites only if they significantly affect the maintenance or restoration of natural habitats and species at a favourable conservation status, the third sentence of the third subparagraph of Article L. 414‑1(V) of the Code de l'environnement applies the 'significant effect' criterion indifferently both to the deterioration of habitats and the disturbance of species, and is therefore imprecise and less strict than Article 6(2) of the Habitats Directive. Article 6(2) requires the Member States to take appropriate steps to avoid, in the special areas of conservation, first, the deterioration of natural habitats and the habitats of species and, second, the disturbance of species in so far as such disturbance could be significant in relation to the objectives of that directive. In other words, disturbances of species, which occur most often over a short period of time, may be tolerated up to a certain level, in contrast to the deterioration of habitats, which can be defined as a physical degradation affecting those habitats and which is systematically prohibited because placing a habitat in danger is more serious than disturbing a species.

15 Even though the Commission recognises that the first subparagraph of Article L. 414‑1(V) of the Code de l'environnement distinguishes, in accordance with Article 6(2) of the Habitats Directive, between the need to avoid the deterioration of habitats and the need to avoid disturbance of species with the 'significant effect' criterion only being laid down in respect of disturbance of species, it nevertheless criticises the French legislation at issue for not making that distinction when, in the third subparagraph of Article L. 414‑1(V) of the Code de l'environnement, it specifically regulates human activities, which cannot be prohibited by the competent authorities where they do not have a significant effect.

16 The French Republic contends that, under the first subparagraph of Article L. 414‑1(V) of the Code de l'environnement, the deterioration of habitats must in all cases be avoided, in accordance with the requirements of Article 6(2) of the Habitats Directive. However, the third subparagraph of Article L. 414‑1(V) of that code means that an outright prohibition need not be imposed on human

activities which do not have a significant effect on the conservation of habitats. Such activities may, under the first subparagraph of Article L. 414‑1(V) of that code, be the subject of specific measures to prevent the deterioration of habitats and disturbance of species.

17 According to the French Republic, by reconciling the requirement of conservation of habitats and species with the maintenance of human activities which respect that requirement, the third subparagraph of Article L. 414‑1(V) of the Code de l'environnement is consistent with the objectives pursued by the Habitats Directive, and with Article 2(3) of that directive, which provides that measures taken are to take account of economic, social and cultural requirements and regional and local characteristics. The Commission's position, by contrast, is not consistent with the requirements of the Habitats Directive.

– Findings of the Court

18 Article 6(2) of the Habitats Directive establishes a general obligation to take appropriate protective steps to avoid the deterioration of habitats and the disturbance of species, in so far as such disturbance could be significant in relation to the objectives of that directive.

19 It should be pointed out, in that regard, that the first subparagraph of Article L. 414‑1(V) of the Code de l'environnement provides that Natura 2000 sites are to be the subject of appropriate preventive measures to avoid the deterioration of natural habitats and disturbances likely significantly to affect the populations of species of wild fauna and flora which justified the designation of the sites.

20 As regards human activities, the third subparagraph of Article L. 414‑1(V) of the Code de l'environnement states that such measures are not to result in human activities being prohibited, where those activities do not have a significant effect on the maintenance or restoration of natural habitats and species at a favourable conservation status.

21 In that regard, the third subparagraph of Article L. 414-1(V) of the Code de l'environnement must be read in conjunction with the first subparagraph of that provision and in the light thereof.

22 For the purposes of determining whether the complaint raised by the Commission is well founded, it should be borne in mind that, according to settled case‑law, it is incumbent upon the Commission to prove the allegation that an obligation has not been fulfilled. It is the Commission's responsibility to place before the Court all the information needed to enable the Court to establish

that the obligation has not been fulfilled, and in so doing the Commission may not rely on any presumption (see, inter alia, judgment of 11 December 2008 in Case C-293/07 Commission v Greece, paragraph 32 and the case-law cited).

23 In the present case, however, the Commission merely alleges, in essence, that, in order to ensure a correct transposition of Article 6(2) of the Habitats Directive, the third subparagraph of Article L. 414-1(V) of the Code de l'environnement must prohibit all deteriorations, even if they do not have a significant effect. By isolating that provision in that way, and not taking sufficient account of its immediate legislative context, the Commission has, inter alia, failed to show that the appropriate measures adopted pursuant to the first subparagraph of Article L. 414-1(V) of that code do not, in fact, allow the deterioration of habitats within the meaning of Article 6(2) of the Habitats Directive to be avoided.

24 In those circumstances, it has not been established that Article L. 414-1(V) of the Code de l'environnement, considered in its entirety, does not constitute a correct transposition of Article 6(2) of the Habitats Directive, as alleged in the first complaint.

25 Consequently, the first complaint must be rejected.

The second complaint: the general assertion that certain activities do not cause disturbance

– Arguments of the parties

26 The Commission claims that the fourth sentence of the third subparagraph of Article L. 414-1(V) of the Code de l'environnement, which provides that fishing, aquaculture, hunting and other hunting-related activities practised under the conditions and in the areas authorised by the laws and regulations in force shall not constitute activities causing disturbance or activities having such an effect, does not ensure a clear, precise and complete transposition of Article 6(2) of the Habitats Directive. Compliance with rules without any assurance that those rules take account of the requirements specific to a particular site cannot, a priori, lead to the general assertion that those activities cause no disturbance.

27 The Commission takes the view, in particular, that the statement of objectives, on which the regulatory power is based, is not such as to take account of the requirements specific to a particular

site, inasmuch as that document, established on a contractual basis, is not intended to regulate activities such as hunting or fishing and has no binding force, as it has no accompanying sanction.

28 The French Republic contends that it correctly transposed Article 6(2) of the Habitats Directive by laying down the principle that, in so far as aquatic and hunting-related activities are carried out in accordance with the laws and regulations in force, they are not causing disturbance, and that, therefore, they are presumed to comply with the conservation objectives pursued in the context of the Natura 2000 European Ecological Network.

29 While recognising that the statement of objectives does not contain directly applicable regulatory measures, the French Republic submits that the necessary regulatory measures, specific to the site concerned, are approved subsequently by decision of the competent authorities, supplementing the existing general rules. It states, moreover, that the general rules on fishing and hunting-related activities can relate to areas which are delimited and demarcated according to ecological criteria and give rise to the setting of quotas.

– Findings of the Court

30 It should be recalled, first, that, in accordance with the Court's case-law, Article 6(2) and (3) of the Habitats Directive seek to ensure the same level of protection (see, to that effect, Case C-127/02 Waddenvereniging and Vogelbeschermingsvereniging [2004] ECR I-7405, paragraph 36, and Case C-418/04 Commission v Ireland [2007] ECR I-10947, paragraph 263).

31 Second, it should be noted that, as regards Article 6(3) of the Habitats Directive, the Court has already held that the option of exempting generally certain activities, in accordance with the rules in force, from the need for an assessment of the implications for the site concerned does not comply with that provision. Such an exemption is not such as to guarantee that those activities do not adversely affect the integrity of the protected site (see, to that effect, Case C-98/03 Commission v Germany [2006] ECR I-53, paragraphs 43 and 44).

32 Accordingly, taking into account the similar levels of protection required by Article 6(2) and 6(3) of the Habitats Directive, the fourth sentence of the third subparagraph of Article L. 414-1(V) of the Code de l'environnement by providing generally that certain activities such as fishing or hunting do not cause disturbance, can be regarded as consistent with Article 6(2) of that directive only if it is ensured that those activities cause no disturbance likely significantly to affect the objectives of the directive.

33 The French Republic submits in that regard that a statement of objectives is drawn up for each site and serves as the basis for the adoption of targeted measures taking account of the ecological requirements specific to the site concerned. It adds that where the activities in question are carried out in accordance with the general rules applicable to those activities, that allows account to be taken of areas which are delimited and demarcated according to ecological criteria and allows for quotas to be set.

34 It is therefore necessary to examine whether such measures or rules guarantee, in fact, that the activities in question do not cause any disturbance likely to have a significant effect.

35 As regards the statement of objectives, the French Republic indicates that it does not contain directly applicable regulatory measures and that it is a diagnostic tool which allows, on the basis of available scientific knowledge, measures to be proposed to the competent authorities which will enable the conservation objectives set by the Habitats Directive to be met. It adds that, currently, only half the sites concerned have a statement of objectives.

36 It follows that the statement of objectives cannot systematically guarantee in all cases that the activities in question will not cause disturbances likely significantly to affect those conservation objectives.

37 Such a conclusion applies all the more as regards targeted measures which take account of the ecological requirements specific to a particular site, since the adoption of those measures is based on the statement of objectives.

38 In relation to the general rules applicable to the activities in question, it must be held that, while those rules can admittedly reduce the risk of significant disturbance, they can however remove that risk altogether only it they provide for mandatory compliance with Article 6(2) of the Habitats Directive. The French Republic does not claim that that is the situation in this case.

39 It follows from the foregoing that by providing generally that fishing, aquaculture, hunting and other hunting-related activities practised under the conditions and in the areas authorised by the laws and regulations in force do not constitute activities causing disturbance or having such an affect, the French Republic has failed to fulfil its obligations under Article 6(2) of the Habitats Directive.

Article 6(3) of the Habitats Directive

First complaint: the exemption of works or developments under Natura 2000 contracts from the procedure of assessment of their implications for the site

– Arguments of the parties

40 The Commission criticises the second subparagraph of Article L. 414‑4(1) of the Code de l'environnement for not constituting a correct transposition of Article 6(3) of the Habitats Directive in that it systematically exempts works or developments provided for in the Natura 2000 contracts from the procedure of assessment of their implications for the site referred to in Article 6(3).

41 Under French law, Natura 2000 contracts are concluded 'to implement the statement of objectives' which contains, inter alia, one or more specifications applicable to Natura 2000 contracts, establishing good practice to be followed when executing contractual measures and defining the objective pursued and the species and habitats concerned. Although those contracts must comply with the statement of objectives, there is no indication, according to the Commission, that they are comprised exclusively of measures directly connected with or necessary for the management of the site.

42 The French Republic accepts that works and developments provided for in Natura 2000 contracts are exempt from the assessment of implications procedure and considers that Article 6(3) of the Habitats Directive does not require that those works and developments be subject to that assessment procedure since, in its view, they do not adversely affect the site in a significant way.

43 Natura 2000 contracts are concluded, in accordance with Article L. 414‑3 of the Code de l'environnement, to implement the statements of objectives and it is impossible for them to contravene the conservation objectives of habitats and species or to involve actions which are unnecessary for maintaining the conservation status of the site.

– Findings of the Court

44 It should be borne in mind that, under Article 6(3) of the Habitats Directive, any plan or project not directly connected with or necessary to the management of the site but likely to have a

significant effect thereon must be subject to appropriate assessment of its implications for the site in view of that site's conservation objectives.

45 In that regard, it is not in dispute that works or developments provided for in Natura 2000 contracts can be categorised as plans or projects within the meaning of Article 6(3) of the Habitats Directive.

46 It is therefore necessary to examine whether the works or developments provided for in Natura 2000 contracts are directly connected with or necessary for the management of the site, so that their authorisation is not subject to the obligation to carry out the assessment of implications referred to in Article 6(3) of the Habitats Directive.

47 In accordance with Article L. 414‑3(I) of the Code de l'environnement a Natura 2000 contract is concluded 'to implement the statement of objectives', and comprises 'a series of commitments consistent with the policies and measures established in the statement of objectives concerning the conservation and, if necessary, the restoration of the natural habitats and species which justified the creation of the Natura 2000 site'.

48 Under the first subparagraph of Article L. 414‑2(I) of that code, the statement of objectives establishes, inter alia, the management policies and the conservation or restoration measures.

49 According to the French Republic, the systematic exemption of works and developments provided for in Natura 2000 contracts from the obligation, laid down in Article 6(3) of the Habitats Directive, to carry out an assessment of their implications for the site is justified by the notion that, in so far as those contracts are intended to achieve fixed conservation and restoration objectives for the site, they are directly connected with or necessary for the management of the site.

50 Such an approach presupposes therefore that the measures provided for in Natura 2000 contracts which seek to attain conservation and restoration objectives are also, under all circumstances, measures directly connected with or necessary for the management of the site.

51 However, it cannot be ruled out that, while they may have as their objective the conservation or restoration of a site, the works or developments provided for in those contracts may, nevertheless, not be directly connected with or necessary for the management of that site.

52 In that regard, the French Republic accepts, moreover, in the context of the complaint alleging a uniform application of the 'significant effect' criterion, that conservation measures for habitats may prove favourable for some habitats concerned but involve a deterioration in other types of habitats. It cites salt production as an example: the creation of basins called 'œillets' for the purposes of industrialised salt production leads to the deterioration of the habitat formed by lagoons, even if, otherwise, that activity may have beneficial effects for regenerating that environment owing to the retention of certain types of marsh.

53 It follows that determining the conservation and restoration objectives in the context of Natura 2000 may require, as the Advocate General pointed out in point 71 of her Opinion, the reconciliation of various conflicting objectives.

54 In order to ensure fully the attainment of the conservation objectives referred to in the Habitats Directive, it is therefore necessary, in accordance with Article 6(3) of the Habitats Directive, that each plan or project, not directly connected with or necessary for the management of the site, which is likely significantly to affect the site be subject to an individual assessment of its implications for the site concerned in view of the site's conservation objectives.

55 It follows that the mere fact that the Natura 2000 contracts comply with the conservation objectives of sites cannot be regarded as sufficient, in the light of Article 6(3) of the Habitats Directive, to allow the works and developments provided for in those contracts to be systematically exempt from the assessment of their implications for the sites.

56 Accordingly, by systematically exempting works and developments provided for in Natura 2000 contracts from the procedure of assessment of their implications for the site, the French Republic has failed to fulfil its obligations under Article 6(3) of the Habitats Directive.

The second complaint: the existence of activities not subject to authorisation

– Arguments of the parties

57 The Commission claims that the first subparagraph of Article L. 414‑4(I) of the Code de l'environnement does not comply with Article 6(3) of the Habitats Directive, in that only activities which require administrative authorisation or approval are subject to the procedure of assessment of their implications for the site laid down in Article 6(3). Programmes or projects subject to a declaratory scheme are excluded. Those programmes or projects have a significant effect on the site

in view of the conservation objectives, which is the decisive criterion when applying Article 6(3) of the Habitats Directive.

58 The French Republic does not dispute the merits of that complaint and merely points to the legislative amendments which it has undertaken in order to comply with the Community rules, amendments which were introduced by Law No 2008-757 of 1 August 2008 concerning environmental liability and various provisions for adaptation to Community law in the environmental sector (JORF, 2 August 2008, p. 12361).

– Findings of the Court

59 It is settled case-law that the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation obtaining in the Member State at the end of the period laid down in the reasoned opinion and that the Court cannot take account of any subsequent changes (see judgment of 25 July 2008 in Case C-504/06 Commission v Italy, paragraph 24 and the case-law cited).

60 In the present case, the French Republic does not dispute that on 15 February 2007, at the end of the period laid down in the reasoned opinion, namely before Law No 2008-757 was adopted, the national provision at issue did not constitute a correct transposition of Article 6(3) of the Habitats Directive.

61 In those circumstances, without it being necessary to examine whether Law No 2008-757 complies with the Habitats Directive, it is sufficient to note that that law was adopted after the period laid down in the reasoned opinion had expired.

62 Accordingly, by systematically exempting works and development programmes and projects which are subject to a declaratory system from the procedure of assessment of their implications for the site, the French Republic has failed to fulfil its obligations under Article 6(3) of the Habitats Directive.

The third complaint: failure to examine alternative solutions

– Arguments of the parties

63 The Commission criticises point 1 of Article R. 414-21(III) of the Code de l'environnement for not requiring the person making the application, in the context of an appropriate assessment of the implications for the site laid down in Article 6(3) of the Habitats Directive, to provide a description of the various alternative solutions which can be envisaged for carrying out the plan or project. That assessment requires, first, that a description be made of the various alternative solutions examined and an analysis of their implications for the site be carried out and, second, that the public authorities, even in the absence of an adverse affect on the integrity of the site, study those alternative solutions before making a decision on the basis of Article 6(3) of the Habitats Directive.

64 The Commission considers that the mere obligation on the person making the application to indicate the reasons for which there is no other satisfactory solution does not suffice to ensure an examination of alternative solutions in the context of assessment of the implications for the site. The French legislation does not therefore comply with the obligation, arising from Article 6(3) of the Habitats Directive, to make sure that there are no alternative solutions.

65 The French Republic contends that the disputed provision represents a correct transposition of Article 6(3) of the Habitats Directive. Furthermore, the French legislation actually results in the person making the application studying, describing and mapping alternative solutions and explaining the advantages and drawbacks of each solution in view of the site's conservation objectives.

66 The French Republic states that, in any event, in order to remove all doubt in that regard, the decrees implementing Law No 2008-757 expressly lay down the obligation on the person making the application to describe the alternative solutions.

– Findings of the Court

67 By this complaint, the Commission claims that the appropriate assessment which must be carried out pursuant to Article 6(3) of the Habitats Directive must also include an examination of alternative solutions.

68 It must be held, in that regard, that that complaint arises from an incorrect interpretation of Article 6(3) of the Habitats Directive both in relation to the concept of appropriate assessment and in relation to the stage in the procedure at which the examination of alternative solutions must be carried out.

69 First, according to settled case-law, the appropriate assessment of the implications for the site which must be carried out pursuant to Article 6(3) implies that all the aspects of the plan or project which can, either individually or in combination with other plans or projects, affect those objectives must be identified in the light of the best scientific knowledge in the field (Waddenvereniging and Vogelbeschermingsvereniging, paragraph 54, and Commission v Ireland, paragraph 243). Such an assessment does not therefore involve an examination of the alternatives to a plan or project.

70 Second, it must be pointed out that the obligation to examine alternative solutions to a plan or project does not come within the scope of Article 6(3) of the Habitats Directive, but within the scope of Article 6(4) (see, to that effect, Case C-441/03 Commission v Netherlands [2005] ECR I-3043, paragraph 27 et seq.).

71 In accordance with Article 6(4) of the Habitats Directive, the examination referred to in that provision, which concerns, in particular, the absence of alternative solutions, can only be undertaken where the assessment required under Article 6(3) of that directive is negative and where the plan or project must nevertheless be carried out for imperative reasons of overriding public interest (see, to that effect, Commission v Netherlands, paragraphs 26 and 27).

72 Thus, following the assessment of the implications undertaken pursuant to Article 6(3) of the Habitats Directive and in the event of a negative assessment, the competent authorities have the choice of either refusing authorisation for the plan or project or of granting authorisation under Article 6(4) of that directive, provided that the conditions laid down in that provision are satisfied (see Case C-239/04 Commission v Portugal [2006] ECR I-10183, paragraph 25, and, to that effect, Waddenvereniging and Vogelbeschermingsvereniging, paragraphs 57 and 60).

73 In those circumstances, the examination of alternative solutions, which is a requirement set out in Article 6(4) of the Habitats Directive, cannot constitute a factor which the competent national authorities are obliged to take into account when they undertake the appropriate assessment laid down in Article 6(3) of that directive (see, to that effect, Commission v Netherlands, paragraph 28).

74 It follows that the Commission is not justified in claiming that point 1 of Article R. 414-21(III) of the Code de l'environnement does not comply with Article 6(3) of the Habitats Directive in that regard.

75 Accordingly, this complaint cannot be upheld.

76 In the light of the foregoing considerations, it must be held that,

– first, by providing generally that fishing, aquaculture, hunting and other hunting-related activities practised under the conditions and in the areas authorised by the laws and regulations in force do not constitute activities causing disturbance or having such an effect, and

– second, by systematically exempting works and developments provided for in Natura 2000 contracts from the procedure of assessment of their implications for the site, and

– by systematically exempting works and development programmes and projects which are subject to a declaratory system from that procedure,

the French Republic has failed to fulfil its obligations under Article 6(2) and Article 6(3) respectively of the Habitats Directive.

Costs

77 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Under Article 69(3) of the Rules of Procedure, the Court may order that the costs be shared or that the parties bear their own costs, inter alia, where each party succeeds on some and fails on other heads.

78 In the present case, it must be taken into account that some of the Commission's complaints have not been upheld.

79 Accordingly, the French Republic should be ordered to pay two thirds of the costs and the Commission to pay the other third.

On those grounds, the Court (Second Chamber) hereby:

1. Declares that,

– first, by providing generally that fishing, aquaculture, hunting and other hunting-related activities practised under the conditions and in the areas authorised by the laws and regulations in force do not constitute activities causing disturbance or having such an effect, and

– second, by systematically exempting works and developments provided for in Natura 2000 contracts from the procedure of assessment of their implications for the site, and

– by systematically exempting works and development programmes and projects which are subject to a declaratory system from that procedure,

the French Republic has failed to fulfil its obligations under Article 6(2) and Article 6(3) respectively of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora;

2. Dismisses the action as to the remainder;

3. Orders the French Republic to pay two thirds of the costs and the European Commission to pay the other third.

JUDGMENT OF THE COURT (Second Chamber)

14 January 2010 (*)

(Directive 92/43/EEC – Conservation of natural habitats and of wild fauna and flora – Decision of the Member State concerned to give its agreement to the draft list of sites of Community importance drawn up by the Commission – Interests and points of view which must be taken into account)

In Case C-226/08,

REFERENCE for a preliminary ruling under Article 234 EC from the Verwaltungsgericht Oldenburg (Germany), made by decision of 13 May 2008, received at the Court on 26 May 2008, in the proceedings

Stadt Papenburg

v

Bundesrepublik Deutschland,

THE COURT (Second Chamber),

composed of J.-C. Bonichot, President of the Fourth Chamber, acting for the President of the Second Chamber, C.W.A. Timmermans, K. Schiemann, P. Kūris and L. Bay Larsen (Rapporteur), Judges,

Advocate General: E. Sharpston,

Registrar: K. Malacek, Administrator,

having regard to the written procedure and further to the hearing on 26 March 2009,

after considering the observations submitted on behalf of:

– Stadt Papenburg, by K. Füßer, Rechtsanwalt,

– Bundesrepublik Deutschland, by W. Ewer, Rechtsanwalt,

– the Commission of the European Communities, by B. Eggers and D. Recchia, acting as Agents,

after hearing the Opinion of the Advocate General at the sitting on 9 July 2009,

gives the following

Judgment

1 This reference for a preliminary ruling concerns the interpretation of Articles 2(3), 4(2) and 6(3) and (4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of

natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7), as amended by Council Directive 2006/105/EC of 20 November 2006 (OJ 2006 L 363, p. 368) ('the Habitats Directive').

2 The reference was made in the course of proceedings between Stadt Papenburg (the municipality of Papenburg) and Bundesrepublik Deutschland (the Federal Republic of Germany), concerning the agreement that that State intends to give to the draft list of sites of Community importance ('SCIs') drawn up by the Commission of the European Communities and including a site on the river Ems downriver from that municipality's local authority area.

Legal context

Community law

3 Article 2(3) of the Habitats Directive is worded as follows:

'Measures taken pursuant to this Directive shall take account of economic, social and cultural requirements and regional and local characteristics.'

4 According to Article 3(1) of the Habitats Directive, 'a coherent European ecological network of special areas of conservation shall be set up under the title Natura 2000. This network, composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range'.

5 Article 4(1) and (2) of that directive provides:

'1. On the basis of the criteria set out in Annex III (Stage 1) and relevant scientific information, each Member State shall propose a list of sites indicating which natural habitat types in Annex I and which species in Annex II that are native to its territory the sites host. …

The list shall be transmitted to the Commission, within three years of the notification of this Directive, together with information on each site. …

2. On the basis of the criteria set out in Annex III (Stage 2) and in the framework both of each of the nine biogeographical regions referred to in Article 1(c)(iii) and of the whole of the territory referred to in Article 2(1), the Commission shall establish, in agreement with each Member State, a draft list of [SCIs] drawn from the Member States' lists identifying those which host one or more priority natural habitat types or priority species.

Member States whose sites hosting one or more priority natural habitat types and priority species represent more than 5% of their national territory may, in agreement with the Commission, request that the criteria listed in Annex III (Stage 2) be applied more flexibly in selecting all the [SCIs] in their territory.

The list of sites selected as [SCIs] … shall be adopted by the Commission in accordance with the procedure laid down in Article 21.'

6 Annex III to the Habitats Directive states in Stage 2, entitled 'Assessment of the Community importance of the sites included on the national lists':

'1. All the sites identified by the Member States in Stage 1 which contain priority natural habitat types and/or species will be considered as [SCIs].

2. The assessment of the Community importance of other sites on Member States' lists, i.e. their contribution to maintaining or re-establishing, at a favourable conservation status, a natural habitat in Annex I or a species in Annex II and/or to the coherence of Natura 2000 will take account of the following criteria:

(a) relative value of the site at national level;

(b) geographical situation of the site in relation to migration routes of species in Annex II and whether it belongs to a continuous ecosystem situated on both sides of one or more internal Community frontiers;

(c) total area of the site;

(d) number of natural habitat types in Annex I and species in Annex II present on the site;

(e) global ecological value of the site for the biogeographical regions concerned and/or for the whole of the territory referred to in Article 2, as regards both the characteristic or unique aspect of its features and the way they are combined.'

7 Article 6(2), (3) and (4) of the Habitats Directive provides:

'2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety,

to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

National law

8 Article 28(2) of the Basic Law (Grundgesetz) is worded as follows:

'Municipalities must be guaranteed the right to regulate all local affairs on their own responsibility, within the limits prescribed by the laws. Within the limits of their functions designated by law, associations of municipalities shall also have the right to administrative autonomy according to the laws. The guarantee of administrative autonomy shall extend to the basic elements of financial autonomy; these basic elements shall include the right of municipalities to a source of tax revenues based upon economic ability and the right to establish the rates at which these sources shall be taxed.'

9 The referring court interprets that provision as meaning that the administrative autonomy which is constitutionally guaranteed to the municipalities grants them a right to have their interests taken into account where measures going beyond the level of the municipal territory have a lasting effect on their development or cause lasting interference with plans which are sufficiently concrete and established. That also applies to measures implemented outside the municipal territory, in so far as the municipality is clearly and particularly affected.

The dispute in the main proceedings and the questions referred for a preliminary ruling

10 Papenburg is a port town in Lower Saxony on the river Ems, where there is a shipyard.

11 In order to enable ships with a draught of 7.3 metres to navigate between the shipyard and the North Sea, the Ems must be deepened by means of 'required dredging operations'. By a decision of 31 May 1994 of the Wasser und Schifffahrtsdirektion Nordwest (Waterways and Navigation Directorate for the North-West Region), Stadt Papenburg, Landkreis Emsland (the district of Emsland) and the Wasser und Schifffahrtsamt Emden (Emden Waterways and Navigation Office) were granted permission to dredge that river, where required. That decision is definitive and means, in accordance with German law, that future 'required dredging operations' are considered to have been granted permission.

12 On 17 February 2006, the Federal Republic of Germany indicated to the Commission that parts of the Ems situated downriver from Stadt Papenburg's local authority area, under the description 'Unterems und Außenems' (Lower Ems and Outer Ems), could be accepted as a possible SCI within the meaning of the Habitats Directive.

13 The Commission included those parts of the Ems in its draft list of SCIs. It requested the Federal Republic of Germany to give its agreement thereto, pursuant to the first subparagraph of Article 4(2) of the Habitats Directive.

14 On 20 February 2008, Stadt Papenburg brought an action before the Verwaltungsgericht Oldenburg (Administrative Court, Oldenburg) seeking to prevent the Federal Republic of Germany from giving its agreement. It claimed that an agreement on the part of that Member State would amount to a breach of the administrative autonomy which it has under German constitutional law.

15 According to Stadt Papenburg, as a seaport with a shipyard its planning and investments and its economic development depend on the Ems remaining navigable for large seagoing ships. It fears that, if the Lower Ems and Outer Ems were included in the list of SCIs, the dredging operations required for that purpose would in future, and in every case, have to undergo the assessment provided for in Article 6(3) and (4) of the Habitats Directive.

16 The Federal Republic of Germany contends that the action should be dismissed. It is of the opinion that to take into account the interests asserted by Stadt Papenburg when deciding whether to give the agreement at issue in the main proceedings would contravene Community law. Under the first subparagraph of Article 4(2) of the Habitats Directive, the Member State is permitted to take the decision whether to give agreement only on the basis of nature conservation criteria.

17 By order of 31 March 2008, which has become definitive, the Verwaltungsgericht Oldenburg granted Stadt Papenburg interim relief and prohibited the Federal Republic of Germany from giving its agreement until judgment has been delivered in the main proceedings.

18 In those circumstances, the Verwaltungsgericht Oldenburg decided to stay the proceedings and refer the following questions to the Court for a preliminary ruling:

'(1) Does the first subparagraph of Article 4(2) of [the Habitats Directive] allow a Member State to refuse to agree to the Commission's draft list of [SCIs], in relation to one or more sites, on grounds other than nature conservation?

(2) If Question 1 is answered in the affirmative: Do those grounds include the interests of municipalities and associations of municipalities, in particular their plans, planning intentions and other interests with regard to the further development of their area?

(3) If Questions 1 and 2 are answered in the affirmative: Do the third recital in the preamble to [the Habitats Directive], Article 2(3) of the directive or other provisions of Community law even require that such grounds be taken into account by the Member States and the Commission when giving agreement and establishing the list of [SCIs]?

(4) If Question 3 is answered in the affirmative: Would it be possible – under Community law – for a municipality which is affected by the inclusion of a particular site in the list to claim in legal proceedings after final adoption of the list that the list infringes Community law, because its interests were not, or not sufficiently, taken into account?

(5) Must ongoing maintenance works in the navigable channels of estuaries, which were definitively authorised under national law before the expiry of the time-limit for transposition of [the Habitats Directive], undergo an assessment of their implications pursuant to Article 6(3) or (4) of the directive where they are continued after inclusion of the site in the list of [SCIs]?'

The request to have the oral procedure reopened

19 By document lodged at the Court Registry on 17 September 2009, Stadt Papenburg requested the Court to order that the oral procedure be reopened, pursuant to Article 61 of the Rules of Procedure.

20 In support of its request, Stadt Papenburg states that the Advocate General, in her Opinion, expressed the answer that she proposes the Court should give to the fifth question on the basis of a description of the facts which in such as to mislead the Court. In particular, Stadt Papenburg states that, contrary to what the Advocate General suggests, the approval of the Wasser- und Schifffahrstsdirektion Nordwest of 31 May 1994 by which Stadt Papenburg, Landkreis Emsland and the Wasser- und Schifffahrstsamt Emden were granted permission to dredge the Ems where required is not the first such decision concerning the navigability of the river Ems. Furthermore, the Ems cannot be considered to be a river which naturally enables ships with a draught of 6.3 metres to be navigated. Such a situation is the result of previously authorised dredging operations. Finally, Stadt Papenburg also disputes the arguments raised by the Advocate General in support of her reply to the first question referred.

21 The Court may of its own motion, or on a proposal from the Advocate General, or at the request of the parties, order the reopening of the oral procedure in accordance with Article 61 of the Rules of Procedure if it considers that it lacks sufficient information, or that the case must be dealt with on the basis of an argument which has not been debated between the parties (see, inter alia, Case C-284/06 *Burda* [2008] ECR I-4571, paragraph 37, and Case C-42/07 *Liga Portuguesa de Futebol Profissional and Bwin International* [2009] ECR I-0000, paragraph 31).

22 In the present case, it is evident that Stadt Papenburg is contending, in essence, first, that certain facts underlying the Advocate General's assessment are incorrect, and, second, that the view expressed by the Advocate General concerning the interpretation of the first subparagraph of Article 4(2) of the Habitats Directive is incorrect.

23 As regards the first point, it should be noted that, under Article 234 EC, which is based on a clear separation of functions between the national courts and the Court of Justice, the latter is empowered only to give rulings on the interpretation or the validity of a Community provision on the basis of the facts which the national court puts before it (see, inter alia, Case 104/77 *Oehlschläger* [1978] ECR 791, paragraph 4, and Case C-435/97 *WWF and Others* [1999] ECR I-5613, paragraph 31); those facts, in conjunction with the legal material provided by the referring court, are to enable the Court to give a useful answer to the questions submitted to it (see, to that effect, inter alia, Case C-11/07 *Eckelkamp and Others* [2008] ECR I-6845, paragraph 28).

24 The order for reference contains all the information necessary to enable the Court to give a useful answer to the questions submitted to it and, in particular, to the first question.

25 With regard to the second point, suffice it to state that Stadt Papenburg's request contains nothing to indicate that it would be useful or necessary to reopen the oral procedure.

26 Therefore, the Court, after hearing the Advocate General, holds that there is no need to order that the oral procedure be reopened.

The questions referred for a preliminary ruling

The first question

27 The first subparagraph of Article 4(2) of the Habitats Directive provides that, on the basis of the criteria set out in Annex III (Stage 2) to that directive, the Commission is to

establish, in agreement with each Member State, a draft list, drawn from the Member States' lists, of SCIs for each of the biogeographical regions referred to in Article 1(c)(iii) of the directive.

28 Annex III to the Habitats Directive, which relates to the criteria for selecting sites eligible for identification as SCIs and designation as special areas of conservation, lists, so far as concerns Stage 2 in that annex, criteria for assessing the Community importance of the sites included on the national lists.

29 Those assessment criteria were defined on the basis of the objective of conserving the natural habitats or the wild fauna and flora listed respectively in Annex I or Annex II to the Habitats Directive, and of the objective of coherence of Natura 2000, namely the European ecological network of special areas of conservation which is provided for in Article 3(1) of the Habitats Directive.

30 It follows that the first subparagraph of Article 4(2) of the Habitats Directive, as such, does not provide for requirements other than those relating to the conservation of natural habitats and wild fauna and flora or to the setting up of the Natura 2000 network to be taken into account when the Commission, in agreement with each of the Member States, draws up a draft list of SCIs.

31 If, in the phase of the classification procedure that is governed by the first subparagraph of Article 4(2) of the Habitats Directive, the Member States were permitted to refuse to give their agreement on grounds other than environmental protection, the achievement of the objective referred to in Article 3(1) of the Habitats Directive would be put in danger, namely the setting up of the Natura 2000 network, which is composed of sites hosting the natural habitat types listed in Annex I to the directive and habitats of the species listed in Annex II and which must enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range.

32 That would, in particular, be the case were the Member States able to refuse to give their agreement on the basis of economic, social and cultural grounds and regional and local characteristics as referred to in Article 2(3) of the Habitats Directive, a provision which, moreover, as was stated by the Advocate General in point 38 of her Opinion, does not constitute an autonomous derogation from the general system of protection put in place by that directive.

33 The answer to the first question is therefore that the first subparagraph of Article 4(2) of the Habitats Directive must be interpreted as not allowing a Member State to refuse to agree on grounds other than environmental protection to the inclusion of one or more sites in the draft list of SCIs drawn up by the Commission.

The second, third and fourth questions

34 In the light of the answer given to the first question, it is not necessary to reply to the second, third and fourth questions.

The fifth question

35 By its fifth question, the referring court asks, in essence, whether ongoing maintenance works in respect of the navigable channel of the estuary at issue in the main proceedings, which are not directly connected with or necessary to the management of the site and which were already authorised under national law before the expiry of the time-limit for transposing the Habitats Directive, must, to the extent that they are likely to have a significant effect on the site concerned, undergo an assessment of their implications for the site pursuant to Article 6(3) and (4) of the Habitats Directive where they are continued after inclusion of the site in the list of SCIs pursuant to the third subparagraph of Article 4(2) of that directive.

36 Under the first sentence of Article 6(3) of the Habitats Directive, a plan or project likely to have a significant effect on the site concerned cannot be authorised without a prior assessment of its implications for the site (Case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging* [2004] ECR I-7405, paragraph 22).

37 Therefore, it is necessary, first, to assess whether the dredging works at issue in the main proceedings are covered by the concept of 'plan' or 'project' referred to in the first sentence of Article 6(3) of the Habitats Directive.

38 It should be recalled that the Court, after noting that the Habitats Directive does not define the terms 'plan' and 'project', has stated that the definition of 'project' in the second indent of Article 1(2) of Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment (OJ 1985 L 175, p. 40) is relevant to defining the concept of 'plan' or 'project' as provided for in the Habitats Directive (*Waddenvereniging and Vogelbeschermingsvereniging*, paragraphs 23, 24 and 26).

39 An activity consisting of dredging works in respect of a navigable channel may be covered by the concept of 'project' within the meaning of the second indent of Article 1(2) of Directive 85/337, which refers to 'other interventions in the natural surroundings and landscape including those involving the extraction of mineral resources'.

40 Therefore, such an activity may be considered to be covered by the concept of 'project' in Article 6(3) of the Habitats Directive.

41 Next, the fact that that activity has been definitively authorised under national law before the expiry of the time-limit for transposition of the Habitats Directive does not constitute, in itself, an obstacle to regarding it, at the time of each intervention in the navigable channel, as a distinct project for the purposes of the Habitats Directive.

42 If it were otherwise, those dredging works in respect of the channel concerned, which are not directly connected with or necessary to the management of the site, would, in so far as they are likely to have a significant effect on the latter, automatically be excluded from any prior assessment of their implications for that site within the meaning of Article 6(3) of the Habitats Directive, and from the procedure provided for in Article 6(4).

43 Furthermore, the objective of the conservation of natural habitats and of wild fauna and flora pursued by the Habitats Directive would be at risk of not being fully achieved.

44 Contrary to what Stadt Papenburg and the Commission claim, no reason based on the principle of legal certainty or the principle of protection of legitimate expectations precludes the dredging works at issue in the main proceedings, although they have been permanently

authorised under national law, from being subject to the procedure provided for in Article 6(3) and (4) of the Habitats Directive as distinct and successive projects.

45 With regard to the principle of legal certainty, this requires in particular that rules involving negative consequences for individuals should be clear and precise and their application predictable for those subject to them (Case C-17/03 *VEMW and Others* [2005] ECR I-4983, paragraph 80). The Habitats Directive fulfils those requirements with regard to the situation in the main proceedings.

46 With regard to the principle of the protection of legitimate expectations, it follows from settled case-law that a new rule applies immediately to the future effects of a situation which arose under the old rule and that the scope of the principle of the protection of legitimate expectations cannot be extended to the point of generally preventing new rules from applying to the future effects of situations which arose under the earlier rules (see, inter alia, Case C-162/00 *Pokrzeptowicz-Meyer* [2002] ECR I-1049, paragraphs 50 and 55).

47 Finally, if, having regard in particular to the regularity or nature of the maintenance works at issue in the main proceedings or the conditions under which they are carried out, they can be regarded as constituting a single operation, in particular where they are designed to maintain the navigable channel at a certain depth by means of regular dredging necessary for that purpose, those maintenance works can be considered to be one and the same project for the purposes of Article 6(3) of the Habitats Directive.

48 In that case, as such a project has been authorised before the expiry of the time-limit for transposing the Habitats Directive, it would not be subject to the requirements relating to the procedure for prior assessment of the implications of the project for the site concerned, set out in that directive (see, to that effect, Case C-209/04 *Commission* v *Austria* [2006] ECR I-2755, paragraphs 53 to 62).

49 Nevertheless, if the site concerned were, pursuant to the third subparagraph of Article 4(2) of the Habitats Directive, included in the list adopted by the Commission of sites chosen as SCIs, the implementation of such a project would be covered by Article 6(2) of that directive, a provision which makes it possible to satisfy the fundamental objective of preservation and protection of the quality of the environment, including the conservation of natural habitats and of wild fauna and flora, and establishes a general obligation of protection consisting in avoiding deterioration and disturbance which could have significant effects in the light of the directive's objectives (see *Waddenvereniging and Vogelbeschermingsvereniging*, paragraphs 37 and 38, and Case C-117/03 *Dragaggiand Others* [2005] ECR I-167, paragraph 25). Before the Commission adopts that list, in so far as such a site is already included in a national list transmitted to the Commission for the purpose of being included in the Community list, it must not, by virtue of Article 4(1) of the Habitats Directive, be subject to interventions which risk seriously compromising its ecological characteristics (Case C-244/05 *Bund Naturschutzin Bayern and Others* [2006] ECR I-8445, paragraphs 44 and 47).

50 In the light of the above, the answer to the fifth question is that Article 6(3) and (4) of the Habitats Directive must be interpreted as meaning that ongoing maintenance works in respect of the navigable channels of estuaries, which are not connected with or necessary to the management of the site and which were already authorised under national law before the expiry of the time-limit for transposing the Habitats Directive, must, to the extent that they

constitute a project and are likely to have a significant effect on the site concerned, undergo an assessment of their implications for that site pursuant to those provisions where they are continued after inclusion of the site in the list of SCIs pursuant to the third subparagraph of Article 4(2) of that directive.

51 If, having regard in particular to the regularity or nature of those works or the conditions under which they are carried out, they can be regarded as constituting a single operation, in particular where they are designed to maintain the navigable channel at a certain depth by means of regular dredging necessary for that purpose, the maintenance works can be considered to be one and the same project for the purposes of Article 6(3) of the Habitats Directive.

Costs

52 Since these proceedings are, for the parties to the main proceedings, a step in the action pending before the national court, the decision on costs is a matter for that court. Costs incurred in submitting observations to the Court, other than the costs of those parties, are not recoverable.

On those grounds, the Court (Second Chamber) hereby rules:

1. **The first subparagraph of Article 4(2) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, as amended by Council Directive 2006/105/EC of 20 November 2006, must be interpreted as not allowing a Member State to refuse to agree on grounds other than environmental protection to the inclusion of one or more sites in the draft list of sites of Community importance drawn up by the European Commission.**

2. **Article 6(3) and (4) of Directive 92/43, as amended by Directive 2006/105, must be interpreted as meaning that ongoing maintenance works in respect of the navigable channels of estuaries, which are not connected with or necessary to the management of the site and which were already authorised under national law before the expiry of the time-limit for transposing Directive 92/43, as amended by Directive 2006/105, must, to the extent that they constitute a project and are likely to have a significant effect on the site concerned, undergo an assessment of their implications for that site pursuant to those provisions where they are continued after inclusion of the site in the list of sites of Community importance pursuant to the third subparagraph of Article 4(2) of that directive.**

If, having regard in particular to the regularity or nature of those works or the conditions under which they are carried out, they can be regarded as constituting a single operation, in particular where they are designed to maintain the navigable channel at a certain depth by means of regular dredging necessary for that purpose, the maintenance works can be considered to be one and the same project for the purposes of Article 6(3) of Directive 92/43, as amended by Directive 2006/105.

In Case C-418/04,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 29 September 2004,

Commission of the European Communities, represented by B. Doherty and M. van Beek, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Ireland, represented by D. O'Hagan, acting as Agent, assisted by E. Cogan, Barrister, and G. Hogan SC,

defendant,

supported by:

Hellenic Republic, represented by E. Skandalou, acting as Agent, with an address for service in Luxembourg,

and

Kingdom of Spain, represented by N. Díaz Abad, acting as Agent, with an address for service in Luxembourg,

interveners,

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, L. Bay Larsen, R. Schintgen, R. Silva de Lapuerta and P. Kūris (Rapporteur), Judges,

Advocate General: J. Kokott,
Registrar: L. Hewlett, Principal Administrator,

having regard to the written procedure and further to the hearing on 6 July 2006,

after hearing the Opinion of the Advocate General at the sitting on 14 September 2006,

gives the following

Judgment

1 By its application the Commission of the European Communities is seeking a declaration from the Court that, by failing:

— to classify, since 1981, in accordance with Article 4(1) and (2) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1), as amended by Commission Directive 97/49/EC of 29 July 1997 (OJ 1997 L 223, p. 9) ('the Birds Directive'), all the most suitable territories in number and size for the species in Annex I to that directive ('Annex I'), as well as regularly occurring migratory species;

— to establish, since 1981, in accordance with Article 4(1) and (2) of the Birds Directive, the necessary legal protection regime for those territories;

— to ensure that, since 1981, the provisions of the first sentence of Article 4(4) of the Birds Directive are applied to areas requiring classification as special protection areas ('SPAs') under that directive;

— to transpose and apply the requirements of the second sentence of Article 4(4) of the Birds Directive fully and correctly;

— in respect of classified SPAs under the Birds Directive, to take all the measures necessary to comply with the provisions of Article 6(2) to (4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7) ('the Habitats Directive'), and, in respect of recreational use of all sites intended to be subject to Article 6(2) of that directive, to take all the necessary measures to comply with the provisions of the said Article 6(2); and

— to take all the measures necessary to comply with Article 10 of the Birds Directive;

Ireland has failed to fulfil its obligations under those articles of the said directives.

2 By order of the President of the Court of 17 March 2005, the Hellenic Republic and the Kingdom of Spain were granted leave to intervene in support of the form of order sought by Ireland, which has asked the Court to dismiss the action or, in the alternative, to limit the scope of any order made to the specific issues upon which it finds that Ireland has failed to comply with its obligations under the relevant directives.

Legal framework

Community legislation

The Birds Directive

3 The ninth recital in the preamble to the Birds Directive states that 'the preservation, maintenance or restoration of a sufficient diversity and area of habitats is essential to the conservation of all species of birds; ... certain species of birds should be the subject of special conservation measures concerning their habitats in order to ensure their survival and reproduction in their area of distribution; ... such measures must also take account of migratory species and be coordinated with a view to setting up a coherent whole'.

4 According to Article 4 of the Birds Directive:

'1. The species mentioned in Annex I shall be the subject of special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution.

In this connection, account shall be taken of:

(a) species in danger of extinction;

(b) species vulnerable to specific changes in their habitat;

(c) species considered rare because of small populations or restricted local distribution;

(d) other species requiring particular attention for reasons of the specific nature of their habitat.

Trends and variations in population levels shall be taken into account as a background for evaluations.

Member States shall classify in particular the most suitable territories in number and size as special protection areas for the conservation of these species, taking into account their protection requirements in the geographical sea and land area where this Directive applies.

2. Member States shall take similar measures for regularly occurring migratory species not listed in Annex I, bearing in mind their need for protection in the geographical sea and land area where this Directive applies, as regards their breeding, moulting and wintering areas and staging posts along their migration routes. To this end, Member States shall pay particular attention to the protection of wetlands and particularly to wetlands of international importance.

...

4. In respect of the protection areas referred to in paragraphs 1 and 2 above, Member States shall take appropriate steps to avoid pollution or deterioration of habitats or any disturbances affecting the birds, in so far as these would be significant having regard to the objectives of this Article. Outside these protection areas, Member States shall also strive to avoid pollution or deterioration of habitats.'

5 Article 10 of the Birds Directive provides:

'1. Member States shall encourage research and any work required as a basis for the protection, management and use of the population of all species of bird referred to in Article 1.

2. Particular attention shall be paid to research and work on the subjects listed in Annex V. Member States shall send the Commission any information required to enable it to take appropriate measures for the coordination of the research and work referred to in this Article.'

6 The topics of research and work listed in Annex V to the Birds Directive are as follows:

'(a) National lists of species in danger of extinction or particularly endangered species, taking into account their geographical distribution.

(b) Listing and ecological description of areas particularly important to migratory species on their migratory routes and as wintering and nesting grounds.

(c) Listing of data on the population levels of migratory species as shown by ringing.

(d) Assessing the influence of methods of taking wild birds on population levels.

(e) Developing or refining ecological methods for preventing the type of damage caused by birds.

(f) Determining the role of certain species as indicators of pollution.

(g) Studying the adverse effect of chemical pollution on population levels of bird species.'

The Habitats Directive

7 Article 6 of the Habitats Directive is worded as follows:

'...

2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

National legislation

The European Communities Act

8 The European Communities Act 1972 empowers ministers to legislate independently of the national Parliament where obligations under Community law so require.

The Wildlife Act

9 Section 11(1) and (3) of the Wildlife Act 1976, as amended by the Wildlife (Amendment) Act 2000 ('the Wildlife Act'), provides:

'1. It shall be a function of the Minister to secure the conservation of wildlife and to promote the conservation of biological diversity.

...

3. The Minister may, either directly or in association with or through the agency of another person:

(a) carry out or cause to be carried out research which he considers desirable for the performance of his functions under this Act;

...'

10 Sections 15 to 17 of the Wildlife Act give the competent minister the power to create nature reserves on State-owned land by means of establishment orders. It also gives the minister a power to recognise nature reserves on other land and to designate areas of land as refuges for fauna.

The Birds Regulations

11 The European Communities (Conservation of Wild Birds) Regulations 1985 ('the Birds Regulations') prohibit the deposit of food, waste and deleterious matter in the SPAs concerned.

The Habitats Regulations

12 The preamble to the European Communities (Natural Habitats) Regulations 1997, as amended by the Wildlife (Amendment) Act 2000 ('the Habitats Regulations'), states that the regulations were enacted with a view to giving effect to the Habitats Directive in domestic law.

13 Regulation 2 of the Habitats Regulations defines 'European site' as: (a) a site notified for the purposes of Regulation 4; (b) a site adopted by the Commission as a site of Community importance for the purposes of Article 4(2) of the Habitats Directive, in accordance with the procedure laid down in Article 21 of that directive; (c) a special area of conservation; (d) an area classified pursuant to Article 4(1) and (2) of the Birds Directive.

14 Regulation 4 of those regulations provides:

'1. The Minister shall cause a copy of the candidate list of European sites or a modified list under Regulation 3(3) to be sent to the Minister for the Environment, the Minister for Agriculture, Food and Forestry, the Minister for the Marine, the Minister for Transport, Energy and Communications, the Commissioners of Public Works in Ireland, the Environmental Protection Agency and to any planning authority within whose functional area the land to which the list relates, or any part of such land, is situated and the Minister shall, where appropriate, consult with all or any of them.

2. (a) The Minister by notice shall notify every owner and occupier of any land mentioned in the candidate list of European sites and any holder of a valid prospecting licence or exploration licence duly issued under any enactment which relates to such land of the proposal to include the land in such a list and to transmit the list to the Commission pursuant to the provisions of the Habitats Directive;

(b) Where the address of any person to whom subparagraph (a) of this paragraph relates cannot be found after reasonable inquiry, notices and maps showing the site concerned shall be displayed in a conspicuous place:

(i) in one or more Garda Síochána stations, local authority offices, local offices of the Department of Social Welfare, local offices of the Department of Agriculture, Food and Forestry and offices of Teagasc which are located within or contiguous to the site concerned, or

(ii) where in any case there is no such station or office so located, in one or more of each such station or office within the vicinity or closest to such site, and

advertisements shall be broadcast on at least one radio station duly broadcasting in the area of the site concerned and be placed in at least one newspaper circulating in that area and every such advertisement shall request any person affected by the candidate list of European sites to contact the Department of Arts, Culture and the Gaeltacht.

...

3. The candidate list of European sites sent by the Minister under paragraph (1) and the notification issued by the Minister under paragraph (2) shall, in respect of each site:

(a) be accompanied by an ordnance map of appropriate scale in the circumstances, upon which is marked the site, so as to identify the land comprising the site to which the notice relates and the boundaries thereof;

(b) indicate the operation or activity which the Minister considers would be likely to alter, damage, destroy or interfere with the integrity of the site;

(c) indicate the habitat type, or types, the site hosts or the species the site hosts and for which the site is proposed to be identified as a site of Community importance;

(d) indicate the procedures by which a person may object.

...'

15 Regulation 5 provides that any person to whom notice is given under Regulation 4(2) has the right to object to the inclusion of the site in the candidate list of European sites, and defines the procedure for deciding on objections.

16 Regulation 7 of the Habitats Regulations provides that the minister may appoint 'authorised officers' to enter onto land and inspect it.

17 Regulation 9 provides:

'1. Not later than six years from the date a site is adopted by the Commission in accordance with the procedure laid down in paragraph 2 of Article 4 of the Habitats Directive the Minister shall designate the site as a special area of conservation and the Minister shall publish, or cause to be published, in the *Iris Oifigiúil* a copy of every such designation.

...'

18 Regulation 13 is worded as follows:

'1. The Minister shall establish the conservation measures which the Minister considers appropriate in respect of special areas of conservation designated under Regulation 9 including, if necessary, management plans ... either specifically designated for the sites or integrated into appropriate plans.

2. The Minister shall establish the administrative or contractual measures which correspond to the ecological requirements of the natural habitat types in Annex I to the Habitats Directive and the species in Annex II to that Directive present on the sites.

3. The Minister shall take the appropriate steps to avoid, in the special areas of conservation designated under Regulation 9, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated in so far as such disturbance could be significant in relation to the objectives of the Habitats Directive.'

19 According to Regulation 14 of the Habitats Regulations:

'1. A person shall not carry out, cause to be carried out or continue to carry out, on any land included in a special area of conservation or a site placed on a list in accordance with Chapter I of this Part an operation or activity mentioned in a notice issued under Regulation 4(2) unless the operation or activity is carried out, or caused

or permitted to be carried out or continued to be carried out, by the owner, occupier or user of the land and:

(a) one of them has given the Minister written notice of a proposal to carry out the operation, or activity, specifying its nature and the land on which it is proposed to carry it out, and

(b) one of the conditions specified in paragraph (2) is fulfilled.

2. The conditions referred to in paragraph (1) are as follows:

(a) that the operation or activity is carried out with the written consent of the Minister, or

(b) that the operation or activity is carried out in accordance with the terms of a management agreement provided for under Regulation 12.

3. A person who, without reasonable excuse, contravenes paragraph (1) shall be guilty of an offence.

4. The provisions of this Regulation shall not apply to an operation or activity to which Regulation 15(2) relates.'

20 Regulation 15(1) provides that, where an application to the Irish authorities for consent under Regulation 14 relates to a proposed activity which is likely to have a significant effect on the site, those authorities are to assess the implications for the site in view of that site's conservation objectives. Regulation 15(2) further provides that, where the proposed activity has already been authorised under other legislation, the competent minister under whose authority the authorisation was issued is to assess that activity and, where appropriate, modify or revoke the authorisation in question.

21 Regulation 16 states that if, in the light of the assessment under Regulation 15, the proposed activity would harm the site, the activity must not be allowed. There is, however, an exception for 'imperative reasons of overriding public interest'.

22 Regulation 17 provides:

'1. Where the Minister considers that an operation or activity is being carried out or may be carried out on:

(a) a site placed on a list in accordance with Chapter I of this Part, or

(b) a site where consultation has been initiated in accordance with Article 5 of the Habitats Directive, or

(c) a European site,

which is neither directly connected with nor necessary to the management of such sites but likely to have a significant effect thereon either individually or in combination with other operations or activities the Minister shall ensure that an appropriate assessment of the implications for the site in view of the site's conservation objectives is undertaken.

2. An environmental impact assessment in respect of a proposed operation or activity shall be an appropriate assessment for the purposes of this Regulation.

3. If the Minister, having regard to the conclusions of the assessment undertaken under paragraph (1), is of the opinion that the operation or activity will adversely affect the integrity of the site concerned, the Minister shall make application to a court of competent jurisdiction to prohibit the continuance of the operation or activity.

4. An application to a court of competent jurisdiction for a prohibition under this Regulation shall be in a summary manner and the Court when considering the matter may make such interim or interlocutory order (if any) as it considers appropriate having regard to paragraph 4 of Article 6 of the Habitats Directive and to the overall requirement of safeguarding the integrity of the site concerned and ensuring that the overall coherence of Natura 2000 is protected.

5. For the purposes of this section "a court of competent jurisdiction" means either a Judge of the Circuit Court within whose Circuit the lands or part of the lands concerned are situated or the High Court.'

23 Regulation 18 is worded as follows:

'1. Where an operation or activity is being carried out, or is proposed to be carried out, on any land that is not within:

(a) a site placed on a list in accordance with Chapter I of this Part, or

(b) a site where consultation has been initiated in accordance with Article 5 of the Habitats Directive, or

(c) a European site,

and is liable to have an adverse effect on the integrity of the site concerned either alone or in combination with other operations or activities the Minister shall ensure that an appropriate assessment of the implications for the site in view of the site's conservation objectives is undertaken.

2. Having regard to the conclusions of the assessment undertaken under paragraph (1) the provisions of paragraphs (2) to (5) of Regulation 17 shall apply.'

24 Regulation 34 provides:

'The provisions of Regulations 4, 5, 7, 13, 14, 15 and 16 shall, where appropriate, apply with any necessary modifications to areas classified pursuant to paragraph 1 and 2 of Article 4 of the Birds Directive.'

25 Regulation 35 is worded as follows:

'The Minister shall:

(a) promote education and general information on the need to protect species of wild flora and fauna and to conserve their habitats and natural habitats;

(b) encourage the necessary research and scientific work for the purpose of meeting the requirements of Article 11 of the Habitats Directive with particular attention to scientific work necessary for the implementation of Articles 4 and 10 of that Directive;

(c) supply information, where appropriate, for the purpose of proper co-ordination of research carried out at Member State and Community level to other Member States and the Commission.'

Pre-litigation procedure and written procedure before the Court

26 After receiving complaints, the Commission initiated two sets of infringement proceedings against Ireland and sent it, between 11 November 1998 and 18 April 2002, four letters of formal notice relating, first, to a failure fully and correctly to transpose and apply the Birds and Habitats Directives and, secondly, to specific infringements concerning damage caused to habitats by recreational users.

27 As the explanations provided by the Irish authorities in their replies were not considered to be satisfactory, and following bilateral meetings between Ireland and the Commission, the latter sent Ireland, on 24 October 2001, a reasoned opinion and, on 11 July 2003, an additional reasoned opinion and a reasoned opinion concerning recreational activities.

28 As it took the view that the arguments put forward by Ireland in its replies to the reasoned opinions were not wholly satisfactory and, accordingly, that there was a continuing failure on Ireland's part to comply with a number of its obligations under the Birds and Habitats Directives, the Commission decided to bring the present action.

29 Given the close connection between the two cases, the Commission decided to join both infringements in a single set of proceedings before the Court.

The action

30 In support of its application, the Commission relies on six complaints concerning the failure of Ireland to comply with a number of obligations imposed on it by Articles 4(1), (2) and (4) and 10 of the Birds Directive and by Article 6(2) to (4) of the Habitats Directive.

Preliminary observations

31 Under Article 18(1) of the Birds Directive the Member States were required to comply with that directive within two years of its notification. Accordingly, the period within which Ireland was required to transpose the Birds Directive into national law expired on 6 April 1981.

32 Under Article 23(1) of the Habitats Directive the Member States were required to comply with that directive within two years of its notification. Accordingly, the period within which Ireland was required to transpose the Habitats Directive into national law expired on 10 June 1994.

33 It is not disputed that, in the present case, the date of expiry of the period laid down in the reasoned opinions must be set at 11 September 2003.

The first complaint: inadequate number and size of areas classified as SPAs, contrary to Article 4(1) and (2) of the Birds Directive

34 The Commission claims that Ireland has failed, since 1981, to classify, in accordance with Article 4(1) and (2) of the Birds Directive, all the most suitable areas in number and size for the conservation of the species referred to in Annex I as well as regularly occurring migratory species not listed in that annex. There are two aspects to the first complaint. The Commission states, firstly, that there has been a failure to make any classification in respect of certain sites and, secondly, that there has been a failure to make a complete classification of other sites.

35 Ireland denies the alleged failure to comply with its obligations. It states that when it informs the Commission of its intentions regarding SPA classification, it does so as part of the cooperation and consultation between the Member States, as provided for by the Birds and Habitats Directives. Moreover, when it informs the Commission that research is being carried out, it does not follow that the present SPA network is inadequate or that Ireland has failed to fulfil its obligations under the Birds Directive.

Preliminary observations

36 The Court notes, as a preliminary point, that, according to its settled case-law, Article 4(1) and (2) of the Birds Directive requires the Member States to classify as SPAs the territories meeting the ornithological criteria specified by those provisions (Case C-378/01 *Commission* v *Italy* [2003] ECR I-2857, paragraph 14 and case-law cited).

37 Secondly, Member States are obliged to classify as SPAs all the sites which, in accordance with the ornithological criteria, appear to be the most suitable for conservation of the species in question (Case C-3/96 *Commission* v *Netherlands* [1998] ECR I-3031, paragraph 62).

38 Thirdly, the obligation imposed on Member States to classify sites as SPAs cannot be avoided by the adoption of other special conservation measures (see, to that effect, *Commission* v *Netherlands*, paragraph 55).

39 Fourthly and lastly, although Member States do have a certain margin of discretion with regard to the choice of SPAs, the classification of those areas is nevertheless subject exclusively to the ornithological criteria determined by the Birds Directive (see, to that effect, Case C-355/90 *Commission* v *Spain* [1993] ECR I-4221, paragraph 26). The economic requirements mentioned in Article 2 of that directive may therefore not be taken into account when selecting an SPA and defining its boundaries (*Commission* v *Netherlands*, paragraph 59 and case-law cited).

IBA 2000

40 In support of its complaint the Commission refers, inter alia, to the judgment in *Commission* v *Netherlands*, in which the Court took account of the *Inventory of Important Bird Areas in the European Community*, published in 1989 ('IBA 89'), finding that, although it was not legally binding on the Member States concerned, it could, by reason of its scientific value in that case, be used by the Court as a basis of reference for assessing the extent to which a Member State had complied with its obligation to classify SPAs. According to the Commission, a similar inventory is under consideration in the present case.

41 Ireland disagrees with the Commission on certain aspects of the *Review of Ireland's Important Bird Areas*, drawn up in 1999 in the context of a European census and published in 2000 ('IBA 2000'). It argues that neither the existence of such a list alone nor the existence of such disagreement is evidence of a failure on Ireland's part to comply with its obligations under the Birds Directive.

42 The Hellenic Republic and the Kingdom of Spain take the view that IBA 2000 is deficient and therefore cannot be attributed the same value as IBA 1989.

43 The Greek and Spanish Governments contend that IBA 2000 differs from IBA 89 on a number of points. In their view, IBA 2000 contains scientific data which may well provide a reference attesting to the existence of species in each territory, but which are merely indicative and general in nature in terms of the size of the population of the various species and boundaries and, therefore, the size of the areas to be classified as SPAs. IBA 2000, by contrast, does not contain scientific information sufficient to enable a delimitation of areas important for bird conservation to be made with certainty, it includes areas which are too large and of limited ornithological interest and the list of areas should be updated in accordance with the most recent scientific analysis. Accordingly, the content of the list in question cannot be used in the present case to draw certain conclusions as to the populations and exact boundaries of the SPAs.

44 The Hellenic Republic and the Kingdom of Spain infer therefrom that IBA 2000 is not a sufficient or unique basis on which to establish that Ireland has failed to fulfil its obligations, as alleged by the Commission.

45 Since the merits of the first complaint depend in large measure on whether the discrepancy between IBA 2000 and the SPAs actually classified by Ireland establishes that that Member State has not fulfilled its obligation to classify sites as SPAs to a sufficient degree, it is appropriate to consider whether IBA 2000 carries scientific value comparable to that of IBA 89 and whether it may thus be used as a reference to appraise the alleged failure to fulfil obligations.

46 It must be borne in mind that Article 4 of the Birds Directive lays down a protection regime which is specifically targeted and reinforced both for the species listed in Annex I and for migratory species, an approach justified by the fact that they are, respectively, the most endangered species and the species constituting a common heritage of the Community (Case C-191/05 *Commission* v *Portugal* [2006] ECR I-6853, paragraph 9 and case-law cited). Furthermore, it is clear from the ninth recital in the preamble to that directive that the preservation, maintenance or restoration of a sufficient diversity and area of habitats is essential to the conservation of all species of birds. The Member States are therefore required to adopt the measures necessary for the conservation of those species (Case C-235/04 *Commission* v *Spain* [2007] ECR I-5415, paragraph 23).

47 For that purpose, the updating of scientific data is necessary to determine the situation of the most endangered species and the species constituting the common heritage of the Community in order to classify the most suitable areas as SPAs. It is therefore necessary to use the most up-to-date scientific data available at the end of the period laid down in the reasoned opinion (Case C-235/04 *Commission* v *Spain*, paragraph 24).

48 In that regard, it should be borne in mind that the national inventories, including IBA 2000 prepared by BirdLife International, revised the initial Europe-wide study carried out in IBA 89 by presenting more specific and up-to-date scientific data. IBA 2000 states that that inventory lists 48 new sites in Ireland in comparison with IBA 89.

49 As noted by the Advocate General in point 20 of her Opinion, the areas listed in both inventories result from the application of specific criteria to information on the presence of birds. The criteria of IBA 2000 are largely the same as those of IBA 89. It follows that the increase in the number and territory of the areas stems essentially from better knowledge of the presence of birds.

50 Ireland maintains that the Commission is wrong to argue that IBA 2000 is not exhaustive. It adds that IBA 2000 is merely a reference for establishing correctly a network of areas of importance for the conservation of birds and that other ornithological studies may serve as a basis for the classification of the most suitable areas for the conservation of certain bird species.

51 That lack of completeness, as pointed out by the Advocate General in point 25 of her Opinion, does not undermine the probative value of IBA 2000. The situation would be different if Ireland had adduced scientific evidence tending in particular to show that the obligations flowing from Article 4(1) and (2) of the Birds Directive could be satisfied by classifying as SPAs sites other than those appearing in that inventory and covering a smaller total area (see *Commission* v *Italy*, paragraph 18).

52 In view of the scientific nature of IBA 89 and of the absence of any scientific evidence adduced by a Member State tending in particular to show that the obligations flowing from Article 4(1) and (2) of the Birds Directive could be satisfied by classifying as SPAs sites other than those appearing in that inventory and covering a smaller total area, the Court has held that that inventory, although not legally binding, could be used by the Court as a basis of reference for assessing whether a Member State has classified a sufficient number and size of areas as SPAs for the purposes of the abovementioned provisions of that directive (Case C-235/04 *Commission* v *Spain*, paragraph 26 and case-law cited).

53 In the present case, it is common ground that Ireland has not put forward any other ornithological criteria which are objectively verifiable, as compared with those used in IBA 2000, to serve as a basis for a different classification; nor has it presented a complete national inventory contradicting IBA 2000, established according to scientific methods and designating all the most suitable areas with a view to classification as SPAs.

54 The Court accordingly finds that IBA 2000 provides an up-to-date inventory of the areas of importance for the conservation of birds in Ireland which, in the absence of scientific evidence to the contrary, provides a point of reference which makes it possible to assess whether that Member State has classified as SPAs sufficient areas of territory in terms of number and size to provide protection to all the species of birds listed in Annex I and also to migratory species not listed in that annex.

55 This finding cannot be affected by the Spanish Government's argument that the various non-governmental organisations involved in bird conservation chose to modify unilaterally the previous inventory concerning the various Member States, without any competent State environmental body having supervised that process or having guaranteed the accuracy and correctness of the data contained therein.

56 The Court finds in that regard, firstly, that IBA 2000 was published by BirdLife International, an association of national organisations for the protection of birds which had already been involved in drawing up IBA 89 under the designation of the International Council for Bird Preservation. The Eurogroup for the Conservation of Birds, which was also involved at that time, was an ad hoc group of experts of that council. Consequently, BirdLife International provides continuity in respect of the work on the area inventories, as noted by the Advocate General in point 22 of her Opinion.

57 Secondly, it is common ground that the IBA 2000 chapter on Ireland was drawn up in collaboration with Dúchas, the heritage service of the Department of Arts, Heritage, Gaeltacht and the Islands (now National Parks and Wildlife Service of the Department of the Environment, Heritage and Local Government) ('National Parks and Wildlife'). That part of the inventory was drawn up with the help of high-level Irish ornithological experts and is based mostly on available data on numbers and distribution of birds and on studies carried out with the financial support of the competent authorities. The list of scientific references shows, moreover, that the experts relied largely on studies published and carried out with the participation of scientists from the competent conservation authorities.

58 At the hearing, Ireland maintained its position that the nature of a Member State's obligation in the light of Article 4(1) of the Birds Directive and the recitals in the preamble thereto must be assessed at European level and not in the light of the territory of the Member State concerned alone. It is thus possible that a specific area may be eligible but may not be the most suitable area for classification as an SPA.

59 Yet even if, as Ireland correctly points out, the Member States' obligation under Article 4(1) of that directive concerns only the classification of the most suitable areas for the conservation of birds and it is possible that areas which, in the light of species protection requirements, would in fact be suitable for such conservation never become classified as SPAs, it nevertheless follows from Article 4(1) of the Birds Directive, as interpreted by the Court, that, if species mentioned in Annex I occur on the territory of a Member State, it is obliged inter alia to define SPAs for them (see *Commission* v *Netherlands*, paragraph 56 and case-law cited).

60 As noted by the Advocate General in point 32 of her Opinion, in the Member States in which these species occur relatively frequently, the SPAs ensure above all that large sections of the overall population are conserved. However, SPAs are also necessary where these species are rather rare. In that case the SPAs help the geographical distribution of the species.

61 Indeed, if each Member State could escape the obligation to classify SPAs to ensure protection of the species listed in Annex I and present on its territory on the sole ground that there were numerous other sites in other Member States which were much more appropriate for the conservation of those same species, the objective of creating a coherent network of SPAs, as referred to in Article 4(3) of the Birds Directive, might not be achieved (see, by analogy, *Commission* v *Netherlands*, paragraph 58).

62 The Greek Government submits that the obligation on Ireland, within the framework of cooperation with the competent Commission departments, and the timetable which Ireland set for delimiting new SPAs and extending existing SPAs must be taken into account, as that Member State must verify the content of IBA 2000 for the suppose of being able to determine areas of importance for the conservation of birds and classification as SPAs.

63 The Court finds on this point that, although any classification presupposes that the competent authorities are convinced, based on the best scientific knowledge available, that the site in question is among the most suitable areas for the protection of birds (see, to that effect, Case C-60/05 *WWF Italia and Others* [2006] ECR I-5083, paragraph 27), that does not however mean that the obligation to classify does not, as a rule, arise so long as those authorities have not completed their evaluation and check of the new scientific knowledge.

64 On the contrary, as the Court has held previously, faithful transposition becomes particularly important in the case of the Birds Directive, where management of the common heritage is entrusted to the Member States in their respective territories (see Case 262/85 *Commission* v *Italy* [1987] ECR 3073, paragraph 9, and Case C-38/99 *Commission* v *France* [2000] ECR I-10941, paragraph 53).

65 In view of the fact that the obligation to classify the most suitable areas for species conservation as SPAs has been in place for Ireland since 6 April 1981, Ireland's request for an additional period in which to assess the best scientific source available cannot succeed, as that request is not compatible with the objectives pursued by the Birds Directive or with the responsibility which that directive imposes on the Member States to manage the common heritage on their territory.

66 Moreover, as has just been held in paragraph 47 of this judgment, it is necessary to use the most up-to-date scientific data available at the end of the period laid down in the reasoned opinion.

67 It follows from all the foregoing that, in the absence of scientific studies capable of rebutting the results of IBA 2000, that inventory is the most up-to-date and accurate reference for identifying the most suitable sites in number and in size for the conservation of the species listed in Annex I and for the regularly occurring migratory species not listed in that annex.

The first part of the first complaint

— Arguments of the parties

68 The Commission acknowledged, during the pre-litigation procedure, that Ireland had classified a relatively high number of sites as SPAs. It takes the view, however, that other areas also should have been thus classified. After noting that IBA 2000 listed a total of 140 areas of importance for the conservation of birds covering an area of 4 309 km^2, or approximately 6% of Ireland's total land area (approximately 60% of those areas are coastal areas, in line with the fact that Ireland has 7 100 km of coast; internal waters account for another 20%), the Commission maintains that 42 of those areas had not been classified as SPAs. It its view, even if all of those areas were to be classified as SPAs, Ireland's SPA network would still suffer from shortcomings with regard to a number of bird species referred to in Annex I and regularly occurring migratory species because they are not entirely covered by the classification made in IBA 2000.

69 It further observes that, in terms of territorial coverage, Ireland's SPA network is the second smallest of the group of 15 Member States prior to enlargement in 2004. The level of territorial coverage of Ireland's SPA network has in fact already been surpassed by several of the 10 new Member States.

70 Lastly, the Commission notes that, during the pre-litigation procedure, the Irish authorities proposed a timetable for the classification, re-classification and extension of a certain number of sites. In reality that timetable has not been adhered to and Ireland has not made or notified any classification.

71 After stating that it is well aware that its obligation to classify appropriate areas for species conservation follows from the Birds Directive and not from IBA 2000, Ireland replies that the overall research work for extending, if necessary, Ireland's SPA network is currently being carried out and should be completed soon.

72 Ireland adds, however, that the kingfisher (*Alcedo athis*) is the least appropriate species for an attempt at conservation using SPA classification and that there is good reason for not classifying other SPAs for the corncrake (*Crex crex*). Ireland adds that it may lawfully deem the Cross Lough area not to be one of the most suitable territories for classification on the basis of information available to it.

— Findings of the Court

A —
The sites identified in IBA 2000

73 The Court finds, as a preliminary point, that the Commission acknowledged, in its additional reasoned opinion, that there was en error in Table 1 in its reasoned opinion notified on 24 October 2001 concerning the Bull and Cow Rocks site, already classified as an SPA, and that, consequently, that site no longer forms part of the subject-matter of the present action.

74 According to settled case-law, the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation in that Member State as it stood at the end of the period laid down in the reasoned opinion, and the Court cannot take account of any subsequent changes (see, inter alia, Case C-282/02 *Commission* v *Ireland* [2005] ECR I-4653, paragraph 40).

75 In the present case, it is clear from the indications given as to the abovementioned grounds for failure to fulfil obligations that Ireland does not dispute the allegation that it had not classified 42 of the 140 sites identified in IBA 2000 as SPAs within the period laid down in the additional reasoned opinion notified on 11 July 2003.

76 In the light of what has been stated in paragraph 67 of this judgment, the mere fact that Ireland has embarked upon an extensive SPA classification and re-classification programme cannot justify the failure to classify the sites identified in IBA 2000 as SPAs.

77 By contrast, the interest in classifying the Cross Lough area, as well as the three sites suitable for conservation of the corncrake, namely Falcarragh to Min an Chladaigh, Malin Head and the Fanad Head Peninsula, is the subject of a detailed challenge by Ireland.

78 Accordingly, the Commission's action must be upheld in respect of 38 of the 42 sites identified in IBA 2000 and it is appropriate to examine the merits of the action in respect of the four sites the ornithological interest of which is specifically challenged by Ireland.

1. The Cross Lough area

(a) Arguments of the parties

79 The Commission has referred to the Cross Lough area for two reasons. Firstly, Ireland has specifically challenged the need to classify that area as an SPA, even though it was, up to quite recently, an important breeding ground for the sandwich tern (*Sterna sandvicensis*). Secondly, the failure to classify the area in a timely manner was likely to have a negative impact on the protection of the species.

80 The Commission states that, according to the information available to it, the disappearance of the sandwich tern colony, which, according to IBA 89, had been present in the area since 1937, can be traced to predatory activity on the part of the American mink (*Mustela vison*) and that no measures were ever put in place to protect the colony. According to the Commission, with appropriate restoration measures, the sandwich tern might resettle this important long-standing breeding ground. Ireland should not be allowed to benefit from the fact that it failed to ensure classification and protection of the Cross Lough area in a timely manner.

81 Ireland states that the Commission has failed to provide scientific substantiation for its assertion that Ireland is required to classify as an SPA an area which is no longer of interest to the species in question and is no longer an important area for bird conservation but to which birds, after having bred and even though they have moved, might return. Although the Commission might be right in believing that, according to its information, the Cross Lough (or any other) area might be recolonised by the sandwich tern and enjoy the protection of classification as an SPA, it has not succeeded in establishing hat that area would be one of the most

suitable for the conservation of the species in question. Ireland adds that the Commission has not proven that the disappearance of the sandwich tern colony was caused by the predatory activity of the American mink in that area.

(b) Findings of the Court

82 It is common ground that the Cross Lough area was identified in both IBA 89 and IBA 2000 as being one of the most suitable areas for conservation of the sandwich tern, a species referred to in Annex I, according to the ornithological criteria drawn up in 1984 and 1995 respectively. It must accordingly be held that the area has featured among the most suitable areas for conservation of that species since 6 April 1981. Consequently, pursuant to the case-law resulting from the judgment in *Commission* v *Netherlands*, paragraph 62, Ireland should have classified that area as an SPA.

83 As noted by the Advocate General in point 58 of her Opinion, that classification obligation does not necessarily cease to apply if the area is no longer most suitable.

84 According to settled case-law, areas which have not been classified as SPAs but should have been so classified continue to fall under the regime governed by the first sentence of Article 4(4) of the Birds Directive, since otherwise the protection objectives of that directive, as expressed in the ninth recital in the preamble thereto, could not be achieved (see Case C-355/90 *Commission* v *Spain*, paragraph 22, and Case C-374/98 *Commission* v *France* [2000] ECR I-10799, paragraphs 47 and 57).

85 It follows that Ireland ought, at the very least, to have adopted appropriate measures pursuant to the first sentence of Article 4(4) of the Birds Directive in order to avoid pollution or deterioration of the habitats in the Cross Lough area or any disturbances affecting the sandwich tern, in so far as those disturbances may have been significant with regard to the objectives of that article.

86 In the present case, having failed to take such measures for that area, Ireland has not provided proof that the area would no longer be suitable even if protection measures had been taken (see, to that effect, Case C-191/05 *Commission* v *Portugal*, paragraphs 13 and 14).

87 Moreover, according to the results of scientific studies and observations submitted by the Commission during the proceedings, which have not been disputed by Ireland, protection measures were possible. Relying on two articles written by an Irish naturalist, the Commission explained the predatory effect of the American mink on the nests of ground-breeding sandwich terns and, referring to recent observations carried out in an area of County Donegal, showed that management (trapping of minks) reduced the problems of predators and that most of the local population of sandwich terns always nest in the same area.

88 Relying on the aforementioned observations, not disputed by Ireland, which confirm the potential for recolonisation of areas by the sandwich tern, the Commission adds that there is a genuine chance that the sandwich tern may resettle in the area. It adds that the species must have a number of nesting sites within one area, not all of which are necessarily used in a given breeding season.

89 In those circumstances, the Court finds that the action is well-founded in respect of the Cross Lough area.

2. The three suitable areas for conservation of the corncrake

(a) Arguments of the parties

90 The Commission states that the corncrake is the only bird species endangered at world level which is present in Ireland. Its population has declined sharply in recent years and it is now to be found only in limited pockets. Only a much reduced population now survives in Ireland, a fact which justifies a high level of site protection.

91 In its view, a Member State may not validly rely on the low number and vulnerability of a corncrake population to justify a failure to classify the most suitable areas for the conservation of that species. In its reply, the Commission adds that the successful conservation and management of core areas are essential for the corncrake to recover and expand from its current, precarious population.

92 Ireland, for its part, contends that any further designation of SPAs must be considered in the context of available species information (which is extensive) and the positive species conservation steps taken by the National Parks and Wildlife Service. The application of the term 'globally endangered' to the corncrake is no longer valid in the light of available species information and it is therefore misleading to describe it as such. The use of the relevant land is changing substantially. The insistence by the Commission that other areas suitable for

conversation of the corncrake must be classified as SPAs is misguided and is in any event not supported by adequate evidence.

93 After observing that there is indeed a small and unpredictable distribution of corncrakes outside current SPAs, Ireland goes on to state that it is the unpredictability, not the precariousness, of a site's occupation by corncrakes which presents the difficulty. In other words, sound ornithological criteria, and not speculation, should form the basis for classification.

(b) Findings of the Court

94 Although new studies on the presence of the corncrake in Europe have changed its classification category, the fact remains that the 'near threatened' category in which it is currently classified, as much as the 'vulnerable' category in which it was classified previously, meets the conditions for identification of areas of importance for the conservation of birds according to the C.1 criterion used in IBA 2000. This also does not affect the application of the C.6 criterion used in that same inventory. The sites identified in IBA 2000 accordingly cannot be called into question.

95 This finding cannot be rebutted by Ireland's argument that the requirements of the Birds Directive are met with regard to the needs of the corncrake by designating as SPAs the lands used by a significant proportion of the corncrake population through the State funding of the Corncrake Grant Scheme, which involves funding for three fieldworkers, administration costs and payments to farmers, funding and facilitating research and the inclusion of a corncrake tier in the latest Rural Environment Protection Scheme.

96 As evidenced by the case-law referred to in paragraphs 37 to 39 of this judgment, such conservation measures cannot be considered to be sufficient.

97 Ireland's argument that the distribution of corncrakes outside current SPAs is small and unpredictable must also be rejected.

98 The Commission submitted, without being contradicted by Ireland on the point, ornithological publications indicating that, between 1999 and 2001, an average of 39% of the corncrake population present on Irish territory was outside SPAs and that, between 2002 and 2004, that figure was closer to 50%.

99 Ireland's argument that major changes have affected the distribution of the species over short periods (less than 10 years), and that it would be premature to recommend classification of other areas as SPAs as long as the situation has not stabilised, must also be rejected.

100 It is clear in this regard that there has been a sufficiently stable presence of the corncrake in the sites in question over brief periods. Ireland has not disputed that, according to the results of a study carried out by BirdWatch Ireland and submitted

by the Commission, in the period from 1993 to 2001, the reduced presence of the corncrake in the area of Falcarragh to Min an Chladaigh accounted for 8% of its population in Ireland, in Malin Head 4% of the population in Ireland, and on the Fanad Head Peninsula 3% of the population in Ireland. According to the same source, the figures are similar for the period 2002 to 2004.

101 As to Ireland's argument that the goodwill and cooperation of landowners is conducive to the success of future conservation schemes and the application of protective instruments, the Court observes that, even if that were the case, that fact does not release a Member State from its obligations under Article 4 of the Birds Directive.

102 In those circumstances, the Court finds that the action is also well-founded in respect of the sites of Falcarragh to Min an Chladaigh, Malin Head and the Fanad Head Peninsula.

B — *The birds to be protected in other sites*

103 The Commission submits that for the red-throated diver (*Gavia stellata*), the hen harrier (*Circus cyaneus*), the merlin (*Falco columbarius*), the peregrine falcon (*Falco peregrinus*), the golden plover (*Pluvialis apricaria*), the corncrake, the kingfisher, the white-fronted goose (Greenland race) (*Anser albifrons flavirostris*) and the short-eared owl (*Asio flammeus*), protected species referred to in Annex I, and also for the lapwing (*Vanellus vanellus*), the redshank (*Tringa totanus*), the snipe (*Gallinago gallinago*), the curlew (*Numenius arquata*) and the dunlin (*Calidris alpina*), regularly occurring migratory species, the areas of importance for the conservation

of birds identified in IBA 2000 clearly do not offer a sufficient set of sites in number and in size to satisfy the conservation needs of those species.

104 Ireland states that studies have been carried out on six of the nine abovementioned species included in Annex I as well as on the dunlin, a regularly occurring migratory species. The completion of that work henceforth allows for the identification of sites which may be classified as SPAs for the conservation of the red-throated diver, the hen harrier, the merlin, the golden plover and the dunlin. During the pre-litigation procedure, Ireland stated that the SPAs which will be proposed for the conservation of the hen harrier would also allow for conservation of the short-eared owl. Moreover, at the current time, the golden plover is already a 'qualifying interest' in three classified SPAs and the merlin is a 'qualifying interest' at four sites with a multi-species interest. The peregrine falcon is likely to be a qualifying species in most of the SPAs concerning the red-billed chough (*Pyrrhocorax pyrrhocorax*).

105 Although Ireland provides evidence of a number of partial initiatives, these had not been completed at the end of the period laid down in the additional reasoned opinion notified on 11 July 2003. Since the question whether there has been a failure to fulfil obligations must be examined solely on the basis of the position in which the Member State found itself at the end of the period laid down in the reasoned opinion, the Court finds that, in the light of the information referred to in the preceding paragraph of this judgment, Ireland has failed to fulfil its obligations in respect of the designation of SPAs to ensure the conservation of the red-throated diver, the hen harrier, the merlin, the peregrine falcon, the golden plover and the short-eared owl, species referred to in Annex I, and the protection of the dunlin, a regularly occurring migratory species not listed in Annex I. The complaint is also well-founded on this point.

106 Furthermore, it does not appear that the Commission, which has the burden of proof in proceedings for failure to fulfil obligations (Case C-288/02 *Commission* v *Greece* [2004] ECR I-10071, paragraph 35 and case-law cited), has succeeded in

demonstrating to the requisite legal standard that Ireland has failed to fulfil its obligations in respect of the designation of SPAs to ensure the conservation of the white-fronted goose (Greenland race), a species referred to in Annex I, and the protection of the lapwing, the redshank, the snipe and the curlew, regularly occurring migratory species not listed in Annex I. Consequently, the complaint is not well-founded on this point.

107 As regards the kingfisher and the corncrake, Ireland disputes the need to classify other sites as SPAs for their conservation.

1. Suitable sites for conservation of the kingfisher

108 The Commission takes the view that the Irish SPA network should include a representative set of river corridors that could be used by the kingfisher. Ireland, however, has taken no steps towards classifying the most suitable territories for the conservation of the kingfisher and does not even know the current population of the species.

109 Ireland considers that a species as widely dispersed as the kingfisher is the least appropriate of the dispersed species to attempt to conserve through SPA classification. This conclusion is based on available information including two 'breeding atlases' compiled between 1988 and 1991. Although the current population of the kingfisher is not known, it is understood that BirdWatch Ireland intends to carry out a survey. In the event that the survey shows a more significant kingfisher population, the Irish authorities would reconsider the matter of the creation of SPAs for the purpose of kingfisher conservation in the future.

110 As has just been pointed out in paragraph 59 of this judgment, it is clear from Article 4(1) of the Birds Directive, as interpreted by the Court, that if species listed in Annex I occur on the territory of a Member State, it is obliged to define SPAs for them. It follows that Ireland ought to have identified the most suitable territories for conservation of the kingfisher and classified them as SPAs.

111 It follows that Ireland, which acknowledges that the kingfisher is present in its territory, had failed to comply with that obligation at the end of the period laid down in the additional reasoned opinion notified on 11 July 2003. The action is therefore also well-founded as regards the suitable sites for conservation of the kingfisher.

2. Suitable sites for conservation of the corncrake

112 The Commission observes that the current SPA network for protection of the corncrake is weak. It states that IBA 2000 identifies five additional areas: Falcarragh to Min an Chladaigh, Malin Head, the Fanad Head Peninsula, the Mullet Peninsula and the Moy Valley.

113 As regards the five additional areas referred to in the preceding paragraph, the Court finds, first, that they are areas of importance for the conservation of birds and, second, that for three of them — Falcarragh to Min an Chladaigh, Malin Head and the Fanad Head Peninsula — the failure to fulfil obligations has already been declared in paragraph 102 of this judgment.

114 With regard to the Mullet Peninsula, the Commission states, in its reply, that part of this area is subject to SPA classification for other purposes. It is clear, therefore, that the Mullet Peninsula is an example of part classification.

115 Next, the C.6 criterion is applicable to the Mullet Peninsula. That criterion designates an area which is one of the five most important areas in each European region for a species or subspecies listed in Annex I. Therefore, under the criteria used in IBA 2000, it is sufficient that the area in question hosts a significant number of individuals of such a species or subspecies (at least 1% of the national breeding population of a species referred to in Annex I or 0.1% of the biogeographical population) in order for it to have to be classified as an SPA.

116 Thus, in the present case, in its reply, the Commission submitted results — which were not challenged by Ireland — of a study by BirdWatch Ireland, according to which, in the period from 1993 to 2001, the reduced presence of the corncrake on the Mullet Peninsula accounted for 4% of the national population. According to the same source, similar figures can be shown for the years 2002 to 2004.

117 Accordingly, the Commission's action must be upheld in respect of the Mullet Peninsula.

118 With regard to the Moy Valley, the Commission acknowledges that the census data show an absence of corncrakes for several years. However, the BirdWatch figures indicate that the Moy Valley had important numbers of corncrakes in the 1980s and up to the mid-1990s. In particular, up to 1993, the area held the second largest concentration of corncrakes in the country after the Shannon Callows and therefore would have unreservedly qualified for classification on any reasonable application of ornithological criteria. Thus there was evidence to justify classification of the Moy Valley as an SPA for a long period after the Birds Directive came into force. The loss of corncrakes in the Moy Valley was the result of changes in agricultural practices

which Ireland took no steps to remedy. The Commission submits that Ireland ought not to derive any advantage from its failure to classify and protect this site. Ireland has not demonstrated the infeasibility of re-establishing a corncrake presence in that area.

119 It is clear that the figures from BirdWatch Ireland, submitted by the Commission in its reply and showing that the Moy Valley area had numerous corncrakes in the 1980s until the mid-1990s, are not disputed by Ireland. It follows that that site was one of the most suitable areas for conservation of the corncrake and that, in line with the case-law cited in paragraph 37 of this judgment, Ireland ought to have classified it as an SPA.

120 According to the settled case-law referred to in paragraph 84 of this judgment, areas which have not been classified as SPAs but should have been so classified continue to fall under the regime governed by the first sentence of Article 4(4) of the Birds Directive, since otherwise the protection objectives of that directive, as expressed in the ninth recital in the preamble thereto, could not be achieved. It follows that Ireland ought at the very least to have adopted appropriate measures under the first sentence of Article 4(4) of the Birds Directive in order to prevent the deterioration of habitats in the Moy Valley and disturbances affecting the corncrake, in so far as they have significant effects in the light of the objectives of that article.

121 The case-file shows that in the Moy Valley, which should have been classified as an SPA, the loss of corncrake was the result of changes in agricultural practices which Ireland took no steps to remedy.

122 Nor has Ireland demonstrated that it would be impossible to re-establish the presence of the corncrake in that area. Accordingly, the Commission's action must be upheld on this point.

123 It follows that the action is also well-founded in respect of the Mullet Peninsula and the Moy Valley.

The second part of the first complaint

— Arguments of the parties

124 The Commission argues that Ireland has failed to fulfil its obligation under Article 4(1) and (2) of the Birds Directive because it classified certain sites as SPAs only partially. In its view, the SPA boundaries were in many cases drawn so as to exclude equivalent adjacent areas of ornithological interest as identified in IBA 2000. These criticisms cover a total of 37 sites.

125 After pointing out that SPA boundaries should be defined by ornithological considerations and not economic ones, the Commission notes that the Irish authorities, by contrast, have in many cases limited SPAs to sites in public ownership and have not classified sites seriously contested by economic interests.

126 The Commission adds that, during the proceedings, the Irish authorities stated that they intended to extend and re-designate a large number of sites by the end of June 2004, but do not appear to have followed up on that intention in practice.

127 Ireland states that the relevant survey work is in progress and that it is intended that fresh SPAs will be classified for the purpose of conservation of the species concerned. All reclassifications and new classifications will be carried out in accordance with the requirements of the Habitats Regulations. Nevertheless, it disputes the alleged failure to classify a sufficiently large area for the Sandymount Strand and Tolka Estuary SPA.

— Findings of the Court

128 In acknowledging that certain SPAs must be extended, Ireland admits that it has failed to fulfil its obligations under Article 4(1) and (2) of the Birds Directive. Accordingly, the Commission's action must be upheld in respect of 36 of the 37 sites.

129 Next, the situation of the Sandymount Strand and Tolka Estuary SPA must be examined.

130 The Commission claims that the boundaries of the Sandymount Strand and Tolka Estuary SPA have not taken proper account of ornithological interests, contrary to Article 4(1) and (2) of the Birds Directive.

131 In its view, evidence indicates that the approach taken by the Irish authorities for the demarcation of the boundaries of the Sandymount Strand and Tolka Estuary SPA, an internationally important wetland for waterfowl, situated in Dublin Bay and regularly supporting over 20 000 wintering birds, leads to the exclusion of two areas earmarked for development in connection with major public works; that exclusion was decided upon on the basis of an isolated consideration of the ornithological value of those areas, whereas the boundaries of the SPAs should have been drawn up in the light of the natural boundaries of the wetland ecosystem.

132 According to the Commission, the first area of 4.5 hectares, the inclusion of which in the SPA had been proposed previously, was excluded from the initial extension project for the Sandymount Strand and Tolka Estuary SPA following representations by the Dublin Port Company, which wished to infill the area for a port extension.

133 Ireland, for its part, contends that that area should not have been included in the proposed extended area in the first instance and that its inclusion has no scientific basis. The adjustment of the proposed extended SPA was subjected to close examination and it was concluded that the inclusion of the area was not scientifically justified on the ground that only a small part is exposed briefly at low spring tides.

134 Ireland observes in particular that common adaptable wader species can use the area only when it is exposed at low tide. Those species find the bulk of their food elsewhere. Further, the area may not relate to significant habitats located nearby which provide better conditions for the species concerned. In Ireland's view, no real attempt has been made by the Commission to dispute the underlying scientific basis for this view.

135 As regards the first area, the Court finds, as a preliminary point, that the complaints expressed by the Commission in its reply regarding other sites in that area are inadmissible at the stage of proceedings before the Court on the ground that they were not the subject-matter of the action.

136 In accordance with the Court's settled case-law, the subject-matter of an action under Article 226 EC for failure to fulfil obligations is delimited by the pre-litigation procedure provided for by that provision, so that the application must be based on the same grounds and pleas as the reasoned opinion (see Case C-456/03 *Commission* v *Italy* [2005] ECR I-5335, paragraph 35 and case-law cited).

137 Next, as evidenced by the case-file, the Commission produced an ornithological study carried out in November 2002 by Dublin Bay Watch, which, on the basis of an examination of the ornithological implications of the infilling project, called for the inclusion of those areas in the Sandymount Strand and Tolka Estuary SPA. That study, which has not been disputed by the Irish authorities, shows, as noted by the Advocate General in point 72 of her Opinion, that various species make above-average use of the land, which is exposed infrequently. Furthermore, at least parts of this land are exposed also on less extreme tides and can be used by birds. Lastly, the areas in question are used not only by wading birds but also by sandwich terns, for example, which do not rely on the land being exposed.

138 Accordingly, the first area in question is an integral part of the wetland ecosystem and should have been classified as an SPA. It follows that the action is well-founded in respect of the first area excluded from the initial proposal to extend the Sandymount Strand and Tolka Estuary SPA.

139 The second area comprised 2.2 hectares of inter-tidal mudflat at the entry to the estuary of the Tolka, destroyed, according to the Commission, in the construction of the Dublin Port Tunnel, the promoter of which is Dublin Corporation (now the Dublin City Council). The Commission argues that, although small, the excluded area had features similar to those of a complete ecosystem, namely mudflats, and had confirmed usage by birds that depend on the overall ecosystem, that is to say, the oystercatcher (*Haematopus ostralegus*) and the redshank. Such piecemeal exclusions of portions of an integrated wetland system undermine the objectives of the Birds Directive.

140 Ireland contends that only very small numbers of oystercatcher and redshank occur in the 2.2 hectare inter-tidal mudflat area, which is exposed as a feeding area only for very short periods of time at low tide. The area is therefore not regarded as significant for the purposes of inclusion in the relevant SPA. The criteria applied in reaching that decision were scientifically sound ornithological criteria. Ireland submits that the Commission's view that the loss of the 2.2 hectare area constitutes a significant deterioration of bird habitats and source of disturbance is not accepted and that the Commission has not identified any scientific or objectively verifiable evidence for its view.

141 In respect of the second area, it should be borne in mind that, according to the case-law referred to in paragraph 39 of this judgment, the classification of areas as SPAs is subject solely to the ornithological criteria determined by the Birds Directive.

142 The Commission is therefore correct in claiming, first, that SPA classification cannot be the result of an isolated study of the ornithological value of each of the areas in question but must be carried out in the light of the natural boundaries of the wetland ecosystem and, second, that the ornithological criteria which form the

foundation of the classification must have a scientific basis. The use of flawed, allegedly ornithological criteria might lead to an incorrect demarcation of the boundaries of SPAs.

143 In the present case, it is common ground that the area in question is separated from the rest of the classified estuary by a road which crosses the river and, being a mudflat, has the same characteristics as the Dublin Bay site as a whole.

144 It is furthermore clear from the environmental impact assessment published in July 1998, on which both parties relied during the proceedings, that that area is used as a feeding ground by some of the wild birds present in the Sandymount Strand and Tolka Estuary SPA.

145 The Court accordingly finds that the second area is used as a feeding ground by three of the nine bird species which are decisive for the classification of Dublin Bay as an area of ornithological importance. That area is used by those species within the average limits which could be expected, if not more. Consequently, it is an integral part of the entire wetland ecosystem and for that reason ought also to have been classified as an SPA.

146 It follows that the action is also well-founded in respect of the second area not included in the Sandymount Strand and Tolka Estuary SPA.

147 Consequently, the Court finds that the second part of the first complaint is well-founded.

148 In the light of all the foregoing considerations, the Court finds that the first complaint is well-founded, except for the point relating to the classification of SPAs to ensure conservation of the Greenland white-fronted goose, a species referred to in Annex I, and protection of the lapwing, the redshank, the snipe and the curlew, regularly occurring migratory species not listed in Annex I.

The second complaint: failure to establish the necessary legal protection regime in accordance with Article 4(1) and (2) of the Birds Directive

Arguments of the parties

149 The Commission argues that, since 1981, Irish legislation has failed adequately to give effect to Article 4(1) and (2) of the Birds Directive and that, moreover, Ireland has not applied those provisions in practice by establishing a specific legal protection regime for SPAs such as to ensure survival and reproduction of the bird species concerned.

150 In the Commission's view, ensuring the survival and reproduction of bird species within SPAs may require not only preventive measures, but also active or positive measures, which, with one exception, have not been taken in Ireland. Secondly, there is a doubt as to whether the relevant Irish legislation actually provides a legal basis for taking such measures.

151 Ireland disputes the alleged failure to fulfil obligations. Regarding the obligation to establish an effective legal protection regime for SPAs, whilst accepting that the preventive approach is not sufficient to protect birds in all situations, it contends

that that view informed the creation of the voluntary Corncrake Grant Scheme. To that may be added a number of plans, at the draft stage, for bird management and conservation in a number of SPAs.

152 As regards the scope of the Irish legislation transposing Article 4(1) and (2) of the Birds Directive, Ireland denies that the sole purpose of the Habitats Regulations is to implement the Habitats Directive and contends that those regulations provide an adequate legal basis in national law for the creation and implementation of SPA management plans. Ireland states that the Habitats Regulations clearly apply a number of key protective and enforcement measures to SPAs, including Regulation 13, which is expressly listed in Regulation 34 as a provision applying to areas classified pursuant to the Birds Directive.

Findings of the Court

153 According to the case-law of the Court, Article 4(1) and (2) of the Birds Directive requires the Member States to provide SPAs with a legal protection regime that is capable, in particular, of ensuring both the survival and reproduction of the bird species listed in Annex I to the directive and the breeding, moulting and wintering of migratory species not listed in Annex I which are, nevertheless, regular visitors (Case C-166/97 *Commission* v *France* [1999] ECR I-1719, paragraph 21 and case-law cited).

154 As observed by the Advocate General in point 77 of her Opinion, the protection of SPAs may not be limited to avoiding harmful human effects but must also include positive measures to preserve or improve the state of the area, as the case may be.

155 It is common ground that Regulation 13 of the Habitats Regulations would have adequately transposed Article 4(1) and (2) of the Birds Directive if that provision had been applicable to SPAs. However, contrary to Ireland's position that Regulation 13 applies also to SPAs essentially by virtue of Regulation 34, the Commission takes the view that the Habitats Regulations are intended to implement only the Habitats Directive.

156 Regulation 34 of the Habitats Regulations provides that '[t]he provisions of Regulations 4, 5, 7, 13, 14, 15 and 16 shall, where appropriate, apply with any necessary modifications to areas classified pursuant to paragraph 1 and 2 of Article 4 of the Birds Directive'.

157 According to the wording of the third paragraph of Article 249 EC, a directive, in binding all addressee Member States as to the result to be achieved, leaves it to the national authorities to decide the form and methods. It follows that Ireland, just like any other Member State, may choose the form and methods for implementing the Birds Directive (see, to that effect, Case C-296/01 *Commission* v *France* [2003] ECR I-13909, paragraph 55).

158 However, according to the case-law of the Court, the transposition of a directive into domestic law must guarantee the full application of the directive in a sufficiently clear and precise manner (see, to that effect, Case C-361/88 *Commission* v *Germany* [1991] ECR I-2567, paragraph 15).

159 The Court has also held, as mentioned in paragraph 64 of this judgment, that faithful transposition becomes particularly important in the case of the Birds Directive, where management of the common heritage is entrusted to the Member States in their respective territories.

160 It is therefore appropriate to examine whether Regulation 34 of the Habitats Regulations does not guarantee the application of Regulation 13 of those regulations to the areas classified as SPAs under Article 4(1) and (2) of the Birds Directive, as claimed by the Commission.

161 A literal reading of Regulation 34 shows that it does not, on the face of it, exclude from the scope of application of the Habitats Regulations the application of Regulation 13 to areas classified under Article 4(1) and (2) of the Birds Directive.

162 Consequently, it is not possible to accept the Commission's argument that, due to the lack of reference in the Habitats Regulations to a distinct objective of giving effect also to the Birds Directive and in the light of the limitations imposed by the European Communities Act, those regulations cannot provide a legal basis allowing the adoption of management plans for bird conservation in the SPAs.

163 For the same reason, it is also not possible to accept the Commission's argument that the Habitats Regulations do not allow for application to SPAs of the management measures provided for in Article 6(1) of the Habitats Directive, as the sole declared purpose of those regulations is to implement that directive. As observed by the Advocate General in point 82 of her Opinion, if measures similar to those provided for in Article 6(1) are to be applied to SPAs pursuant to Article 4(1) and (2) of the Birds Directive, the national legislature is not prevented from creating a single provision to transpose the rules of both directives.

164 The Court also cannot accept the Commission's argument relating to the limitations imposed by the European Communities Act. Ireland contends in its statement in

defence, without being contradicted on the point by the Commission, that the Habitats Regulations are not a statute but are, in their entirety and undoubtedly, of full force and effect unless and until they are successfully challenged before a court of competent jurisdiction.

165 Lastly, on the same ground as that referred to in paragraph 161 of this judgment, the Court cannot accept the Commission's argument that the application to SPAs of Regulation 13 of the Habitats Regulations, which relates to conservation measures to be taken by the Minister in relation to Special Areas of Conservation, is not automatic since, according to the wording of Regulation 34 of those regulations, some provisions of those regulations apply 'where appropriate' and 'with any necessary modifications' to areas classified under Article 4(1) and (2) of the Birds Directive.

166 Moreover, the Court has consistently held that the scope of national laws, regulations or administrative provisions must be assessed in the light of the interpretation given to them by national courts (Case C-300/95 *Commission* v *United Kingdom* [1997] ECR I-2649, paragraph 37 and case-law cited). In the present case, the Commission has not put forward in support of its action any decisions of national courts which interpreted the disputed national provision in a manner contrary to the Birds Directive.

167 In those circumstances, it does not appear that the Commission, which has the burden of proof in proceedings for failure to fulfil obligations (*Commission* v *Greece*, paragraph 35 and case-law cited), has demonstrated to the requisite legal standard that, at the date of expiry of the period laid down in the additional reasoned opinion notified on 11 July 2003, the Habitats Regulations had the scope attributed to them by the Commission.

168 The second complaint must accordingly be rejected.

The third complaint: failure to apply the first sentence of Article 4(4) of the Birds Directive to the areas which should have been classified as SPAs

Arguments of the parties

169 The Commission argues that, since 1981, Ireland has failed to ensure the application of the first sentence of Article 4(4) of the Birds Directive as regards sites which should have been classified as SPAs under that directive, but have not been. It considers that, given the extent of the inadequacy of the classification of SPAs by the Irish authorities, that omission has potentially important implications for the conservation of the bird species concerned.

170 In its view, although there is Irish legislation of relevance to the protection of habitats other than classified SPAs, that legislation lacks the ornithological specificity required by the first sentence of Article 4(4) of the Birds Directive. In particular, the Irish legislation fails to impose any specific duties in respect of the habitats of the wild bird species which should benefit from the protection conferred on SPAs in areas not covered by Ireland's existing SPA network. The Commission cites the specific example of the difficulties faced by the hen harrier and adds that unclassified areas requiring classification do not enjoy in Ireland the protection required by the first sentence of Article 4(4) of the Birds Directive, even in respect of the actions of public authorities.

171 Ireland replies, essentially, that important hen harrier survey work is nearing completion and that draft guidelines in relation to the development of wind energy are soon to be concluded.

Findings of the Court

172 As already noted in paragraph 84 of this judgment, the protection objectives of the Birds Directive, as expressed in the ninth recital in the preamble thereto, cannot be achieved if Member States are required to comply with their obligations under Article 4(4) thereof only where an area has been previously classified as an SPA.

173 As is also clear from the Court's case-law, the text of Article 7 of the Habitats Directive states that Article 6(2) to (4) of that directive replaces the first sentence of Article 4(4) of the Birds Directive as from the date of implementation of the Habitats Directive or the date of classification by a Member State under the Birds Directive, where the latter date is later. It is clear, therefore, that areas which have not been classified as SPAs but which should have been so classified continue to fall under the regime governed by the first sentence of Article 4(4) of the Birds Directive (Case C-374/98 *Commission* v *France*, paragraphs 46 and 47).

174 In the present case, however, Ireland has not even asserted that it ensured the application of the first sentence of Article 4(4) of the Birds Directive to areas requiring classification as SPAs under that directive.

175 Consequently, and without its being necessary to consider the specific examples provided by the Commission, the Court finds that the third complaint is well-founded.

The fourth complaint: failure to transpose and apply the second sentence of Article 4(4) of the Birds Directive

Arguments of the parties

176 The Commission complains that Ireland has failed to transpose and apply fully and correctly the second sentence of Article 4(4) of the Birds Directive relating to appropriate steps to be taken by the Member States to avoid pollution or deterioration of habitats outside SPAs.

177 In support of its complaint, the Commission states that the various domestic legal measures, in particular integrated pollution control licences, the Control of Farmyard Manure scheme, and provisions of planning legislation including environmental impact assessment requirements, which are deemed to transpose the second sentence of Article 4(4) of the Birds Directive, do not have any specifically ornithological content from that article. In the absence of any specific ornithological considerations, entities playing a role in the context of environmental measures cannot be expected to take account of ornithological interests. In the Commission's view, several of the domestic measures transposing the second sentence of Article 4(4) are partial and numerous lacunae remain. The shortcomings of those measures are borne out by the deterioration of habitats and, despite denials by Ireland, it cannot validly be disputed in the present case that human intervention has led to a deterioration of the habitats.

178 Ireland replies by stating that Article 4(4) of the Birds Directive is in practice transposed by a number of statutory schemes and measures. It adds that the second sentence of Article 4(4) of the Birds Directive is implemented by the Wildlife Act, which provides a sound legal basis for the protection of bird species in the wider countryside.

Findings of the Court

179 Although the second sentence of Article 4(4) of the Birds Directive does not require that certain results be achieved, the Member States must nevertheless make a serious attempt at protecting those habitats which lie outside the SPAs. It is thus clear, in the present case, that Ireland must endeavour to take suitable steps to avoid pollution or disturbances of the habitats (see, to that effect, Case C-166/97 *Commission* v *France*, paragraph 48).

180 First of all, it is appropriate to consider whether Ireland has transposed that provision fully and correctly by taking suitable steps to avoid pollution or deterioration of the habitats lying outside the SPAs.

181 It is clear, in the light of all the evidence submitted, assessed as a whole, that that is not so in the present case.

182 As regards the licences issued by the Environmental Protection Agency under the integrated pollution control scheme, it is not disputed, as pointed out by the Commission, that that scheme covers only a limited range of polluting activities and does not contain any specific reference to the ornithological considerations referred to in Article 4 of the Birds Directive. It would appear, moreover, that Ireland refers to the transposition of Council Directive 96/61/EC of 24 September 1996 concerning integrated pollution prevention and control (OJ 1996 L 257, p. 26), the objectives of which are different. Accordingly, the national rules relating to those licences cannot be regarded as being an adequate transposition of the second sentence of Article 4(4) of the Birds Directive.

183 With regard to the cross-compliance aspect of the single payment under the common agricultural policy, Ireland states that the various statutory management requirements (SMRs), the first key element of cross-compliance, referred to in Article 4 of Council Regulation (EC) No 1782/2003 of 29 September 2003 establishing common rules for direct support schemes under the common agricultural policy and establishing certain support schemes for farmers and amending Regulations (EEC) No 2019/93, (EC) No 1452/2001, (EC) No 1453/2001, (EC) No 1454/2001, (EC) No 1868/94, (EC) No 1251/1999, (EC) No 1254/1999, (EC) No 1673/2000, (EEC) No 2358/71 and (EC) No 2529/2001 (OJ 2003 L 270, p. 1), the list of which is contained in Annex III to that regulation, are to be introduced progressively over three years, starting on 1 January 2005. Ireland adds that the list of those regulatory requirements includes a reference to the Birds Directive. However, for the same reasons as those referred to in paragraph 74 of this judgment, the progressive introduction in national law of those requirements may not be taken into account.

184 The same holds true for the second key element of cross-compliance of the single payment, relating to good agricultural and environmental condition referred to in Article 5 of Regulation No 1782/2003, the minimum requirements of which must be defined on the basis of the framework laid down in Annex IV to that regulation, with transposition measures for that article entering into force only as of 1 January 2005.

185 Regarding the steps taken under the Rural Environment Protection Scheme, designed to reward farmers for carrying out their farming activities in an environmentally friendly manner and to bring about environmental improvements on existing farms, the Commission acknowledges that they have advantages for wild birds in that they make it possible to avoid pollution and deterioration of habitats. It is common ground, however, that that scheme does not apply generally to all farmlands or to territories not classified as SPAs. Accordingly, those steps also cannot be regarded as transposing the second sentence of Article 4(4) of the Birds Directive.

186 The arguments concerning the Farm Waste Management Scheme and the planning legislation, including the provisions on environmental impact assessment, must also be rejected. In those texts, Ireland has not introduced any ornithological considerations in respect of the second sentence of Article 4(4) of the Birds Directive.

187 Lastly, with regard to the Wildlife Act, it is clear that the only provision of that act relevant in this context and referred to by Ireland during the proceedings is section 11(1). However, that provision is not sufficiently specific to be regarded as guaranteeing the transposition of the second sentence of Article 4(4) of the Birds Directive.

188 Secondly, it is appropriate to consider whether the Commission has established that Ireland has not made sufficient efforts in practice to avoid pollution or deterioration of habitats lying outside SPAs.

189 The Commission puts forward in this regard, by way of example, the habitats of the cuckoo (*Cuculus canorus*), skylark (*Alauda arvensis*), swallow (*Hirundo rustica*) and sand martin (*Riparia riparia*), widespread bird species contained in the 'orange list' of the *Birds of Conservation Concern in Ireland* inventory published in 1999 by BirdWatch Ireland and the Royal Society for the Protection of Birds. That inventory states that those species suffer greatly from the changes in agricultural practices. In addition, the Commission refers to the report *Ireland's Environment 2004*, drawn up by the Environmental Protection Agency, which attributes the general deterioration of habitats in Ireland to a number of developments.

190 It is also clear that the mere fact that a number of programmes and regulatory measures may have been implemented and taken, as contended by Ireland, does not

establish that Ireland has made sufficient efforts to avoid pollution or deterioration of habitats. As noted by the Advocate General in point 111 of her Opinion, serious endeavours, namely the taking of all reasonable measures to achieve the success being sought, require targeted action.

191 The Court finds in the present case that the measures taken by Ireland are partial, isolated measures, only some of which promote conservation of the bird populations concerned, but which do not constitute a coherent whole.

192 That finding is supported by the fact that Ireland has not contradicted the content of the inventory *Birds of Conservation Concern in Ireland*, published in 1999, or the report *Ireland's Environment 2004*, two ornithological studies referred to above and submitted by the Commission.

193 Accordingly, in the light of all the evidence adduced by the Commission, the Court finds that Ireland has not transposed or applied fully and correctly the second sentence of Article 4(4) of the Birds Directive. Consequently, the failure to fulfil obligations in regard to this complaint is well-founded.

The fifth complaint: inadequate transposition and application of Article 6(2) to (4) of the Habitats Directive

194 The fifth complaint concerns, in respect of the SPAs classified under the Birds Directive, the fact that Ireland has not adopted all the measures required to comply with Article 6(2) to (4) of the Habitats Directive. This complaint also concerns the inadequate transposition of Article 6(2) of that directive as regards the use of all the sites covered by that provision for recreational purposes.

Preliminary observations

195 Article 7 of the Habitats Directive provides that obligations arising under Article 6(2) to (4) of that directive are to replace any obligations arising under the first sentence of Article 4(4) of the Birds Directive in respect of areas classified pursuant to Article 4(1) of that directive or similarly recognised under Article 4(2) thereof, as from the date of implementation of the Habitats Directive or the date of classification or recognition by a Member State under the Birds Directive, where the latter date is later.

196 It follows that Article 6(2) to (4) of the Habitats Directive has applied to SPAs in Ireland since 10 June 1994, the date on which the period for transposition of that directive in Ireland expired, or since the date of their classification or recognition under the Birds Directive, where the latter date is later.

Inadequate transposition and application of Article 6(2) of the Habitats Directive

— Arguments of the parties

197 The Commission submits that Ireland has not transposed or applied correctly, as at 10 June 1994 or after that date, Article 6(2) of the Habitats Directive to all the areas classified under Article 4(1) of the Birds Directive or recognised under Article 4(2) thereof.

198 It submits that, according to the wording of the Habitats Regulations, which, Ireland asserts, implement Article 6(2) of the Habitats Directive, the ability to control potentially damaging activities on the part of landowners is to a significant extent dependent on notices being served on landowners at the time an area is proposed to become a site subject to Article 6(2) of the Habitats Directive. Regulation 14 of those regulations provides for ministerial power to issue notices and impose conditions concerning the use of land. That power is subject to two limitations, however.

199 The first of those limitations is a limitation de jure in that Regulation 14 of the Habitats Regulations is worded in such a manner as to apply only to SPAs so classified after the entry into force of those regulations, so that it does not cover SPAs classified before that date. In the case of existing SPAs, there is no provision for issuing notices to landowners expressly informing them of the activities which require authorisation under the transposing legislation, so as to make the system of controls on damaging activities operational for these.

200 The second is a limitation de facto in that that regulation has not been applied to all SPAs.

201 According to the Commission, in the absence of any use of restrictive notices, Irish legislation does not contain any provision giving full effect to Article 6(2) of the Habitats Directive for State-owned land situated inside SPAs. It also takes the view that, in so far as those activities take place on State-owned land or State-controlled land, the national legislation does not provide for any explicit statutory obligation requiring the authorities responsible for regulating those activities to take enforcement action to ensure compliance with Article 6(2) of that directive.

202 The Commission refers, by way of example of an activity which infringes Article 6(2) of the Habitats Directive, to unauthorised mechanical cockle harvesting in the Bannow Bay SPA and also refers to the damaging development of the Glen Lough SPA.

203 Ireland rejects all of the Commission's allegations. It contends that, in addition to Regulation 14 of the Habitats Regulations, Regulation 13(3) of those regulations, which applies to both Special Areas of Conservation and SPAs, transposes Article 6(2) of the Habitats Directive. Ireland also refers, for the same purposes, to Regulations 17 and 18 of the Habitats Regulations and maintains its position that the Foreshore Acts ensure protection of SPAs.

— Findings of the Court

204 Article 6(2) of the Habitats Directive, like the first sentence of Article 4(4) of the Birds Directive, requires Member States to take appropriate steps to avoid, in the areas classified pursuant to Article 4(1) or recognised pursuant to Article 4(2), the deterioration of habitats and disturbances having a significant effect on the species for which the SPAs were classified or recognised (see, to that effect, Case C-117/00 *Commission* v *Ireland* [2002] ECR I-5335, paragraph 26).

205 As regards Ireland's argument that Regulation 13(3) of the Habitats Regulations transposes Article 6(2) of the Habitats Directive, it is clear that the sole purpose of Regulation 13(3) of those regulations is to require the competent minister to take appropriate steps to avoid the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been

designated, with the result that that provision has effect only when that minister has direct responsibility over the SPAs concerned. Moreover, under the Habitats Regulations scheme, Regulation 13(3) thereof complements the provisions of Regulations 4 and 14, which provide for a notice-based scheme of landowner liability. In the present case, since it is common ground that notices were not issued for all the SPAs, Regulation 13(3) of the Habitats Regulations cannot be regarded as ensuring adequate transposition of Article 6(2) of the Habitats Directive.

206 With regard to the argument that Regulation 14 of the Habitats Regulations provides for the control of operations and activities listed in a notice issued by the competent minister pursuant to Regulation 4 and that listed activities may only be carried out with ministerial consent or pursuant to a management agreement provided for in Regulation 12 of those regulations, suffice it to hold that Regulation 14 is also dependent on the existence of a notice. Accordingly, and for the same reason as stated in the preceding paragraph of this judgment, the latter provision cannot be regarded as ensuring adequate transposition of Article 6(2) of the Habitats Directive.

207 As to the argument that Regulation 17 of the Habitat Regulations empowers the competent minister to seek injunctive relief to stop operations or activities that appear on assessment to be damaging to a European site, including an SPA, and that Regulation 18 of those regulations provides for similar ministerial powers in the event that an operation or activity damaging to an SPA is being carried out in an area outside the SPA, the Court finds that, as rightly pointed out by the Commission and the Advocate General in point 127 of her Opinion, those provisions do not make it possible to avoid the deterioration of natural habitats and the habitats of species as well as significant disturbance of the species for which the areas concerned have been designated.

208 Although Ireland states, in its rejoinder, that the powers of the competent minister, as described in the preceding paragraph of this judgment, can be used to apply immediately for injunctive relief on an interim basis, it is clear that those provisions necessarily can come into play only after the activities in question have already commenced and thus only after any deterioration has already occurred. Moreover, the competent minister is not entitled to prohibit a harmful activity unilaterally and the abovementioned powers presuppose that an appropriate assessment of the environmental impact of that activity has been carried out before any judicial relief is sought. The reactive protection of SPAs may be delayed considerably by those procedural steps. Moreover, those provisions do not ensure protection of SPAs against the activities of individuals, as such protection requires that individuals be prevented in advance from engaging in potentially harmful activities.

209 Accordingly, Regulations 17 and 18 of those regulations also cannot be regarded as constituting an adequate transposition of Article 6(2) of the Habitats Directive.

210 Moreover, Ireland's argument that the Foreshores Acts ensure protection of SPAs cannot be accepted either. Those statutes ensure protection of coastal areas only and therefore do not apply to SPAs situated outside such areas.

211 Lastly, as regards the unauthorised mechanical harvesting of cockles in the Bannow Bay SPA, referred to by the Commission as an activity which infringes Article 6(2) of the Habitats Directive, the Court finds, as noted by the Advocate General in point 140 of her Opinion, that this is mere illustrative use which is not the subject-matter of the application. In any event, the Commission has not adduced any evidence such as to establish the failure to fulfil obligations on this point.

212 It follows that, as at 10 June 1994 or after that date, Ireland had not correctly transposed Article 6(2) of the Habitats Directive in respect of all the areas classified under Article 4(1) of the Birds Directive or recognised under Article 4(2) of that directive.

213 Consequently, the Court finds that the complaint is well-founded on this point.

Inadequate transposition of Article 6(2) of the Habitats Directive in the field of recreational activities

— Arguments of the parties

214 The Commission takes the view that Ireland has not adequately transposed Article 6(2) of the Habitats Directive in respect of the use for recreational purposes of all the sites covered by that provision. It considers that the Irish legislation covers only the activities of landowners and that the legislation suffers from a number of shortcomings in terms of prevention of damage to habitats caused by users of the land for recreational purposes. The application of Regulations 14 and 17 of the Habitats Regulations has not resulted in the compilation of exhaustive lists of prohibited activities. Moreover, the mechanisms provided for in Regulation 17 of those regulations are reactive in nature and no other legislative provision referred to by Ireland appears to protect the SPAs against recreational activities engaged in by users.

215 Notwithstanding indications regarding proposals for appropriate legislative amendments, including the 2004 draft Maritime Safety Bill, Ireland denies that the current legislation is inadequate for implementing Article 6(2) of the Habitats Directive in the context of recreational use of land situated in the SPAs. Ireland explains that the

national authorities have powers to control recreational and other activities in European sites by persons other than the landowner and to impose penalties. In that context, Ireland refers to Regulation 4(3)(b) of the Habitats Regulations and to Regulations 14, 17 and 18 of those regulations, to the Wildlife Act and to the Criminal Justice (Public Order) Act 1994.

— Findings of the Court

216 With regard to Ireland's argument that Regulation 14 of the Habitats Regulations, which places restrictions on operations and activities, does not cover only landowners, occupiers or licence-holders, but also applies to all persons provided that the operation or activity is referred to in a notice issued pursuant to Regulation 4(2) of those regulations, suffice it to hold that Regulation 14(3) of those regulations does not allow for proceedings to be brought against third parties who were not aware of that notice. The latter may, in fact, rely on the defence of 'reasonable excuse' contained in Regulation 14(3). Accordingly, the transposition of Article 6(2) of the Habitats Directive is, at the very least, not sufficiently precise.

217 As to Ireland's argument that the procedure provided for in Regulations 17 and 18 of the Habitats Regulations is a separate and distinct procedure which may be implemented in respect of anyone and does not depend on the content of any particular 'notice', it is clear that there is no guarantee that it may be applied to persons who have not received the notice provided for in Regulation 4 of those regulations. Moreover, as has just been found in paragraphs 208 and 209 of this judgment, that procedure is a merely reactive measure; consequently, Regulations 17 and 18 of the Habitats Regulations cannot be regarded as ensuring adequate transposition of Article 6(2) of the Habitats Directive.

218 With respect to the argument that the Wildlife Act provides, in sections 22, 23 and 76, for a power to act where there is evident and wilful interference with the breeding place or the resting place of a protected wild animal, or where there is disturbance of protected birds as they nest, and under which the powers conferred by that statute include the power to seize equipment and vehicles used by the perpetrators, suffice it to hold that it is common ground that that statute does not cover all types of damage likely to be caused by recreational use.

219 Lastly, regarding the argument that trespass on private property was reclassified as a crime under Irish law by section 19A of the Criminal Justice (Public Order) Act, 1994, and that penalties on conviction include fines and the seizure of vehicles and equipment, the Court notes that, in the context of the Habitats Directive, which lays down complex and technical rules in the field of environmental law, the Member States are under a particular duty to ensure that their legislation intended to transpose that directive is clear and precise (see Case C-6/04 *Commission* v *United Kingdom* [2005] ECR I-9017, paragraph 26).

220 An examination of the criminal-law provisions on trespass on private property relied on by Ireland shows that those provisions are not specifically linked to the protection of natural habitats and of habitats of species against deterioration or against disturbances affecting species and that they are therefore not designed to avoid damage caused to habitats by the use of SPAs for recreational purposes. Consequently, they do not constitute a clear and precise implementation of the provisions of the Habitats Directive such as to satisfy in full the requirements of legal certainty.

221 The complaint is, accordingly, also well-founded on this point.

Inadequate transposition and application of Article 6(3) and (4) of the Habitats Directive

— Arguments of the parties

222 The Commission states that Ireland has not correctly transposed or applied Article 6(3) and (4) of the Habitats Directive.

223 In terms of transposition, the Commission argues that the national legislation does not contain any provisions designed to ensure that plans, as distinct from projects, are assessed in accordance with Article 6(3) and (4) of the Habitats Directive. The national legislation also fails to make proper provision for the application of those Community provisions to projects situated outside SPAs but having significant effects inside them.

224 As regards application, the Commission takes the view that Ireland fails to ensure systematically that plans and projects likely to have significant effects on SPAs, either by themselves or in combination with other plans and projects, undergo appropriate prior assessment.

225 Ireland maintains that no action or project under any plan can have any effect in law or substance without having been subjected to assessment. Although plans can stimulate certain activities, they do not override or obviate controls applying to sites under relevant regulatory regimes. They have no bearing on whether a project which can have an effect on a site is agreed or not. Before any plan or project can affect a site, it will have gone through a full assessment procedure either under the regulatory system provided by the Habitats Regulations, the planning system or under another regulatory system, in compliance with the provisions of the Habitats

Directive. Therefore, no plan or project can affect a site without having been subject to assessment.

— Findings of the Court

226 As regards the transposition of Article 6(3) and (4) of the Habitats Directive, it should be noted at the outset that the Court has already held that Article 6(3) of that directive makes the requirement for an appropriate assessment of the implications of a plan or project conditional on there being a probability or a risk that that plan or project will have a significant effect on the site concerned. In the light, in particular, of the precautionary principle, such a risk exists if it cannot be excluded on the basis of objective information that the plan or project will have a significant effect on the site concerned (Case C-6/04 *Commission* v *United Kingdom*, paragraph 54 and case-law cited).

227 It follows that the Habitats Directive requires that any plan or project undergo an appropriate assessment of its implications if it cannot be excluded on the basis of objective information that that plan or project will have a significant effect on the site concerned.

228 On this point, Ireland maintains that the plans are made subject to an appropriate assessment of their implications on a site under Regulations 27 to 33 of the Habitats Regulations, which provide for various development proposals. However, Ireland has not demonstrated that such projects are plans within the meaning of Article 6(3) of the Habitats Directive.

229 Next, Ireland contends that the Planning and Development Act 2000 introduced requirements in relation to the consideration of the likely significant effects on the environment of certain plans including regional planning guidelines, development plans and local area plans. Since 1 January 2001, each of those plans is required to include information on the likely significant effects on the environment of its implementation. Those requirements were included in anticipation of the terms of Directive 2001/42/EC of the European Parliament and of the Council of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment (OJ 2001 L 197, p. 30). Despite the existence of such legislation, however, it cannot be said that Ireland has satisfied its obligations under Article 6(3) of the Habitats Directive. The obligation provided for in the Planning and Development Act concerns only information relating to likely significant effects on the environment, whereas Article 6(3) of the Habitats Directive requires a prior assessment of the implications of development plans.

230 Ireland adds that it implements the assessments pursuant to Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment (OJ 1985 L 175, p. 40) and to Directive 2001/42, also transposed by the European Communities (Environmental Assessment of Certain Plans and Programmes) Regulations 2004 and by the Planning and Development Strategic Environmental Assessment Regulations 2004.

231 Those two directives contain provisions relating to the deliberation procedure, without binding the Member States as to the decision, and relate to only certain projects and plans. By contrast, under the second sentence of Article 6(3) of the Habitats Directive, a plan or project can be authorised only after the national authorities have ascertained that it will not adversely affect the integrity of the site.

Accordingly, assessments carried out pursuant to Directive 85/337 or Directive 2001/42 cannot replace the procedure provided for in Article 6(3) and (4) of the Habitats Directive.

232 Lastly, regarding the Commission's assertion that the Irish legislation does not make adequate provision for the application of Article 6(3) and (4) of the Habitats Directive to projects situated outside SPAs but having significant effects inside them, the Court finds that it is common ground that the environmental impact assessment report, which must be commissioned by the private persons concerned, who must bear the costs thereof, amounting to a minimum of EUR 15 000, is required only for plantations of over 50 hectares, whereas the average surface area of a plantation in Ireland is approximately 8 hectares.

233 It therefore follows that, since the Irish legislation does not make plans subject to an appropriate assessment of their effects on SPAs, Article 6(3) and (4) of the Habitats Directive has not been adequately transposed in the Irish domestic legal order.

234 Accordingly, the action is well-founded on this point.

235 As to the application of Article 6(3) and (4) of the Habitats Directive, the Commission relies on examples of aquaculture programmes and drainage work inside the Glen Lough SPA. It is, accordingly, appropriate to consider them in turn.

236 Firstly, regarding the aquaculture programmes, the Commission relies, essentially, on the *Review of the Aquaculture Licensing System in Ireland* carried out in 2000 by BirdWatch Ireland as the basis for its view that Ireland has systematically failed to

carry out a proper assessment of those projects situated in SPAs or likely to have effects on SPAs, contrary to Article 6(3) and (4) of the Habitats Directive. In that context, it emphasises the importance of a prior assessment for the purpose of weighing the implications of a project with the conservation objectives fixed for the SPA concerned.

237 The Court notes that that study covered 271 authorisations for aquaculture programmes issued by the Department of Communications, Marine and Natural Resources during the period from June 1998 to December 1999 and 46 applications yet to be decided on. Moreover, 72 licences and nine pending applications concerned aquaculture programmes situated inside or near an SPA. The authorisations issued concern, in 84% of the activities authorised in SPAs, oyster and clam farms.

238 It should also be borne in mind that, under the first sentence of Article 6(3) of the Habitats Directive, any plan or project not directly connected with or necessary to the management of the site is to be made subject to an appropriate assessment of its implications for the site in view of the site's conservation objectives if it cannot be excluded, on the basis of objective information, that it will have a significant effect on that site, either individually or in combination with other plans or projects (Case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging* [2004] ECR I-7405, paragraph 45).

239 The study carried out by BirdWatch Ireland refers to a number of potential negative effects of shellfish farming, including the loss of feeding areas and disturbances caused by increased human activity and states that, even when an aquaculture programme is inside an SPA, very little protection is provided for bird habitats. Ireland, for its part, does not allege that no aquaculture programmes have any effects on SPAs.

240 It follows that the authorisation procedure ought to have included an appropriate assessment of the implications of each specific project. It is clear that Ireland merely stated, without offering further explanation, that the Irish scheme for authorising mollusc farms, including the provisions on consultation, does in fact provide for detailed consideration of all aspects of an aquaculture development project before a decision is taken on authorisation.

241 Accordingly, the Court finds that Ireland fails to ensure systematically that aquaculture programmes likely to have a significant effect on SPAs, either individually or in combination with other projects, are made subject to an appropriate prior assessment.

242 This finding is supported by the fact that Ireland has not put forward any specific scientific studies showing that a prior, detailed ornithological study was carried out, in order to challenge the failure to fulfil obligations alleged by the Commission.

243 Under Article 6(3) of the Habitats Directive, an appropriate assessment of the implications for the site concerned of the plan or project implies that, prior to its approval, all aspects of the plan or project which can, by themselves or in combination with other plans or projects, affect the site's conservation objectives must be identified in the light of the best scientific knowledge in the field. The competent national authorities are to authorise an activity on the protected site only if they have made certain that it will not adversely affect the integrity of that site. That is the case where no reasonable scientific doubt remains as to the absence of such effects (see *Waddenvereniging and Vogelbeschermingsvereniging*, paragraph 61).

244 As to Ireland's argument that no environmental impact assessment had been required for shellfish farms because they are small in size and are of only limited impact on the environment, the Commission is correct in arguing that that is not an adequate reason not to assess the effects of such a plan or project. As just pointed out in paragraph 238 of this judgment, the first sentence of Article 6(3) of the Habitats Directive requires an appropriate assessment of any plan or project in combination with other plans and projects.

245 It is also clear from the Court's case-law that the failure to take account of the cumulative effect of projects in practice leads to a situation where all projects of a certain type may escape the obligation to carry out an assessment, whereas, taken together, they are likely to have significant effects on the environment (see, by analogy, Case C-392/96 *Commission* v *Ireland* [1999] ECR I-5901, paragraph 76).

246 Lastly, regarding Ireland's argument that maintenance authorisation for development projects carried out without prior authorisation is compatible with the Habitats Directive, the Court finds that the assessment of an already-completed development project cannot be regarded as being equivalent to the assessment of a plan or project within the meaning of the first sentence of Article 6(3) of the Habitats Directive.

247 Accordingly, the complaint must be regarded as being well-founded on this point.

248 Secondly, regarding the drainage work in the Glen Lough SPA, the Commission argues that in 1992 and 1997 Ireland carried out, contrary to Article 6(3) and (4) of the Habitats Directive, drainage work likely to have a significant effect on the Glen Lough SPA without having previously carried out an appropriate assessment of that

project or employed an adequate decision-making procedure, which led to habitat deterioration, contrary to Article 6(2) of that directive. Moreover, Ireland has failed to demonstrate that this deterioration has been remedied.

249 The Court notes, as a preliminary point, that at the time of the drainage works undertaken by the Office of Public Works in 1992, the Habitats Directive was not yet applicable. Consequently, those works do not form part of the subject-matter of the present proceedings.

250 It is, moreover, clear from the Court's case-law that the fact that a plan or project has been authorised according to the procedure laid down in Article 6(3) of the Habitats Directive renders superfluous, as regards the action to be taken on the protected site under the plan or project, a concomitant application of the rule of general protection laid down in Article 6(2) (*Waddenvereniging and Vogelbeschermingsvereniging*, paragraph 35).

251 Accordingly, in so far as the complaint relating to the drainage works carried out in 1997 are concerned, it is appropriate to ascertain whether such activities may be contrary to Article 6(3) and (4) of the Habitats Directive.

252 Infringement of Article 6(3) and (4) of that directive presupposes that the drainage works in question are a project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects.

253 In this regard, it is common ground that those works are a project and that they are not directly connected with or necessary to the management of the site. It follows that, in accordance with the case-law referred to in paragraph 226 of this judgment, they had to be made subject to an assessment of their effects on the conservation objectives fixed for the Glen Lough SPA if it could not be ruled out, on the basis of objective information, that they would have a significant effect thereon, either individually or in combination with other plans or projects.

254 In the light, in particular, of the precautionary principle, which is one of the foundations of the high level of protection pursued by Community policy on the environment, in accordance with the first subparagraph of Article 174(2) EC, and by reference to which the Habitats Directive must be interpreted, such an assessment must be carried out if there is doubt as to the absence of significant effects (see *Waddenvereniging and Vogelbeschermingsvereniging*, paragraph 44).

255 The case-file shows that the Glen Lough SPA, which comprises approximately 80 hectares and was classified in 1995, is an important over-wintering site for migratory species of wild birds in the Irish midlands. In particular, it held internationally important numbers of whooper swan (*Cygnus cygnus*) and is especially valuable to birds because of its water.

256 In the present case, however, Ireland, after stating that the works in question were merely maintenance work on existing drains, as part of a system of earlier drainage which preceded the classification of Glen Lough as an SPA, and did not have a significant impact on the wild bird habitats in that SPA, recognises, in its statement in defence, that the drain maintenance of the Silver River carried out by the Office of Public Works in 1997 seems to have reduced the hydrological response times and hence the usage of the site by whooper swans.

257 Accordingly, the Court finds that Ireland, in failing to assess the impact of the drains maintenance works on the conservation objectives of the Glen Lough SPA before those works were carried out, infringed the first sentence of Article 6(3) of the Habitats Directive.

258 Next, it follows from the second sentence of Article 6(3) of the Habitats Directive that, in a situation such as that in the present case, the competent national authorities, taking account of the conclusions of the appropriate assessment of the implications of those works for the site concerned in the light of the site's conservation objectives, could have authorised such an activity only if they had made certain that it would not adversely affect the integrity of that site, which would have been the case if there had remained no reasonable scientific doubt as to the absence of such effects (see *Waddenvereniging and Vogelbeschermingsvereniging*, paragraph 67).

259 As noted by the Advocate General in point 182 of her Opinion, in the absence solely of an assessment of the impact on the site of the drain maintenance works carried out in 1997, authorisation would have been unlawful under the second sentence of Article 6(3) of the Habitats Directive. Ireland's submission shows, as just noted in paragraph 256 of this judgment, that authorisation was not possible also on account of the adverse effects that the works in question were likely to have on the Glen Lough SPA. Since conservation of the whooper swans' wintering area is the principal conservation objective of the SPA, its integrity was adversely affected within the meaning of the second sentence of Article 6(3) of the Habitats Directive.

260 It also follows that, in spite of a negative assessment of the implications for the site, an authorisation under Article 6(4) of the Habitats Directive would have been possible only if there had been no alternative solutions and if the project had had to be carried out for imperative reasons of overriding public interest, and on the

condition that the Member State took all necessary compensatory measures to ensure that the overall coherence of Natura 2000 was protected.

261 In that regard, and even if there was a public interest in the drainage, as noted by the Advocate General in point 183 of her Opinion, such an interest can justify a deterioration of the SPA within the meaning of Article 6(4) of the Habitats Directive only if there are no alternative solutions.

262 However, Ireland itself states that the National Parks and Wildlife Service, after having installed a dyke in 1998 along the Silver River where it runs through the SPA and holds back the lake water while allowing that river to fulfil its arterial drainage role for the lands upstream, in early 2005 entered into a contract to have the dyke repaired and a sluice and weir installed as well as the overflow pipe. According to Ireland, this will enable the close regulation of the lake level and the hydrological regime will be designed to optimise the usage of the lake by whooper swans. Ireland has not, however, put forward any arguments showing that such alternatives could not have been implemented before the drain maintenance works were carried out in 1997.

263 It follows that, contrary to Article 6(3) and (4) of the Habitats Directive, Ireland carried out a drain maintenance project in 1997 which was likely to have a significant effect on the Glen Lough SPA without having carried out beforehand an appropriate assessment of its implications on the site or employed an adequate decision-making procedure, which resulted in habitat deterioration, contrary to Article 6(2) of that directive.

264 Accordingly, the complaint is also well-founded on this point.

265 In those circumstances, the fifth complaint is well-founded.

The sixth complaint: failure to transpose Article 10 of the Birds Directive

Arguments of the parties

266 The Commission submits that the use of the verb 'shall' in Article 10 of the Birds Directive imposes an obligation on Member States to encourage research and any work required as a basis for the protection, management and use of the population of all species of bird as referred to in Article 1 of that directive. The national regulatory provisions, however, do not reflect that obligation. In its view, the position under Irish law is ambiguous, to say the least.

267 The Commission submits that the wording of the Wildlife Act makes the promotion of research an optional activity for the competent minister.

268 Conversely, Ireland denies that it has failed to comply with its obligation to encourage research. It contends that its legislation is not flawed, and that section 11(3) of the Wildlife Act constitutes a satisfactory transposition into national law of Article 10 of the Birds Directive and fully reflects, and arguably exceeds, the degree of obligation imposed by that Community provision.

Findings of the Court

269 As a preliminary point, section 11(3) of the Wildlife Act, read literally, clearly provides for the possibility for the competent minister to carry out or cause to be carried out research which he considers desirable for the performance of his functions under that statute. It does not, however, lay down any obligation for the competent minister to encourage such activities.

270 As correctly pointed out by the Commission, however, Article 10 of the Birds Directive creates an obligation for Member States to encourage research and any work required as a basis for the protection, management and use of the population of all species of bird as referred to in Article 1 of that directive.

271 It follows that Ireland cannot be deemed to have transposed Article 10 of the Birds Directive into its domestic legal order.

272 This finding cannot be affected by Ireland's argument that the competent minister's role is further extended by section 11(1) of the Wildlife Act. That provision merely states that it is his function to secure the conservation of wildlife and to promote the conservation of biological diversity.

273 Furthermore, the Court cannot accept Ireland's argument that the use of the word 'may', for the purpose of interpreting the national legislation, does not necessarily mean that the competent minister may, at his discretion, decide to carry out, or not to carry out, research.

274 The national case-law referred to by Ireland does not show that such an interpretation of Irish law is systematic, or refer specifically to the national provision in question.

275 Consequently, the sixth complaint is well-founded.

276 In the light of all the foregoing considerations, the Court finds that, by failing:

— to classify, since 6 April 1981, in accordance with Article 4(1) and (2) of the Birds Directive, all the most suitable territories in number and size for the species mentioned in Annex I, with the exception of those intended to ensure conservation of the Greenland white-fronted goose, as well as for regularly occurring migratory species not mentioned in Annex I, with the exception of those intended to ensure protection of the lapwing, the redshank, the snipe and the curlew;

— to ensure that, since 6 April 1981, the provisions of the first sentence of Article 4(4) of the Birds Directive are applied to areas requiring classification as SPAs under that directive;

— to transpose and apply the provisions of the second sentence of Article 4(4) of the Birds Directive fully and correctly;

— to take all the measures necessary to comply with Article 6(2) of the Habitats Directive in respect of all SPAs classified under Article 4(1) of the Birds Directive or recognised under Article 4(2) of that directive;

— to take all the measures necessary to comply with Article 6(2) of the Habitats Directive in respect of recreational use of all sites intended to be subject to that article;

— to take all the measures necessary to comply with Article 6(3) and (4) of the Habitats Directive in respect of plans;

— to take all the measures necessary to comply with Article 6(3) of the Habitats Directive in respect of authorisation of aquaculture projects;

— to take all the measures necessary to comply with Article 6(2) to (4) of the Habitats Directive in respect of the drain maintenance works in the Glen Lough SPA; and

— to take all the measures necessary to comply with Article 10 of the Birds Directive,

Ireland has failed to fulfil its obligations under Articles 4(1), (2) and (4), and 10 of the Birds Directive and Article 6(2) to (4) of the Habitats Directive.

Costs

277 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission has applied for costs to be awarded against Ireland and the latter has, in essence, been unsuccessful, Ireland must be ordered to pay the costs.

278 Pursuant to the first subparagraph of Article 69(4) of the Rules of Procedure, the Member States which have intervened in the proceedings are to bear their own costs. The Hellenic Republic and the Kingdom of Spain must accordingly bear their own costs.

On those grounds, the Court (Second Chamber) hereby:

1. Declares that, by failing:

— **to classify, since 6 April 1981, in accordance with Article 4(1) and (2) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds, as amended by Commission Directive 97/49/EC of 29 July**

1997, all the most suitable territories in number and size for the species mentioned in Annex I to that directive, with the exception of those intended to ensure conservation of the Greenland white-fronted goose (*Anser albifrons flavirostris*), as well as for regularly occurring migratory species not mentioned in Annex I, with the exception of those intended to ensure protection of the lapwing (*Vanellus vanellus*), the redshank (*Tringa totanus*), the snipe (*Gallinago gallinago*) and the curlew (*Numenius arquata*);

— **to ensure that, since 6 April 1981, the provisions of the first sentence of Article 4(4) of Directive 79/409, as amended by Directive 97/49, are applied to areas requiring classification as special protection areas under that directive;**

— **to transpose and apply the provisions of the second sentence of Article 4(4) of Directive 79/409, as amended by Directive 97/49, fully and correctly;**

— **to take all the measures necessary to comply with Article 6(2) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora in respect of all special protection areas classified under Article 4(1) of Directive 79/409, as amended by Directive 97/49, or recognised under Article 4(2) of that directive;**

— **to take all the measures necessary to comply with Article 6(2) of Directive 92/43 in respect of recreational use of all sites intended to be subject to that article;**

— **to take all the measures necessary to comply with Article 6(3) and (4) of Directive 92/43 in respect of plans;**

— **to take all the measures necessary to comply with Article 6(3) of Directive 92/43 in respect of authorisation of aquaculture programmes;**

— **to take all the measures necessary to comply with of Article 6(2) to (4) of Directive 92/43 in respect of the drain maintenance works in the Glen Lough special protection area; and**

— **to take all the measures necessary to comply with Article 10 of Directive 79/409, as amended by Directive 97/49,**

Ireland has failed to fulfil its obligations under Articles 4(1), (2) and (4), and 10 of Directive 79/409, as amended by Directive 97/49, and Article 6(2) to (4) of Directive 92/43.

2. **Dismisses the remainder of the action.**

3. **Orders Ireland to pay the costs.**

4. **Orders the Hellenic Republic and the Kingdom of Spain to bear their own costs.**

JUDGMENT OF THE COURT (Fourth Chamber)

4 October 2007 *

In Case C-179/06,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 5 April 2006,

Commission of the European Communities, represented by D. Recchia, acting as Agent, with an address for service in Luxembourg,

applicant,

v

Italian Republic, represented by I.M. Braguglia, acting as Agent, assisted by G. Fiengo, avvocato dello Stato, with an address for service in Luxembourg,

defendant,

* Language of the case: Italian.

THE COURT (Fourth Chamber),

composed of K. Lenaerts, President of the Chamber, E. Juhász, R. Silva de Lapuerta (Rapporteur), G. Arestis and J. Malenovský, Judges,

Advocate General: J. Kokott,
Registrar: M. Ferreira, Principal Administrator,

having regard to the written procedure and further to the hearing on 21 June 2007,

having decided, after hearing the Advocate General, to proceed to judgment without an Opinion,

gives the following

Judgment

1 By its application, the Commission of the European Communities seeks a declaration from the Court that, as a result of approval by the municipality of Altamura and the region of Apulia, with effect from December 2000, of an alteration to an urban development plan comprising a series of industrial construction projects likely to have a significant effect on the Special Protection Area ('SPA') and proposed site of Community importance ('SCIp') IT 9120007 Murgia Alta without having first

carried out an impact assessment at least in respect of the SPA, the Italian Republic has failed to fulfil its obligations under the combined provisions of Articles 6(3) and 7 of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7) ('the Directive').

Community legal context

2 The aim of Directive 92/43 is to contribute towards ensuring biodiversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States where the EC Treaty applies.

3 Article 4 of the Directive lays down the procedure for establishing a network, known as 'Natura 2000', provided for in Article 3 thereof, and for the designation of special areas of conservation.

4 Article 6 of the Directive, which lays down the conservation measures for those areas, provides:

'...

2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well

as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

...'

5 Article 7 of Directive 92/43 provides that obligations arising under Article 6(2) to (4) thereof are to replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1) in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of Directive 92/43 or the date of classification or recognition by a Member State under Directive 79/409, where the latter date is later.

The Murgia Alta area

6 In 1998, the Murgia Alta site was classified as an SPA pursuant to Article 4(1) of Directive 79/409 (code IT 9120007). It is part of the Mediterranean biogeographical region and has a surface area of 143 152 ha.

7 That SPA is home to numerous bird species listed in Annex I to Directive 79/409, including the largest population of the lesser kestrel (Falco naumanni) species in Italy.

8 Two priority habitats referred to in Annex I to Directive 92/43 are in that SPA, namely habitat 6210, 'Semi-natural dry grasslands and scrubland facies: on calcareous substrates *(Festuco-Brometalia)*', and habitat 6220, 'Pseudosteppe with grasses and annuals *Thero-Brachypodietea*', and also a priority plant referred to in Annex II to Directive 92/43: Stipa austroitalica Martinovsky.

9 The Murgia Alta site is described as follows in the data form established pursuant to Commission Decision 97/266/EC of 18 December 1996 concerning a site information format for proposed Natura 2000 sites (OJ 1997 L 107, p. 1):

'General site character

Habitat classes	% cover
Heath, scrub, maquis and garrigue, phrygana	20.00
Dry grassland, steppes	65.00
Evergreen woodland	15.00
Total habitat cover	100

Other site characteristics

Evocative landscape made up of slightly rolling terrain and depressions in the shape of dolines, with superficial karstic phenomena represented by karstic basins and sink-holes. The substratum is formed by cretaceous limestone, generally covered by Pleistocene limestone. The bioclimate is sub-Mediterranean.

Quality and importance

Sub-region strongly characterised by the vast dry, limestone plateau which culminates at 679 m at Monte Caccia. It appears mainly to be a high, rocky calcareous plateau. It is one of the largest sub-steppe areas in Italy, with herbaceous vegetation due to the Festuco brometalia. The area's flora is particularly rich, totalling some 1 500 species. Over 90 species of nesting aviary fauna have been recorded, which places this area in second position in the region, after Gargano. The residual woodland formations are characterised by the prevalence of Quercus pubescens, often accompanied by Fraxinus ornus. Rare Quercus cerris and Q. frainetto have also been observed.

Vulnerability

The principal factor of destruction is the removal of the calcareous substratum, which is then reduced to powder by mechanical means. In this manner, vast stretches comprising sub-steppe vegetation are destroyed by the cultivation of new areas. The operation also often involves drystone walls and other forms of delimitation, which carry serious dangers of hydrogeological catastrophe. Recurring fires, related to prevalent grain farming; the construction of secondary residences in the most attractive tourist areas. Improper use of the karstic cavities as dumps for urban solid waste and solid waste.'

Facts

10 On 27 December 2000, the municipality of Altamura, by a series of decisions taken by its municipal council, approved framework agreements for the purposes of Article 27 of Law No 142 of 8 June 1990 on arrangements for local autonomy (Ordinamento delle autonomie locali, ordinary supplement to GURI No 135 of 12 June 1990) concerning approximately 100 industrial construction projects, many of which were situated within the Murgia Alta SPA and SCIp. Those agreements concerned in particular 34 sites covering 60 ha, falling within the project of the Consorzio di Sviluppo Murgiano and 11 sites, covering 8 ha, coming within the project of the Consorzio San Marco. Those agreements were subsequently approved by a decree of the Giunta regionale (regional government) of the region of Puglia.

11 In order to promote employment in industrial and trade production units, the mayors of the municipalities concerned may ask the Giunta regionale to adopt a framework agreement to authorise major projects which provide an immediate significant boost to employment.

12 The signature of a framework agreement, which must be authorised by the Giunta regionale, is allowed only if the urban development plan in effect does not provide for areas intended for specific purposes which are operational and legally effective for the works to be carried out or if it is necessary to expand existing structures in adjacent areas which are not intended for industrial and trade activities.

13 In the period from 1998 to 2001, a large number of undertakings submitted applications to the municipality of Altamura with a view to obtaining industrial- and trade-related framework agreements, some of which involved amendments to the

general urban development plan. The procedures undertaken on the basis of those applications did not comprise any general programming phase, although they did contain various procedures for amending that plan.

14 The regional administration subjected the Consorzio di Sviluppo Murgiano projects to a verification procedure concerning the need for an environmental impact assessment, taking the view that other projects, such as the Consorzio San Marco projects, did not need to undergo such a procedure. On the basis of those agreements, the municipality of Altamura granted a certain number of construction permits.

Pre-litigation procedure

15 Pursuant to Article 226 EC, on 9 July 2004 the Commission sent a letter of formal notice to the Italian Republic, asking it to provide its observations on the situation of the area in question in the light of the obligations laid down in Articles 6(3) and (7) of the Directive.

16 The Italian Republic replied to that letter of formal notice by correspondence of 14 October 2004 and 9 June 2005, to which it attached memoranda from the Ministry of the Environment and the Protection of Natural Resources.

17 The Commission sent the Italian Republic a reasoned opinion on 13 July 2005, requesting it to adopt the measures necessary to comply with that opinion within a period of two months from its notification.

18 The Italian Republic replied to that opinion by forwarding two new ministerial memoranda dated 3 and 7 October 2005.

19 Finding that the situation remained unsatisfactory, the Commission brought the present action.

The action

Arguments of the parties

20 The Commission states that no impact assessment within the meaning of Article 6(3) of Directive 92/43 was made in relation to the series of operations provided for in the relevant framework agreements which are likely to have a significant effect on the area in question.

21 The Commission observes that the various administrative decisions by which those operations were approved are contrary to Article 6(3) of the Directive, in that the interventions referred to were not subjected to an environmental impact assessment, even though they are likely to have a significant effect on the Murgia Alta SPA and SCIp.

22 The Commission states that whether or not the framework agreements and the measures resulting therefrom are of a legal nature is irrelevant, in the light of the Member States' obligations under Article 6(3) of the Directive.

23 The Commission adds that the parts of the area affected by the projects in question are contiguous and that it is therefore possible that there may be overall significant effects.

24 The Commission adds that it is not relevant that the municipality of Altamura issued only a limited number of construction permits, that no further construction permits were issued in 2003, that the other construction permit applications have been made subject to an impact assessment and that a mission is under way to conduct an overall assessment of the sites affected by installations covered by earlier plans.

25 The Commission also notes that no grounds have been put forward to justify the lack of impact assessment and that no information has been provided to demonstrate that the industrial and trade construction operations in question were not likely to have significant effects on the protected area.

26 The Italian Republic notes that a framework agreement is not a measure defining a legal situation, or an administrative measure, or a contract, but a procedural module under which public and private persons define beforehand the conduct and commitments by which they will be bound in order to attain a final result. Consequently, other administrative measures will be necessary for the works covered by the framework agreements which are the subject of the present action to be actually carried out.

27 The Italian Republic adds that the legislative provisions relating to the promotion of employment may not derogate from the rules governing the protection of the environment and natural resources. Under Italian law, moreover, the SPAs and sites of Community importance enjoy protection similar to that provided by the stringent legal rules applicable to parks and other natural areas.

28 That Member State observes that the municipality of Altamura granted only a limited number of construction permits for individual projects, some of which were linked to expansions of current plants and some of which were situated in areas intended for industrial installations. Since June 2003 no construction permits have been granted and no authorisations given for projects proposed by the Consorzio di Sviluppo Murgiano and the Consorzio San Marco.

29 The Italian Republic observes that only 15 projects have actually been carried out, relating to different parts of the area and involving different methods of completion, according to whether new construction or expansions are involved. There is no contiguity between those projects; nor is there any general or territorial plan covering them. An impact assessment has been carried out for some of them, whereas in other cases various authorisations have been granted in keeping with environmental and landscape aspects.

30 That Member State states that the municipality of Altamura is preparing to carry out an overall impact assessment and to promote initiatives aimed at mitigating any effects on the environment.

31 The Italian Republic adds that all the procedures relating to applications for plant construction in the municipality of Altamura have ben suspended pending the results of scientific studies concerning the environmental impact assessments for the projects in question.

Findings of the Court

32 The Court observes, as a preliminary point, that the provision infringement of which is alleged by the Commission is part of a complex set of rules the purpose of which is the establishment and management of areas forming part of the European network Natura 2000, as reflected in the third to sixth recitals in the preamble to the Directive.

33 Article 6(3) of Directive 92/43 provides that the obligation to carry out an appropriate assessment of the impact of a plan or project on a protected site subject is conditional on the plan or project in question being likely to have a significant effect on that site (Case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging* [2004] ECR I-7405, paragraph 40).

34 The Court also held, in paragraph 43 of that judgment, that the environmental protection mechanism provided for in Article 6(3) of the Directive requires that there be a probability or a risk that a plan or project will have significant effects on the site concerned.

35 In respect of the latter criterion, the Court stated, in paragraphs 46 to 48 of the same judgment, that, as is clear from the first sentence of Article 6(3) of the Directive in conjunction with the 10th recital in its preamble, the significant nature of the effect on a site of a plan or project must be linked to the site's conservation objectives. Consequently, where a plan or project has an effect on that site but is not likely to undermine its conservation objectives, that plan or project cannot be considered likely to have a significant effect on the site. That risk must be assessed in the light, inter alia, of the characteristics and specific environmental conditions of the site concerned by that plan or project.

36 In order to determine whether the complaint directed against the Italian Republic is well founded, it is appropriate to situate the obligation under Article 6(3) of the Directive, as clarified in the preceding paragraphs of this judgment, in the context of the action for failure to fulfil obligations brought by the Commission under Article 226 EC.

37 It is clear from established case-law that in such an action it is for the Commission to prove the existence of the alleged infringement. It is the Commission which must provide the Court with the information necessary for it to determine whether the infringement is made out, and the Commission may not rely on any presumption for that purpose (Case C-342/05 *Commission* v *Finland* [2007] ECR I-4713, paragraph 23 and case-law cited).

38 Moreover, the burden of proof borne by the Commission in an action for failure to fulfil obligations must be determined according to the types of obligations which directives impose on the Member States and therefore in the results which must be achieved by them (see, to that effect, Case C-60/01 *Commission* v *France* [2002] ECR I-5679, paragraph 25).

39 Under Article 6(3) of Directive 92/43, then, it is for the Commission to furnish the proof that, in the light of the characteristics and the specific environmental conditions of the site affected by a plan or project, that plan or project is likely to have a significant effect on that site, in the light of the conservation objectives fixed for the site.

40 With regard to the measures which are the subject of the present action and in order to determine whether it is well founded, it is appropriate to distinguish between the various framework agreements, on the one hand, and the works carried out subsequent to the granting of construction permits by the municipality of Altamura, on the other.

41 First, as regards the framework agreements, which are at varying stages of preparation, in the light of the defendant's line of argument that those agreements do not bear the legal hallmarks of a plan or project referred to in Article 6(3) of the Directive, the Court notes that the Commission, in an action for failure to fulfil obligations laid down in that provision, cannot simply allege the mere existence of such agreements, but must also provide sufficiently specific evidence to show that they are more than at the stage of preliminary administrative reflection and carry a degree of precision in the planning in question which calls for an environmental assessment of their effects.

42 Thus, without its being necessary to determine the scope and legal consequences stemming from the disputed framework agreements under national law, it is clear that the Commission, in merely alleging the existence of such agreements, did not furnish sufficiently specific evidence enabling the Court to consider that measures likely to have a significant effect on the site concerned within the meaning of Article 6(3) of the Directive were at issue.

43 Second, as regards projects carried out and the evidence supporting the burden of proof of the obligation to carry out an assessment of environmental implications, the Court finds that the Commission did not give the Court specific indications as to the geographic location and the scope of the construction work carried out in relation to the site. It moreover acknowledged at the hearing that it did not have this information.

44 Nor has the Commission provided data on the technical nature of the works in question or provided explanations as to what extent those works, in the light of the characteristics and specific environmental conditions of the site, are likely to have a significant effect on it.

45 In those circumstances, it is clear that the Commission has not satisfied the obligation to adduce evidence concerning the alleged infringement.

46 Therefore, the action must be dismissed as unfounded in its entirety.

Costs

47 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Italian Republic has applied for costs and the Commission has been unsuccessful, the Commission must be ordered to pay the costs.

On those grounds, the Court (Fourth Chamber) hereby:

1. Dismisses the action.

2. Orders the Commission of the European Communities to pay the costs.

[Signatures]

JUDGMENT OF THE COURT (Fourth Chamber)

20 September 2007 *

In Case C-304/05,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 29 July 2005,

Commission of the European Communities, represented by M. van Beek and D. Recchia, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Italian Republic, represented by I.M. Braguglia and G. Fiengo, acting as Agents, with an address for service in Luxembourg,

defendant,

* Language of the case: Italian.

THE COURT (Fourth Chamber),

composed of K. Lenaerts, President of the Chamber, E. Juhász, R. Silva de Lapuerta (Rapporteur), J. Malenovský and T. von Danwitz, Judges,

Advocate General: J. Kokott,
Registrar: R. Grass,

having regard to the written procedure,

after hearing the Opinion of the Advocate General at the sitting on 19 April 2007,

gives the following

Judgment

1 By its application, the Commission of the European Communities asks the Court to declare that, in relation to the project for the extension and improvement of the Santa Caterina Valfurva skiing area (the 'Bucaneve' and 'Edelweiss' runs) and for the provision of associated facilities with a view to the holding of the 2005 World Alpine Ski Championships in Special Protection Area ('SPA') IT 2040044 Parco Nazionale dello Stelvio ('the park'), by:

— authorising measures likely to have a significant impact on that area without making them subject to an appropriate assessment of their implications for the

site in the light of the site's conservation objectives and, in any event, without complying with the provisions which allow a project to be carried out in spite of a negative assessment of the implications and in the absence of alternative solutions only for imperative reasons of overriding public interest and only after adopting and communicating to the Commission all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected;

— failing to adopt measures to avoid the deterioration of natural habitats and habitats of species and the disturbance of species for which that area was designated;

— failing to endow that area with a protective legal status capable of ensuring, in particular, the survival and reproduction of the species of birds mentioned in Annex I to Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1), and the breeding, moulting and migration of the regularly-occurring migratory species not covered by Annex I,

the Italian Republic has failed to fulfil its obligations under Articles 6(2) to (4) and 7 of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7) and Article 4(1) and (2) of Directive 79/409.

Community legal context

2 The aim of Directive 92/43 is to contribute to ensuring bio-diversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the EC Treaty applies.

3 The 10th recital in the preamble to that directive states:

'... an appropriate assessment must be made of any plan or programme likely to have a significant effect on the conservation objectives of a site which has been designated or is designated in future'.

4 Article 3(1) of that directive provides:

'A coherent European ecological network of special areas of conservation shall be set up under the title Natura 2000. This network, composed of sites hosting the natural habitat types mentioned in Annex I and habitats of the species mentioned in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range.

The Natura 2000 network shall include the special protection areas classified by the Member States pursuant to Directive 79/409/EEC.'

5 Article 4 of Directive 92/43 governs the procedure permitting the establishment of the Natura 2000 network and the designation of special areas of conservation by the Member States.

6 Article 6 of that directive, which establishes the conservation measures for those areas, provides:

'...

2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

7 Article 7 of that directive provides:

'Obligations arising under Article 6(2), (3) and (4) of this Directive shall replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this Directive or the date of classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later.'

8 Directive 79/409 aims to guarantee the protection, management and control of all species of naturally occurring birds in the wild in the European territory of the Member States to which the Treaty applies.

9 Article 4 of that directive requires, for the bird species mentioned in Annex I thereto, special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution. Article 4 provides:

'1. The species mentioned in Annex I shall be the subject of special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution.

In this connection, account shall be taken of:

(a) species in danger of extinction;

(b) species vulnerable to specific changes in their habitat;

(c) species considered rare because of small populations or restricted local distribution;

(d) other species requiring particular attention for reasons of the specific nature of their habitat.

Trends and variations in population levels shall be taken into account as a background for evaluations.

Member States shall classify in particular the most suitable territories in number and size as special protection areas for the conservation of these species, taking into account their protection requirements in the geographical sea and land area where this Directive applies.

2. Member States shall take similar measures for regularly occurring migratory species not mentioned in Annex I, bearing in mind their need for protection in the geographical sea and land area where this Directive applies, as regards their breeding, moulting and wintering areas and staging posts along their migration

routes. To this end, Member States shall pay particular attention to the protection of wetlands and particularly to wetlands of international importance.

...

4. In respect of the protection areas referred to in paragraphs 1 and 2 above, Member States shall take appropriate steps to avoid pollution or deterioration of habitats or any disturbances affecting the birds, in so far as these would be significant having regard to the objectives of this Article. Outside these protection areas, Member States shall also strive to avoid pollution or deterioration of habitats.'

The park

The status of the park in national law

10 The park was created by Law No 740 of 24 April 1935, initially on the territory only of the provinces of Trento and Bolzano, with the aim of protecting and promoting flora, of increasing fauna and of preserving the special geological formations and the beauty of the landscapes.

11 By decree of the President of the Republic of 23 April 1977, the territory of the park was extended to the areas of Cancano and Livigno and to Mounts Sobretta, Gavia and Serottini, situated in the provinces of Sondrio and Brescia in the Region of Lombardy.

12 The park is a protected area within the meaning of Framework Law No 394 of 6 December 1991 on national protected areas. That law sets out the fundamental principles governing those areas in order to guarantee and promote, in a coordinated manner, the conservation and utilisation of the natural heritage of the country.

13 By decree of the President of the Council of Ministers of 23 November 1993 the Consorzio del Parco Nazionale dello Stelvio ('the Consorzio') was constituted. Its powers and tasks are defined by its statutes.

14 In accordance with Article 4 of the statutes, the Consorzio is required to ensure, in its management of the park, the protection of nature and conservation of the countryside.

The status of the park in Community law

15 In 1998, the park was classified as an SPA within the meaning of Article 4 of Directive 79/409. It is designated, in the 'Region of Lombardy' chapter, under number IT 2040044.

16 According to a data form completed by the Italian Republic in 1998 in accordance with Commission Decision 97/266/EC of 18 December 1996 concerning a site information format for proposed Natura 2000 sites (OJ 1996 L 107, p. 1), the park hosts a large number of species of birds protected pursuant to Annex I to Directive 79/409 — the golden eagle (*Aquila chrysaetos*), the peregrine (*Falco peregrinus*), the honey buzzard (*Pernis apivorus*), the hazel hen (*Bonasa bonasia*), the ptarmigan (*Lagopus mutus helveticus*), the black grouse (*Tetrao tetrix*), the capercaillie (*Tetrao*

urogallus) and the black woodpecker (*Dryocopus martius*) — and three species of migratory birds — the sparrowhawk (*Accipiter nisus*), the common buzzard (*Buteo buteo*) and the wallcreeper (*Tichodroma muraria*).

17 Another data form, of 14 May 2004, indicates the presence in that area of other species mentioned in Annex I to Directive 79/409, that is to say the bearded vulture (*Gypaetus barbatus*), the kite (*Milvus mulvus*), the dotterel (*Charadrius morinellus*), the boreal owl (*Aegolius funereus*), the Eurasian pygmy owl (*Glaucidium passerinum*), the eagle owl (*Bubo bubo*), the grey-headed woodpecker (*Picus canus*) and the rock partridge (*Alectoris graeca saxatilis*).

Facts

18 On 4 October 1999, a proposal for the improvement of the Santa Caterina Valfurva skiing area and its facilities was lodged with the regional authorities with a view to the holding of the 2005 World Alpine Ski Championships.

19 That project provided for the creation of a corridor in a forest area for the ski runs. It also involved the construction of a cable car which, from the entrance of Santa Caterina, was to run to Plaghera and, over a second section, to Valle dell'Alpe. In addition, it provided for a link between Valle dell'Alpe and Costa Sobretta by way of a single-cable four-seat chairlift. The project involved further work closely linked to the proposed improvements, namely the provision of a departure station, a ski stadium and a car park near to the departure station, modification to the 'Edelweiss' run, and construction of a bridge over the Frodolfo stream, of a refuge at Valle dell'Alpe and service routes, of a programmable artificial snow machine and of a depot for vehicles.

20 By Decree No 13879 of 30 May 2000, the Region of Lombardy, on the basis of a study carried out by an architect for the undertakings Montagne di Valfurva and Santa Caterina Impianti, gave a favourable opinion with regard to the environmental compatibility of the project, subject to compliance with a series of general conditions and specific conditions linked to the carrying out of the various elements of the project. That decree stated that, in the context of later authorisation procedures, compliance with those conditions would be monitored, as would compliance with certain prohibitions and the environmental compensation required.

21 In the preamble to the study referred to in Decree No 13879, it was stated that the condition of the ski installations and of the facilities of the area concerned had deteriorated and that their modernisation was necessary, this having the additional objective of obtaining a subsidy for the proposed project.

22 According to that study, account had not been taken of the effect of the increase of anthropogenic pressure on species whose reproductive activity is sensitive to human presence, in particular the ptarmigan and the marmot, nor of the possible consequences for invertebrates and amphibians, nor of the effect on the migration routes of wading birds.

23 According to the study, the environmental impact and questions relating to mitigation, compensatory and monitoring measures in respect of the effects of the proposed works on the various environmental components had been examined in a summary manner and the 'flora, vegetation and habitat' component had been analysed merely in an ad hoc way. The study thus concluded that a morphological and environmental recovery project, dealing with the replanting of the area once the works were completed, was necessary.

24 The study contained the following conclusions:

'...

If the works are not carried out, the consequence could be a slow but unavoidable economic decline, not only of the region of Santa Caterina, but of the entire skiing area. Consequently, it is essential to support the carrying out of the proposed development of the lifts and the creation of the new ski runs, with associated facilities, because of the proposal's socio-economic value, particularly from the point of view of tourism.

...

The works proposed may be regarded as respecting the environment on the following conditions:

— the entire project to improve the installations and put the new installations and services into operation must be subject to the creation of the car park down the valley from the urban centre of Santa Caterina, as a logical support for the construction of the new installations. Having regard to the type and economic scale of the parking project and given the limits on authorised contributions at Community level, it must be stressed that it is possible that the installations will be financed mainly by the applicants themselves.

...

— in order to limit to the maximum extent possible the felling of trees, soil movements and the width of the bridge over the Frodolfo, the linking run, proposed initially to have a minimum width of 40 metres, must be reduced to a width of 20 metres. ...

...

— the valley facilities (stands, commentators' and timekeepers' cabins) must be the subject of a specific proposal. ...

— the width of the corridor to be deforested for the creation of the lifts must be strictly limited to that required by the safety standards of those installations. ...

— the dimensions of the linking run between the existing ski runs and the new arrival/departure station of Plaghera must be altered to reduce soil movements.

...

— in order to reduce soil movements and consequent impairment of the sites, neither the linking road between the arrival station and the Valle dell'Alpe refuge nor the depot for the cabins must be built. ...

— the proposed new road for traffic to the worksite for the Valle dell'Alpe-Costa Sobretta chairlift must not be built, in light of the excessive impairment of the sites which it would cause. ...

— given the great natural quality of the sites (ground cover in the natural meadows, perennial plants, rupestral and moraine plants, typical landscape having the massive vertical lines of rock faces and the broken lines of ridges) and the various risks for the environmental framework which are set out above, the final project ... must comply with all directions in the various domains (flora, fauna, ecosystems, geology, hydrogeology, stability of slopes ...), in order to permit an assessment of the works proposed consistent with high levels of protection for the Alpine nature of the sites.

If the works can be carried out, the final project must also include ... the following:

— compensation must be made for the loss of forest resulting from the tree felling by planting twice the number of trees felled. ...

— all the [places where] soil [will be moved] must be landscaped and replanted. ...

— the service routes (aqueducts, drainage, electricity, artificial snow machines) must be underground. The siting of overhead electricity cables near to lifts must be prohibited.

— it is necessary and vital to provide for a morphological and environmental recovery project, dealing definitively with the replanting of the area once the works have been completed. ...

The following conditions must be met before the definitive project is carried out:

— with regard to hydrogeology, the problems relating to the consequences of the creation of the ski runs and to the impact of the construction sites on the hydrogeological system at Valle dell'Alpe and on the south slope of Costa Sobretta must be dealt with;

— specific studies must be made with regard to the hydrogeological system and geomechanics, with studies of groundwater circulation. ...

— an appropriate check of the alterations to the geomorphological state of the outcrop formations on the rock faces affected must be made. ...

With regard to the environmental component of fauna, it is vital again to measure the effect of the works in their global context ...'

25 Subsequently, in September 2000, the Region of Lombardy instructed the Istituto di Ricerca per l'Ecologia e l'Economia Applicate alle Aree Alpine (Research Institute for Applied Ecology and Economics in Alpine Regions; 'the IREALP') to draw up a report relating to assessment of the environmental impact of the project in question.

26 That report was conceived as a feasibility study which was to cover the environmental-improvement matters, corrective action, environmental engineering works and environmental restoration considered necessary, with a view to drawing up a preliminary proposal followed by a definitive project.

27 The project was subsequently amended, in particular to include the widening of the 'Edelweiss' ski run, the width of which was increased from 20 to almost 50 metres.

28 In September 2002, the IREALP published its report on the assessment of the impact of the proposed measures. That report described, in a summary manner, that part of the area affected by the project in question as a 'spruce forest containing few rare species but with the characteristically wide diversity of subalpine forests, very fragile and slow to regenerate'.

29 The report referred to the 'presence of particularly interesting nesting fauna in the forest: goshawk, black woodpecker, great spotted woodpecker, green woodpecker'. Amongst the main effects of the project during the work phase, the report mentioned the 'reduction of the forest habitat used for nesting by species of conservation interest'.

30 It follows from the conclusions of the IREALP report that the guidelines which the study was able to take into consideration had not yet been fully defined, but were in the course of progressive development, in particular on the basis of the knowledge and details coming to light during the process of implementing the project. It was also pointed out that the report constituted an opportunity to introduce other proposals for improvement of the environmental impact of the management of the whole of the skiing area.

31 The report also stated as follows:

'Although the process may be regarded as positive, it does, however, show less positive aspects, since it reflects the necessity for other determinations on certain equally important technical aspects which will probably require technical clarification during the next phases. Clearly, the present study also expresses that limitation and must, consequently, be considered a guidance document for decisions, which highlights risks and provides suggestions in order to resolve problems, rather than a precise measurement of the impact which the works proposed will have on the environment. More exact assessments of that impact ... can be supplied in the future in environmental impact studies which will accompany the development of the current guidelines ...'

32 The report's conclusions set out a series of assessments regarding the feasibility from an environmental point of view of the guidelines for the project studied. They state as follows:

'In any event, further design activities must provide for a significant reduction in environmental interference in relation to the initial hypotheses, an aim [for the achievement of which] proposals on the subject contained in the present report can also be used. [That objective must be pursued] with determination as regards the

works in Valle dell'Alpe, for which it will be necessary to carry out another specific study of the environmental impact once all the works proposed have been decided.'

33 On 3 October 2002, the Consorzio stated that it approved the general guidelines and the steps recommended by the IREALP report and the proposals contained therein.

34 On 14 February 2003, the Consorzio granted authorisation relating to the project for extension and modification of the 'Bucaneve' and 'Edelweiss' Alpine ski runs and associated facilities in the area of Santa Caterina Valfurva ('the authorisation of 14 February 2003'). The Consorzio took the view that the works proposed complied with the content of the IREALP report. However, it stated that the authorisation was granted provided that there was such compliance. The authorisation was, in addition, subject to compliance with a series of conditions and requirements.

35 As early as February 2003, almost 2 500 trees were felled in an area 50 metres wide and 500 metres long, at an altitude of between 1 700 and 1 900 metres. Furthermore, the effect of the improvement of the ski runs and facilities at Santa Caterina Valfurva, within SPA IT 2040044, was to split completely the habitat of the birds present on the site.

36 On 19 June 2003, after the guidance contained in the IREALP report, a new proposal was published, accompanied by a supplementary study by the municipality of Valfurva on the environmental impact. In July 2003, an environmental impact assessment procedure was opened, to obtain an opinion relating to the part of the project sited between Plaghera, Costa Sobretta and Valle dell'Alpe.

37 On 20 August 2003, the Consorzio gave an unfavourable opinion with regard to the environmental compatibility of the project, on the ground of non-compliance with the guidance given in the IREALP report.

38 On 16 October 2003, a memorandum of understanding was signed between the Region of Lombardy, the Consorzio, the organising committee of the World Ski Championships and the party responsible for the framework programme for the project in order to settle the controversial elements of the project. That understanding provided for:

— establishment of the method of gathering opinions with a view to completing the regional assessment procedures;

— adoption of an overall view of the works subject to examination, coordinating so far as possible the procedures in question;

— a guarantee that the conditions laid down by the board of the Consorzio would be observed;

— confirmation of the siting of the intermediate station at Plaghera and of the refuge at Valle dell'Alpe;

— re-examination and adaptation of the projects regarding the works on the Santa Caterina-Plaghera site in accordance with the monitoring requirements laid down by the Consorzio.

39 By Decree No 20789 of 28 November 2003, the Region of Lombardy determined that the project to improve the lifts and associated services on the territory of the municipality of Valfurva was compatible with the environment of SPA IT 2040044.

40 That decree, which sets out the conclusions of an impact assessment carried out by the Direzione Generale Agricoltura (Directorate-General for Agriculture) of the Region of Lombardy, gave responsibility to the municipality of Valfurva for monitoring compliance with the conditions laid down during both the approval phase of the projects and their implementation phase. Furthermore, it provided that the definitive projects were to be supplemented by a series of requirements, including submission of a study of the impact of the works.

Pre-litigation procedure

41 In accordance with Article 226 EC, by letter of 19 December 2003 the Commission gave the Italian Republic formal notice to submit its observations on the situation in SPA IT 2040044.

42 As it received no response to that letter, on 9 July 2004 the Commission sent a reasoned opinion to the Italian Republic.

43 The Italian Republic responded to the complaints raised by the Commission in the reasoned opinion by sending a number of ministerial communications.

44 Taking the view that the response thus supplied was not satisfactory, the Commission brought the present action.

The action

45 The Commission raises four complaints against the Italian Republic, the first three of which relate to Directive 92/43 and the fourth to Directive 79/409.

The first complaint, alleging breach of Article 6(3) of Directive 92/43 in conjunction with Article 7

Arguments of the parties

46 The Commission takes the view that the authorisation of 14 February 2003 was not based on an appropriate assessment of the environmental impact of the decision to widen the 'Bucaneve' and 'Edelweiss' ski runs and to construct a number of associated facilities.

47 The Commission states that the IREALP report does not contain an appropriate assessment of the effect on SPA IT 2040044 of the works proposed.

48 It notes that that area forms the habitat of numerous species of protected birds, as is apparent from the details appearing in the *Atlas of European Breeding Birds*, a work which combines studies carried out by more than 10 000 ornithologists from all over Europe and which is considered to be an extremely reliable document with regard to birds nesting in Europe.

49 Furthermore, the Commission notes that, although the IREALP report contains useful recommendations, these have not been duly taken into account in the context of the authorisation of 14 February 2003.

50 The Commission concludes therefrom that the authorisation was granted without the national authorities being certain that the works envisaged would not adversely affect the integrity of the SPA concerned.

51 The Italian Republic submits that two types of works must be distinguished, that is to say, on the one hand, works for which the procedure of environmental impact assessment took place and for which the measures to be adopted to limit that impact were laid down and, on the other, works for which, on the basis of the IREALP report, adjustments were envisaged.

52 The Italian Republic states that, with regard to the first category of works, which includes the works carried out between Plaghera and Valle dell'Alpe, it must be determined whether the competent authorities undertook an assessment of the environmental interests present in SPA IT 2040044. For the other works, that is to say the works carried out between Santa Caterina and Plaghera, it should be ascertained whether the same procedure took place and whether the postponement of determination of the measures to reduce the environmental repercussions to a later phase of refinement of the project is compatible with the provisions of Directive 92/43.

53 The Italian Republic submits that Regional Decree No 13879 of 30 May 2000 was adopted after analysis of the criteria laid down in that directive, even though it does not expressly refer to the environmental impact assessment.

54 In the view of the Italian Republic, it follows that the assessment which constitutes the basis of that decree is vital to any later decision giving authorisation.

Findings of the Court

55 It must be stated, as a preliminary point, that the parties are in agreement on the fact that the works to modify the ski runs and construct associated facilities were such as to create the obligation to carry out a prior assessment of their environmental impact, in accordance with Article 6(3) of Directive 92/43.

56 Article 6(3) provides for an assessment procedure intended to ensure, by means of a prior examination, that a plan or project which is not directly connected with or necessary to the management of the site concerned but likely to have a significant effect on it is authorised only to the extent that it will not adversely affect the integrity of that site (see Case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging* [2004] ECR I-7405 ('*Waddenzee*'), paragraph 34, and Case C-239/04 *Commission* v *Portugal* [2006] ECR I-10183 ('*Castro Verde*'), paragraph 19).

57 With regard to the concept of 'appropriate assessment' within the meaning of Article 6(3) of Directive 92/43, it should be noted that the latter does not define any particular method for the carrying out of such an assessment.

58 The Court has, however, held that that assessment must be organised in such a manner that the competent national authorities can be certain that a plan or project will not have adverse effects on the integrity of the site concerned, given that, where doubt remains as to the absence of such effects, the competent authority will have to refuse authorisation (see, to that effect, *Waddenzee*, paragraphs 56 and 57, and *Castro Verde*, paragraph 20).

59 With regard to the factors on the basis of which the competent authorities may gain the necessary level of certainty, the Court has stated that no reasonable scientific doubt may remain, those authorities having to rely on the best scientific knowledge in the field (see *Waddenzee*, paragraphs 59 and 61, and *Castro Verde*, paragraph 24).

60 Accordingly, it is necessary to ascertain whether, in the present case, the impact of the disputed works on the integrity of the site concerned was examined in a manner compatible with the parameters set out above before authorisation was granted on 14 February 2003.

61 It is apparent from the documents submitted to the Court that prior consideration was given to the matter on a number of occasions before authorisation was granted. The assessments which might be considered appropriate within the meaning of Article 6(3) of Directive 92/43 are, firstly, an environmental impact study prepared in 2000 and, secondly, a report submitted in 2002 (see paragraphs 21 to 24 and paragraphs 25 to 32 of this judgment).

62 With regard, firstly, to the abovementioned study, which was carried out by an architect on behalf of two public works undertakings, it should be noted that, although the study addresses the question of the impact of the proposed works on the fauna and flora of the area, it highlights itself the summary and selective nature of the examination of the environmental repercussions of the widening of the ski runs and of the construction of associated facilities.

63 It should also be noted that that study itself mentions a large number of matters which were not taken into account. It thus recommends, in particular, additional morphological and environmental analyses and a new examination of the impact of the works, in their global context, on the wild fauna in general and on the situation of certain protected species, in particular in the area of forest to be felled.

64 Furthermore, the study takes the view that the carrying out of the proposed works, desirable from an economic point of view, must comply with a large number of conditions and protection requirements.

65 The inescapable conclusion is that the study does not constitute an appropriate assessment on which the national authorities could rely for granting authorisation for the disputed works pursuant to Article 6(3) of Directive 92/43.

66 With regard, secondly, to the IREALP report submitted in 2002, it must be noted that it also describes the proposed works, examining their impact on the hydrological regime, geomorphology and the area's vegetation. As regards the birds for which the SPA has been designated, the report does not contain an exhaustive list of the wild birds present in the area.

67 Although it is true that the IREALP report states that the main disturbance threatening fauna comes from the destruction of nests during the deforestation phase and from habitat fragmentation, it nonetheless contains numerous findings that are preliminary in nature and it lacks definitive conclusions. The report refers to the importance of assessments to be carried out progressively, in particular on the basis of knowledge and details likely to come to light during the process of implementation of the project. Furthermore, the report was designed as an opportunity to introduce other proposals for improvement of the environmental impact of the operations proposed.

68 These factors mean that the IREALP report cannot be considered an appropriate assessment of the impact of the disputed works on SPA IT 2040044 either.

69 It follows from all the foregoing that both the study of 2000 and the report of 2002 have gaps and lack complete, precise and definitive findings and conclusions capable of removing all reasonable scientific doubt as to the effects of the works proposed on the SPA concerned.

70 Such findings and conclusions were essential in order that the competent authorities might gain the necessary level of certainty to take the decision to authorise the works.

71 In the circumstances, the authorisation of 14 February 2003 did not comply with Article 6(3) of Directive 92/43.

72 With regard to the other studies, it is sufficient to note that they cannot be considered relevant, given that they were prepared either during the works or after their completion, that is to say after grant of the authorisation of 14 February 2003.

73 The failure to fulfil obligations under Article 6(3) of Directive 92/43 must, accordingly, be considered established.

The second complaint, alleging breach of Article 6(4) of Directive 92/43 in conjunction with Article 7

Arguments of the parties

74 The Commission takes the view that it was clear that the works which were proposed could well seriously harm the integrity of the area in question. However, no alternative was seriously suggested. Regional Decree No 13879 of 30 May 2000 raised the possibility that the 'Bucaneve' and 'Edelweiss' ski runs might not be modified but rather maintained, so far as possible, in their current route, departing from that route further on.

75 The Commission deduces therefrom that the project was authorised although there were other solutions less harmful to the environment in that area, which, however, were not taken into consideration by the national authorities.

76 The Commission also submits that the carrying out of the works was not justified by imperative reasons of overriding public interest. In addition, provision was not made for any compensatory measures.

77 The Italian Republic points out that the disputed works were the subject of a double authorisation procedure. Thus, the initial part of the routes and installations between Santa Caterina and Plaghera were considered compatible with the environment by virtue of Regional Decree No 13879 of 30 May 2000, supplemented by a later, favourable opinion from the Regional Council of Lombardy. A revision phase, for that part of the project sited between Plaghera and Valle dell'Alpe, was

begun after the guidance contained in the IREALP report, in order to initiate an environmental impact assessment procedure.

78 The Italian Republic points out that the Region of Lombardy had imposed the condition, laid down in Regional Decree No 20789 of 28 November 2003 which contains an environmental impact assessment with regard to the area between Plaghera and Valle dell'Alpe, that an impact study be submitted for all the works, relating also to the area between Santa Caterina and Plaghera.

79 The Italian Republic adds that the competent authorities had become certain that it was necessary to subject all the works, including those authorised by the regional decree, to an environmental impact assessment.

Findings of the Court

80 Having regard to the fact that the complaint alleging breach of Article 6(3) of Directive 92/43 is well founded, it must be ascertained whether the authorisation of 14 February 2003 complied with the requirements set out in Article 6(4) of the directive.

81 That provision states that, if, in spite of a negative assessment carried out in accordance with the first sentence of Article 6(3) of the directive, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, and there are no alternative solutions, the Member State is to take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected.

82 As the Court has pointed out in paragraphs 35 and 36 of the judgment in *Castro Verde*, Article 6(4) of the directive must, as a derogation from the criterion for authorisation laid down in the second sentence of Article 6(3), be interpreted strictly.

83 Furthermore, Article 6(4) of Directive 92/43 can apply only after the implications of a plan or project have been studied in accordance with Article 6(3) of that directive. Knowledge of those implications in the light of the conservation objectives relating to the site in question is a necessary prerequisite for application of Article 6(4) since, in the absence thereof, no condition for application of that derogating provision can be assessed. The assessment of any imperative reasons of overriding public interest and that of the existence of less harmful alternatives require a weighing up against the damage caused to the site by the plan or project under consideration. In addition, in order to determine the nature of any compensatory measures, the damage to the site must be precisely identified.

84 It follows from the foregoing that the national authorities did not have that information at the time of the decision to grant the authorisation of 14 February 2003. Accordingly, that authorisation cannot be based on Article 6(4) of Directive 92/43.

85 Consequently, the authorisation of 14 February 2003 did not comply with Article 6(4) of the directive.

86 The Commission's action is therefore also well founded in this regard.

The third complaint, alleging breach of Article 6(2) of Directive 92/43 in conjunction with Article 7

Arguments of the parties

87 The Commission submits that the national authorities did not have power to grant the authorisation for the extension and improvement works to the Alpine skiing area since those works were likely seriously to harm the integrity of the park.

88 The Commission states that the area in question suffered significant degradation following the works authorised by the Consorzio. It recalls that the modification of the 'Bucaneve' and 'Edelweiss' Alpine ski runs entailed the felling of almost 2 500 trees which constituted an important habitat for numerous species of protected birds.

89 The Italian Republic notes that the fact that the carrying out of the disputed works entailed certain critical aspects and that these have not yet been remedied does not mean that the works proposed were not correctly assessed. When public works involving negative implications for the environment are necessary, the provisions of Directive 92/43 do not involve a prohibition on carrying out those works, but an obligation to adopt suitable compensatory measures.

90 The Italian Republic takes the view that such measures must be implemented, in accordance with what is possible, before, during and after the carrying out of the works concerned.

Findings of the Court

91 In order to determine whether the complaint raised is well founded, it must be examined whether activities affecting an SPA can infringe both Article 6(3) and (4) of Directive 92/43, as has been found in the present case in paragraphs 73 and 85 of this judgment, and Article 6(2).

92 The latter provision establishes an obligation to take appropriate protective measures, consisting in avoiding deterioration and disturbance which could be significant in the light of the objectives of Directive 92/43.

93 That obligation corresponds to the objective set out in the seventh recital in the preamble to the directive, according to which each special area of conservation must form part of a coherent European ecological network.

94 Where, as is apparent in the present case from examination of the first complaint, authorisation for a plan or project has been granted without complying with Article 6(3) of Directive 92/43, a breach of Article 6(2) in relation to a special area of conservation may be found where deterioration of a habitat or disturbance of the species for which the area in question was designated has been established.

95 With regard to the present case, it should be recalled that almost 2 500 trees were felled in an afforested part of the area concerned, which constitutes the habitat of protected species of birds, inter alia the goshawk, the ptarmigan, the black woodpecker and the black grouse. Consequently, the disputed works destroyed the breeding sites of those species.

96 The inevitable conclusion is that the works and their repercussions on SPA IT 2040044 were incompatible with the protective legal status from which that area should have benefited pursuant to Article 6(2) of Directive 92/43.

97 Accordingly, the Commission's action must also be upheld on this point.

The fourth complaint, alleging breach of Article 4(1) and (2) of Directive 79/409

Arguments of the parties

98 The Commission takes the view that analysis of the measures taken by the national authorities shows that SPA IT 2040044 did not benefit from a protective legal status under national law capable of ensuring, in particular, the survival and reproduction of the bird species mentioned in Annex I to Directive 79/409 and the breeding, moulting and wintering of regularly-occurring migratory species not mentioned in that annex.

99 The Commission takes the view that the works carried out following the authorisation of 14 February 2003 are such as seriously to damage the species of birds present in that SPA, in particular during the breeding period.

100 The Commission states that, although that area is subject to a certain number of rules, the decision of 14 February 2003 shows that the national authorities did not take the necessary measures to put in place an appropriate legal regime to ensure not only protection of the area, but also effective protection of the bird species present there.

101 The Italian Republic asserts that the disputed area is heavily regulated.

102 It states that it follows from the legislation which led to creation of the park that the area in question enjoys a protective status which is appropriate for guaranteeing the objectives laid down by Community legislation. The creation of the park was intended to protect the fauna by putting into place a management system based around conservation of animal and plant species.

Findings of the Court

103 As a preliminary point, it must be noted that the area which is the subject of the present action was designated as an SPA in accordance with Article 4 of Directive 79/409.

104 It must also be noted that, although it is true that Article 7 of Directive 92/43 substitutes the obligations arising from Article 6(2) to (4) of that directive for those arising from Article 4(4) of Directive 79/409, the obligations which arise from Article 4(1) and (2) of Directive 79/409 remain fully applicable. The latter obligations are autonomous in nature and pursue objectives different from those envisaged in Article 6(2) to (4) of Directive 92/43.

105 In order to determine whether the complaint raised is well founded, it must be pointed out that, in accordance with established case-law, it is incumbent upon the Commission to prove the allegation that an obligation has not been fulfilled. It is the Commission's responsibility to place before the Court all the information needed to enable the Court to establish that the obligation has not been fulfilled, and in so doing the Commission may not rely on any presumption (see, inter alia, Case C-434/01 *Commission* v *United Kingdom* [2003] ECR I-13239, paragraph 21; Case C-117/02 *Commission* v *Portugal* [2004] ECR I-5517, paragraph 80; and Case C-135/05 *Commission* v *Italy* [2007] ECR I-3475, paragraph 20).

106 In that regard, it must be noted that, as the Commission has pointed out itself, the management of the SPA in question is subject to regulation under a number of instruments of Italian law.

107 In those circumstances, it is for the Commission to prove that the legal framework determined by those various instruments is not such as to confer an appropriate protective status on that area.

108 The Commission has not shown how that legal framework would be insufficient in the light of the provisions of Article 4(1) and (2) of Directive 79/409. It has merely pleaded the adoption by the administrative authority of a decision giving authorisation contrary to Article 6(2) to (4) of Directive 92/43, a fact which cannot, however, be sufficient to establish the incompatibility of that legal framework with Article 4 of Directive 79/409.

109 The inevitable conclusion is that the Commission's fourth complaint must be rejected.

Costs

110 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. As the Commission has applied for costs to be awarded against the Italian Republic and the latter has been essentially unsuccessful, the Italian Republic must be ordered to pay the costs.

On those grounds, the Court (Fourth Chamber) hereby:

1. Declares that:

— **by authorising measures likely to have a significant impact on Special Protection Area IT 2040044, Parco Nazionale dello Stelvio, without making them subject to an appropriate assessment of their implications in the light of the area's conservation objectives;**

— **by authorising such measures, without complying with the provisions which allow a project to be carried out, in spite of a negative assessment of the implications and in the absence of alternative solutions, only for imperative reasons of overriding public interest and then only after adopting and communicating to the Commission of the European Communities all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected; and**

— **by failing to adopt measures to avoid the deterioration of natural habitats and habitats of species and the disturbance of species for which SPA IT 2040044, Parco Nazionale dello Stelvio, was designated,**

the Italian Republic has failed to fulfil its obligations under Article 6(2) to (4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, in conjunction with Article 7 of that directive, and under Article 4(1) and (2) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds;

2. **Dismisses the remainder of the action;**

3. **Orders the Italian Republic to pay the costs.**

[Signatures]

JUDGMENT OF THE COURT (Second Chamber)

28 June 2007 *

In Case C-235/04,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 4 June 2004,

Commission of the European Communities, represented by M. van Beek and G. Valero Jordana, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Kingdom of Spain, represented by N. Díaz Abad, acting as Agent, with an address for service in Luxembourg,

defendant,

* Language of the case: Spanish.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, P. Kūris (Rapporteur), J. Klučka, R. Silva de Lapuerta and L. Bay Larsen, Judges,

Advocate General: J. Kokott,
Registrar: M. Ferreira, Principal Administrator,

having regard to the written procedure and further to the hearing on 22 June 2006,

after hearing the Opinion of the Advocate General at the sitting on 14 September 2006,

gives the following

Judgment

1 By its action, the Commission of the European Communities requests the Court to declare that, by failing to classify territories of a sufficient number and size as special protection areas for birds ('SPAs') in order to provide protection for all the species of birds listed in Annex I to Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1), as amended, inter alia, by

Commission Directive 97/49/EC of 29 July 1997 (OJ 1997 L 223, p. 9; 'Directive 79/409'), and for the migratory species not mentioned in the said Annex I, the Kingdom of Spain has failed to fulfil its obligations under Article 4(1) and (2) of Directive 79/409.

Legal context

2 Article 1(1) of Directive 79/409 provides:

'This Directive relates to the conservation of all species of naturally occurring birds in the wild state in the European territory of the Member States to which the Treaty applies. It covers the protection, management and control of these species and lays down rules for their exploitation.'

3 Article 2 of that directive provides:

'Member States shall take the requisite measures to maintain the population of the species referred to in Article 1 at a level which corresponds in particular to ecological, scientific and cultural requirements, while taking account of economic and recreational requirements, or to adapt the population of these species to that level.'

4 Article 4(1) and (2) of that directive states as follows:

'1. The species mentioned in Annex I shall be the subject of special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution.

In this connection, account shall be taken of:

(a) species in danger of extinction;

(b) species vulnerable to specific changes in their habitat;

(c) species considered rare because of small populations or restricted local distribution;

(d) other species requiring particular attention for reasons of the specific nature of their habitat.

Trends and variations in population levels shall be taken into account as a background for evaluations.

Member States shall classify in particular the most suitable territories in number and size as special protection areas for the conservation of these species, taking into account their protection requirements in the geographical sea and land area where this Directive applies.

2. Member States shall take similar measures for regularly occurring migratory species not listed in Annex I, bearing in mind their need for protection in the geographical sea and land area where this Directive applies, as regards their breeding, moulting and wintering areas and staging posts along their migration routes. To this end, Member States shall pay particular attention to the protection of wetlands and particularly to wetlands of international importance.'

Pre-litigation procedure

5 Following a number of complaints, on 26 January 2000 the Commission sent the Kingdom of Spain a letter of formal notice noting the incorrect application by that Member State of Directive 79/409 in that it had failed to classify territories of a sufficient number and size as SPAs.

6 Since the Commission took the view that the replies of the Spanish authorities and the information and proposals for classification of new SPAs, sent between 18 May 2000 and 10 January 2001, were not convincing, on 31 January 2001 the Commission issued a reasoned opinion requesting the Kingdom of Spain to take the measures necessary to comply therewith within a period of two months from notification of that opinion, the period for replying to which was extended to 3 May 2001.

7 By letters of 17 April and 15 May 2001, the Spanish authorities responded to the reasoned opinion and, between 28 May 2001 and 25 October 2002, sent additional information and details of classifications of and extensions to SPAs.

8 After having analysed all of those replies and taking the view that the Autonomous Communities of Andalusia, the Balearics, the Canaries, Castilla y León, Castilla-La Mancha and Madrid had not yet fulfilled all the obligations arising out of Article 4(1) and (2) of Directive 79/409 and that the Autonomous Communities of the Asturias, Catalonia, Extremadura, Galicia and Valencia had classified SPAs in a wholly inappropriate and inadequate manner, the Commission decided, during January 2003, to bring the matter before the Court of Justice.

9 The Spanish authorities continued to send the Commission, between 13 January 2003 and 5 April 2004, proposals for SPA classifications, files relating to the redefinition and extension of the SPA network, including various data brought up to date and supplemented by cartographic documents, and information on the situation of the bird species.

10 After having analysed all these replies, the Commission, considering that the failure to fulfil obligations arising under Directive 79/409 was continuing, decided to bring, on 4 June 2004, the present action.

The action

11 By its action, the Commission alleges that the Kingdom of Spain has failed to classify sufficient SPAs, in number and in size, having regard to the objectives of protection of the bird species listed in Annex I to Directive 79/409 and of the migratory species not covered in that annex.

12 Since, at the hearing, the Commission withdrew its action with regard to the Autonomous Community of Extremadura, the present case for failure to fulfil obligations concerns only the Autonomous Communities of Andalusia, the Balearics, the Canaries, Castilla-La Mancha, Catalonia, Galicia and Valencia.

Classification of SPAs

Arguments of the parties

13 The Commission takes the view that the Kingdom of Spain has not classified as SPAs territories sufficient in size and in number having regard to the areas of importance for the conservation of birds identified in the ornithological list published in 1998 ('the IBA 98').

14 The Spanish Government objects to the use of the IBA 98. That inventory, it submits, does not have the same value as the *Inventory of Important Bird Areas in the European Community* published in 1989 ('the IBA 89') since, because it was neither commissioned nor supervised by the Commission, the accuracy of its results is not guaranteed.

15 The IBA 98 was drawn up exclusively on the initiative of the Sociedad Española de Ornitología (Spanish Ornithological Society; 'SEO/BirdLife') which decided unilaterally to amend the IBA 89 in order to increase the number and size of the areas to be protected in Spain. No public authority having responsibility for environmental matters supervised the drawing-up of that list to ensure the precision and accuracy of its data. The increase in number and above all in size of new areas

requiring to be protected in the IBA 98 in comparison with the IBA 89 is therefore impossible to justify or check.

16 Next, still in the view of the Spanish Government, the use of incomplete information in the IBA 98 does not permit areas of interest for the conservation of birds to be correctly defined. The criteria used to define the SPAs are also incorrect, are of low ornithological value and do not comply with Directive 79/409.

17 The Spanish Government also takes the view that the surveys and the numerous population estimates carried out for all the areas of importance for the conservation of birds are not supported by any bibliographical reference, which prevents any checking or comparison of data. Furthermore, SEO/BirdLife explicitly accepted that the sources of the ornithological data were not cited for each of these areas.

18 Thus, there are serious lacunae in SEO/BirdLife's definition of the areas to be protected because of the lack of bibliographical references and the poor quality of the information used. The IBA 98 does not therefore have the minimum quality required of a scientific work with regard to accuracy of data and precision of the criteria used.

19 Finally the Spanish Government submits that SEO/BirdLife prohibited, without its express authorisation, the release to the autonomous communities, which have administrative jurisdiction in environmental matters, of the information which it used to identify and define the areas of importance for the conservation of birds.

20 According to the Commission, the IBA 98 relies on the best documented and most accurate references available to define the areas most appropriate to the survival and reproduction of bird species in accordance with Article 4(1) and (2) of Directive 79/409. The IBA 98 is based on balanced ornithological criteria such as population size, bird diversity and the risks to which the species are exposed on an international scale, allowing identification of the places most likely to ensure conservation of the species listed in Annex I to Directive 79/409 and of the migratory species not listed in that annex.

21 The Commission states that the assessment of the network of SPAs classified by the Kingdom of Spain was not carried out on the basis of the IBA 98 alone, but also on the basis of two other criteria relying, first, on an analysis of the presence in each area of the bird species mentioned in Annex I to Directive 79/409 and, second, on the taking into account of wetlands.

22 Finally, also in the view of the Commission, the fact that it is impossible to access the database used by SEO/BirdLife does not invalidate the scientific nature of the study and does not preclude the various Spanish authorities from drawing up or arranging for their own studies to comply with their obligations under Directive 79/409.

Findings of the Court

23 As a preliminary point, it must be borne in mind that Article 4 of Directive 79/409 lays down a regime which is specifically targeted and reinforced both for the species listed in Annex I and for the migratory species, an approach justified by the fact that they are, respectively, the most endangered species and the species constituting a common heritage of the European Community (Case C-191/05 *Commission* v *Portugal* [2006] ECR I-6853, paragraph 9, and case-law cited). Furthermore, it is

clear from the ninth recital in the preamble to that directive that the preservation, maintenance or restoration of a sufficient diversity and area of habitats is essential to the conservation of all species of birds. The Member States are therefore required to adopt the measures necessary for the conservation of those species.

24 For that purpose, the updating of scientific data is necessary to determine the situation of the most endangered species and the species constituting the common heritage of the Community in order to classify the most suitable areas as SPAs. It is therefore necessary to use the most up-to-date scientific data available at the end of the period laid down in the reasoned opinion.

25 In that regard, it should be recalled that the national lists, including the IBA 98 drawn up by SEO/BirdLife, revised the first pan-European study carried out in the IBA 89 and provide more exact and up-to-date scientific data.

26 In view of the scientific nature of the IBA 89 and of the absence of any scientific evidence adduced by a Member State tending particularly to show that the obligations flowing from Article 4(1) and (2) of Directive 79/409 could be satisfied by classifying as SPAs sites other than those appearing in that inventory and covering a smaller total area, the Court has held that that inventory, although not legally binding, could be used by the Court as a basis of reference for assessing whether a Member State has classified a sufficient number and size of areas as SPAs for the purposes of the abovementioned provisions of Directive 79/409 (see, to that effect, Case C-3/96 *Commission* v *Netherlands* [1998] ECR I-3031, paragraphs 68 to 70, and Case C-378/01 *Commission* v *Italy* [2003] ECR I-2857, paragraph 18).

27 It must be held that the IBA 98 provides an up-to-date list of the areas of importance for the conservation of birds in Spain which, in the absence of scientific proof to the

contrary, constitutes a basis of reference permitting an assessment to be made as to whether that Member State has classified areas of a sufficient number and size as SPAs to protect all the bird species listed in Annex I to Directive 79/409 and the migratory species not listed in that annex.

28 In that regard, it should be pointed out that the IBA 98 was used by the Autonomous Communities of Castilla-La Mancha, Catalonia, Galicia and Valencia to define SPAs and that, with regard to the Autonomous Communities of Aragon, Cantabria, Extremadura, Madrid, Murcia, the Basque Country and the Autonomous City of Ceuta, the Commission accepted up-to-date scientific information supplied to it in the place of that relating to the important bird areas listed in the IBA 98.

29 It is then appropriate to consider the arguments of the Spanish Government with regard to criteria C.1 and C.6 used in that inventory.

30 Under the IBA 98, criterion C.1 designates an area regularly visited by a significant number of birds of a globally threatened species or of a species whose preservation is of interest on a worldwide level. Criterion C.6 designates an area constituting one of the five most important areas in each European region for a species or a subspecies listed in Annex I to Directive 79/409.

31 With regard to criterion C.1, the Spanish Government considers that the identification threshold for SPAs cannot be less than 1% of the national reproducing population of a species listed in that annex.

32 That argument disregards the definition of that criterion and thus cannot be accepted. Since criterion C.1 relates to globally threatened species, it is sufficient that the area concerned be the habitat of a significant number of individual members of such a species. No threshold of 1% is laid down by criterion C.1 or imposed by virtue of Directive 79/409.

33 With regard to criterion C.6, the Spanish Government submits that the biogeographical regions defined in Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7) are to be regarded as being equivalent to areas defined for the purposes of Directive 79/409. The use of a different method to define habitats and areas of importance for the conservation of birds would create considerable and unjustifiable disparities, taking into account the existence of numerous different administrative territorial divisions within the Member States.

34 As the Advocate General noted in point 90 of her Opinion, the Kingdom of Spain did not attempt to divide Spanish territory on an ornithological basis which would permit identification of SPAs, but merely referred to the existence of biogeographical regions, which do not constitute a basis comparable to the autonomous communities for the putting into place of a network covering the Community in a more or less uniform manner, which is necessary in order to obtain a comparable breadth of reference in all the Member States for application of criterion C.6.

35 In the light of all the foregoing, it must be found that, in the absence of the submission of scientific studies capable of contradicting the results of the IBA 98, that inventory constitutes the most up-to-date and exact reference for the identification of the sites most suitable in number and size for the conservation of birds.

36 That conclusion cannot be undermined by the argument that it was impossible to consult the database set up by SEO/BirdLife.

37 In that regard, it must be noted that, as the Spanish Government has confirmed, such access was not refused to the Spanish Government, but there was a prohibition on the passing of the information to the autonomous communities.

38 Furthermore, it is not in dispute that the Commission concluded a contract in 1991 with SEO/BirdLife for the carrying-out of a precise scientific study allowing maps of areas of importance for bird conservation to be produced, in which each site was to be described from the point of view of its ornithological value using the most complete information available.

39 To that must be added the fact that the IBA 98 was produced with the participation of a number of non-governmental organisations, local SEO/BirdLife groups, three national parks, six universities, the environmental departments of 12 autonomous communities, the Directorate-General for the Protection of Nature of the Ministry of the Environment and the autonomous body Parques Nacionales of the same ministry, which constitutes sufficient indication, in the absence of scientific proof to the contrary, as to the standing of the IBA 98 as a work of reference.

40 In those circumstances, the arguments of the Spanish Government alleging, first, a lack of control over the preparation of the IBA 98 by a competent public authority and, second, that it was impossible to access the database used by SEO/BirdLife must be rejected.

The lack of classification and the partial or inappropriate classification of territories as SPAs

Arguments of the parties

41 According to the Commission, the IBA 98 identifies 391 areas of importance for the conservation of birds in Spain, covering an area of 15 862 567 hectares, which represents approximately 31.5% of the surface area of the country. An examination of the 427 SPAs classified by the Kingdom of Spain, representing a total surface area of approximately 7 977 789 hectares, that is to say 15.8% of the national territory, shows that 148 areas of importance for the conservation of birds are classified as SPAs over more than 75% of their surface area (2 730 612 hectares of a total of 2 967 119 hectares), 194 areas of importance for the conservation of birds are classified as SPAs over less than 75% of their surface area (4 388 748 hectares of a total of 10 739 054 hectares) and 99 areas of importance for the conservation of birds have not been classified as SPAs (2 684 713 hectares). The SPA network is therefore insufficient.

42 The Spanish Government submits that the surface area of the network of SPAs in Spain represents a proportion of the national territory two and a half times greater than the Community average (15.51% as against 6.89%), and up to 10 times greater than the proportion of the territory of certain neighbouring Member States. Furthermore, that government points out that, for the period between April 2000 and May 2004, the Spanish network grew from 179 to 416 SPAs, that is to say 237 new areas, which represents an increase of 132.4% and 35% of the number of new SPAs declared by all Member States. With regard to the increase in surface area of the areas classified as SPAs, the Spanish share of new declarations corresponds to 43% of the total surface area declared in all the Community. The Spanish contribution alone corresponds to 35% of the total surface area of the SPAs in the Community, while the surface area of the Kingdom of Spain represents only 16% of that of the Community. These data show that the Kingdom of Spain has made an effort greater, firstly, than the Community average and, secondly, than the individual effort of each Member State to comply with the obligations arising under Directive 79/409.

43 With regard to the areas partially or inappropriately classified as SPAs, the Commission takes the view that, in the light of the IBA 98, the current degree of cover of areas of importance for the conservation of birds by the Spanish SPAs is very low, which represents an additional danger for the survival of the species whose habitat they are, since the measures necessary for the protection of their habitat have not been adopted.

Findings of the Court

44 By its action for failure to fulfil obligations, the Commission seeks a declaration that territories sufficient in size and number to offer protection to all the bird species listed in Annex I to Directive 79/409 and the migratory species not covered by that annex have not been classified as SPAs in the Autonomous Communities of Andalusia, the Balearics, the Canaries, Castilla-La Mancha, Catalonia, Galicia and Valencia.

45 As a preliminary point, it should be pointed out that a Member State may not rely on the situation in other Member States to exonerate itself from its obligation to classify SPAs. Only ornithological criteria such as those laid down in Article 4(1) and (2) of Directive 79/409 permit the definition of the most suitable sites with a view to their classification as SPAs.

46 Next, it should be noted, on the one hand, that the Commission claims that all the autonomous communities have defined SPAs of an insufficient size compared with that given in the IBA 98 whereas, on the other, it accepts the updated scientific arguments which have shown that the current limits of the SPAs classified in the Autonomous Communities of Castilla-La Mancha, Catalonia, Galicia and Valencia are sufficient to ensure compliance with Directive 79/409.

47 Such a contradiction in the heads of claim put forward by the Commission in support of its action for failure to fulfil obligations does not satisfy the requirements of Article 21 of the Statute of the Court of Justice and Article 38(1)(c) of the Rules of Procedure.

48 The Court has held that the Commission must, in the heads of claim in an application made under Article 226 EC, indicate the specific complaints on which the Court is asked to rule. Those heads of claim must be set out unambiguously so that the Court does not rule *ultra petita* or indeed fail to rule on a complaint (see Case C-255/04 *Commission* v *France* [2006] ECR I-5251, paragraph 24 and case-law cited).

49 It follows that the complaint that the classification of areas of importance for the conservation of birds as SPAs by the Autonomous Communities of Castilla-La Mancha, Catalonia, Galicia and Valencia is insufficient in size is inadmissible.

50 Accordingly, it is appropriate to consider that complaint in turn as regards the Autonomous Communities of Andalusia, the Balearics and the Canaries only.

51 First of all, with regard to the Autonomous Community of Andalusia, the Spanish Government gave notification, after expiry of the period laid down in the reasoned opinion, of the classification of 39 new SPAs and the enlargement of other areas, which represents an increase in the area protected of 560 000 hectares. Furthermore, it indicated that a declaration procedure is under way for new SPAs whose main value lies in the protection of steppe-land birds.

52 According to consistent case-law, in the context of an action under Article 226 EC, the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation obtaining in the Member State at the end of the period laid down in the reasoned opinion and the Court cannot take account of any subsequent changes (see, inter alia, Case C-168/03 *Commission* v *Spain* [2004] ECR I-8227, paragraph 24). The Commission's claim with regard to the Autonomous Community of Andalusia must therefore be accepted.

53 Next, with regard to the Autonomous Community of the Balearics, although it is established that 40 SPAs, of a total size of 121 015 hectares and covering in whole or in part 20 areas of importance for the conservation of birds and almost 54% of the total surface area of the network of areas to be protected, had been classified before expiry of the period laid down in the reasoned opinion, the fact remains that those areas do not cover the areas of habitat of the red kite (*Milvus milvus*), a species referred to in Annex I to Directive 79/49, which was protected after expiry of that period. The Commission's claim with regard to the Autonomous Community of the Balearics must therefore be accepted.

54 Finally, with regard to the Autonomous Community of the Canaries, the IBA 98 identifies 65 sites covering a surface area of 133 443 hectares as areas of importance for the conservation of birds. Before expiry of the period laid down in the reasoned opinion, 28 SPAs of a total surface area of 211 598 hectares covered in part 41 areas of importance for the conservation of birds and approximately 59.5% of the surface area of the network of areas to be protected. The Commission therefore takes the view that coverage remains insufficient, in particular, for the Houbara (*Chlamydotis undulata*), the Egyptian vulture (*Neophron percnopterus*), the Fuerteventura chat (*Saxicola dacotiae*), the cream-coloured courser (*Cursorius cursor*) and the Bulwer's petrel (*Bulweria bulwerii*).

55 Although the Spanish Government submits that there were internal difficulties in the classification of certain SPAs, it must be recalled that, according to the Court's settled case-law, a Member State cannot plead provisions, practices or situations prevailing in its domestic legal order to justify failure to observe obligations and time-limits laid down by a directive (see, inter alia, Case C-374/98 *Commission* v *France* [2000] ECR I-10799, paragraph 13).

56 Nevertheless, the Spanish Government accepts that certain SPAs must be extended. Accordingly, the Commission's claim in respect of the Autonomous Community of the Canaries must be accepted.

57 In those circumstances, it must be held that the complaint that the classification of areas of importance for the conservation of birds as SPAs by the Autonomous Communities of Andalusia, the Balearics and the Canaries is insufficient in size must be upheld.

58 Finally, the Commission claims that the Kingdom of Spain classified an insufficient number of areas of importance for the conservation of birds as SPAs in the Autonomous Communities of Andalusia, the Balearics, the Canaries, Castilla-La Mancha, Catalonia, Galicia and Valencia.

59 With regard to the Autonomous Communities of Andalusia and Galicia, the authorities of those communities, after expiry of the period laid down in the reasoned opinion, classified new SPAs and enlarged part of the existing SPAs. However, it is clear from the case-law cited in paragraph 52 of the present judgment that the existence of a failure to fulfil obligations must be determined by reference to the situation obtaining in the Member State at the end of the period laid down in the reasoned opinion and that the Court cannot take account of any subsequent changes. The Commission's claim in that regard must be accepted.

60 With regard to the Autonomous Community of the Balearics, although the authorities of that community, after expiry of the period laid down in the reasoned opinion, did indeed declare new SPAs specifically in order to protect the red kite and new SPAs were proposed in Majorca and Minorca to protect the nesting sites of that species, since the existence of a failure to fulfil obligations must be determined only by reference to the situation obtaining in a Member State at the end of the period laid down in the reasoned opinion, it must be found that there was a failure to fulfil obligations in that regard.

61 Furthermore, with regard to the Autonomous Community of the Canaries, 23 areas of importance for the conservation of birds were not covered at all by an SPA following expiry of the period laid down in the reasoned opinion. The Spanish Government, whilst recognising that it is necessary to classify new SPAs, has produced in support of its defence a detailed study of the areas of importance for the conservation of birds which have not yet been covered. As the Advocate General observed in point 106 of her Opinion, since the Commission did not challenge that study, its content must be regarded as having been accepted and it constitutes, in respect of the ongoing failures to classify, more up-to-date and precise evidence than the IBA 98.

62 That complaint stands in respect only of those SPAs which ought to have been classified before expiry of the period laid down in the reasoned opinion.

63 With regard to the Autonomous Community of Valencia, although, before expiry of the period laid down in the reasoned opinion, new SPAs had been classified, there are still, nevertheless, areas not classified, which, as the Spanish authorities have recognised, are part of a process of extension of the current network of SPAs.

64 In those circumstances, it must be held that the complaint alleging insufficient classification of areas of importance for the conservation of birds as SPAs by the Autonomous Communities of Andalusia, the Balearics, the Canaries, Galicia and Valencia should be upheld.

65 With regard to the Autonomous Community of Castilla-La Mancha, the Commission takes the view that 10 areas of importance for the conservation of birds have not been classified as SPAs. The Spanish Government has recognised the need to classify as an SPA area No 183 (Hoces del Río Mundo y del Río Segura). With regard to area No 189 (Parameras de Embid-Molina), the Spanish Government admits the need for classification of part of that area, recognising the presence of a colony of Dupont's lark (*Chersophilus duponti*) estimated at 1 250 birds over an area of 1 800 hectares.

66 However, the Spanish Government disputes the need to classify areas No 70 (El Escorial — San Martín de Valdeiglesias), No 72 (Carrizales y Sotos de Aranjuez), No 157 (Hoces del Turia y Los Serranos), No 210 (Sierras de Cazorla y Segura) and No 305 (Bajo Tietar y Rampa de la Vera), since they cover areas which are also located in other autonomous communities and the part within the autonomous community concerned is very small.

67 That argument must be rejected. Because of the importance and homogeneity of a site considered the most suitable for the conservation of certain species such as the Spanish imperial eagle (*Aquila adalberti*), threatened on a global scale, the black stork (*Ciconia nigra*), Bonelli's eagle (*Hieraaetus fasciatus*), the golden eagle (*Aquila chrysaetos*), the Griffon vulture (*Gyps fulvus*) the Egyptian vulture and the peregrine falcon (*Falco peregrinus*), the fact that a site covers a number of regions cannot constitute a ground on which Member States may exonerate themselves from their obligations under Article 4(1) and (2) of Directive 79/409.

68 The Spanish Government also disputes the classification as an SPA of area No 185 (San Clemente-Villarrobledo) in which the populations of lesser kestrel (*Falco naumanni*), little bustard (*Tetrax tetrax*) and pin-tailed sandgrouse (*Pterocles alchata*) mentioned in the IBA 98 are of little interest and represent only 6%, 4% and 4% respectively of the population in the entire Autonomous Community of Castilla-

La Mancha. What is more, that area is of no interest in ornithological terms since it includes urban areas, industrial zones and stretches of vineyards as well as large expanses of irrigable land under intensive cultivation.

69 Such an argument must also be rejected. That area has significant populations of species threatened on a global and European scale and constitutes one of the main feeding areas of those species.

70 With regard to area No 78 (Puebla de Beleña), the Spanish authorities dispute the need for its classification because of the seasonal nature of the lagoons and the very irregular presence of cranes (*Grus grus*), without providing scientific data capable of contradicting the results of the IBA 98. Accordingly, the claim of the Commission must be accepted on that point.

71 It is also necessary to reject the arguments of the Spanish Government that the population of certain species is not significant and does not need protection by way of classification of new SPAs in area No 199 (Torrijos). It must be pointed out that, firstly, the population of 150 to 200 great bustards (*Otis tarda*) exceeds the existing worldwide threshold of 50 individuals. Secondly, it should be noted that the population of little bustards amounts to 1 200 birds, whilst the threshold value is 200 birds. All those elements therefore make it necessary to classify new SPAs to meet the requirements of protection of those species.

72 According to the Commission, other species, such as the lesser kestrel, are still insufficiently protected and it points out that since the expiry of the period laid down in the reasoned opinion the Autonomous Community of Castilla-La Mancha has not classified any new SPAs. The Spanish Government raises the objection that that species is found within urban areas which cannot be classified as SPAs.

73 Such an argument must be rejected. In order to protect species, classification as an SPA is necessary where an area constitutes a specific nesting area, as is the case of the lesser kestrel. In addition, as the Advocate General noted in point 118 of her Opinion, if measures of urban development were to override the interest in protecting that species, they would have to be implemented under Article 6(4) of Directive 92/43, that is to say in the absence of alternatives and with the adoption of compensatory measures. That is not the case here.

74 The Commission's claim with regard to insufficient classification of areas of importance for the conservation of birds as SPAs by the Autonomous Community of Castilla-La Mancha must therefore be accepted.

75 With regard to the Autonomous Community of Catalonia, the Commission takes the view that 10 areas of importance for the conservation of birds have not been designated as SPAs. Thus, of 62 breeding species listed in Annex I to Directive 79/409, the lesser grey shrike (*Lanius minor*), the capercaillie (*Tetrao urogallus*), the shag (*Phalacrocorax aristotelis*), the little bustard, the Calandra lark (*Melanocorypha calandra*), Dupont's lark, the European roller (*Coracias garrulus*), the short-toed lark (*Calandrella brachydactyla*) and the collared pratincole (*Glareola pratincola*) are inadequately protected.

76 However, as the Advocate General observed in point 121 of her Opinion, the IBA 98 does not list the lesser grey shrike, the capercaillie, Dupont's lark, or the collared pratincole. No complaint can therefore be levelled against the Kingdom of Spain for failing to classify SPAs because of the presence of those four species.

77 The argument of the Spanish Government that the action is inadmissible because of the lack of precision with regard to the species, among the 62 listed in Annex I to Directive 79/409, for which new SPAs should have been classified, must be rejected. As is apparent from the foregoing, the Commission stated precisely which species are inadequately protected and for which additional SPAs must be classified.

78 Finally, the Spanish Government submits that most of the habitats which are not yet classified as SPAs are protected by virtue of Directive 92/43 in the context of the Natura 2000 network.

79 Such an argument must be rejected. It should be recalled that the Court has held that the legal regimes of Directives 79/409 and 92/43 are separate (see, to that effect, Case C-374/98 *Commission* v *France*, paragraphs 50 to 57). It follows that a Member State cannot exonerate itself from its obligations under Article 4(1) and (2) of Directive 79/409 by relying on measures other than those laid down by that directive.

80 The Commission's claim with regard to insufficient classification of areas of importance for the conservation of birds as SPAs by the Autonomous Community of Catalonia must therefore be accepted.

81 With regard to wetland areas, it is clear from Article 4(2) of Directive 79/409 that the Member States are to pay particular attention to the protection of wetlands and particularly to wetlands of international importance.

82 According to the Commission, the wetlands of international importance, identified as areas of importance for the conservation of birds, of Albufera de Adra and Embalses de Cordobilla y Malpasillo in Andalusia and Complejo húmedo de Corrubedo in Galicia were not classified as SPAs on expiry of the period laid down in the reasoned opinion.

83 In that regard, it is clear from the proceedings that it is common ground that the classification as SPAs of wetlands of international importance in Andalusia and in Galicia took place after expiry of the period laid down in the reasoned opinion. Accordingly, the Commission's claim in this regard must therefore be accepted.

84 It follows that the Kingdom of Spain failed to classify as SPAs all the areas which, by application of ornithological criteria, appear the most suitable for the conservation of the species in question.

85 In the light of all foregoing, it must be held that, by failing to classify as SPAs territories of adequate size in the Autonomous Communities of Andalusia, the Balearics and the Canaries, and territories of sufficient number in the Autonomous Communities of Andalusia, the Balearics, the Canaries, Castilla-La Mancha, Catalonia, Galicia and Valencia to provide protection for all the species of birds listed in Annex I to Directive 79/409 and the migratory species not covered by that annex, the Kingdom of Spain has failed to fulfil its obligations under Article 4(1) and (2) of Directive 79/409.

Costs

86 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission applied for costs to be awarded against the Kingdom of Spain and the latter has been unsuccessful in its main pleas, the Kingdom of Spain must be ordered to pay the costs.

On those grounds, the Court (Second Chamber) hereby:

1. **Declares that, by failing to classify as special protection areas for birds territories of adequate size in the Autonomous Communities of Andalusia, the Balearics and the Canaries, and territories of sufficient number in the Autonomous Communities of Andalusia, the Balearics, the Canaries, Castilla-La Mancha, Catalonia, Galicia and Valencia to provide protection for all the species of birds listed in Annex I to Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds, as amended, inter alia, by Commission Directive 97/49/EC of 29 July 1997, and the migratory species not covered by that annex, the Kingdom of Spain has failed to fulfil its obligations under Article 4(1) and (2) of Directive 79/409, as amended;**

2. **Dismisses the remainder of the action;**

3. **Orders the Kingdom of Spain to pay the costs.**

[Signatures]

JUDGMENT OF THE COURT (Second Chamber)

14 June 2007 *

In Case C-342/05,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 14 September 2005,

Commission of the European Communities, represented by M. van Beek and I. Koskinen, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Republic of Finland, represented by E. Bygglin, acting as Agent, with an address for service in Luxembourg,

defendant,

* Language of the case: Finnish.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, K. Schiemann, J. Makarczyk, L. Bay Larsen (Rapporteur) and J.-C. Bonichot, Judges,

Advocate General: J. Kokott,
Registrar: R. Grass,

having regard to the written procedure,

after hearing the Opinion of the Advocate General at the sitting on 30 November 2006,

gives the following

Judgment

1 By its application, the Commission of the European Communities seeks a declaration that, by authorising wolf hunting in breach of the grounds of derogation laid down in Article 16(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7) ('the Habitats Directive'), the Republic of Finland has failed to fulfil its obligations under Articles 12(1) and 16(1) of that directive.

Legislative background

The Habitats Directive

2 Under Article 12(1) of the Habitats Directive:

'Member States shall take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) in their natural range, prohibiting:

(a) all forms of deliberate capture or killing of specimens of these species in the wild;

...'.

3 Annex IV to the Habitats Directive is entitled 'Animal and Plant Species of Community Interest in Need of Strict Protection'. Annex IV(a), as amended by the Act concerning the conditions of accession of the Republic of Austria, the Republic of Finland and the Kingdom of Sweden and the adjustments to the Treaties on which the European Union is founded (OJ 1994 C 241, p. 21, and OJ 1995 L 1, p. 1) ('Annex IV(a)'), mentions the following species: 'Canis lupus (except the ... Finnish populations within the reindeer management area as defined in paragraph 2 of the Finnish Act No 848/90 of 14 September 1990 on reindeer management)'.

4 Article 16(1) of the Habitats Directive states:

'Provided that there is no satisfactory alternative and the derogation is not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range, Member States may derogate from the provisions of Articles 12, 13, 14 and 15(a) and (b):

(a) in the interest of protecting wild fauna and flora and conserving natural habitats;

(b) to prevent serious damage, in particular to crops, livestock, forests, fisheries and water and other types of property;

(c) in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment;

...'

5 The conservation status of species is defined in Article 1(i) of the Habitats Directive:

'(i) *conservation status of a species* means the sum of the influences acting on the species concerned that may affect the long-term distribution and abundance of its populations within the territory referred to in Article 2;

The *conservation status* will be taken as "favourable" when:

— population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats, and

— the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future, and

— there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis'.

Finnish law

6 It is clear from the documents before the Court that Articles 12 and 16 of the Habitats Directive have been transposed in substantially identical terms in the Finnish legislation on hunting.

7 However, there are specific regulations as regards authorisation to kill wolves. Wolf hunting is authorised on a case-by-case basis by the competent game management district. On the other hand, the upper regional limits, that is to say the maximum number of wolves which may be hunted in each district during the hunting season from 1 November until 31 March, are set by the Ministry of Agriculture and Forestry. The limits are set so that the wolf population is not threatened in those districts. All information on mortality is taken into account, particularly mortality resulting from road accidents and human activities.

8 In order to authorise hunting the game management districts must consider whether the conditions set out in Article 16(1) of the Habitats Directive, which has been transposed into national law, are satisfied. Furthermore, where an upper regional limit has been reached it may be exceeded only if the conditions laid down in Article 16(1) are complied with and a special ministerial authorisation is granted.

9 Moreover, although the police may kill animals in exceptional circumstances, they may only do so if the conditions set out in paragraph 8 of this judgment are respected.

The pre-litigation procedure

10 The Commission initiated the procedure for failure to fulfil obligations by sending the Republic of Finland a letter of formal notice on 10 April 2001. After that Member State had responded, by a letter of 6 July 2001, the Commission issued a reasoned opinion on 26 June 2002. In that opinion the Commission stated that since (i) the conservation status of the wolf was not favourable in Finland, (ii) alternative approaches could be employed and (iii) hunting permits were issued without any relationship to the particular wolves causing serious damage being established, wolf hunting as authorised did not satisfy the conditions laid down in Article 16(1) of the Habitats Directive. The Republic of Finland responded to the reasoned opinion by a letter of 28 August 2002.

11 However, taking the view that the failure to fulfil obligations complained of persisted, the Commission brought the present action on 14 September 2005.

The action

Arguments of the parties

12 The Commission states, first of all, that in Finland the wolf is an endangered species and, consequently, its conservation status cannot be regarded as favourable in that Member State.

13 Next, the Commission submits that the practice in Finland consisting in authorising hunting as a preventive measure is contrary to Article 16(1) of the Habitats

Directive. Where it is thought highly likely that a wolf will cause serious damage, the latter may generally be avoided by means other than preventive killing. The use of repellents, scents, electric or other fences, the confinement of cattle or dogs at night or even compensation for damage sustained could be considered. Where hunting permits are issued on preventive grounds, it is highly unlikely that the wolves killed are those which cause the serious damage. In any event, those permits are issued by the Finnish authorities without any relationship with the particular wolves causing such damage being duly established. In those circumstances hunting is not a very effective means to prevent such damage.

14 Finally, the Commission states that the annual regional quotas set in advance by the Ministry of Agriculture and Forestry for a specific period are not justified, since derogations from the system of strict protection must be assessed regardless of the period concerned and be considered separately with respect to each hunting permit, in accordance with Article 16(1) of the Habitats Directive. Furthermore, the practice of the Finnish authorities leads to a situation in which wolves may be legally killed even though the maximum limit set by the Ministry of Agriculture and Forestry has been exceeded substantially. Thus, in the 2003-04 season in particular, although the maximum limit had been fixed at eight wolves, in addition eleven derogatory permits were issued and two permits were issued by the police. Ultimately, twelve wolves were killed during that season.

15 The Commission concludes that since the conservation status of the wolf in Finland is not favourable, alternative approaches may be employed and the hunting permits are issued without any relationship to the particular wolves causing serious damage being properly established, wolf hunting is authorised in Finland to an extent which infringes the conditions laid down in Article 16(1) of the Habitats Directive.

16 The Finnish Government argues that wolf hunting requires a permit, which may be obtained by written request to the local game management district stating the reasons for the request and the territory and number of animals concerned. The local game management district, having the appropriate information relating to its area, examines whether hunting impedes the maintenance of the species at a favourable conservation level, whether it is possible to find another satisfactory solution, and whether the conditions for derogation laid down in Article 16(1) of the Habitats Directive have been satisfied.

17 Furthermore, decisions to issue hunting permits are also taken with regard to an upper regional limit of specimens that may be hunted in each game management district, which is set by the Ministry of Agriculture and Forestry and corresponds to the number of specimens which may biologically be removed without the populations being endangered. It is not, therefore, a quota which must be attained or exhausted.

18 The Finnish Government submits that its practice does not prevent the maintenance in Finland of a favourable conservation status of the wolf population. That population has increased considerably in recent years. The same is true for the geographic population area. Moreover, the dynamics data on the species concerned indicates that it is likely to maintain itself on a long-term basis as a viable component of its natural habitats.

19 As regards the condition that there is 'no satisfactory alternative', the Finnish Government contends that many different means are used as far as possible, either alone or in combination, in order to prevent or reduce the damage caused by wolves. In any event, the game management districts consider all satisfactory alternatives before issuing a hunting permit. In that connection, the Finnish Government stresses the fact that the alternatives to which the Commission refers in the present case are not appropriate to each individual instance.

20 According to the Finnish Government, and contrary to the Commission's submissions, Article 16(1) of the Habitats Directive does not prohibit derogations from the system of strict protection in order to prevent serious damage. Further, it is not the case that the decisions by which the competent national authorities issue wolf hunting permits do not identify the wolves which cause serious damage. The decisions precisely determine the geographical areas covered by the permits where wolves causing such damage are present. However, since wolves live in packs the hunting permit cannot always identify the specimen(s) causing the damage. Nevertheless, where the particular wolves in question belonging to the pack are known, they are the subject of the hunting permit issued. Furthermore, where the animal concerned moves about alone, the hunting permit may also refer to it individually.

Findings of the Court

21 As the Advocate General rightly observes in point 16 of her Opinion, in this case the Commission does not challenge either Finnish legislation or a specific case of killing wolves, but criticises the administrative practice of the Finnish authorities regarding wolf hunting.

22 A failure to fulfil obligations may arise due to the existence of an administrative practice which infringes Community law, even if the applicable national legislation itself complies with that law (see Case C-441/02 *Commission* v *Germany* [2006] ECR I-3449, paragraph 47).

23 It is clear from established case-law that in an action for failure to fulfil obligations it is for the Commission to prove the existence of the alleged infringement. It is the Commission which must provide the Court with the information necessary for it to determine whether the infringement is made out, and the Commission may not rely on any presumption for that purpose (see, inter alia, Case C-434/01 *Commission* v *United Kingdom* [2003] ECR I-13239, paragraph 21, and *Commission* v *Germany*, paragraph 48).

24 Thus, in the context of this action, it is incumbent upon the Commission to prove that the practice followed in Finland adversely affects the system, laid down by Article 12(1) of the Habitats Directive, providing strict protection for the wolf as a species listed in Annex IV(a), on the ground that derogations from that system are not granted in compliance with the conditions laid down in Article 16(1) of the directive (see, to that effect, *Commission* v *United Kingdom*, paragraph 22).

25 Since the latter provision provides for exceptional arrangements which must be interpreted strictly and must impose on the authority taking the decision the burden of proving that the necessary conditions are present for each derogation, the Member States are required to ensure that all action affecting the protected species is authorised only on the basis of decisions containing a clear and sufficient statement of reasons which refers to the reasons, conditions and requirements laid down in Article 16(1) of the Habitats Directive (see, to that effect, Case C-60/05 *WWF Italia and Others* [2006] ECR I-5083, paragraph 34).

26 In this case it is common ground that:

— the Finnish authorities authorise wolf hunting each year, to a limited extent, by way of derogation;

— according to the report on the threat to species in Finland in 2000, published in 2001 by the Ministry of the Environment and the Finnish Environment Centre (Pertti Rassi, Aulikki Alanen, Tiina Kanerva ja Ilpo Mannerkoski: (toim.): Suomen lajien uhanalaisuus 2000. Uhanalaisten lajien II seurantaryhmä. Ympäristöministeriö & Suomen ympäristökeskus, Helsinki 2001), the wolf is classified as an endangered species in Finland;

— in that report, it is stated that the number of wolves capable of reproducing is less than 50, a figure which is the limit below which an acute danger of extinction exists;

— according to point 7.2 of the Management Plan for the Wolf Population, published in 2005 by the Ministry of Agriculture and Forestry ('the management plan'), it can be estimated that Finland requires 20 breeding pairs in order to ensure the maintenance in the long term of a wolf population as a viable component of its natural habitats;

— as regards 2001, 2002, 2003 and 2004, the number of breeding pairs was estimated, according to point 2.1.5 of the management plan, at 11, 12, 13 and 16 respectively.

27 It appears therefore, having regard to the criterion laid down in the first indent of Article 1(i) of the Habitats Directive, that at the end of the period set in the reasoned opinion the conservation status of the wolf in Finland was not favourable.

28 Article 16(1) of the directive makes the favourable conservation status of the populations of the species concerned in their natural range a necessary precondition in order for the derogations for which it provides to be granted (see Case C-508/04 *Commission* v *Austria* [2007] ECR I-3787, paragraph 115).

29 None the less, the grant of such derogations remains possible by way of exception where it is duly established that they are not such as to worsen the unfavourable conservation status of those populations or to prevent their restoration at a favourable conservation status. Following the example of the views formulated by the Commission, in particular in paragraphs 47 to 51 of Section III of its Guidance document on the strict protection of animal species of Community interest under the Habitats Directive 92/43/EEC (final version, February 2007), it is possible that the killing of a limited number of specimens may have no effect on the objective envisaged in Article 16(1) of the Habitats Directive, which consists in maintaining the wolf population at a favourable conservation status in its natural range. Such a derogation would therefore be neutral for the species concerned.

30 It is clear from two decisions to issue wolf hunting permits, which were taken by the Finnish authorities before the Commission sent the letter of formal notice to the Republic of Finland and were produced before the Court by the Commission, that in both those cases the authorities permitted the hunting of a fixed number of wolves in a well defined geographical area, but without relying on an assessment of the conservation status of the species, without providing a clear and sufficient statement of reasons as to the absence of a satisfactory alternative and without specifically identifying the wolves causing serious damage which could be killed.

31 Such decisions, which are not based on an assessment of the effect of the killing of the wolves that they authorise on the maintenance at a favourable conservation

status of the population of that species in its natural range, and which do not contain a clear and sufficient statement of reasons as to the absence of a satisfactory alternative, are contrary to Article 16(1) of the Habitats Directive.

32 However, as is clear from paragraph 21 of this judgment, by this action the Commission does not seek to complain of specific cases, but criticises the administrative practice of the Finnish authorities regarding wolf hunting.

33 In that connection, the Court has held that, although a State's action consisting in an administrative practice contrary to the requirements of Community law can amount to a failure to fulfil obligations for the purposes of Article 226 EC, that administrative practice must be, to some degree, of a consistent and general nature (see, in particular, *Commission* v *Germany*, paragraph 50).

34 Furthermore, as is clear from settled case-law, the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation prevailing in the Member State at the end of the period laid down in the reasoned opinion (see, inter alia, Case C-494/01 *Commission* v *Ireland* [2005] ECR I-3331, paragraph 29).

35 In this case, the Commission has not produced any of the decisions relating to the issuing of wolf hunting permits that the Finnish authorities have taken after the decisions noted in paragraph 30 of this judgment, with the exception of two decisions in 2006, to which it refers in order to emphasise the progress made in the matter by the Finnish authorities in the meantime.

36 Furthermore, the Commission, which in these proceedings has never pleaded a lack of sincere cooperation by the Finnish authorities as regards the communication of decisions relating to the issuing of hunting permits, has not provided the Court with any decision of that kind dating from the period corresponding to the end of the pre-litigation procedure and capable of providing the Court with the evidence necessary to ascertain whether the complaints are well founded.

37 Moreover, it must be recalled, as stated in paragraph 26 of this judgment, that the number of breeding pairs rose from 11 to 16 in the period from 2001 to 2004. Nor is it disputed that during the same period the total number of wolves present on Finnish territory rose from between 110 and 130 specimens to between 185 and 200 specimens.

38 Although that data is not in itself conclusive, it is in any event capable of showing that, in spite of the wolf hunting authorised by way of derogation in Finland, the conservation status of the species concerned substantially and consistently improved in that Member State during the pre-litigation phase and a significant part of the period before the present action was brought.

39 Therefore, the Commission has not adduced sufficient evidence as to the existence of an administrative practice by the Finnish authorities of issuing wolf hunting permits without relying on an assessment of the conservation status of the species or without providing a clear and sufficient statement of reasons as to the absence of a satisfactory alternative.

40 As regards the complaint by the Commission relating to the fact that hunting permits are issued on a preventive basis or, in any event, without any relationship

with the particular wolves causing serious damage being duly established, it must be observed, as the Advocate General has also noted in point 29 of her Opinion, that Article 16(1) of the Habitats Directive does not require serious damage to be sustained before derogating measures can be adopted.

41 However, it is the case that the Finnish Government admits that, as the wolf is an animal which generally lives in a pack, hunting permits cannot always target the specimen(s) which cause serious damage.

42 Although it cannot be automatically ruled out that authorising the killing of one or several wolves in a pack certain of whose members cause or are likely to cause such damage may prevent, eliminate or reduce that damage, it must be stated that the information on the file is not capable of confirming that hypothesis.

43 In that regard, as stated in point 5.4.5 of the management plan, certain parties are of the opinion that continued hunting keeps wolves wary of humans and thus helps to reduce damage, while others consider that hunting of wolves which belong to packs only increases damage. Furthermore, it is stated that little biological research on this topic is available.

44 In those circumstances, the Commission's complaint relating to the fact that hunting permits are issued on a preventive basis must be upheld.

45 As to the fact that decisions to issue wolf hunting permits are also subject to a maximum regional limit of specimens which may be killed in each game management district, this cannot be regarded as contrary to Article 16(1) of the Habitats Directive. That limit, which is set according to the number of specimens which may be killed without endangering the species in question, is, as the Advocate General has observed in point 33 of her Opinion, only the framework within which the game management districts may issue hunting permits where, in addition, the conditions in Article 16(1) of the Habitats Directive are fulfilled.

46 Having regard, in particular to what is stated in paragraph 8 of this judgment, the fact that during the 2003-04 season the limit in question was in fact exceeded cannot in itself be sufficient to prove that the Finnish authorities have issued hunting permits to an extent which may harm the maintenance at a favourable conservation status of wolf populations in their natural range.

47 Accordingly, by authorising wolf hunting on a preventive basis, without it being established that the hunting is such as to prevent serious damage within the meaning of Article 16(1)(b) of the Habitats Directive, the Republic of Finland has failed to fulfil its obligations under Articles 12(1) and 16(1)(b) of that directive; the remainder of the Commission's application must be dismissed.

Costs

48 Under the first subparagraph of Article 69(3) of the Rules of Procedure, the Court may order that the costs should be shared or that the parties are to bear their own costs where each party succeeds on some and fails on other heads.

49 Since both parties have failed in one or several of their claims, they must be ordered to bear their own costs.

On those grounds, the Court (Second Chamber) hereby:

1. Declares that, by authorising wolf hunting on a preventive basis, without it being established that the hunting is such as to prevent serious damage within the meaning of Article 16(1)(b) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, the Republic of Finland has failed to fulfil its obligations under Articles 12(1) and 16(1)(b) of that directive;

2. Dismisses the action as to the remainder;

3. Orders the Commission of the European Communities and the Republic of Finland to bear their own costs.

[Signatures]

JUDGMENT OF THE COURT (Fourth Chamber)

10 May 2007 *

In Case C-508/04,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 8 December 2004,

Commission of the European Communities, represented by M. van Beek and B. Schima, acting as Agents, and by M. Lang, Rechtsanwalt, with an address for service in Luxembourg,

applicant,

v

Republic of Austria, represented by E. Riedl and H. Dossi, acting as Agents, with an address for service in Luxembourg,

defendant,

* Language of the case: German.

THE COURT (Fourth Chamber),

composed of K. Lenaerts, President of the Chamber, R. Silva de Lapuerta (Rapporteur), G. Arestis, J. Malenovský and T. von Danwitz, Judges,

Advocate General: J. Kokott,
Registrar: R. Grass,

having regard to the written procedure,

after hearing the Opinion of the Advocate General at the sitting on 11 January 2007,

gives the following

Judgment

1 By its application, the Commission of the European Communities requested the Court to declare that the Republic of Austria has failed to fulfil its obligations under Articles 1, 6(1) to (4), 7, 11, 12, 13, 15, 16(1) and 22(b) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7; 'the Directive').

Legal context

Community legislation

2 Article 1 of the Directive contains a number of definitions, including the following:

'(e) *conservation status of a natural habitat* means the sum of the influences acting on a natural habitat and its typical species that may affect its long-term natural distribution, structure and functions as well as the long-term survival of its typical species within the territory referred to in Article 2.

The conservation status of a natural habitat will be taken as "favourable" when:

— its natural range and areas it covers within that range are stable or increasing, and

— the specific structure and functions which are necessary for its long-term maintenance exist and are likely to continue to exist for the foreseeable future, and

— the conservation status of its typical species is favourable as defined in (i);

...

(g) *species of Community interest* means species which, within the territory referred to in Article 2, are:

(i) endangered, except those species whose natural range is marginal in that territory and which are not endangered or vulnerable in the western palearctic region; or

(ii) vulnerable, i.e. believed likely to move into the endangered category in the near future if the causal factors continue operating; or

(iii) rare, i.e. with small populations that are not at present endangered or vulnerable, but are at risk. The species are located within restricted geographical areas or are thinly scattered over a more extensive range; or

(iv) endemic and requiring particular attention by reason of the specific nature of their habitat and/or the potential impact of their exploitation on their habitat and/or the potential impact of their exploitation on their conservation status.

Such species are listed or may be listed in Annex II and/or Annex IV or V;

(h) *priority species* means species referred to in (g)(i) for the conservation of which the Community has particular responsibility in view of the proportion of their natural range which falls within the territory referred to in Article 2; these priority species are indicated by an asterisk (*) in Annex II;

(i) *conservation status of a species* means the sum of the influences acting on the species concerned that may affect the long-term distribution and abundance of its populations within the territory referred to in Article 2;

The *conservation status* will be taken as "favourable" when:

— population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats, and

— the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future, and

— there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis;

...

(l) *special area of conservation* means a site of Community importance designated by the Member States through a statutory, administrative and/or contractual act where the necessary conservation measures are applied for the maintenance or restoration, at a favourable conservation status, of the natural habitats and/or the populations of the species for which the site is designated'.

3 Article 6(1) of the Directive states that, 'for special areas of conservation, Member States shall establish the necessary conservation measures involving, if need be, appropriate management plans specifically designed for the sites or integrated into other development plans, and appropriate statutory, administrative or contractual measures which correspond to the ecological requirements of the natural habitat types in Annex I and the species in Annex II present on the sites'.

4 Article 6(2) of the Directive provides that 'Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of [the] Directive'.

5 Article 16(1) of the Directive states:

'Provided that there is no satisfactory alternative and the derogation is not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range, Member States may derogate from the provisions of Articles 12, 13, 14 and 15(a) and (b):

(a) in the interest of protecting wild fauna and flora and conserving natural habitats;

(b) to prevent serious damage, in particular to crops, livestock, forests, fisheries and water and other types of property;

(c) in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment;

(d) for the purpose of research and education, of repopulating and re-introducing these species and for the [breeding] operations necessary for these purposes, including the artificial propagation of plants;

(e) to allow, under strictly supervised conditions, on a selective basis and to a limited extent, the taking or keeping of certain specimens of the species listed in Annex IV in limited numbers specified by the competent national authorities.'

6 Article 22(b) of the Directive states in particular that the Member States are to 'ensure that the deliberate introduction into the wild of any species which is not native to their territory is regulated so as not to prejudice natural habitats within their natural range or the wild native fauna and flora and, if they consider it necessary, prohibit such introduction'.

The provisions of Laws and regulations of the various Austrian provinces the compatibility of which with the Directive's provisions is contested

Province of Lower Austria

7 The following provisions are at issue: Paragraph 95 of the Law of Lower Austria on Hunting (Niederösterreichisches Jagdgesetz 1974, LGBl. (Niederösterreich) No 76/74; 'the Nö JagdG'); Paragraphs 9(5), 17(5), 20(4), 21 and 22 of the Law of Lower Austria on Nature Protection (Niederösterreichisches Naturschutzgesetz 2000, LGBl. (Niederösterreich) No 87/2000; 'the Nö NSchG').

8 Paragraph 95 of the Nö JagdG provides:

'1. All non-selective hunting methods are prohibited; in particular it is prohibited:

...

(3) to hunt at night, that is to say during the period from 90 minutes after sundown until 90 minutes before sunrise; the hunting of wild boar, predatory game, capercaillie, black grouse, wild goose, wild duck and snipe is excluded from this prohibition;

(4) to use, when capturing or killing game, devices for illuminating targets (with the exception of mobile lamps ...), artificial night-time sighting aids, such as infra-red apparatus, electronic sight units, sighting devices for night shooting comprising an electronic image magnifier or image converter, such as residual light amplifiers;

...

(8) to use blind or mutilated animals as live decoys, or anaesthetic bait; to use tape recorders, or electric or electronic devices capable of killing or stunning; to use mirrors or other dazzling devices, explosives, or nets that operate non-selectively; to gas or smoke animals out;

(9) to hunt game birds with snares, limes, hooks, nets or traps;

(10) to hunt from aircraft, moving motor vehicles, or boats that can be operated at a speed of more than five kilometres per hour.

...'

9 Paragraph 9 of the Nö NSchG provides:

'...

2. ... the following definitions shall apply:

...

(6) "conservation status of a natural habitat" means the sum of the influences acting on a natural habitat and its typical species that may affect its long-term natural distribution, structure and functions as well as the long-term survival of its typical species;

(7) "priority species" means wild fauna and flora for the conservation of which the Community has particular responsibility and which are indicated by an asterisk (*) in Annex II to the Habitats Directive;

(8) "conservation status of a species" means the sum of the influences acting on the species concerned that may affect the long-term distribution and abundance of its populations;

(9) "conservation objectives" means the maintenance or restoration at a favourable conservation status of the natural habitats listed in Annex I to the Habitats Directive

and the species of fauna and flora listed in Annex II to that directive which a site of Community importance hosts, and of the species of birds listed in Annex I to the Birds Directive or referred to in Article 4(2) of that directive and their habitats which a European bird protection area hosts.

3. Sites referred to in subparagraph 1 shall, by regulation of the Provincial Government, be declared special areas of conservation called "European areas of conservation". In particular, existing nature conservation areas and landscape conservation areas may also be declared European areas of conservation.

4. The regulation adopted in accordance with subparagraph 3 shall lay down the boundaries of the area of conservation, the subject-matter of protection in each case, in particular priority natural habitat types and priority species, the conservation objectives and, if need be, the obligations and prohibitions necessary in order to achieve a favourable conservation status. In particular, measures which may lead to destruction of, or substantial detriment to, the area of conservation or its components are to be prohibited. More stringent protective provisions under this Law shall not be affected.

5. European areas of conservation shall, if need be, be the subject of appropriate maintenance, development and conservation measures of a governmental or contractual nature which reflect the ecological requirements of the natural habitat types under Annex I and the species under Annex II to the Habitats Directive, and of the species of birds in Annex I to the Birds Directive, which those areas host (management plan). In so far as those measures have implications for land-use planning, they shall be submitted to the Land-Use Planning Advisory Board, with the exception of measures for the administration of European areas of conservation.

6. The Provincial Government shall monitor and document the conservation status of the natural habitats and wild fauna and flora. In so doing, particular regard shall be had to priority natural habitat types and priority species.'

10 Paragraph 17 of the Nö NSchG provides:

'...

(5) The planting and promotion of non-native plants and plants inappropriate to the location and the release and promotion in the wild of non-native fauna require authorisation from the Provincial Government. Authorisation shall be refused if native populations appropriate to the location, the natural (genetic) characteristics of native species of fauna and flora or the beauty and characteristics of a landscape area will suffer lasting harm.'

11 Paragraph 20 of the Nö NSchG states:

'...

(4) The Provincial Government may by decision grant derogations ..., in particular for scientific or pedagogical purposes, when there is no reason to fear a material risk to protected flora growing in the wild and protected fauna living in the wild ... The authorisation shall lay down at least:

1. the species which are subject to the derogation,

2. the means, arrangements or methods authorised for capture or killing and

3. the controls which will be carried out.'

12 Paragraph 21 of the Nö NSchG provides:

'1. Without prejudice to specific rules laid down by the provisions of this Law or to regulations or decisions adopted on the basis of this Law, measures connected with commercial use of land shall remain in principle unaffected ... This exemption clause does not apply where protected flora and fauna or protected habitats are deliberately harmed or fauna and flora threatened with extinction ... are affected by measures.

2. Without prejudice to specific rules laid down by the provisions of this Law or to regulations or decisions adopted on the basis of this Law, measures connected with an up-to-date and sustainable agricultural or silvicultural use of land within the framework of an agricultural or silvicultural operation shall remain in principle unaffected ... This exemption clause does not apply where protected flora and fauna or protected habitats are deliberately harmed or fauna and flora threatened with extinction ... are affected by measures.

3. Agricultural or silvicultural use shall be considered to be up-to-date and sustainable where the activities in an agricultural or silvicultural operation serve to produce or obtain plant or animal products and are organised in accordance with processes which are customary in a particular area and at a particular time or on the

basis of traditional experience, and the use, adapted to the natural conditions, durably ensures performance in a functioning system, without the productive base being exhausted and nature and landscape being unduly burdened.'

13 Paragraph 22 of the Nö NSchG states:

'1. Instead of, or in addition to, the governmental safeguarding of nature protection interests, agreements under private law may also be concluded by the Province of Lower Austria in order to achieve nature protection objectives, in particular in order to conserve, maintain, safeguard and develop sites which are valuable from the point of view of nature protection or are important to the landscape. Such agreements must above all be concerned with the conservation and maintenance, subject to appropriate conditions, of fairly small natural or semi-natural expanses of stagnant surface water, of wet meadowland and of dry and nutrient-poor sites, and also of coppices located in open farmland, and hedges, that are valuable from the point of view of nature protection. Other support measures include:

— payment for measures to create, conserve or improve other areas and objects valuable for nature protection;

— the promotion of a method of use or management that is appropriate particularly to the interests of nature protection, in areas that are ecologically important or important in landscape terms;

— the promotion of measures to improve important rural ecology functions (for example, biotope network, extensification, switch to natural methods for pursuing agricultural and silvicultural activity).

...'

Province of Upper Austria

14 The provision at issue is Paragraph 15(2) of the Law of Upper Austria on Nature and Countryside Protection (Oberösterreichisches Natur- und Landschaftsschutzgesetz 2001, LGBl. (Oberösterreich) No 129/2001; 'the Oö NSchG').

15 That provision states:

'For countryside conservation areas ..., protected countryside zones ..., European areas of conservation ... or nature reserves ..., the Provincial Government may prepare countryside maintenance plans defining those measures which in accordance with subparagraph 1 are necessary in the public interest and which do not significantly hamper the authorised economic use of the affected land. In the absence of an agreement under private law or statutory provisions to the contrary, the costs of implementing such countryside maintenance plans must be borne by the Province as the holder of private rights. The landowner (person with the power of disposal) must permit such measures.'

Province of Salzburg

16 The following provisions are at issue: Paragraphs 3a, 5(8) to (10), 22a, 22b, 29 and 34 of the Law of Salzburg on Nature Protection (Salzburger Naturschutzgesetz 1999, LGBl. (Salzburg) No 73/1999; 'the Sbg NSchG'); Paragraph 104(4) of the Law of Salzburg on Hunting (Salzburger Jagdgesetz 1993, LGBl. (Salzburg) No 100/1993; 'the Sbg JagdG').

17 Paragraph 3a of the Sbg NSchG provides:

'1. When applying this Law and regulations adopted on the basis of this Law, the guiding principle is that the public interest in nature protection may be accorded precedence over all other interests.

2. Measures which, demonstrably, directly serve particularly important public interests are to be approved or taken into account, subject to the interests of nature protection ... being largely safeguarded, if:

(1) in the specific case, the other public interests have precedence over the interests of nature protection and

(2) it is demonstrated that there is no appropriate alternative to the measure in question that would have a lesser adverse effect on the interests of nature protection.

3. Where it can be anticipated that measures under subparagraph 2 will have a significant adverse effect on priority natural habitat types ... or priority species ... in European areas of conservation within the meaning of Paragraph 5(10)(a) and (c), only considerations connected with the following matters of public interest can be included in the weighing of interests:

(1) human life and health,

(2) public safety,

(3) beneficial consequences of primary importance for the environment.

Other public interests can be included in the weighing of interests only if an opinion from the ... Commission has first been obtained. The decision must have regard to that opinion.

4. Where, following a weighing of interests under subparagraph 2 or 3, the interests of nature protection do not have precedence, the adverse effect anticipated to result from the interference is, except in a case covered by subparagraph 6, to be compensated for by appropriate substitute measures. The compensation shall be prescribed by decision. Where the interference concerns particular habitats and populations of fauna and flora, above all the creation of replacement habitats comes into question as a substitute measure. These replacement habitats shall, where possible, be created in the immediate vicinity of the place of the interference. If no

replacement habitats can be created, the applicant shall be required, by decision, to pay a sum of money of an amount corresponding approximately to the costs of an appropriate substitute measure. Where replacement habitats can be created only to an insufficient extent, an appropriately reduced sum of money shall be required to be paid.

5. Where subparagraph 4 applies, the Provincial Government shall, in the case of European areas of conservation, safeguard the coherence of the European ecological network "Natura 2000". The measures adopted for that purpose shall be communicated to the ... Commission.

6. Substitute measures shall not be prescribed in respect of measures which:

(1) are necessary and unavoidable because of a risk to human life or health or in order to avert serious damage to the national economy, and

(2) have no effects on European areas of conservation.'

18 Paragraph 5 of the Sbg NSchG provides:

'For the purposes of this Law:

...

(8) "Interference with a protected site or object" means temporary or permanent measures which, individually or together with other measures, can have not merely insignificant effects, on the protected site or object or with regard to the protective purpose, or can be expected to have such effects through the multiple repetition or accumulation of such measures. Interference also takes place where the measures themselves originate from outside the protected site or object.

(9) "Conservation objectives of a European area of conservation" means the maintenance or restoration at a favourable conservation status:

(a) of the natural habitats specified in Annex I to the Habitats Directive or of the species of fauna and flora specified in Annex II to that directive;

(b) of the species of birds in Annex I to the Birds Directive, of regularly occurring migratory species (Article 4(2) of that directive), and of their habitats, paying particular attention to wetlands of international importance.

(10) "European areas of conservation" means:

(a) sites of Community importance which are entered on the list envisaged in Article 4(2) of the Habitats Directive;

(b) sites which, until the list referred to in (a) exists, have been included in a list pursuant to Article 4(1) of the Habitats Directive;

(c) bird protection areas under Article 4(1) and (2) of the Birds Directive.

...'

19 Paragraph 22a of the Sbg NSchG provides:

'...

2. For European areas of conservation, the Provincial Government shall enact by regulation protective provisions which in any event contain the protective purpose and the necessary requirements and prohibitions. The regulation shall also define the boundaries of the area of conservation. The protective purpose shall indicate the conservation objectives (Paragraph 5(9)) of the area of conservation in question. ...

3. The regulation governing a European area of conservation may prohibit or require measures, and allow certain interference generally or by dispensation granted by the Provincial Government. It shall be ensured by prohibitions, requirements and provisos to dispensations that those natural habitats and those

species of fauna and flora in respect of which, in accordance with the protective purpose, a favourable conservation status is to be maintained or restored are, respectively, not impaired and not significantly disturbed.

4. Before a dispensation is granted, the Provincial Government shall examine whether the interference may have a significant effect on the components of the European area of conservation that are essential for the conservation objectives (Paragraph 5(9)) (assessment of implications). The dispensation shall be granted only if no significant effect is to be anticipated.

5. The adoption of a regulation in accordance with subparagraphs 2 and 3 is not required if adequate protection and achievement of the conservation objective are already ensured for the area by other measures. More stringent protective provisions shall remain unaffected.

6. If necessary, countryside maintenance plans and also detailed plans ... shall be drawn up and implemented for European areas of conservation, having regard to Article 4(1) and (2) of the Birds Directive and Article 6(1) of the Habitats Directive. The conservation status of European areas of conservation shall be regularly monitored by the Provincial Government and, in so doing, particular regard is to be had to priority natural habitat types and priority species.'

20 Paragraph 22b of the Sbg NSchG states:

'1. Until adequate protective provisions have been enacted ..., measures in enjoyment of land may be carried out only in the way, and to the extent, that they were lawfully undertaken ...

2. All measures going beyond what is referred to in subparagraph 1 which may have a significant effect on natural habitats or species of fauna or flora in respect of which, in accordance with the Habitats Directive or the Birds Directive, a favourable conservation status is to be maintained or restored may be undertaken only with authorisation from the Provincial Government.

3. Authorisation is to be granted where the measure can cause no deterioration of the habitats covered by subparagraph 2 or significant disturbance of the species covered by subparagraph 2 and, in addition, it does not run counter to the objective of maintaining or creating a favourable conservation status for those habitats or species.

4. More stringent protective provisions shall remain unaffected.'

21 Paragraph 29 of the Sbg NSchG provides:

'1. Wild plants growing in the open whose population is threatened generally or in specific areas and in whose conservation there is a public interest on grounds of nature protection, and plants which are necessary for maintaining a balanced ecosystem, in particular for safeguarding the population of other plant species and of animals, may be protected entirely or partially by regulation of the Provincial Government. The protection can be limited both in time and in area.

2. The protection of plants in their entirety extends to all their parts, above and below ground. It encompasses a prohibition on damaging them, destroying them,

removing them from their location or treating the location of such plants in such a way that their further existence is jeopardised or precluded, and on keeping or transporting plants taken in the wild or accepting or furnishing such plants against or without payment. The prohibition on keeping or transporting plants or accepting or furnishing them against or without payment also relates to any derivative of the plant and any other goods which appear, from an accompanying document, the packaging or a mark or label, or from any other circumstances, to be parts or derivatives of the plant.'

22 Paragraph 34 of the Sbg NSchG provides:

'1. The competent nature protection authority may, on application, authorise derogations from the prohibitions under [inter alia] Paragraph 29(2) and (3) ... Authorisation may ... only be granted for measures which serve one of the following purposes:

(1) public health including the production of medicinal products;

(2) the production of beverages;

(3) public safety;

(4) air safety;

(5) the protection of wild flora and fauna or the conservation of their habitats;

(6) research or teaching;

(7) the building up of populations or resettlement elsewhere;

(8) the prevention of serious damage to crops and forests, to animals for production or domestic animals, to fishing grounds or to waters;

(9) the construction of installations;

(10) other grounds of overriding public interest.

2. Points 9 and 10 of subparagraph 1 are inapplicable to birds. Points 2 and 9 of subparagraph 1 do not apply to plant species named in Annex IV to the Habitats Directive.

3. Authorisations under subparagraph 1 may be granted only if the purpose of the measure cannot be satisfactorily achieved by other means and the relevant population of the animal or plant species in question also does not suffer deterioration in the area of the interference.

4. Applications for authorisation under subparagraph 1 must state grounds and contain the following details:

...

6. Authorisation cannot be granted to the following persons:

...

7. The authorisation must contain all the details laid down in subparagraph 4 and state that it does not replace the agreement under private law of the person having the power of disposal over the land in question. In the case of authorisations for scientific purposes, the authority shall in addition require that the documentation is to be held in safekeeping, in agreement with a recognised scientific institution.

...'

23 Paragraph 104 of the Sbg JagdG provides:

'...

4. The authority may authorise further derogations from the prohibitions ... where that does not jeopardise the population of the species of game concerned and there is no satisfactory alternative for achieving the purpose pursued. Such derogations may be granted only for the following purposes:

(a) to protect other wild animals and plants and to conserve their natural habitats;

(b) to avoid serious damage to crops, livestock, forests, fishing waters and, in the case of furred game, to other forms of property;

(c) in the interests of public health and public safety or, in the case of furred game, also for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment;

(d) for the purposes of research and teaching;

(e) to increase the population of those species or reintroduce them, and for the breeding required to that end;

(f) for trade in a small number of animals (or parts of animals or products obtained from those animals) of those species of feathered game which ... are allowed to be captured or killed.'

Province of Tyrol

24 The following provisions are at issue: Paragraphs 1(1), 2(2), 5 to 9, 22 to 24 and 28(3) of the Law of Tyrol on Nature Protection (Tiroler Naturschutzgesetz 1997, LGBl. (Tirol) No 33/1997; 'the Tiroler NSchG'); Paragraph 1(1) and (2)(a) and (b), Paragraph 3, the first sentence of Paragraph 6(1) and Paragraph 6(2) of the Regulation of Tyrol on Nature Protection (Tiroler Naturschutzverordnung 1997, LGBl. (Tirol) No 95/1997; 'the Tiroler NSchVO').

25 Paragraph 1(1) of the Tiroler NSchG provides:

'This Law has the objective of conserving and maintaining nature, a foundation of human life, in such a way that:

(a) its diversity, special features and beauty,

(b) its recreational value,

(c) the richness of species in the indigenous animal and plant world and its natural habitats, and

(d) its balance, as unimpaired and efficient as possible,

are preserved and sustainably safeguarded or restored. The conservation and maintenance of nature extend to all its manifestations, in particular to the landscape, and indeed irrespective of whether the landscape is in its original state or has been fashioned by man. Environmentally friendly agriculture and silviculture have particular importance in this regard. Demands can be made on nature only to the extent that its value remains preserved for subsequent generations.'

26 Paragraph 2(2) of the Tiroler NSchG provides:

'Measures that are customary in agriculture and silviculture require no authorisation under this Law.

That does not apply to measures in alluvial forests ..., in wetlands ..., in nature reserves and special protection areas ...'

27 Paragraph 5 of the Tiroler NSchG provides:

'The following are prohibited throughout the territory of the Province:

(a) the conduct of sporting competitions with motor vehicles powered by an internal combustion engine, except on areas for which an authorisation ... exists;

(b) the use of helicopters to transport persons for tourism purposes, except between airports;

(c) the use of watercraft which are powered by a combustion engine on natural watercourses, except to implement schemes for which an authorisation under nature protection law exists and to the extent necessary for those schemes;

(d) any lasting impairment of glaciers and their drainage basins, except in the case of the operation, maintenance and repair of existing installations and their alteration ...'

28 Paragraph 22 of the Tiroler NSchG provides:

'1. The Provincial Government shall by regulation declare to be protected plant species those species of wild plants whose population is threatened generally or in specific areas but whose conservation is required in order to safeguard the interests of nature protection in accordance with Paragraph 1(1).

2. In regulations adopted under subparagraph 1, the Provincial Government may, in so far as this is necessary in order to safeguard the population of particular species of plants, prohibit any person from:

...'

29 Paragraph 23 of the Tiroler NSchG states:

'1. The Provincial Government shall by regulation declare to be protected animal species those species of non-huntable wild animals whose population is threatened generally or in specific areas but whose conservation is required in order to safeguard the interests of nature protection in accordance with Paragraph 1(1).

2. In regulations adopted under subparagraph 1, the Provincial Government may, in so far as this is necessary in order to safeguard the population of particular species of animals, prohibit any person from:

(a) disturbing, pursuing, capturing, holding, keeping whether alive or dead, transporting, offering for sale, selling, acquiring or killing animals of protected species;

(b) removing from their natural surroundings, damaging or destroying, keeping, transporting, offering for sale, selling or acquiring developing forms (such as eggs, larvae and chrysalises) of animals of protected species;

(c) keeping, transporting, offering for sale, selling or acquiring parts of animals of protected species (such as feathers, skins);

(d) removing or destroying breeding places or nests of animals of protected species;

(e) treating the habitat ... of animals of protected species ... in such a way that their continued existence in that habitat becomes impossible.

Prohibitions under (a) to (d) above may be limited to a specific number of animals and their developing forms, to specific developing forms and to specific periods and areas; prohibitions under (e) above may be limited to specific periods and areas.

3. Any person who claims that animals of protected species which he, for the purposes of his occupation, transports, holds, uses or offers for sale have been obtained by him from rearing in Tyrol or have been brought by him into Tyrol from another province or from abroad must, upon request, prove that to the authority.

4. An authorisation under nature protection legislation is required for the release into the wild of animals which are not subject to the provisions of hunting or fisheries law and are not of a native species. Such an authorisation may be granted only if neither a major alteration to existing plant life and wildlife nor prejudice to the interests of nature protection in accordance with Paragraph 1(1) is to be anticipated.

5. In regulations under subparagraph 1, the Provincial Government may enact provisions on the capture and gathering of wild animals of protected species,

including their developing forms, in order to ensure that those activities are carried out properly. In this context, certain methods of capture and the use of certain means of capture may be prohibited.'

30 Paragraph 24 of the Tiroler NSchG provides:

'It is prohibited deliberately to disturb or to pursue wild non-huntable animals of unprotected species, to capture them without justified reason and to remove, damage or destroy their breeding places, nets or developing forms without justified reason.'

Pre-litigation procedure

31 After analysing the various Laws and regulations relating to the transposition of the Directive of which the Republic of Austria had produced copies, on 13 April 2000 the Commission sent that Member State a letter of formal notice complaining that it had not transposed a number of the Directive's provisions completely or correctly.

32 By letter of 27 July 2000, the Republic of Austria submitted observations in this connection to the Commission. It informed the Commission in particular that measures were being taken to amend a number of domestic provisions. However, it put forward arguments divergent from those of the Commission as regards other aspects of the Directive's transposition.

33 By letter of 17 October 2003, the Commission delivered a reasoned opinion in which it concluded that, by not transposing a number of the Directive's provisions completely or correctly, the Republic of Austria had failed to fulfil its obligations under the Directive.

34 By letter of 23 December 2003, the Republic of Austria replied to the reasoned opinion along similar lines to its reply to the letter of formal notice.

35 In those circumstances, the Commission decided to bring the present action.

Procedure before the Court

36 In its application the Commission put forward 27 grounds of infringement against the defendant.

37 In its defence, the defendant accepted that 17 of those grounds were well founded and adhered to its position as to the remainder.

38 In its reply, the Commission withdrew two grounds of infringement.

39 Following a request, made by the Court under Article 54a of the Rules of Procedure, to submit additional information concerning the domestic legal instruments covered by the action the Commission also withdrew its action in so far as it concerned the grounds of infringement relating to Articles 6(3) and (4), 7, 11 and 15 of the Directive.

40 As a result, the action in fact concerns 14 grounds of infringement, which relate to the transposition of Article 1, Article 6(1) and (2), Articles 12 and 13, Article 16(1) and Article 22(b) of the Directive.

41 The Republic of Austria does not dispute that Austrian law, as it stood on expiry of the period laid down in the reasoned opinion, was not consistent with the Directive's requirements with regard to a number of points, which are covered by seven grounds of infringement.

The action

Uncontested grounds of infringement

Arguments of the Commission

— Breach of Article 12 of the Directive in the Provinces of Styria and Tyrol

42 The Commission observes that Paragraph 13d(1) of the Law of Styria on Nature Protection (Steiermärkisches Naturschutzgesetz; 'the Stmk NSchG') provides that

the Government of the Province of Styria is to transpose Article 12 of the Directive by adopting a regulation for that purpose. However, Paragraph 4 of the Regulation of Styria on Nature Protection (Steiermärkische Naturschutzverordnung; 'the Stmk NSchVO'), which sets out the list of animals protected throughout the year, does not fully transpose Article 12 of the Directive, because it does not concern all the species protected by virtue of Annex IV(a) to the Directive.

43 The Commission states that, under Paragraph 23(l)(a) of the Tiroler NSchG, the Government of the Province of Tyrol must, by regulation, declare to be protected species those mentioned in Annex IV(a) to the Directive. However, the provisions of the Tiroler NSchVO do not set out all the species referred to.

— Breach of Article 13 of the Directive in the Provinces of Carinthia, Styria and Tyrol

44 The Commission submits that Annex 1 to the Regulation of the Province of Carinthia on the Protection of Plant Species (Kärntner Pflanzenartenschutzverordnung), which concerns Paragraph 1 of that regulation, does not adequately protect all the plant species listed in Annex IV(b) to the Directive.

45 The Commission asserts that, in accordance with Paragraph 13c(1) of the Stmk NSchG, the Government of the Province of Styria must adopt a regulation transposing Article 13 of the Directive. However, no such regulation has been adopted. Nor do Paragraphs 1 and 2 of the Stmk NschVO, which lay down the plant species that are wholly or partially protected, fully transpose the Directive, given that they do not set out all the protected species referred to in Annex IV(b) to the Directive.

46 The Commission states that, under Paragraph 22(l)(a) of the Tiroler NSchG, the Government of the Province of Tyrol must, by regulation, declare to be protected plant species those listed in Annex IV(b) to the Directive. However, the Tiroler NSchVO does not establish a regime protecting all the species included in Annex IV (b).

— Breach of Article 16(1) of the Directive in the Provinces of Styria and Tyrol

47 The Commission observes that Paragraph 62(2) of the Law of Styria on Hunting (Steiermärkisches Jagdgesetz) fails to take account of the fact that derogations are permitted only if it is ensured that the populations of the protected species are maintained at a 'favourable conservation status'.

48 The Commission submits that, for priority natural habitat types, the prohibition laid down in Paragraph 3 of the Tiroler NSchVO fails to take account of the requirement of a 'favourable conservation status'. The same applies to the plant species referred to in Paragraph 1(2)(b) of the Tiroler NSchVO and the animal species referred to in Paragraph 6(2)(e) of that regulation.

49 The Austrian Government states that a number of measures transposing the Directive are in the process of being drawn up within the competent bodies of the provinces concerned. Those provinces are thereby seeking to make all the domestic enactments at issue consistent with the Directive.

Findings of the Court

50 It is settled case-law that the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation prevailing in that Member State at the end of the period laid down in the reasoned opinion, and that the Court cannot take account of any subsequent changes in primary or secondary legislation (see, inter alia, Case C-323/01 *Commission* v *Italy* [2002] ECR I-4711, paragraph 8, and Case C-23/05 *Commission* v *Luxembourg* [2005] ECR I-9535, paragraph 9).

51 Since the reasoned opinion was notified to the Republic of Austria on 17 October 2003, and given the period laid down in the opinion, the date by which the defendant had to ensure that provisions of domestic law were consistent with the Directive's requirements was 17 December 2003.

52 It is apparent from the information provided regarding the aforementioned grounds of infringement that the Austrian Government does not dispute that the measures necessary to transpose the Directive in respect of all the points concerned had not been adopted within the period set in the reasoned opinion.

53 It must therefore be held that the action is well founded so far as concerns the grounds of infringement relating to the transposition of Article 12 of the Directive in the Provinces of Styria and Tyrol, Article 13 of the Directive in the Provinces of Carinthia, Styria and Tyrol and Article 16(1) of the Directive in the Provinces of Styria and Tyrol.

Contested grounds of infringement

Breach of Article 1 of the Directive in the Province of Salzburg

— Arguments of the parties

54 The Commission states that Paragraph 5 of the Sbg NSchG lays down a set of definitions which do not transpose correctly the definitions set out in Article 1(e), (g), (i) and (l) of the Directive of the terms 'conservation status of a natural habitat', 'species of Community interest', 'conservation status of a species' and 'special area of conservation'.

55 The Commission adds that, while it is true that Paragraph 5(9) of the Sbg NSchG refers to the concepts of maintenance and restoration of a favourable conservation status, it does not define them. Furthermore, neither Paragraph 3(a) of the Sbg NSchG, which merely provides for a weighing of interests, nor Paragraphs 22a, 22b and 29 of that Law, which relate to a number of complementary protective measures, amount to a correct transposition of Article 1 of the Directive.

56 The Austrian Government submits that the transposition of Article 1 of the Directive into the law of the Province of Salzburg is consistent with Community law. All the elements of that provision are reproduced in the applicable Law, as a result of the use of the concept of 'interference' in conjunction with the conservation objectives. The following legal terms in the Directive and national provisions are involved:

— 'conservation status of a natural habitat': Article 1(e) of the Directive; Paragraphs 5(8) and (9) and 22a(3) and (4) of the Sbg NSchG;

— 'species of Community interest': Article 1(g) of the Directive; 'conservation status of a species': Article 1(i) of the Directive; Paragraphs 3a, 22a, 22b and 29 of the Sbg NSchG;

— 'special area of conservation': Article 1(l) of the Directive; Paragraphs 5(9) and (10) and 22a of the Sbg NSchG.

— Findings of the Court

57 It should be remembered at the outset that, as is apparent from the 4th and 11th recitals in the preamble to the Directive, the habitats and species covered by the Directive form part of the Community's natural heritage and that the threats to them are often of a transboundary nature, so that the adoption of conservation measures is a common responsibility of all Member States.

58 With regard to the field under consideration, the Court has pointed out that faithful transposition is particularly important in an instance such as the present one, where management of the common heritage is entrusted to the Member States in their respective territories (see Case C-6/04 *Commission* v *United Kingdom* [2005] ECR I-9017, paragraph 25, and Case C-98/03 *Commission* v *Germany* [2006] ECR I-53, paragraph 59).

59 The Court has held with regard to the definitions set out in Article 1 of the Directive that the terms concerned must be transposed into the Member States' national law (see Case C-72/02 *Commission* v *Portugal* [2003] ECR I-6597, paragraph 17).

60 So far as concerns, first, the terms defined in Article 1(e) and (i) of the Directive ('conservation status of a natural habitat' and 'conservation status of a species'), it is to be noted that, while the words 'favourable conservation status' are used in Paragraph 5(9) of the Sbg NSchG, the wording of the contested provisions of national law does not, however, encompass all the features set out in Article 1(e) and (i) of the Directive.

61 Such a legislative technique does not ensure that all the elements of the definitions in question are actually taken into account when the Directive is implemented, although those elements are decisive for the meaning and scope of the protection afforded to the habitats and species covered.

62 Consequently, Paragraph 5(8) and (9) and Paragraphs 3a, 22a, 22b and 29 of the Sbg NSchG cannot be regarded as amounting to an adequate legislative transposition of Article 1(e) and (i) of the Directive.

63 So far as concerns, second, Article 1(g) of the Directive, this provision equally contains a large number of parameters, intended to define the term 'species of Community interest'.

64 Paragraphs 3a, 22a, 22b and 29 of the Sbg NSchG, on the other hand, concern solely a weighing of interests, supplementary measures of delegated legislation that relate to European areas of conservation, detailed rules governing the grant of dispensations from the prohibitions laid down by the Law, and the specific protection of wild plants. The concept of species of Community interest is not mentioned there.

65 Those provisions accordingly cannot be regarded as transposing Article 1(g) of the Directive.

66 So far as concerns, third, Article 1(l) of the Directive, it is to be noted that Paragraph 5(10) of the Nbg NSchG, which must be read in conjunction with Paragraph 5(9) which lays down as objective the maintenance or restoration of a favourable conservation status, uses the words 'European area of conservation' instead of 'special area of conservation'. The areas referred to by Paragraph 5(10) include the sites which have been entered by the Commission on the list of sites of Community importance, pursuant to Article 4(2) of the Directive, and the sites proposed by the Province of Salzburg for entry on that list, in accordance with Article 4(1) of the Directive.

67 In addition, Paragraph 22a(2) to (4) of the Sbg NSchG indicates with precision the measures to be taken in order to achieve the protective objectives relating to 'European areas of conservation'.

68 It follows from the foregoing that Paragraphs 5(9) and (10) and 22a of the Sbg NSchG provide with sufficient legal precision a definition of the sites which are included in the term 'special area of conservation' within the meaning of Article 1(l) of the Directive.

69 That provision has therefore been transposed correctly in the Province of Salzburg.

70 Accordingly, the present complaint is well founded only with regard to the failure to transpose Article 1(e), (g) and (i) of the Directive.

Breach of Article 6(1) of the Directive in the Province of Lower Austria

— Arguments of the parties

71 The Commission states that Paragraph 9(5) of the Nö NSchG confines itself to laying down an obligation to take, 'if need be', appropriate maintenance, development and conservation measures. However, it is apparent from Article 6(1) of the Directive that the 'necessary conservation measures' must be adopted in all cases, and not 'if need be'. In Article 6(1) the words 'if need be' concern only management plans and cannot be understood as a general restriction on the obligation to adopt the necessary statutory, administrative or contractual measures.

72 The Austrian Government contends that the obligation laid down in Article 6(1) of the Directive is not to adopt conservation measures in all cases, but only the 'necessary' conservation measures. In any event, where such measures are required in addition to the obligations and prohibitions to be laid down pursuant to Paragraph 9(4) of the Nö NSchG, they are indeed taken by the competent authorities of the Province in order to achieve a favourable conservation status.

— Findings of the Court

73 It should be noted first of all that the Directive lays down complex and technical rules in the field of environmental law and that, accordingly, the Member States are under a particular duty to ensure that their legislation intended to transpose the Directive is clear and precise (see *Commission* v *United Kingdom*, paragraph 26).

74 Regarding the complaint set out by the Commission, both Article 6(1) of the Directive and Paragraph 9(5) of the Nö NSchG use the words 'if need be'. However, in the provision of domestic law, those words refer generally to all conservation measures, which means that under that provision the implementation of such measures is not mandatory.

75 In Article 6(1) of the Directive, on the other hand, the same words relate only to particular cases, that is to say to certain means or technical choices for achieving conservation which are defined as 'appropriate management plans specifically designed for the sites or integrated into other development plans'.

76 Thus, the Directive requires the adoption of necessary conservation measures, a fact which excludes any discretion in this regard on the part of the Member States and restricts any latitude of the national authorities when laying down rules or taking decisions to the means to be applied and the technical choices to be made in connection with those measures.

77 It follows that Paragraph 9(5) of the Nö NSchG cannot be regarded as adequately transposing the obligation to take, in all cases, the conservation measures necessary for special areas of conservation.

78 The argument put forward by the Austrian Government that, in any event, this provision of domestic law is interpreted in a manner consistent with the Directive where conservation measures are necessary cannot be upheld.

79 Such interpretation of provisions of domestic law in a manner consistent with a directive cannot in itself achieve the clarity and precision needed to meet the requirement of legal certainty (see, to this effect, Case C-236/95 *Commission* v *Greece* [1996] ECR I-4459, paragraph 13, and Case C-144/99 *Commission* v *Netherlands* [2001] ECR I-3541, paragraph 21).

80 Moreover, mere administrative practices, which by their nature are alterable at will by the authorities and are not given the appropriate publicity, cannot be regarded as constituting fulfilment of the obligations owed by the Member States in the context of transposition of a directive (see Case C-197/96 *Commission* v *France* [1997] ECR I-1489, paragraph 14; Case C-145/99 *Commission* v *Italy* [2002] ECR I-2235, paragraph 30; and Case C-33/03 *Commission* v *United Kingdom* [2005] ECR I-1865, paragraph 25).

81 It must therefore be found that the legislation of the Province of Lower Austria is not consistent with Article 6(1) of the Directive.

82 The action is thus well founded in this regard.

Breach of Article 6(1) of the Directive in the Province of Upper Austria

— Arguments of the parties

83 The Commission states that Paragraph 15(2) of the Oö NSchG provides for the possibility of countryside management plans being drawn up. An option of that kind is not, however, sufficient in view of the obligation laid down in Article 6(1) of the Directive.

84 The Commission further observes that, under that provision, the Provincial Government may draw up for the protected areas countryside maintenance plans including measures which are 'necessary in the public interest and which do not significantly hamper the authorised economic use of the affected land'. The subordinate clause concerning 'economic use' is intended as a restriction on the obligation to draw up countryside management plans.

85 The Austrian Government submits that Article 6(1) of the Directive confers on the Member States the power to determine the nature of the protective measures to be taken.

86 It also pleads that Paragraph 15(2) of the Oö NSchG is consistent with the Directive since the term 'economic use' can only be understood as use complying with the protective rules applicable to the protected areas. Use contrary to the protective objectives which are laid down in Article 6(1) of the Directive cannot therefore be authorised by the competent legislative or administrative authorities.

— Findings of the Court

87 It should be noted at the outset that, by means of the words used in Article 6(1) of the Directive, the Community legislature sought to impose on the Member States the obligation to take the necessary conservation measures that correspond to the ecological requirements of the natural habitat types and species covered by Annex I and Annex II to the Directive respectively.

88 It is clear, however, that Paragraph 15(2) of the Oö NSchG, according to which 'European areas of conservation' and 'nature reserves' 'may' be the subject of countryside maintenance plans, confers discretion on the Provincial Government with regard to whether the taking of 'necessary conservation measures' is required.

89 As has been stated in paragraph 76 of the present judgment, consideration of that kind does not fall within a discretionary power of the Member States. On this basis alone, Paragraph 15(2) of the Oö NSchG does not transpose Article 6(1) of the Directive correctly.

90 In addition, Paragraph 15(2) of the Oö NSchG does not specify the scope of the term 'authorised economic use' and it is conceivable that operations of that kind may prevent necessary conservation measures from being taken. That provision is therefore incompatible with Article 6(1) of the Directive in this respect too.

91 It follows from the foregoing that the legislation of the Province of Upper Austria is not consistent with Article 6(1) of the Directive.

92 The Commission's action is therefore well founded in this regard.

Breach of Article 6(2) of the Directive in the Province of Tyrol

— Arguments of the parties

93 The Commission submits that it cannot be inferred either from Paragraphs 1 and 2 or from Paragraph 5 or 14 of the Tiroler NSchG that Article 6(2) of the Directive has been transposed in a manner consistent with Community law. Paragraphs 22, 23 and 24 of the Tiroler NSchG concern the protection of plant, animal and bird species and measures relating to unprotected species, but they do not lay down a prohibition to prevent the deterioration of special areas of conservation.

94 The Austrian Government contends that the obligation laid down in Article 6(2) of the Directive is taken into consideration in the abovementioned provisions of the Tiroler NSchG.

95 While the Austrian Government accepts that these provisions do not contain a specific prohibition to prevent the deterioration of special areas of conservation, it considers, however, that transposition of that obligation does not necessarily require the wording of Article 6(2) of the Directive to be reproduced verbatim. The provincial legislature took care to have due regard to this requirement for protection, and it is thus ensured that natural habitats and the habitats of species do not deteriorate and that the species for which the areas have been designated are not disturbed.

96 The Austrian Government adds that, in any event, the legislative amendments introduced by Paragraph 14 of the Tiroler NSchG have made that Law consistent with the Directive.

— Findings of the Court

97 It must be stated at the outset that Paragraph 14 of the Tiroler NSchG was not inserted until after the period laid down in the reasoned opinion had expired. In accordance with the Court's case-law set out in paragraph 50 of the present judgment, this legislative amendment is therefore irrelevant for the purposes of assessing the present ground of infringement.

98 With regard to the first obligation laid down in Article 6(2) of the Directive, requiring Member States to take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species, it must be stated, in light of the proposition advanced by the Austrian Government concerning the manner in which Article 6(2) of the Directive is transposed, that the law of the Province of Tyrol as in force at the end of the period laid down in the reasoned opinion did not contain a provision endowed with the necessary legal precision requiring the competent authorities to avoid the deterioration of those habitats (see, to this effect, *Commission* v *United Kingdom*, paragraph 37).

99 In those circumstances, the proposition that the general legal context resulting from the legislation in force in the Province of Tyrol meets the aforementioned requirements cannot be upheld.

100 As to the second obligation resulting from Article 6(2) of the Directive, requiring Member States to take appropriate steps to avoid disturbance of the species for which the special areas of conservation have been designated, Paragraphs 22 to 24 of the Tiroler NSchG likewise do not transpose this obligation, since they concern not species whose conservation makes designation of those areas necessary, that is to say species referred to in Annex II to the Directive, but species referred to in Annex IV(a) thereto, whose protection falls under Article 12 of the Directive.

101 Protection of the species for which special areas of conservation have been designated must be complete (see Case C-75/01 *Commission* v *Luxembourg* [2003] ECR I-1585, paragraph 43).

102 Consequently, the legislation of the Province of Tyrol does not comply with Article 6(2) of the Directive.

103 The Commission's action is therefore well founded in this regard.

Breach of Article 16(1) of the Directive in the Provinces of Lower Austria and Salzburg

— Complaint relating to the legislation of the Province of Lower Austria

Arguments of the parties

104 The Commission submits that Paragraphs 20, 21 and 22 of the Nö NSchG do not refer to the criterion of 'maintenance at a favourable conservation status' and that

the conditions and criteria to be met in order to be able to derogate from the system of protection laid down by the Directive are not listed exhaustively, contrary to Article 16(1) thereof.

105 The Commission adds that the prohibitions set out in Paragraph 95 of the Nö JagdG concern solely animal species living in the wild and therefore that they do not apply to other species.

106 The Austrian Government contends that, by virtue of the legislative technique chosen, the protection required by the Directive is ensured by Paragraph 20(4) of the Nö NSchG. The competent authorities must, first, act in a manner consistent with the Directive and, second, observe the prohibitions laid down in hunting legislation. In practice, derogations are granted only very restrictively, that is to say solely where no significant risk to protected species of wild plants and animals is to be feared.

107 The Austrian Government also maintains that Paragraph 20(4) of the Nö NSchG ensures that the principle of legal certainty is complied with, because it requires the competent authorities to specify expressly the means, devices and methods of capture or killing that are authorised.

108 The Austrian Government explains finally that the derogations provided for in Paragraph 21(1) and (2) of the Nö NSchG can never apply in the case of deliberate harm to protected flora, fauna or habitats.

Findings of the Court

109 Articles 12 to 14 and 15(a) and (b) of the Directive form a coherent body of provisions which require the Member States to establish strict regimes of protection for the animal and plant species concerned (see, to this effect, *Commission* v *United Kingdom*, paragraph 112).

110 Also, Article 16 of the Directive, which defines in a precise manner the criteria on the basis of which the Member States may provide for derogations from the prohibitions set out in Articles 12 to 15, is a provision constituting an exception to the system of protection which the Directive imposes. Consequently, Article 16 must be interpreted restrictively (see *Commission* v *United Kingdom*, paragraph 111).

111 It should be added in this regard that under Article 16(1) of the Directive any measure adopted at national level which derogates from the prohibitions laid down by the Directive must be conditional on there being no satisfactory alternative.

112 It follows that national provisions under which the grant of derogations from the prohibitions established by Articles 12 to 14 and 15(a) and (b) of the Directive is subject not to all the criteria and conditions set out in Article 16 of the Directive but, incompletely, to certain elements of them, cannot constitute a regime consistent with Article 16.

113 Furthermore, as has been pointed out in paragraph 80 of the present judgment, an administrative practice consistent with a directive's provisions is not sufficient to transpose Community law correctly.

114 So far as concerns Paragraph 20(4) of the Nö NSchG, it is to be noted, first, that while it provides that derogations may be granted when there is no reason to fear a risk to flora and fauna in the wild, it does not thereby preclude such derogations where the populations of the species concerned do not have a favourable conservation status.

115 However, Article 16(1) of the Directive makes the favourable conservation status of those populations in their natural range a necessary precondition in order for the derogations for which it provides to be granted.

116 Accordingly, the ambiguity which characterises the wording of Paragraph 20(4) of the Nö NSchG is incompatible with the requirement for a precise and clear transposition of Article 16(1) of the Directive (see, by analogy, Case C-365/93 *Commission* v *Greece* [1995] ECR I-499, paragraph 9).

117 Second, regarding grounds of derogation, Paragraph 20(4) of the Nö NSchG mentions, by way of example, derogations for scientific or pedagogical purposes.

118 While it is true that such derogations are capable of being tied to Article 16(1)(d) of the Directive, the wording of the domestic provision in question does not preclude that derogations may be authorised on grounds other than those which are nevertheless listed exhaustively in Article 16(1)(a) to (d) of the Directive.

119 Third, nor does Paragraph 20(4) of the Nö NSchG reproduce the conditions for a derogation which are included in Article 16(1)(e) of the Directive, namely the requirement that any derogation be under strictly supervised conditions and of a selective and limited nature.

120 So far as concerns, next, Paragraph 21 of the Nö NSchG, it need merely be pointed out that Article 16(1) of the Directive does not provide for a ground of derogation in favour of a commercial operation of an agricultural or silvicultural nature.

121 Finally, so far as concerns the arguments put forward by the Austrian Government which are derived from the provisions of hunting legislation, it is to be pointed out that application of Paragraph 20(4) of the Nö NSchG is liable to infringe Articles 12 to 15 of the Directive outside the field of hunting. Furthermore, even if the competent authorities comply with the domestic nature protection provisions that relate to engaging in hunting, a body of rules of that kind is not capable of establishing a legal framework consistent with the Community provision which lists exhaustively the permitted grounds of derogation: Paragraph 95 of the Nö JagdG does not contain such a list of grounds, but merely prohibits a number of hunting methods for certain animal species.

122 It follows from the foregoing considerations that the legislation of the Province of Lower Austria is not consistent with Article 16(1) of the Directive.

123 The Commission's action is therefore well founded in this regard.

— Complaint relating to the legislation of the Province of Salzburg

Arguments of the parties

124 The Commission observes that Paragraph 34 of the Sbg NSchG and Paragraph 104(4) of the Sbg JagdG do not reproduce the criterion of 'maintenance at a favourable conservation status' set out in Article 16(1) of the Directive. Nor can the grounds of derogation laid down in points 2 and 9 of Paragraph 34(1) of the Sbg NSchG concerning the production of beverages and the construction of installations be tied to any of the grounds included in Article 16(1) of the Directive.

125 The Austrian Government contends that, inasmuch as Article 16(1) of the Directive provides for the possibility of derogation from the prohibitions prescribed by the Directive, it would be contrary to the logic of the system of protection thereby established to lay down an obligation to restore a favourable conservation status within the framework of a provision relating to the authorising of derogations. Furthermore, Paragraph 34(3) of the Sbg NSchG is stricter than Article 16(1) of the Directive since any derogating measure must avoid deterioration in respect of the populations of plant or animal species that are present in the area concerned.

Findings of the Court

126 The words 'maintenance ... at a favourable conservation status' in Article 16(1) of the Directive relate to a situation which is defined in Article 1(i) of the Directive and which involves, first, general factors referred to in the first subparagraph of Article 1(i) and second, a number of cumulative criteria. As is apparent from paragraph 59

of the present judgment, the Member States have the task of transposing those concepts into national law with sufficient legal precision.

127 Paragraph 104(4) of the Sbg JagdG, on the other hand, provides that derogations may be authorised 'where that does not jeopardise the population of the species of game concerned'. This provision deviates from the system of protection prescribed by the Directive since it allows derogations from the general prohibitions without making them dependent on a requirement to maintain the populations of the species concerned at a favourable conservation status.

128 As regards Paragraph 34(1) of the Sbg NSchG, the grounds of justification relating to, respectively, the production of beverages and the construction of installations do not fall within any of the grounds exhaustively listed in Article 16(1) of the Directive.

129 The failure to fulfil obligations that has been alleged must therefore be held to be proved.

Breach of Article 22(b) of the Directive in the Province of Lower Austria

— Arguments of the parties

130 The Commission observes that Paragraph 17(5) of the Nö NSchG makes the grant of authorisation to introduce non-native species dependent on a criterion not

envisaged by the Directive, namely that any harm must not be 'lasting'. In addition, that provision does not prohibit all prejudice to natural habitats within their natural range and to the wild native fauna and flora that is due to the deliberate introduction of non-native species.

131 The Austrian Government submits that, when Paragraph 17(5) of the Nö NSchG is interpreted consistently with the Directive, authorisation to introduce into the wild a species that is not native or not suited to local conditions will always be refused if that adversely affects native fauna and flora.

— Findings of the Court

132 Paragraph 17(5) of the Nö NSchG permits the deliberate introduction of non-native animal or plant species provided that natural habitats and native wild fauna and flora will not suffer lasting harm.

133 Such a regime does not transpose correctly the system of protection laid down by the Directive. That system requires any derogating measure to comply with the conditions prescribed in Article 22(b) of the Directive, in particular the condition under which authorisation may be granted only in so far as this does not prejudice natural habitats.

134 The words 'not ... prejudice' constitute an unambiguous protective requirement which goes further than that laid down in Paragraph 17(5) of the Nö NSchG.

135 This alleged failure to fulfil obligations must accordingly be held to be proved.

136 It follows from the foregoing considerations that the Republic of Austria has failed to fulfil its obligations under Article 1, Article 6(1) and (2), Articles 12 and 13, Article 16(1) and Article 22(b) of the Directive.

Costs

137 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission has applied for costs and the Republic of Austria has been essentially unsuccessful in its pleas remaining at issue in the proceedings, the Republic of Austria should be ordered to pay the costs.

138 As regards the grounds of infringement set out in the application which were withdrawn by the Commission at a subsequent stage in the proceedings, it must be stated that the Commission ceased pursuing the complaints concerned as a result of amendments to the domestic legal instruments at issue. The withdrawal is

accordingly attributable to the defendant, given that the provisions of domestic law were brought into line with the requirements of Community law only belatedly. In accordance with Article 69(5) of the Rules of Procedure, the Republic of Austria should therefore be ordered to bear all the costs of the present proceedings.

On those grounds, the Court (Fourth Chamber) hereby:

1. **Declares that the Republic of Austria has failed to fulfil its obligations under Article 1(e), (g) and (i), Article 6(1) and (2), Articles 12 and 13, Article 16(1) and Article 22(b) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora;**

2. **Dismisses the remainder of the action;**

3. **Orders the Republic of Austria to pay the costs.**

[Signatures]

JUDGMENT OF THE COURT (Second Chamber)

11 January 2007 *

In Case C-183/05,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 22 April 2005,

Commission of the European Communities, represented by M. van Beek, acting as Agent, assisted by M. Wemaëre, avocat, with an address for service in Luxembourg,

applicant,

v

Ireland, represented by D. O'Hagan, acting as Agent, with an address for service in Luxembourg,

defendant,

* Language of the case: English.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, P. Kūris, J. Klučka (Rapporteur), J. Makarczyk and G. Arestis, Judges,

Advocate General: P. Léger,
Registrar: R. Grass,

having regard to the written procedure,

after hearing the Opinion of the Advocate General at the sitting on 21 September 2006,

gives the following

Judgment

1 By its application, the Commission of the European Communities requests the Court to declare that:

— by limiting the transposition of the provisions of Articles 12(2) and 13(1)(b) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural

habitats and of wild fauna and flora (OJ 1992 L 206, p. 7) to the species listed in Annex IV to that directive that occur in Ireland,

— by failing to take all the requisite specific measures for the effective implementation of the system of strict protection required by Article 12(1) of that directive ('the system of strict protection'), and

— by retaining provisions of Irish legislation that are inconsistent with those of Articles 12(1) and 16 of that directive,

Ireland has failed to comply with those articles and with its obligations under the EC Treaty.

Legal context

2 The 4th and 11th recitals in the preamble to Directive 92/43 are worded as follows:

'... in the European territory of the Member States, natural habitats are continuing to deteriorate and an increasing number of wild species are seriously threatened; ... given that the threatened habitats and species form part of the Community's natural

heritage and the threats to them are often of a transboundary nature, it is necessary to take measures at Community level in order to conserve them;

...

... it is recognised that the adoption of measures intended to promote the conservation of priority natural habitats and priority species of Community interest is a common responsibility of all Member States; ...'

3 Article 12(1) and (2) of Directive 92/43 states:

'1. Member States shall take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) in their natural range, prohibiting:

...

(b) deliberate disturbance of these species, particularly during the period of breeding, rearing, hibernation and migration;

...

(d) deterioration or destruction of breeding sites or resting places.

2. For these species, Member States shall prohibit the keeping, transport and sale or exchange, and offering for sale or exchange, of specimens taken from the wild, except for those taken legally before this Directive is implemented.'

4 Article 13 of Directive 92/43 provides for the establishment of a system of strict protection for the plant species listed in Annex IV(b) to that directive.

5 Article 16(1) of Directive 92/43 provides as follows:

'Provided that there is no satisfactory alternative and the derogation is not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range, Member States may derogate from the provisions of Articles 12, 13, 14 and 15(a) and (b):

(a) in the interest of protecting wild fauna and flora and conserving natural habitats;

(b) to prevent serious damage, in particular to crops, livestock, forests, fisheries and water and other types of property;

(c) in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment;

(d) for the purpose of research and education, of repopulating and re-introducing these species and for the breeding operations necessary for these purposes, including the artificial propagation of plants;

(e) to allow, under strictly supervised conditions, on a selective basis and to a limited extent, the taking or keeping of certain specimens of the species listed in Annex IV in limited numbers specified by the competent national authorities.'

Pre-litigation procedure

6 On 18 October 2002, following complaints, the Commission sent Ireland a letter of formal notice in which it informed it of its doubts regarding several aspects of that Member State's implementation of Articles 12, 13 and 16 of Directive 92/43.

7 As the Commission did not consider the Irish authorities' response of 20 December 2002 to be convincing, on 11 July 2003 it sent Ireland a reasoned opinion calling on it to take the requisite measures to comply with its terms within two months of the date of its notification.

8 Ireland responded to the reasoned opinion by letters of 12 September 2003 and 8 January 2004. However, the Commission did not consider that response to be satisfactory and decided to bring the present action.

The action

9 In its action the Commission puts forward three complaints:

— the first complaint relates to the incomplete transposition of Articles 12(2) and 13(1)(b) of Directive 92/43 with regard to the species listed in Annex IV to that directive which do not naturally occur in Ireland;

— the second complaint relates to Ireland's failure to adopt specific measures for the effective implementation of the system of strict protection;

— the third plea relates to the existence in Irish legislation of provisions which are inconsistent with both Article 12(1) and Article 16 of Directive 92/43.

10 The Commission withdrew the first complaint during the procedure in the light of Ireland's response to that point in its statement in defence. There is therefore no need to consider it.

The second complaint

11 The second complaint put forward by the Commission consists of seven parts. The second part of that complaint will be examined together with the third complaint since the wording of the two is identical.

The first part of the second complaint

12 As regards the first part, which alleges that Ireland has failed to fulfil its obligation to establish a system of strict protection in respect of the species listed in Annex IV to Directive 92/43, in that neither the leatherback turtle nor the Kerry slug was listed among the species in the First Schedule to the European Communities (Habitats) Regulations 1997, as amended by the European Communities (Natural Habitats) (Amendment) Regulations 1998 ('the (Habitats) Regulations'), the Commission indicates that the response provided by Ireland in that respect is satisfactory. Ireland pointed out that the field of application of the national legislation which transposes Directive 92/43 had been widened to cover those species. It is therefore not necessary to consider the first part of the second complaint.

The third, fourth and sixth parts of the second complaint

13 By the third, fourth and sixth parts of the second complaint the Commission submits that the measures taken by Ireland in respect of monitoring the species listed in Annex IV(a) to Directive 92/43 are, on the whole, disparate and patchy and cannot be regarded as effectively implementing the system of strict protection.

14 As regards, first, the third part of that complaint, the Commission points out that the species action plans which Ireland intends to prepare for the species listed in Annex IV(a) to Directive 92/43 may, on condition that they are correctly established and applied, constitute an effective means of implementing specifically the requirements regarding protection laid down in Article 12(1) of that directive. However, in the absence of such plans, the system of strict protection contains gaps, except in relation to the natterjack toad, which is covered by an appropriate specific monitoring system.

15 Ireland submits that those plans are currently being published. It also puts forward several government initiatives which have not yet been completed and which, in its opinion, will lead to improved concerted action and a more systematic monitoring of the species listed in Annex IV(a) to Directive 92/43.

16 However, such arguments cannot be upheld.

17 It is settled case-law that the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation prevailing in that Member State at the end of the period laid down in the reasoned opinion, and that the Court cannot take account of any subsequent changes (see, inter alia, Case C-282/02 *Commission* v *Ireland* [2005] ECR I-4653, paragraph 40).

18 The third part of the second complaint must therefore be held to be well founded.

19 As regards the sixth part, which needs to be examined before the fourth, the Commission submits that, with the exception of the horseshoe bat and the natterjack toad, the Irish authorities are not in possession of the necessary information in relation to several of the species listed in Annex IV(a) to Directive 92/43, their resting places and breeding sites and the threats to which those species are subject, which prevents the effective implementation of the system of strict protection.

20 Ireland first of all acknowledges that, with regard to bats other than the horseshoe bat, its pilot monitoring project is no substitute for more detailed survey work. Ireland states that it will provide, in due course, vital information on the population trends of those species and refers to several initiatives for the compilation of information regarding bats. According to the Commission, such an indication shows neither that Ireland is sufficiently informed about the species of bats nor that that Member State will implement a coherent long-term programme in order to obtain the necessary information.

21 Second, Ireland submits that the national study, which was launched in 2004 and was due to come to a close in autumn 2005, is part of the framework of a pre-existing programme and is capable of forming the basis of a future programme for the monitoring of otters. According to the Commission, that assertion is not sufficient to establish with certainty that an adequate monitoring system and programme will be put in place for the species in question.

22 Third, Ireland points out that a national expert on Kerry slugs is preparing an action plan which is due to be published in spring 2006 and will include recommendations in respect of a continuous monitoring programme for that species. According to the Commission, the measures and actions taken by Ireland do not provide any certainty

as to the regular provision of monitoring information compiled in a coherent and integrated manner on the presence of that species, its breeding sites and resting places and the threats to which that species might be subject.

23 Fourth, Ireland refers to current initiatives, such as the decision to establish a national biological records database and the setting up of the National Biological Records Centre or the collection of observer data on incidental catches of cetaceans in certain fishing activities, which have been adopted since the entry into force of Council Regulation (EC) No 812/2004 of 26 April 2004 laying down measures concerning incidental catches of cetaceans in fisheries and amending Regulation (EC) No 88/98 (OJ 2004 L 150, p. 12).

24 In that regard, it should be pointed out that, for the purpose of challenging the sixth part of the second complaint, Ireland refers to a number of initiatives which had not yet been concluded by the date on which the period prescribed in the reasoned opinion expired. Such initiatives cannot, according to the case-law cited in paragraph 17 of this judgment, be taken into account by the Court in its assessment of the failure to act alleged by the Commission.

25 Consequently, the sixth part of the second complaint must be held to be well founded.

26 As regards, finally, the fourth part of that complaint, the Commission submits that, although a network of full-time officials responsible for conservation is of general importance for the implementation of the legislation concerning wild fauna and flora, the existence of such a network does not, as alleged by Ireland, in itself demonstrate that the specific measures required have been adopted for the purpose of transposing Article 12(1) of Directive 92/43.

27 Ireland responds that its officials are highly effective and also protect the natterjack toad by playing a vital role in the enforcement of the protection of that species. Similarly, by reason of the direct knowledge which conservation rangers and district conservation officers have of the zones for which they are responsible, the national network of such rangers and officers is aware of the conservation status of the animal and plant species in those zones.

28 In that regard, it should be recalled that Article 12(1) of Directive 92/43 requires the Member States to take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) to that directive in their natural range.

29 As noted by the Advocate General in point 24 of his Opinion, the transposition of Article 12(1) of the Directive requires the Member States not only to adopt a comprehensive legislative framework but also to implement concrete and specific protection measures (see, to that effect, Case C-103/00 *Commission* v *Greece* [2002] ECR I-1147, paragraphs 34 to 39).

30 Similarly, the system of strict protection presupposes the adoption of coherent and coordinated measures of a preventive nature (Case C-518/04 *Commission* v *Greece*, not published in the ECR, paragraph 16).

31 In the present case, the existence of a network of full-time rangers and officers responsible for monitoring and protecting species does not, in itself, demonstrate effective implementation of the system of strict protection for all of the species listed in Annex IV(a) to Directive 92/43 that occur in Ireland.

32 As pointed out by the Advocate General in points 45 to 48 of his Opinion, those species are not covered by an appropriate monitoring system, with the exception of the horseshoe bat, the natterjack toad and the leatherback turtle, given the limited numbers of the latter species in Irish waters. Such is the case for the otter, the Kerry slug, various species of bats other than the horseshoe bat, and cetaceans, as is apparent from paragraphs 20 to 24 of this judgment.

33 The fourth part of the second complaint must therefore be held to be well founded.

The fifth part of the second complaint

34 By the fifth part of the second complaint, the Commission submits that, although environmental impact assessments undertaken pursuant to Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment (OJ 1985 L 175, p. 40) can play a useful role in alerting the competent authorities to specific threats to the breeding sites and resting places of the species listed in Annex IV to Directive 92/43, only a limited number of projects are subject to such assessments in Ireland. In addition, even where such assessments are undertaken, the Irish authorities require property developers to provide information on protected species only after development consent has been granted for the project concerned. Therefore, that procedure does not prevent certain developments which may be harmful to the environment.

35 The Commission refers, in particular, to three projects having negative impacts on bat populations (the Lough Rynn Estate project), horseshoe bat roosts (the Ennis

Bypass project) and the breeding sites and resting places of cetaceans (the project for the construction of a gas pipeline in Broadhaven Bay).

36 In that regard, as noted by the Advocate General in points 53 to 61 of his Opinion, the authorisation of a project prior to the environmental impact assessment concluding that that project would have negative impacts on the environment (the Lough Rynn Estate project), or the authorisation of other projects without a derogation, even though the preliminary assessment also concluded that that project would have negative impacts on the environment (the Ennis Bypass project and the project for the construction of a gas pipeline in Broadhaven Bay), shows that the species listed in Annex IV(a) to Directive 92/43 and their breeding sites and resting places are subject to disturbances and to threats which the Irish rules do not make it possible to prevent.

37 Consequently, as regards the projects put forward by the Commission in its application, it cannot be concluded that all measures have been taken to implement effectively the system of strict protection. Consequently, the fifth part of the second complaint must be held to be well founded.

The seventh part of the second complaint

38 By the seventh part of the second complaint the Commission submits that Ireland has failed to demonstrate that it instituted any appropriate strategy for responding to the types of threat to the breeding sites and resting places of bat species. It claims, in particular, that timber treatment, building renovations and demolition work constitute threats to bat roosts.

39 In that regard, it must be borne in mind that, according to settled case-law, in an action for failure to fulfil obligations brought under Article 226 EC it is for the Commission to prove that the obligation has not been fulfilled without being able to rely on any presumption (Case C-221/04 *Commission* v *Spain* [2006] ECR I-4515, paragraph 59 and the case-law cited).

40 In the present case, it must be held that the Commission has not put forward any concrete evidence to substantiate the seventh part of its second complaint.

41 The seventh part of the second plea must therefore be held to be unfounded.

The third complaint

42 By its third complaint, the wording of which is identical to that of the second part of the second complaint, the Commission alleges that there exists a parallel regime of derogations which are incompatible with the scope and the conditions of application of Article 16 of Directive 92/43. That regime is to be found, first, in section 23(7) of the 1976 Wildlife Act, as amended by the 2000 Wildlife (Amendment) Act ('the Wildlife Act'), and, second, in section 42 of that act.

43 In the light of Ireland's defence in respect of the failure relating to section 42 of the Wildlife Act, the Commission has withdrawn that part of its third complaint. Therefore, it is not necessary to consider it.

44 As regards the part of the third complaint relating to section 23(7)(a) to (c) of the Wildlife Act, the Commission submits that, under those provisions, it is not an offence for a person: unintentionally to injure or kill a protected wild animal while engaged in agriculture, fishing, aquaculture, forestry or turbary (section 23(7)(a)); to interfere with or destroy the breeding place of such an animal while engaged in such activities (section 23(7)(b)); or unintentionally to kill or injure such an animal or unintentionally to destroy or injure the breeding place or resting place of such an animal while constructing a road or carrying on any archaeological operation, building operation or work of engineering construction, or while constructing or carrying on such other operation or work as may be prescribed (section 23(7)(c)).

45 Ireland submits that the Commission has misinterpreted the purpose of section 23(7). However, in order to remove any ambiguity in that regard, Ireland states that it has made amendments to the (Habitats) Regulations in order to define clearly the regime under section 23 of the Wildlife Act and the provisions of Regulation 23 of the (Habitats) Regulations. The 2005 European Communities (Natural Habitats) Regulations inserted a new provision into the Wildlife Act, namely section 23(8).

46 In that regard, it must, first, be pointed out that the amendment of section 23 of the Wildlife Act brought about by the 2005 Regulations cannot, according to the case-law cited in paragraph 17 of this judgment, be taken into account by the Court in its assessment of the alleged failure to fulfil obligations inasmuch as that amendment was made after the two-month period laid down in the reasoned opinion had expired.

47 Second, suffice it to state that, by providing that acts which unintentionally interfere with or destroy breeding sites or resting places of wild species do not constitute an offence, section 23(7)(b) of the Wildlife Act does not satisfy the requirements of Article 12(1)(d) of Directive 92/43, which prohibits such acts, whether they are intentional or not (see, to that effect, Case C-6/04 *Commission* v *United Kingdom* [2005] ECR I-9017, paragraph 79).

48 In addition, it appears that the derogations laid down in section 23 of the Wildlife Act go beyond what is provided for in Article 16 of Directive 92/43, since the latter determines, in an exhaustive manner, the conditions under which derogations may be made from Article 12 of that directive.

49 It follows that the Commission is correct in law to allege that there is a parallel regime of derogations under Irish legislation which are inconsistent with Articles 12 and 16 of Directive 92/43.

50 The third complaint advanced by the Commission in support of its action is therefore well founded.

51 In the light of all of the foregoing, it must be held that:

— by failing to take all the requisite specific measures for the effective implementation of the system of strict protection, and

— by retaining the provisions of section 23(7)(a) to (c) of the Wildlife Act which are incompatible with those in Articles 12(1) and 16 of Directive 92/43,

Ireland has failed to comply with those articles of Directive 92/43 and to fulfil its obligations under that directive.

Costs

52 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. As the Commission has applied for costs to be awarded against Ireland, and as the latter has been unsuccessful in the essential aspects of its submissions, Ireland must be ordered to pay the costs.

On those grounds, the Court (Second Chamber) hereby:

1. Declares that

— by failing to take all the requisite specific measures for the effective implementation of the system of strict protection laid down in Article 12(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, and

— **by retaining the provisions of section 23(7)(a) to (c) of the 1976 Wildlife Act, as amended by the 2000 Wildlife (Amendment) Act, which are incompatible with those in Articles 12(1) and 16 of Directive 92/43,**

Ireland has failed to comply with those articles of Directive 92/43 and to fulfil its obligations under that directive;

2. Orders Ireland to pay the costs.

AUTO DEL TRIBUNAL DE JUSTICIA (Sala Sexta)

de 7 de noviembre de 2006 (*)

«Recurso de casación – Reglamento (CE) nº 864/2004 – Recurso de anulación – Régimen de ayudas en el sector del aceite de oliva – Personas físicas y personas jurídicas – Falta de afectación individual»

En el asunto C-418/05 P,

que tiene por objeto un recurso de casación interpuesto, con arreglo al artículo 56 del Estatuto del Tribunal de Justicia, el 25 de noviembre de 2005,

Centro Provincial de Jóvenes Agricultores de Jaén (ASAJA),

Salvador Contreras Gila,

José Ramiro López,

Antonio Ramiro López,

Cristóbal Gallego Martínez,

Benito García Burgos,

Antonio Parras Rosa,

con sede y domicilio en Jaén, representados por el Sr. J. Vázquez Medina, abogado,

partes recurrentes,

y en el que la otra parte en el procedimiento es:

Consejo de la Unión Europea, representado por la Sra. M. Balta y el Sr. F. Florindo Gijón, en calidad de agentes,

parte demandada en primera instancia,

apoyado por

Comisión de las Comunidades Europeas, representada por los Sres. M. Nolin y F. Jimeno Fernández, en calidad de agentes, que designa domicilio en Luxemburgo,

parte coadyuvante en casación,

EL TRIBUNAL DE JUSTICIA (Sala Sexta),

integrado por el Sr. J. Malenovský, en funciones de Presidente de la Sala Sexta, los Sres. U. Lõhmus y A. Ó Caoimh (Ponente), Jueces;

Abogado General: Sra. J. Kokott;

Secretario: Sr. R. Grass;

oído el Abogado General;

dicta el siguiente

Auto

1 Mediante su recurso de casación, los recurrentes solicitan la anulación del auto del Tribunal de Primera Instancia de las Comunidades Europeas de 8 de septiembre de 2005, ASAJA y otros/Consejo (T-295/04 a T-297/04, Rec. p. II-3151; en lo sucesivo, «auto recurrido»), mediante el cual éste desestimó su recurso de anulación del artículo 1, apartado 7, del Reglamento (CE) nº 864/2004 del Consejo, de 29 de abril de 2004, por el que se modifica, y se adapta con motivo de la adhesión de la República Checa, de Estonia, de Chipre, de Letonia, de Lituania, de Hungría, de Malta, de Polonia, de Eslovenia y de Eslovaquia a la Unión Europea, el Reglamento (CE) nº 1782/2003 por el que se establecen disposiciones comunes aplicables a los regímenes de ayuda directa en el marco de la política agrícola común y se instauran determinados regímenes de ayuda a los agricultores (DO L 161, p. 48, y corrección de errores DO L 206, p. 20; en lo sucesivo, «disposición impugnada»).

Marco jurídico

2 Los principios de la reforma de la política agrícola común (en lo sucesivo, «PAC») emprendida en 1992 pretendían, en esencia, sustituir el régimen de sostenimiento de los precios y la producción por un régimen de sostenimiento de las rentas de los agricultores. Dicha reforma condujo, en relación con determinados productos agrícolas, a la adopción del Reglamento (CE) nº 1782/2003 del Consejo, de 29 de septiembre de 203, por el que se establecen disposiciones comunes aplicables a los regímenes de ayuda directa en el marco de la PAC y se instauran determinados regímenes de ayuda a los agricultores y por el que se modifican los Reglamentos (CEE) nº 2019/93, (CE) nº 1452/2001, (CE) nº 1453/2001, (CE) nº 1454/2001, (CE) nº 1868/94, (CE) nº 1251/1999, (CE) nº 1254/1999, (CE) nº 1673/2000, (CEE) nº 2358/71 y (CE) nº 2529/2001 (DO L 270, p. 1).

3 Para adaptar las organizaciones comunes de mercados en los sectores del aceite de oliva, del tabaco, del lúpulo y del algodón a la reforma de la PAC, el Consejo de la Unión Europea adoptó el Reglamento nº 864/2004.

4 Este Reglamento derogó el antiguo régimen de ayuda a la producción de aceite de oliva para introducir un sistema denominado de «pago único» o de «ayuda disociada», es decir, una ayuda no vinculada a la cantidad efectivamente producida de aceite de oliva. Sin embargo, para determinadas clases de producción se mantuvo, bajo determinadas condiciones y dentro de ciertos límites, un sistema denominado «de ayuda vinculada» o «de ayuda ligada a la producción».

5 Por lo que respecta al aceite de oliva, la disposición impugnada modificó el artículo 37, apartado 1, del Reglamento nº 1782/2003, estableciendo como importe de referencia para el cálculo del importe de la ayuda disociada «el promedio cuatrienal de los importes totales de los pagos concedidos al agricultor con arreglo al régimen de ayuda al aceite de oliva indicado en el anexo VI [del Reglamento nº 1782/2003, en su versión modificada por el Reglamento nº 864/2004], calculado y ajustado con arreglo al anexo VII [del Reglamento nº 1782/2003, en su versión modificada por el Reglamento

nº 864/2004], durante las campañas de comercialización 1999/2000, 2000/2001, 2001/2002 y 2002/2003».

6 Además, el artículo 1, punto 11, del Reglamento nº 864/2004 modificó el artículo 44, apartado 2, del Reglamento nº 1782/2003, al considerar como «hectáreas admisibles para el disfrute de la ayuda disociada» a las superficies que hayan sido plantadas con olivos antes del 1 de mayo de 1998, salvo para Chipre y Malta, o con nuevos olivos en sustitución de los existentes, o con olivos al amparo de los programas de plantación autorizados, y registrados en el sistema de información geográfica.

Hechos que originaron el litigio y procedimiento ante el Tribunal de Primera Instancia

7 Mediante demandas presentadas en la Secretaría del Tribunal de Primera Instancia el 22 de julio de 2004, los recurrentes interpusieron sendos recursos que tienen por objeto la anulación de la disposición impugnada. Dichas demandas se registraron con los números T-295/04 a T-297/04.

8 Uno de los recurrentes, Centro Provincial de Jóvenes Agricultores de Jaén (en lo sucesivo, «ASAJA»), es una organización profesional agrícola constituida, según sus estatutos, para la representación, gestión y defensa de los intereses profesionales de sus miembros en la provincia de Jaén.

9 Los demás recurrentes son productores de aceite de oliva beneficiarios de ayudas en este sector por las campañas de comercialización 1999/2000, 2000/2001 y 2001/2002.

10 Tanto ASAJA como los demás recurrentes impugnaron que la disposición impugnada añadiese la campaña 1999/2000 al período de referencia para el cálculo de la ayuda disociada, dado que los recurrentes plantaron sus olivos en 1998, por lo que no produjeron aceitunas en 1999.

11 Ante el Tribunal de Primera Instancia, el Consejo propuso excepciones de inadmisibilidad con arreglo al artículo 114, apartado 1, del Reglamento de Procedimiento del Tribunal de Primera Instancia, y solicitó que se declarase la inadmisibilidad de los recursos, basándose en que los recurrentes no resultaban individualmente afectados, en el sentido del artículo 230 CE, párrafo cuarto, por la disposición impugnada.

12 La Comisión de las Comunidades Europeas solicitó intervenir en cada uno de los asuntos de que se trata.

13 Mediante auto de 6 de junio de 2005, y de conformidad con el artículo 50 del Reglamento de Procedimiento, tras oír a las partes, los asuntos T-295/04 a T-297/04 se acumularon a efectos de la fase oral y de la sentencia, por razón de su conexión y de su identidad de objeto.

El auto recurrido

14 Mediante el auto recurrido, el Tribunal de Primera Instancia, por considerar que la disposición impugnada es un acto de alcance general y que los recurrentes no resultan afectados ni directa ni individualmente por dicho acto, declaró la inadmisibilidad de los recursos y que no procedía pronunciarse sobre la demanda de intervención presentada por la Comisión. A tal efecto, el Tribunal de Primera Instancia se basó en los motivos siguientes:

«52. […] ASAJA no reivindica ningún derecho de naturaleza procedimental que le reconozca el

Derecho comunitario en materia de organización común de los mercados del aceite de oliva.

53. […] una asociación constituida para promover los intereses colectivos de una categoría de justiciables no puede considerarse individualmente afectada, cuando éstos no lo están con carácter individual […]

54. […] [ASAJA] no ha aportado ninguna prueba que permita concluir que sus miembros están afectados por la disposición impugnada debido a determinadas cualidades que les son propias o de una situación de hecho que les caracteriza en relación con cualquier otra persona.

55. […] ningún dato de los que figura en los autos permite concluir que ASAJA esté individualizada en relación con la disposición impugnada debido a que la disposición cuya anulación se solicita afecta a su posición negociadora.

56. De ello se deriva que ASAJA no puede ser considerada individualmente afectada en el sentido de la jurisprudencia recordada en el apartado 50 anterior.

57. En lo referente, en segundo lugar, a la admisibilidad de los recursos interpuestos en los asuntos T-296/04 y T-297/04 por productores de aceite de oliva, el Tribunal de Primera Instancia considera que éstos tampoco pueden considerarse individualmente afectados por la disposición impugnada.

58. En efecto, los demandantes en los asuntos T-296/04 y T-297/04 no están afectados por la disposición impugnada por razón de su condición objetiva de productores de aceite de oliva, en el período de referencia, y de beneficiarios de regímenes de ayudas previstos por la legislación anterior, y ello de igual modo que cualquier otro productor de aceite de oliva afectado por la disposición impugnada. Ninguna cualidad particular o situación de hecho caracteriza, por tanto, a los demandantes en relación con los demás operadores económicos que pertenecen a la categoría de sujetos afectados por la disposición impugnada.

59. A este respecto, hay que recordar que, como alega el Consejo en sus excepciones de inadmisibilidad, la disposición impugnada, que establece los criterios de cálculo de la ayuda en el sector del aceite de oliva, se aplica indistintamente a todos los productores de que se trata independientemente de la cantidad efectivamente producida por éstos, incluso de cualquier producción, en el período de referencia.

60. […] En el presente caso, aun cuando la disposición impugnada puede producir efectos que difieren según el productor de aceite de oliva de que se trata, esta circunstancia no basta para demostrar que los demandantes tienen cualidades particulares o se encuentran en una situación de hecho que les caracteriza en relación con los demás productores.

61. Por añadidura, aun suponiendo que, en virtud de la aplicación de la disposición impugnada, los demandantes ya no tengan derecho a la ayuda de que se trata en el sector del aceite de oliva, éstos no estarían individualmente afectados por la citada disposición. En efecto, no basta que un acto tenga sobre determinados operadores mayores repercusiones económicas que sobre los operadores del mismo sector para que se les considere individualmente afectados por ese acto (autos [del Tribunal de Primera Instancia] de 15 de septiembre de 1999, Van Parys y otros/Comisión, T-11/99, Rec. p. II-2653, apartados 50 y 51, y [de 2 de abril de 2004,] Gonnelli y AIFO/Comisión, [T-231/02, Rec. p. II-1051], apartado 45).

62. Además, aunque se acreditara que ya no tienen derecho a la ayuda, ha de tenerse en cuenta que de tales medidas se derivaban consecuencias similares para los demás productores de aceite de

oliva afectados por la disposición impugnada (véase, en este sentido, la sentencia del Tribunal de Justicia de 10 de abril de 2003, Comisión/Nederlandse Antillen, C-142/00 P, Rec. p. I-3483, apartado 77).

63. De las consideraciones que preceden resulta que los demandantes en los asuntos T-296/04 y T-297/04 no están individualmente afectados por la disposición impugnada.»

Pretensiones de las partes

15 Los recurrentes solicitan al Tribunal de Justicia que:

– Anule el auto recurrido por infracción del artículo 230 CE.

– Estime las pretensiones aducidas en primera instancia sobre el fondo del asunto.

– Condene en costas al Consejo.

16 El Consejo solicita al Tribunal de Justicia que:

– Desestime el recurso de casación mediante auto motivado con arreglo al artículo 119 del Reglamento de Procedimiento del Tribunal de Justicia.

– Condene en costas a los recurrentes.

17 La Comisión, admitida a intervenir en apoyo de las pretensiones del Consejo mediante auto del Presidente del Tribunal de Justicia de 4 de mayo de 2006, solicita al Tribunal de Justicia que:

– Desestime el recurso de casación por ser manifiestamente infundado.

– Condene en costas a los recurrentes.

Sobre la admisibilidad del recurso de casación

18 En apoyo de su recurso de casación, los recurrentes afirman que la disposición impugnada les afecta directa e individualmente por ser propietarios de olivos plantados en 1998, circunstancia que los distingue del resto de los olivareros del sector. Consideran que la inclusión de la campaña 1999/2000 carente de toda motivación para el cómputo de la ayuda comunitaria les afecta directa e individualmente, en la medida en que su producción de aceituna en el año 1999 fue de 0 kg, dado que sus olivos fueron plantados en el año 1998.

19 Tanto el Consejo como la Comisión solicitan que se declare la inadmisibilidad del recurso de casación, basándose en que los recurrentes se limitan a repetir los hechos y los argumentos ya expuestos en el recurso ante el Tribunal de Primera Instancia. Estiman que no hacen mención a ningún punto o elemento del auto recurrido que consideren erróneo.

20 Con carácter preliminar, procede recordar que, en virtud del artículo 119 de su Reglamento de Procedimiento, cuando el recurso de casación sea manifiestamente inadmisible o manifiestamente infundado, el Tribunal de Justicia podrá, en todo momento, oído el Abogado General, desestimarlo mediante auto motivado.

21 Con arreglo al artículo 225 CE y al artículo 58, párrafo primero, del Estatuto del Tribunal de Justicia, el recurso de casación se limita a las cuestiones de Derecho y debe fundarse en motivos derivados de la incompetencia del Tribunal de Primera Instancia, de irregularidades de procedimiento ante el mismo que lesionen los intereses de la parte recurrente o de la violación del Derecho comunitario por parte del Tribunal de Primera Instancia (véanse, en particular, los autos de 17 de septiembre de 1996, San Marco/Comisión, C-19/95 P, Rec. p. I-4435, apartado 36, y de 10 de mayo de 2001, FNAB y otros/Consejo, C-345/00 P, Rec. p. I-3811, apartado 28).

22 Además, de los citados artículos así como del artículo 112, apartado 1, párrafo primero, letra c), del Reglamento de Procedimiento del Tribunal de Justicia se desprende que un recurso de casación debe indicar de manera precisa los elementos impugnados de la sentencia cuya anulación se solicita, así como los fundamentos jurídicos que apoyan de manera específica esta pretensión (véanse, en particular, las sentencias de 4 de julio de 2000, Bergaderm y Goupil/Comisión, C-352/98 P, Rec. p. I-5291, apartado 34; de 30 de septiembre de 2003, Eurocoton y otros/Consejo, C-76/01 P, Rec. p. I-10091, apartado 46, y de 12 de septiembre de 2006, Reynolds Tobacco y otros/Comisión, C-131/03 P, Rec. p. I-0000, apartado 49).

23 No cumple este requisito el recurso de casación que se limita a repetir o a reproducir textualmente los motivos y las alegaciones ya formulados ante el Tribunal de Primera Instancia, incluidos los basados en hechos rechazados expresamente por este órgano jurisdiccional. En efecto, tal recurso de casación es, en realidad, un recurso destinado a obtener un mero reexamen del presentado ante el Tribunal de Primera Instancia, lo cual excede de la competencia del Tribunal de Justicia (véase el auto San Marco/Comisión, antes citado, apartado 38; sentencias de 17 de diciembre de 1998, Baustahlgewebe/Comisión, C-185/95 P, Rec. p. I-8417, apartado 113, y Eurocoton y otros/Consejo, antes citada, apartado 47).

24 Pues bien, es preciso señalar que en el caso de autos los recurrentes, por una parte, no formularon alegaciones que acreditasen que el Tribunal de Primera Instancia había incurrido en un error de Derecho en su apreciación y, por otra parte, no precisaron los elementos impugnados del auto de que se trata.

25 En efecto, los recurrentes se limitan a indicar que su recurso de casación tiene por objeto obtener la anulación del auto recurrido y a afirmar su legitimación activa puesto que la disposición impugnada les afecta directa e individualmente, a diferencia de los demás olivareros. Sin embargo, se circunscriben a hacer referencia a circunstancias puramente fácticas, repitiendo la argumentación ya expuesta en su recurso ante el Tribunal de Primera Instancia, sin formular la menor crítica al razonamiento jurídico en que se basa el auto recurrido.

26 El recurso de casación, que tiene así por objeto en realidad obtener un mero reexamen por parte del Tribunal de Justicia de las alegaciones formuladas ante el Tribunal de Primera Instancia y una nueva apreciación de los hechos, excede de la competencia del Tribunal de Justicia.

27 En estas circunstancias, debe desestimarse el recurso de casación en su totalidad por ser manifiestamente inadmisible.

Costas

28 A tenor del artículo 69, apartado 2, del Reglamento de Procedimiento, aplicable al procedimiento de recurso de casación en virtud del artículo 118 del mismo Reglamento, la parte que pierda el proceso

será condenada en costas, si así lo hubiera solicitado la otra parte. Por haber solicitado el Consejo que se condene en costas a los recurrentes y haber sido desestimados los motivos formulados por éstos, procede condenarlos en costas. Con arreglo al artículo 69, aparado 4, del mismo Reglamento, también aplicable al procedimiento de casación en virtud del artículo 118, las instituciones que intervengan como coadyuvantes en el litigio soportarán sus propias costas.

En virtud de todo lo expuesto, el Tribunal de Justicia (Sala Sexta) resuelve:

1) **Desestimar el recurso de casación.**

2) **Condenar en costas a los recurrentes.**

3) **La Comisión de las Comunidades Europeas cargará con sus propias costas.**

JUDGMENT OF THE COURT (Second Chamber)

26 October 2006 *

In Case C-239/04,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 8 June 2004,

Commission of the European Communities, represented by M. van Beek and A. Caeiros, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Portuguese Republic, represented by L. Fernandes, acting as Agent, and J.F. Ganderez and R. Gomes da Silva, advogados, with an address for service in Luxembourg,

defendant,

* Language of the case: Portuguese.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, R. Schintgen, J. Klučka, R. Silva de Lapuerta (Rapporteur), and L. Bay Larsen, Judges,

Advocate General: J. Kokott,
Registrar: B. Fülöp, Administrator,

having regard to the written procedure and further to the hearing on 6 April 2006,

after hearing the Opinion of the Advocate General at the sitting on 27 April 2006,

gives the following

Judgment

1 By its application, the Commission of the European Communities asks the Court to declare that, by implementing a project for a motorway, whose route crosses the Castro Verde special protection area (SPA), notwithstanding the negative environmental impact assessment and the existence of alternative solutions for the route concerned, the Portuguese Republic has failed to fulfil its obligations under Article 6(4) of Council Directive 92/43/EEC of 21 May 1992 on the

conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7), as amended by Directive 97/62/EC of 27 October 1997 (OJ 1997 L 305, p. 42) ('the Habitats Directive').

Legal context

Directive 79/409/EEC

2 Article 4(1) and (2) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1) require member States to classify as SPAs areas fulfilling the criteria laid down by those provisions.

3 Article 4(4) of that directive provides:

'In respect of the protection areas referred to in paragraphs 1 and 2 above, Member States shall take appropriate steps to avoid pollution or deterioration of habitats or any disturbances affecting the birds, in so far as these would be significant having regard to the objectives of this article. Outside these protection areas, Member States shall also strive to avoid pollution or deterioration of habitats.'

The Habitats Directive

4 Article 6(2) to (4) of the Habitats Directive provide:

'2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

...'

5 Pursuant to Article 7 of the Habitats Directive:

'Obligations arising under Article 6(2), (3) and (4) of this Directive shall replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this Directive or the date of classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later.'

Facts of the dispute and the pre-litigation procedure

6 The construction project for the A 2 motorway, linking the city of Lisbon with the Algarve region, was awarded in 1997 to the company BRISA Auto-Estradas de Portugal.

7 For the part of that motorway running between the settlements of Aljustrel and Castro Verde, the company drew up a planned route bypassing to the east the settlements of Messejana, Alcarias, Conceiçao, Aivados and Estação de Ourique and crossing the western side of the Castro Verde SPA.

8 In September 1999, an environmental impact assessment relating to the planned route ('the environmental impact study') was submitted to the Portuguese Ministry of the Environment.

9 In the same month, the Castro Verde area was classified as a SPA by the Portuguese authorities pursuant to Article 4 of Directive 79/409.

10 In January 2000, the Secretary of State for the Environment approved the environmental impact study and authorised the implementation of the project.

11 The section of the A 2 motorway between Aljustrel and Castro Verde was opened to traffic in July 2001.

12 On the basis of a complaint which informed it that, despite the negative assessment of impact of that section of motorway on the Castro Verde SPA, the Portuguese authorities had implemented a motorway construction project whose route crossed that area, the Commission, by letter of 20 October 2000, gave the Portuguese Republic formal notice to submit its observations within two months.

13 The Portuguese authorities submitted their observations to the Commission by letters of 4 December 2000 and 12 January 2001.

14 Having found that the Portuguese authorities had not explained why alternative routes situated outside both the Castro Verde SPA and the residential zones of Alcarias, Conceição, Aivados and Estação de Ourique had not been considered and taking the view that the Portuguese Republic had failed to fulfil its obligations under Article 6(4) of the Habitats Directive, on 11 April 2001 the Commission issued a reasoned opinion calling on that Member State to take the measures necessary in order to comply with the opinion within two months of the date of its notification.

15 Since the Commission was not satisfied by the reply given by the Portuguese authorities, it decided to bring the present action.

The action

16 The Commission asserts that the environmental impact study clearly shows that the route chosen by the Portuguese authorities for the construction of the section of the A 2 motorway between Aljustrel and Castro Verde has a very significant negative impact on 17 species of wild birds listed in Annex I to Directive 79/409 and on the habitat of those birds.

17 The Portuguese Republic submits that the Commission merely makes general observations drawn from the environmental impact study, without demonstrating how the implementation of the route has had a very significant negative impact. In its view, it is necessary to weigh the potential adverse effect on the Castro Verde SPA against that which has actually been caused.

18 Pursuant to Article 6(3) of the Habitats Directive, the competent national authorities are to authorise a plan or project not directly connected with or necessary to the management of the area but likely to have a significant effect thereon only after having ascertained, by means of an appropriate assessment of the implications of the plan or project for the site, that it will not adversely affect the integrity of the site and, if appropriate, after having obtained the opinion of the general public.

19 That provision thus establishes a procedure intended to ensure, by means of a prior examination, that a plan or project which is not directly connected with or necessary to the management of the site concerned but likely to have a significant effect on it is

authorised only to the extent that it will not adversely affect the integrity of that site (Case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging* [2004] ECR I-7405, paragraph 34).

20 In that regard, the Court has already held that a plan or project such as the one in question may be granted authorisation only on the condition that the competent national authorities are certain that it will not have adverse effects on the integrity of the site concerned. That is so where no reasonable scientific doubt remains as to the absence of such effects (*Waddenvereniging and Vogelbeschermingsvereniging*, paragraphs 56 and 59).

21 In the present case, the environmental impact study mentions the presence, in the Castro Verde SPA, of 17 species of bird listed in Annex I to Directive 79/409 and the high sensitivity of certain of them to the disturbance and/or the fragmentation of their habitat resulting from the planned route of the section of the A 2 motorway between the settlements of Aljustrel and Castro Verde.

22 It is also apparent from that study that the project in question has a 'significantly high' overall impact and a 'high negative impact' on the avifauna present in the Castro Verde SPA.

23 The inevitable conclusion is that, when authorising the planned route of the A 2 motorway, the Portuguese authorities were not entitled to take the view that it would have no adverse effects on the SPA's integrity.

24 The fact that, after its completion, the project may not have produced such effects is immaterial to that assessment. It is at the time of adoption of the decision authorising implementation of the project that there must be no reasonable

scientific doubt remaining as to the absence of adverse effects on the integrity of the site in question (see, to that effect, Case C-209/02 *Commission* v *Austria* [2004] ECR I-1211, paragraphs 26 and 27, and *Waddenvereniging and Vogelbeschermingsvereniging*, paragraphs 56 and 59).

25 In those circumstances, the Portuguese authorities had the choice of either refusing authorisation for the project or of authorising it under Article 6(4) of the Habitats Directive, provided that the conditions laid down therein were satisfied (see, to that effect, *Waddenvereniging and Vogelbeschermingsvereniging*, paragraphs 57 and 60).

26 In the present case, therefore, it must be considered whether it was possible to authorise the planned route of the A 2 motorway between the settlements of Aljustrel and Castro Verde on the basis of Article 6(4) of the Habitats Directive.

27 The Commission submits that the Portuguese Republic did not comply with that provision since, in the present case, the Portuguese authorities failed to study certain alternative routes which would not have adverse effects on the Castro Verde SPA or on the population of that area.

28 In particular, it takes the view that those authorities did not take into consideration the alternative routes falling outside the Castro Verde SPA and the residential zone comprising the settlements of Alcarias, Conceição, Aivados and Estação de Ourique.

29 The Commission is of the opinion that such alternative routes should have been examined, in particular those which took the A 2 motorway along a corridor to the west of the Castro Verde SPA, between its boundary and the road IC 1, in an area of

plains with a very low demographic density, so that the Portuguese authorities could have chosen, without significant technical difficulties or unreasonable additional financial costs, an alternative route which did not have adverse effects on the SPA and affected neither the abovementioned nor other settlements.

30 According to the Portuguese Republic, it is for the Commission not only to propose such a route, but also to define it and give details of it, demonstrating the existence and viability of an alternative solution less harmful to the environment which the Portuguese authorities had not envisaged. The Commission has not supplied any evidence in that regard.

31 In any event, the Portuguese Republic submits that the solution proposed by the Commission cannot be considered to be an 'alternative solution' within the meaning of Article 6(4) of the Habitats Directive. In its view, that notion does not simply refer to an alternative solution whose theoretical feasibility is defensible, but also implies that the adverse effects of such a solution are taken into account.

32 In the submission of the Portuguese Republic, the implementation of the route proposed by the Commission would cause serious social, economic and environmental harm since it would affect the populations of Conceição, Aivados and Estação de Ourique as well as the reservoir at the Monte da Rocha dam.

33 Accordingly, that Member State takes the view that the marginal and incidental harm to the integrity of the Castro Verde SPA resulting from the route chosen by the Portuguese authorities is less significant than that which would be caused by implementation of the solution proposed by the Commission.

34 Article 6(4) of the Habitats Directive provides that, if, in spite of a negative assessment carried out pursuant to the first sentence of Article 6(3) and in the absence of alternative solutions, a plan or project must nevertheless be carried out

for imperative reasons of overriding public interest, the Member State is to take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected.

35 That provision, which permits a plan or project which has given rise to a negative assessment under the first sentence of Article 6(3) of the Habitats Directive to be implemented on certain conditions, must, as a derogation from the criterion for authorisation laid down in the second sentence of Article 6(3), be interpreted strictly.

36 Thus, the implementation of a plan or project under Article 6(4) of the Habitats Directive is, inter alia, subject to the condition that the absence of alternative solutions be demonstrated.

37 In the present case, it is common ground that the Portuguese authorities examined and rejected a number of solutions whose routes bypassed the settlements of Alcarias, Conceição, Aivados and Estação de Ourique but crossed the western side of the Castro Verde SPA.

38 On the other hand, it is not apparent from the file that those authorities examined solutions falling outside that SPA and to the west of the settlements referred to above, although, on the basis of information supplied by the Commission, it cannot be ruled out immediately that such solutions were capable of amounting to alternative solutions within the meaning of Article 6(4) of the Habitats Directive, even if they were, as asserted by the Portuguese Republic, liable to present certain difficulties.

39 Accordingly, by failing to examine that type of solution, the Portuguese authorities did not demonstrate the absence of alternative solutions within the meaning of that provision.

40 In those circumstances, it must be held that, by implementing a project for a motorway whose route crosses the Castro Verde SPA, notwithstanding the negative environmental impact assessment and without having demonstrated the absence of alternative solutions for the route concerned, the Portuguese Republic has failed to fulfil its obligations under Article 6(4) of the Habitats Directive.

Costs

41 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission applied for the Portuguese Republic to be ordered to pay the costs and the latter has been unsuccessful, it must be ordered to pay the costs.

On those grounds, the Court (Second Chamber) hereby:

1. **Declares that, by implementing a project for a motorway whose route crosses the Castro Verde special protection area, notwithstanding the negative environmental impact assessment and without having demonstrated the absence of alternative solutions for the route concerned, the Portuguese Republic has failed to fulfil its obligations under Article 6(4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, as amended by Directive 97/62/EC of 27 October 1997;**

2. **Orders the Portuguese Republic to pay the costs.**

[Signatures]

JUDGMENT OF THE COURT (Second Chamber)

14 September 2006 *

In Case C-244/05,

REFERENCE for a preliminary ruling under Article 234 EC from the Bayerischer Verwaltungsgerichtshof (Germany), made by decision of 19 April 2005, received at the Court on 7 June 2005, in the proceedings

Bund Naturschutz in Bayern eV,

Johann Märkl and Others,

Angelika Graubner-Riedelsheimer and Others,

Friederike Nischwitz and Others,

v

Freistaat Bayern,

* Language of the case: German.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, R. Silva de Lapuerta (Rapporteur), P. Kūris, G. Arestis and J. Klučka, Judges,

Advocate General: L.A. Geelhoed,
Registrar: B. Fülöp, Administrator,

having regard to the written procedure and further to the hearing on 6 April 2006,

after considering the observations submitted on behalf of:

— Bund Naturschutz in Bayern eV, by U. Kaltenegger and P. Rottner, Rechtsanwälte,

— J. Märkl and Others, by C. Deißler and A. Schwemer, Rechtsanwälte,

— F. Nischwitz and Others, by A. Lehners and E. Schönefelder, Rechtsanwälte,

— Freistaat Bayern, by Professors A. Brigola and M. Dauses, and by G. Schlapp and M. Wiget, acting as Agents,

— the Commission of the European Communities, by M. Van Beek and M. Heller, acting as Agents,

after hearing the Opinion of the Advocate General at the sitting on 18 May 2006,

gives the following

Judgment

1 The reference for a preliminary ruling concerns the interpretation of Article 3 of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7; 'the Directive').

2 This reference was made in the course of proceedings between Bund Naturschutz in Bayern eV and 23 other persons ('the applicants') and Freistaat Bayern regarding a decision to approve a motorway project.

The Directive

3 Under the sixth recital in the preamble to the Directive, 'in order to ensure the restoration or maintenance of natural habitats and species of Community interest at a favourable conservation status, it is necessary to designate special areas of conservation in order to create a coherent European ecological network according to a specified timetable'.

4 Article 3 of the Directive provides:

'1. A coherent European ecological network of special areas of conservation shall be set up under the title Natura 2000. This network, composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range.

The Natura 2000 network shall include the special protection areas classified by the Member States pursuant to Directive 79/409/EEC.

2. Each Member State shall contribute to the creation of Natura 2000 in proportion to the representation within its territory of the natural habitat types and the habitats of species referred to in paragraph 1. To that effect each Member State shall designate, in accordance with Article 4, sites as special areas of conservation taking account of the objectives set out in paragraph 1. ... .'

5 Article 4 of the Directive is worded as follows:

'1. On the basis of the criteria set out in Annex III (Stage 1) and relevant scientific information, each Member State shall propose a list of sites indicating which natural habitat types in Annex I and which species in Annex II that are native to its territory the sites host ...

The list shall be transmitted to the Commission, within three years of the notification of this Directive, together with information on each site. ...

2. On the basis of the criteria set out in Annex III (Stage 2) and in the framework both of each of the five biogeographical regions referred to in Article 1(c)(iii) and of the whole of the territory referred to in Article 2(1), the Commission shall establish, in agreement with each Member State, a draft list of sites of Community importance drawn from the Member States' lists identifying those which lost one or more priority natural habitat types or priority species.

Member States whose sites hosting one or more priority natural habitat types and priority species represent more than 5% of their national territory may, in agreement with the Commission, request that the criteria listed in Annex III (Stage 2) be applied more flexibly in selecting all the sites of Community importance in their territory.

The list of sites selected as sites of Community importance, identifying those which host one or more priority natural habitat types or priority species, shall be adopted by the Commission in accordance with the procedure laid down in Article 21.

3. The list referred to in paragraph 2 shall be established within six years of the notification of this Directive.

4. Once a site of Community importance has been adopted in accordance with the procedure laid down in paragraph 2, the Member State concerned shall designate that site as a special area of conservation as soon as possible ... .

5. As soon as a site is placed on the list referred to in the third subparagraph of paragraph 2 it shall be subject to Article 6(2), (3) and (4).'

6 In accordance with Article 6(1) of the Directive, Member States are to establish the necessary conservation measures involving, if need be, appropriate management plans specifically designed for the sites or integrated into other development plans, and appropriate statutory, administrative or contractual measures which correspond to the ecological requirements of the natural habitat types in Annex I and the species in Annex II present on the sites.

7 Article 6(2), (3) and (4) of the Directive provide:

'2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

8 Article 7 of the Directive provides that obligations arising under Article 6(2), (3) and (4) of the Directive shall replace any obligations arising under the first sentence of Article 4(4) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1) in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this Directive or the date of classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later.

9 In accordance with Article 11 of the Directive, Member States shall undertake surveillance of the conservation status of the natural habitats and species referred to in Article 2 with particular regard to priority natural habitat types and priority species.

National legislation

10 The law on federal roads (Bundesfernstraßengesetz) lays down, inter alia, the conditions necessary for the construction of that category of roads.

11 Paragraph 17 of that law provides:

'1. The construction or modification of federal roads is subject to the prior approval of a plan. In that context, all the public and private interests concerned by the project must be taken into consideration, including the impact of the project on the environment.

...'

12 Article 10(1)(5) of the Federal Law on Nature protection and countryside conservation (Gesetz über Naturschutz und Landschaftspflege) is worded as follows:

'Within the meaning of the present law, sites of Community importance means sites placed on the list prescribed in the third subparagraph of Article 4(2) of Directive 92/43/EEC, even if they have not yet been declared as protected sites within the meaning of the present law.'

13 That law provides in Articles 32 to 38 measures intended to protect the European ecological network 'Natura 2000'.

14 To that end, Article 33 of the same law establishes the selection procedure for sites which can then be accepted by the Commission. The first sentence of subparagraph 5(1) of that Article states:

'If a site has been published ...

1. all the projects, measures, amendments or disturbances which can adversely affect that site in its essential elements which are necessary for the conservation objectives shall be prohibited on a site of Community importance until the implementation of protective measures.'

15 The first sentence of Paragraph 13(b)(1) of the Bavarian law on the protection of nature, countryside conservation and outdoor leisure (Gesetz über den Schutz der Natur, die Pflege der Landschaft und die Erholung in der freien Natur) is worded as follows:

'Sites of Community importance shall be protected as special areas of conservation under Article 4(4) of Directive 92/43/EEC ... .'

16 Paragraph 13c of that law provides:

'1. Changes or disturbances which may, appreciably or in the long term, adversely affect the integrity of areas which are part of sites of Community importance or European ornithological reserves which have a determining importance with regard to the conservation objectives pursued by those sites or reserves shall be prohibited. The actions referred to in the previous sentence shall be forbidden on sites which are the subject of consultation since they risk adversely affecting, appreciably or in the long term, the biotypes or priority species which they host.

2. Plans shall be prohibited which, individually or in combination with other plans or projects, risk adversely affecting, appreciably or in the long term, the integrity of areas which are part of sites of Community importance or European ornithological reserves which have a determining importance with regard to the objectives of protection or conservation pursued by the latter.

3. Plans which may, individually or in combination with other plans or projects, affect sites of Community importance or European ornithological reserves must take into account the objectives of protection and conservation of those sites and reserves.

...'

17 Paragraph 48 of the same law provides:

'1. The officials or agents of authorities entrusted with nature conservation, of the Bavarian office for the protection of the environment and of municipalities shall be authorised to enter any plot of land in order to carry out the investigations necessary to perform the duties imposed by the present law; that authorisation shall also extend to the members of consultative committees for the protection of the environment in the preparation and holding of meetings. The present provision shall apply in particular to the preparation of measures prescribed by this law and the carrying out of land surveying, soil sampling and similar operations. ...

2. Until implementing regulations shall have been adopted ... the bodies or authorities responsible for nature conservation ... may, by general or individual

order, prohibit changes ... for a period of up to two years, in order to guarantee the provisional protection of the areas and objects to be protected, when there are grounds for fearing that those changes may jeopardise the aim of the protective measures envisaged; if special circumstances so require, that period may be extended for a maximum of a year. That measure may not be adopted unless the authorities responsible for nature conservation or the competent bodies apply the definitive protection procedure at the same time or immediately afterwards.

3. From the notification of the zone to be protected ... until the entry into force of the protective regulation, any alteration shall be prohibited for a maximum of one year in the prescribed natural conservation areas, subject to contrary provisions pursuant to paragraph 2 in the general or individual order. The legal use to which the land is put shall remain as it was at the time of notification. That consequence must be mentioned in the notification.'

The facts which gave rise to the dispute and the questions referred for a preliminary ruling

18 The applicants in the main proceedings object to the construction of the Forstinning-Pastetten section of the new Munich-Mühldorf-Simbach-Pocking A 94 motorway. In the development plans for national trunk roads, that link was classified as an 'absolute priority'.

19 In the planning of that work, the route to be taken, from the Forstinning area, is controversial. The existing national B 12 trunk road, in the corridor of which it is planned to construct the main part of the new A 94 motorway, passes through the village of Haag ('the Haag route').

20 By decision of 7 March 2002 the Upper Bavarian government approved the plan for the construction of the Forstinning-Pastetten section of the A 94 motorway, 6.2 kilometres long, and turned down the Haag route in favour of a route passing further to the north through the village of Dorfen ('the Dorfen route'). The choice of the Dorfen route means that the A 94 would cross, in particular, the Hammerbach and Isen rivers and their tributaries, the Lappach, Goldach and Rimbach.

21 These are parts of areas which have been identified by the German authorities, on 29 September 1994, as sites eligible to be considered sites of Community importance. Those sites are designated as follows:

— Strogn, Hammerbach, Kollinger Bach (DE 7637-371),

— The valley of the Isen and its tributaries (DE 7739-371)

— Colonies of long-eared bats in the Lower Bavarian hill country (DE 7839-371).

22 According to ecological data relating to those zones, in both site DE 7637-371 and site DE 7739-371 there is a priority natural habitat type which appears in Annex I to the Directive and is listed under the name 'alluvial forests with Alnus glutinosa and Fraxinus excelsior'.

23 In addition, in the vicinity of the Haag route, the German authorities have designated the following additional protection zone:

— Ebersberger and Großhaager forest (DE 7837-371).

24 The applicants in the main proceedings having brought an action before it, the referring court points out that it would be possible to set aside the decision of approval of 7 March 2002 in accordance with the applicants' application only if there were irreparable errors of examination or breaches of Community law, in particular if the view were to be taken that the disputed planning significantly affected the designated protection zones with a view to their recognition as sites of Community importance.

25 In those circumstances, the Bayerischer Verwaltungsgerichtshof (Administrative Court, Bavaria) (Germany) firstly ruled that the claims should have suspensory effect and, secondly, decided to stay the proceedings and to refer the following questions to the Court of Justice for a preliminary ruling:

'(1) What protection regime is required under Article 3(1) of Directive 92/43 in conjunction with the sixth recital in the preamble to that Directive in the light of the prohibition of any measure that might jeopardise the attainment of the objectives of the Treaty laid down in the second paragraph of Article 10 EC, as a result of the judgment of the Court of 13 January 2005 in Case C-117/03 in respect of sites which could be designated sites of Community importance, particularly those with priority natural habitat types or priority species, before

they appear in the list of sites of Community importance adopted by the Commission of the European Communities under the procedure provided for in Article 21 of the Directive?

(2) What is the effect on that protection regime if those sites already appear in the national list submitted to the Commission under Article 4(1) of Directive 92/43?

(3) Is a national protection scheme for those sites under Article 48(2) ... (the Bavarian Law on the protection of nature and countryside conservation) sufficient to satisfy the requirements of Community law under Article 3(1) of Directive 92/43 in conjunction with the sixth recital in the preamble to that Directive in the light of the prohibition of any measure that might jeopardise the attainment of the Treaty laid down in the second paragraph of Article 10 EC?'

26 In its assessments relating to the proceedings before it, the Verwaltungsgerichtshof wonders whether the protection scheme which must be determined is a protection scheme under Community law or whether the Member States must ensure the protection of the designated sites by means of measures within the scope of a national protection scheme alone. The response to that question will determine the legislation, criteria and also factual circumstances on the basis of which foreseeable damage linked to the planning at issue is to be assessed.

27 The Verwaltungsgerichtshof points out that it is not inconceivable that the planning might have significantly prejudicial consequences for the priority natural habitat type 'alluvial forests'. It finds that, in this case, the planned route crosses and, as it were,'criss-crosses' an integrated alluvial system (the Isen and its tributaries) several times. Consideration should also be given to the adverse effects on the area caused by noise, exhaust emissions, shadows cast by the bridges, land drying out under the bridges, harmful chemicals coming from the carriageway and also the emergence of atypical plant species during the construction period.

28 The Verwaltungsgerichtshof finally points out that a determination of the seriousness of the foreseeable damage to a designated zone with a view to its inclusion on the list of sites of Community importance depends also on whether the Directive requires the protection of such a zone to be strengthened before it is placed on that list.

Concerning the questions referred for a preliminary ruling

The first and second questions

29 By those questions which may appropriately be dealt with together, the referring court raises the question of the protection scheme applicable to sites which have been designated by the national competent authorities with a view to their recognition as sites of Community importance, but whose inclusion on the list awaits a decision by the Commission.

30 More specifically, the referring court puts forward firstly the question of the legal nature of that protection scheme and, secondly, the question of its material characteristics.

31 It must first be remembered that the process of designating sites with a view to their inclusion on the list of sites of Community importance is governed by the provisions listed in Articles 3 and 4 of the Directive.

32 As is clear from Article 3(2) of the Directive, the decision of the national competent authorities relating to the designation of a site eligible to be considered as the element forming the European ecological network of special areas of conservation constitutes the first step of a process leading to the creation of the 'Natura 2000' network.

33 In that context, when scientific assessments and decisions identifying natural habitats and species are made, in particular those of a priority nature, account must be taken of the selection criteria established in Annex III of the Directive.

34 Following that process, it is the Commission's duty, on the basis of those criteria, to establish, in agreement with each of the Member States, a draft list of the sites of Community importance, showing in particular the sites which host one or more priority natural habitat types or one or more priority species.

35 As regards the level of protection applicable to the sites which appear on the national list transmitted to the Commission, it must be remembered that, in accordance with Article 4(5) of the Directive, the protection scheme for special areas of conservation laid down in Article 6(2), (3) and (4) thereof applies to a site once the latter is placed, in accordance with the third subparagraph of Article 4(2) of the Directive, on the list of sites selected as sites of Community importance, adopted by the Commission.

36 It follows, as the Court ruled in Case C-117/03 *Dragaggi and Others* [2005] ECR I-167, paragraph 25, that the protective measures prescribed in Article 6(2) to (4) of the Directive are required only as regards sites which are placed on the list of sites selected as sites of Community importance.

37 However, the Court pointed out at paragraph 26 of that judgment that that did not mean that the Member States are not to protect sites as soon as they propose them, under Article 4(1) of the Directive, as sites eligible for identification as sites of Community importance on the national list transmitted to the Commission.

38 At paragraph 29 of that judgment, the Court held that, in the case of sites eligible for identification as sites of Community importance that are mentioned on the national lists transmitted to the Commission and may include in particular sites hosting priority natural habitat types or priority species, the Member States are, by virtue of the Directive, required to take protective measures 'appropriate' for the purpose of safeguarding that ecological interest.

39 As the national court raises the question of the interpretation to be given to the obligation to take such 'appropriate' protective measures, more precisely, the criteria

for the application of the protection scheme for sites designated by the national competent authorities, it must be remembered that, as the Court pointed out in Case C-371/98 *First Corporate Shipping* [2000] ECR I-9235, paragraphs 22 and 23, to produce a draft list of sites of Community importance, capable of leading to the creation of a coherent European ecological network of special sites of conservation, the Commission must have available an exhaustive list of the sites which, at national level, have an ecological interest which is relevant from the point of view of the Directive's objective of conservation of natural habitats and wild fauna and flora. Only in that way is it possible to realise the objective, in Article 3(1) of the Directive, of maintaining or restoring the natural habitat types and the species' habitats concerned at a favourable conservation status in their natural range, in the entire European territory of the Member States.

40 The Court also pointed out, at paragraph 23 of that judgment, that, having regard to the fact that, when a Member State draws up the national list of sites, it is not in a position to have precise detailed knowledge of the situation of habitats in the other Member States, it cannot, of its own accord, exclude sites which at national level have an ecological interest relevant from the point of view of the objective of conservation without jeopardising the realisation of that objective at Community level.

41 Consequently, the Commission must be sure of having available an exhaustive list of sites eligible as special areas of conservation, the drawing up of which is aimed at a coherent European ecological network. It also follows from this that, at the time of the decision which the Commission is called upon to take, the sites identified by the Member States must reflect the situation on the basis of which the scientific evaluations of potential sites of Community importance have been carried out.

42 If that were not the case, the Community decision-making process which is not only based on the integrity of the sites as notified by the Member States, but is also characterised by the ecological comparisons between the different sites proposed by the Member States, would run the risk of being distorted and the Commission would no longer be in a position to fulfil its duties in the area concerned.

43 It must be added that, in accordance with Annexe III, Stage 2, paragraph 1 of the Directive, 'all the sites identified by the Member States in Stage 1 which contain priority natural habitat types and/or species will be considered as sites of Community importance'. It is therefore correct that those sites appear on the list which the Commission must draw up.

44 Having regard to the foregoing considerations, the Member States must, as regards the sites identified with a view to their inclusion on the Community list, take appropriate protective measures in order to maintain the ecological characteristics of those sites.

45 In that regard, it must be remembered that, in accordance with the first part of Annexe III to the Directive, the ecological characteristics of a site identified by the competent national authorities must reflect the assessment criteria which are listed there, namely, the degree of representativity of the habitat type, its area, its structure and functions, the size and density of the population of the species present on the site, the features of the habitat which are important for the species concerned, the degree of isolation of the population present on the site and the value of the site for conservation of the habitat type and species concerned.

46 Member States cannot therefore authorise interventions which may pose the risk of seriously compromising the ecological characteristics of a site, as defined by those

criteria. This is particularly the case when an intervention poses the risk either of significantly reducing the area of a site, or of leading to the disappearance of priority species present on the site, or, finally, of having as an outcome the destruction of the site or the destruction of its representative characteristics.

47 The answer to the first and second questions must therefore be that the appropriate protection scheme applicable to the sites which appear on a national list transmitted to the Commission under Article 4(1) of the Directive requires Member States not to authorise interventions which incur the risk of seriously compromising the ecological characteristics of those sites.

The third question

48 By this question, the national court seeks an interpretation of Community law as regards the methods of implementation of the abovementioned protection scheme.

49 As regards the implementation of the protection scheme applicable to the sites concerned, it is for the Member States to take all the measures which are necessary.

50 In that regard, the detailed procedural rules applicable fall within the ambit of the domestic legal order of each Member State, provided that such rules are not less favourable than those governing similar domestic situations of an internal nature

and do not render impossible in practice or excessively difficult the exercise of rights conferred by Community law (see, to that effect, inter alia, Case C-312/93 *Peterbroeck* [1995] ECR I-4599, paragraph 12, and Case C-78/98 *Preston and Others* [2000] ECR I-3201, paragraph 31).

51 Consequently, the answer to the third question must be that Member States must, in accordance with the provisions of national law, take all the measures necessary to avoid interventions which incur the risk of seriously compromising the ecological characteristics of the sites which appear on the national list transmitted to the Commission. It is for the national court to assess whether that is the case.

Costs

52 Since these proceedings are, for the parties in the main proceedings, a step in the action pending before the national court, the decision on costs is a matter for that court. Costs incurred in submitting observations to the Court, other than the costs of those parties, are not recoverable.

On those grounds, the Court (Second Chamber) hereby rules:

1. **The appropriate protection regime applicable to sites which appear on a national list transmitted to the Commission, under Article 4(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, requires Member States not to**

authorise interventions which incur the risk of seriously compromising the ecological characteristics of those sites.

2. **Member States must, in accordance with the provisions of national law, take all the measures necessary to avoid interventions which incur the risk of seriously compromising the ecological characteristics of the sites which appear on the national list transmitted to the Commission. It is for the national court to assess whether that is the case.**

JUDGMENT OF THE COURT (Second Chamber)

13 July 2006 *

In Case C-191/05,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 28 April 2005,

Commission of the European Communities, represented by M. van Beek and A. Caeiros, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Portuguese Republic, represented by L. Fernandes, acting as Agent,

defendant,

* Language of the case: Portuguese.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, R. Silva de Lapuerta, P. Kūris (Rapporteur), J. Klučka and L. Bay Larsen, Judges,

Advocate General: J. Kokott,
Registrar: R. Grass,

having regard to the written procedure,

after hearing the Opinion of the Advocate General at the sitting on 23 February 2006,

gives the following

Judgment

1 By its application, the Commission of the European Communities asks the Court to declare that, by altering the demarcation of the 'Moura, Mourão, Barrancos' Special Protection Area ('the SPA concerned'), thereby excluding from it areas providing a habitat for species of wild birds for whose protection that SPA was designated, the Portuguese Republic has failed to fulfil its obligations under Article 4(1) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1, 'the Directive').

2 Article 4(1) of the Directive provides:

'The species mentioned in Annex I shall be the subject of special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution.

In this connection, account shall be taken of:

(a) species in danger of extinction;

(b) species vulnerable to specific changes in their habitat;

(c) species considered rare because of small populations or restricted local distribution;

(d) other species requiring particular attention for reasons of the specific nature of their habitat.

Trends and variations in population levels shall be taken into account as a background for evaluations.

Member States shall classify in particular the most suitable territories in number and size as special protection areas for the conservation of these species, taking into account their protection requirements in the geographical sea and land area where this directive applies.'

3 Following a complaint stating that the SPA concerned had been altered without any scientific basis, on 17 October 2003, the Commission sent the Portuguese Government a letter of formal notice, to which the Portuguese authorities responded by letter of 19 December 2003.

4 On 9 July 2004, the Commission issued a reasoned opinion to the Portuguese Government, stating that, by altering the demarcation of the SPA concerned, thereby excluding from it areas providing a habitat for species of wild birds for whose protection that SPA was designated, the Portuguese Republic had failed to fulfil its obligations under Article 4(1) of the Directive, and calling on that Member State to take the measures necessary to comply with the opinion within two months of receipt thereof. After examining the Portuguese authorities' response of 24 February 2005 and taking the view that the situation remained unsatisfactory, the Commission brought the present proceedings.

5 In its application, the Commission maintains that, in reducing, by Decree-Law No 141/2002 of 20 May 2002 (Diário da República I, Series A, No 116, of 20 May 2002), the extent of the SPA concerned as defined when it was created by Decree-Law No 384-B/99 of 23 September 1999 (Diário da República I, Series A, No 223, of 29 September 1999), the Portuguese Government excluded from protection several species of wild birds listed on the Natura 2000 Standard Data Form, which was used as a basis for creating that SPA, although those species were to be protected under the Directive.

6 The Commission further maintains that the alteration of the boundaries of the SPA concerned has no scientific basis, which is contrary to the requirements laid down in the Court's case-law.

7 The Portuguese Government, for its part, recognises that, irrespective of the discretion enjoyed by the Member States, the boundaries for SPAs must be defined in accordance with the criteria laid down in the Directive, as emphasised in the case-law of the Court.

8 That government states that new, adequate boundaries are currently being drawn up for the SPA concerned. They will take into account, on the one hand, the requirements for adequate protection of the species on account of which that area was designated as an SPA, such as the crane (Grus grus), the eagle owl (Bubo bubo), the black vulture (Aegypius monachus), the booted eagle (Hieraaetus pennatus) and the griffon vulture (Gyps fulvus), and, on the other hand, the protection necessary for steppe-land birds in suitable areas.

Findings of the Court

9 It must be borne in mind that Article 4 of the Directive lays down a protection regime which is specifically targeted and reinforced both for the species listed in Annex I and for migratory species, an approach justified by the fact that they are, respectively, the most endangered species and the species constituting a common heritage of the Community (see to that effect, Case C-169/89 *Van den Burg* [1990] ECR I-2143, paragraph 11, and Case C-44/95 *Royal Society for the Protection of Birds* [1996] ECR I-3805, paragraphs 23 and 26).

10 It is the ornithological criteria laid down in paragraphs (1) and (2) of Article 4 which are to guide the Member States in designating and defining the boundaries of SPAs (see, to that effect, *Royal Society for the Protection of Birds*, paragraph 26).

11 It follows from the provisions of Decree-Law No 141/2002 that the boundaries of the SPA concerned were altered on the ground that that SPA included areas which were not important habitats for steppe-land birds.

12 However, as rightly pointed out by the Commission, although the areas excluded from the SPA concerned by that Decree-Law do not provide a habitat for steppe-land birds, they did provide a habitat for other species of wild birds listed in Annex I to the Directive for whose protection that SPA had been designated, namely the crane (Grus grus), the eagle owl (Bubo bubo), the black vulture (Aegypius monachus), the booted eagle (Hieraaetus pennatus) and the griffon vulture (Gyps fulvus).

13 In those circumstances a Member State may not reduce the surface area of an SPA or alter its boundaries unless the areas excluded from the SPA are no longer the most suitable territories for the conservation of species of wild birds within the meaning of Article 4(1) of the Directive.

14 The Portuguese Government has not even sought to establish the existence of such a situation in this case.

15 The Commission's action must therefore be held to be well founded.

16 In the light of the foregoing considerations, it must be held that, by altering the demarcation of the SPA concerned, thereby excluding from it areas providing a habitat for species of wild birds for whose protection that SPA was designated, the Portuguese Republic has failed to fulfil its obligations under Article 4(1) of the Directive.

Costs

17 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission asked that the Portuguese Republic be ordered to pay the costs and the latter has been unsuccessful in its defence, it must be ordered to pay the costs.

On those grounds, the Court (Second Chamber) hereby:

1. **Declares that, by altering the demarcation of the 'Moura, Mourão, Barrancos' Special Protection Area, thereby excluding from it areas providing a habitat for species of wild birds for whose protection that area was designated, the Portuguese Republic has failed to fulfil its obligations under Article 4(1) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds;**

2. **Orders the Portuguese Republic to pay the costs.**

JUDGMENT OF THE COURT (Second Chamber)

18 May 2006 *

In Case C-221/04,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 27 May 2004,

Commission of the European Communities, represented by G. Valero Jordana and M. van Beek, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Kingdom of Spain, represented by F. Díez Moreno, acting as Agent, with an address for service in Luxembourg,

defendant,

* Language of the case: Spanish.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, J. Makarczyk, R. Schintgen, P. Kūris (Rapporteur) and G. Arestis, Judges,

Advocate General: J. Kokott,
Registrar: M. Ferreira, Principal Administrator,

having regard to the written procedure and further to the hearing on 1 December 2005,

after hearing the Opinion of the Advocate General at the sitting on 15 December 2005,

gives the following

Judgment

1 By its application, the Commission of the European Communities asks the Court for a declaration that, owing to the authorisation by the authorities in Castilla y Léon of the setting of stopped snares in several private hunting areas, the Kingdom of Spain has failed to fulfil its obligations under Article 12(1) of and Annex VI to Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7) ('the directive').

Legal context

2 The aim of the directive, according to Article 2(1) thereof, is 'to contribute towards ensuring biodiversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the Treaty applies'.

3 Article 12(1) of the directive provides that:

'Member States shall take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) in their natural range, prohibiting:

(a) all forms of deliberate capture or killing of specimens of these species in the wild;

...'

4 Annex IV to the directive, entitled 'Animal and plant species of Community interest in need of strict protection', cites *Lutra lutra* ('the otter') under (a), 'Animals'.

5 Annex VI to the directive, entitled 'Prohibited methods and means of capture and killing and modes of transport', mentions, as regards mammals, '[t]raps which are non-selective according to their principle or their conditions of use' under (a), 'Non-selective means'.

6 Article 15 of the directive provides that:

'In respect of the capture or killing of species of wild fauna listed in Annex V(a) and in cases where, in accordance with Article 16, derogations are applied to the taking, capture or killing of species listed in Annex IV(a), Member States shall prohibit the use of all indiscriminate means capable of causing local disappearance of, or serious disturbance to, populations of such species, and in particular:

(a) use of the means of capture and killing listed in Annex VI(a);

...'

7 Article 16 of the directive provides that:

'1. Provided that there is no satisfactory alternative and the derogation is not detrimental to the maintenance of the populations of the species concerned at a

favourable conservation status in their natural range, Member States may derogate from the provisions of Articles 12, 13, 14 and 15(a) and (b):

...

(b) to prevent serious damage, in particular to crops, livestock, forests, fisheries and water and other types of property;

...'

Facts and pre-litigation procedure

8 On 19 April 2001, following a complaint registered in 2000, the Commission sent the Kingdom of Spain a letter of formal notice in which it maintained that that Member State had failed to fulfil its obligations under Article 12(1) of and Annex VI to the directive by authorising the setting of stopped snares in a hunting area in which some of the animal species referred to in Annexes II and IV to that directive are to be found. The Spanish authorities replied by means of a detailed letter of 29 June 2001.

9 Having received two new complaints concerning permits for setting stopped snares in the course of 2001, the Commission, on 21 December 2001, sent a supplementary letter of formal notice to the Spanish authorities, who replied by letter of 25 February 2002.

10 As it considered that the infringements of the directive were persisting, the Commission sent the Kingdom of Spain a reasoned opinion on 3 April 2003 concerning the grant by the Spanish authorities of permits to set stopped snares, which do not constitute a selective hunting method, on various hunting grounds. It requested that that Member State take the measures necessary to comply with that opinion within two months of its notification.

11 In its letter of reply of 15 July 2003, the Spanish Government stated that the Commission had contravened the provisions of Article 226 EC by mentioning in the reasoned opinion a permit of 13 December 2002 which had not been cited either in the initial letter of formal notice or in the supplementary letter of formal notice. Moreover, that government again contested the grounds of complaint put forward by the Commission.

12 As it took the view that the Kingdom of Spain was still failing to fulfil some of the obligations stemming from the directive, the Commission brought this action.

13 The action relates to three permits for the use of stopped snares for fox hunting issued by the authorities of Castilla y Léon on 10 January 2000, 24 May 2001 and 13 December 2002 ('the contested permits'). The contested permits relate to two hunting areas ('the areas concerned'), namely the AV-10.198 area situated in the territory of the municipality of Mediana de la Voltoya in the province of Ávila which is referred to in the permit of 24 May 2001 and the SA-10.328 area situated in the territory of the municipality of Aldeanueva de la Sierra in the province of Salamanca which is referred to in the permits of 10 January 2000 and 13 December 2002.

Admissibility of the action

14 The Spanish Government raises two pleas of inadmissibility. The first concerns alteration of the subject-matter of the application and in the alternative its lack of precision and the second relates to the insufficient statement of grounds in the application.

The plea of inadmissibility concerning alteration of the subject-matter of the application

15 The Spanish Government submits principally that the Commission altered the subject-matter of the application following its submission by alleging that the directive was incorrectly transposed although in earlier correspondence it had restricted itself to alleging that the Kingdom of Spain had infringed the directive by issuing the contested permits.

16 According to the Commission that claim is incorrect as the action for failure to fulfil obligations has the sole aim of challenging the permits.

17 It is clear from the documents in the file that the debate regarding the incorrect transposition of the directive has its origin in the position taken by the Spanish Government in its defence which consisted of justifying the contested permits with regard to the derogations provided for in the directive.

18 The subject-matter of this action is clearly not the possible incorrect transposition into Spanish law of that directive, but the alleged infringement thereof by the grant of the contested permits. Accordingly, that plea of inadmissibility, as set out in the principal argument, must be rejected.

19 In the alternative, the Spanish Government submits that the Commission did not define the subject-matter of the action sufficiently. In that regard, the Spanish Government puts forward five arguments.

20 By its first argument, the Spanish Government objects to the expansion of the subject-matter of the application to include the permits of 24 May 2001 and 13 December 2002. On the one hand, the permit of 24 May 2001 was revoked by the competent authorities on 29 May 2001 and consequently has no legal force or status. On the other hand, the permit of 13 December 2002 was mentioned for the first time in the reasoned opinion so that that government did not have an opportunity to make observations.

21 The Commission contends first of all that the Spanish Government has not proved that the permit of 24 May 2001 was revoked. According to the Commission that permit shows the continuing existence of the administrative practice of issuing permits for hunting using stopped snares in hunting areas in which otters are to be found and should, on that basis, be taken into account in spite of the fact that it was granted only for a very brief period. As regards the permit of 13 December 2002, it was applied for and granted as an extension to the permit of 10 January 2000.

22 It must be borne in mind that it follows from the express terms of the second paragraph of Article 226 EC that the Commission may bring an action for failure to fulfil obligations before the Court only if the Member State concerned has failed to comply with the reasoned opinion within the period laid down by the Commission for that purpose (see, inter alia, Case C-362/90 *Commission* v *Italy* [1992] ECR I-2353, paragraph 9, and Case C-525/03 *Commission* v *Italy* [2005] ECR I-9405, paragraph 13).

23 It is, furthermore, settled case-law that the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation prevailing in the Member State at the end of the period laid down in the reasoned

opinion (see, inter alia, Case C-362/90 *Commission* v *Italy*, paragraph 10; Case C-173/01 *Commission* v *Greece* [2002] ECR I-6129, paragraph 7; Case C-114/02 *Commission* v *France* [2003] ECR I-3783, paragraph 9; and Case C-525/03 *Commission* v *Italy*, paragraph 14).

24 In the present case, it appears that the permit of 24 May 2001 was granted for a limited period ending on 15 June 2001, that is to say well before the reasoned opinion was sent.

25 It has not been shown that that permit continued to produce legal effects after the expiry of the period laid down in the reasoned opinion.

26 It follows that the action is inadmissible in so far as it relates to the permit issued on 24 May 2001.

27 As regards the permit of 13 December 2002, it must be noted that it was granted as an extension to the permit of 10 January 2000.

28 In that regard, it must be borne in mind that, according to the settled case-law of the Court, the subject-matter of a dispute may be extended to events which took place after the reasoned opinion was delivered in so far as they are of the same kind and constitute the same conduct as the events to which the opinion referred (see to that effect Case 42/82 *Commission* v *France* [1983] ECR 1013, paragraph 20, and Case 113/86 *Commission* v *Italy* [1988] ECR 607, paragraph 11).

29 In the present case, it must be noted that the permit of 13 December 2002 is of the same kind as the permit of 10 January 2000, as it states the conditions applicable under the latter for using and setting stopped snares without altering the meaning and scope thereof, and that the grant of those two permits constitutes the same conduct. Consequently, the fact that the permit of 13 December 2002 was cited as an example by the Commission in the reasoned opinion and is referred to again in this application did not deprive the Kingdom of Spain of the rights conferred by Article 226 EC. Therefore, that permit can be incorporated lawfully into the subject-matter of the action.

30 By its second argument, the Spanish Government submits that the Commission did not specify the obligations which the Kingdom of Spain failed to fulfil.

31 However, it is absolutely clear from the Commission's application that it alleges that the Kingdom of Spain failed to fulfil specific obligations stemming from Article 12(1)(a) of and Annex VI to the directive, namely the obligation to establish a system of strict protection for the animal species listed in Annex IV(a) to the directive (among which is to be found the otter) prohibiting all forms of deliberate capture or killing and the obligation to prohibit means of capture and killing which are non-selective according to their principle or their conditions of use. Accordingly, the Kingdom of Spain was aware of the obligations which it is alleged that it failed to fulfil.

32 By its third and fourth arguments, the Spanish Government alleges that the Commission restricted the subject-matter of the application for failure to fulfil obligations. During the pre-litigation procedure the Commission referred, on the one hand, to the protection of five other animal species apart from the otter and, on the other hand, to a variety of hunting methods and not only the use of stopped snares.

33 It must be borne in mind that, as the Commission rightly observes, the Court has already found that it is possible to limit the subject-matter of the proceedings at the stage of the proceedings before the Court (see to that effect Case C-279/94 *Commission* v *Italy* [1997] ECR I-4743, paragraphs 24 and 25; Case C-52/00 *Commission* v *France* [2002] ECR I-3827, paragraph 44; Case C-139/00 *Commission* v *Spain* [2002] ECR I-6407, paragraphs 18 and 19; and Case C-433/03 *Commission* v *Germany* [2005] ECR I-6985, paragraph 28). Accordingly, the Commission could limit the subject-matter of the failure to fulfil obligations alleged in its application to one of the species and one of the hunting methods mentioned during the pre-litigation procedure.

34 By its fifth argument, the Spanish Government submits that the Commission used the pre-litigation procedure as a means of progressively establishing the grounds for the failure to fulfil obligations. The consequence of such conduct is a breach of the principles of legal certainty and of respect for the fundamental rights of the defence.

35 The Commission considers that that argument alleges, on the one hand, the limitation of the subject-matter of the action, and, on the other hand, the absence, in the letter of formal notice, of sufficient evidence to warrant the initiation of infringement proceedings.

36 In this connection, such factors do not however appear capable of affecting the admissibility of the action. First, the Commission was permitted to limit the subject-matter of the proceedings at the stage of the proceedings before the Court, as observed in paragraph 33 of this judgment. Secondly, according to the case-law of the Court the purpose of the pre-litigation procedure is to give the State concerned the opportunity, on the one hand, to comply with its obligations under Community law and, on the other hand, to avail itself of its right to defend itself against the complaints formulated by the Commission (Case C-117/02 *Commission* v *Portugal*

[2004] ECR I-5517, paragraph 53). Furthermore, the formal notice cannot be subject to such strict requirements of precision as is the reasoned opinion, since the formal notice cannot, of necessity, contain anything more than an initial brief summary of the complaints (see to that effect Case C-279/94 *Commission* v *Italy*, paragraph 15).

37 As the Advocate General observed at point 24 of her Opinion, whilst it is true that the aim of the letter of formal notice is to delimit the subject-matter of the dispute, the Commission is obliged to specify precisely in the reasoned opinion the grounds of complaint which it has already raised more generally in the letter of formal notice. However, that does not prevent it from restricting the subject-matter of the dispute or expanding it to cover subsequent measures that are essentially the same as the measures challenged in the formal notice.

The plea of inadmissibility alleging an insufficient statement of grounds in the application

38 The second plea of inadmissibility raised by the Spanish Government alleges infringement of Article 38(1)(c) of the Rules of Procedure of the Court of Justice on the one hand and on the other hand an insufficient statement of grounds in the application and failure to prove the alleged failures to fulfil obligations.

39 As regards the first point, it must be stated that the application meets the requirements set out in Article 38(1)(c) of the Rules of Procedure of the Court of Justice as regards the subject-matter of the proceedings and a summary of the pleas in law.

40 With regard to the second point, it must be noted that, as the Commission states, the ground of complaint set out therein falls to be examined in the context of the substance of the case. Therefore, that plea of inadmissibility cannot be upheld.

41 In the light of the foregoing, it must be held that the action is inadmissible to the extent that it is founded on the permit of 24 May 2001 concerning the AV-10.198 hunting area situated in the territory of the municipality of Mediana de la Voltoya in the province of Ávila and is admissible as to the remainder.

The merits of the action

42 It must therefore be considered whether the permit of 13 December 2002 ('the contested permit') which relates to the SA-10.328 hunting area situated in the territory of the municipality of Aldeanueva de la Sierra in the province of Salamanca ('the area concerned') was issued by the Spanish authorities in breach of the directive.

43 The Commission puts forward two complaints in support of its action. First, the permit to use stopped snares in the area concerned entails the deliberate capture or killing of otters, in breach of Article 12(1)(a) of the directive. Secondly, the Commission submits that the Kingdom of Spain also infringed the provisions in Annex VI(a) to the directive as that permit relates to a means of hunting which is non-selective according to its principle and its conditions of use.

The complaint concerning infringement of Annex VI(a) to the directive

44 By its second complaint, which it is appropriate to examine first, the Commission submits that the permit to use stopped snares infringes Annex VI(a) to the directive since it involves a means of hunting which is non-selective according to its principle and its conditions of use.

45 Under the directive the methods and means of capture and killing listed in Annex VI(a) are prohibited only as regards the cases referred to in Article 15 of the directive, which is the only article referring to that annex.

46 It is clear from that provision that it is prohibited to use non-selective means, in particular those listed in Annex VI(a) to the directive, to capture or kill species of wild fauna listed in Annex V(a) to the directive and, where in accordance with Article 16, derogations are applied, to take, capture or kill species listed in Annex IV(a) to the directive.

47 It must be borne in mind that the contested permit was issued for fox hunting and that the fox is an animal species which is not referred to in either Annex IV(a) or Annex V(a) to the directive. It follows that the prohibition with regard to non-selective means of hunting is not binding on the Spanish authorities in the present case. Therefore, the complaint concerning infringement of Annex VI(a) to the directive must be rejected.

The complaint concerning infringement of Article 12(1)(a) of the directive

48 It must be borne in mind that under Article 12(1)(a) of the directive Member States are required to take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) to the directive in their natural range. That system must, according to that provision, prohibit all forms of deliberate capture or killing of the species referred to.

49 In order to assess the validity of the complaint put forward by the Commission, the presence of the otter in the area concerned must be ascertained, and the circumstances under which the capture or killing of that species is deliberate must be established.

The presence of the otter in the area concerned

— Arguments of the parties

50 First, the Commission submits that, in its reply to the reasoned opinion, the Spanish Government acknowledged the presence of the otter in the area concerned as in that response it stated that the otter may be found throughout virtually the whole of the territory of Castilla y Léon.

51 Secondly, the presence of the otter is borne out by the scientific information sheets 'Natura 2000' which the Kingdom of Spain submitted to the Commission concerning the sites of Quilamas (Salamanca) and Encinares de los ríos Adaja y Voltoya (Ávila), the site of Quilamas being adjacent to the area concerned.

52 Thirdly, waterways, which are a necessary component of the habitat of otters, cross that area.

53 Lastly, monographs on the position of otters in Spain also confirm that that species is to be found in the area concerned.

54 In view of all those factors, the Commission submits that if the Spanish Government considers that the otter is not to be found in that area, it must prove it by submitting a technical study carried out on site.

55 The Spanish Government submits that there are no otters in the area concerned. In reply to the first argument put forward by the Commission, it observes that acknowledging that a particular animal species is present in a territory does not imply that that species occupies all the habitats in that territory.

56 The Spanish Government also states that waterways are a necessary component of the habitat of otters whereas the area concerned is neither a coastal area nor an area adjoining a river. It adds that the rivers and streams which cross that area are of a seasonal nature as they dry up during the summer months.

57 Furthermore, monographs produced by the Commission prove that there are no otters in the area concerned.

58 Lastly, the Spanish Government considers that there is in that area merely a likelihood that otters are to be found and that the Commission has not established their presence in so far as it does not have either direct evidence, such as the capture of specimens of that species, or indirect evidence, such as the existence of otter tracks.

— Findings of the Court

59 It must be borne in mind that, according to the settled case-law of the Court, in an action for failure to fulfil obligations brought under Article 226 EC it is for the Commission to prove that the obligation has not been fulfilled without being able to rely on any presumption (see to that effect, inter alia, Case 96/81 *Commission* v *Netherlands* [1982] ECR 1791, paragraph 6; Case C-194/01 *Commission* v *Austria* [2004] ECR I-4579, paragraph 34; and Case C-6/04 *Commission* v *United Kingdom* [2005] ECR I-9017, paragraph 75).

60 As regards the scientific information sheets 'Natura 2000', it must be stated that, as the Advocate General observed in point 71 of her Opinion, they cover the Quilamas site, which has a surface area of over 10 000 hectares. Admittedly, the area concerned is situated in the immediate vicinity of that site, to the north-west. However, it is common ground that the largest waterways on that site, including the Arroyo de las Quilamas, flow to the south-east and are separated from the area concerned by a range of hills with a height of several hundred metres. Therefore, it is unlikely that otters from the populations living in the network of waterways on the Quilamas site would move into the area concerned.

61 Furthermore, as the Spanish Government, which has not been contradicted on that point by the Commission, has stated, although waterways are a necessary component of the habitat of otters those which cross the area concerned or flow near it are of a seasonal nature.

62 Lastly, as regards the monographs produced by the Commission, it must be stated that they contain contradictory information so that no certainty regarding the presence of the otter in the area concerned is apparent from them.

63 It is clear from the foregoing that the Commission has not furnished evidence to the requisite legal standard as to the presence of otters in the area concerned as the evidence produced proves at the very most that there is a possibility that they are to be found in that area.

Whether the capture of otters is deliberate

— Arguments of the parties

64 The Commission submits that the capture of otters cannot be regarded as accidental and therefore that the condition as to intention which is provided for in Article 12(1)(a) of the directive is met if the Spanish authorities, although they know that otters are present in an area, nevertheless authorise for the purposes of fox hunting the use of a non-selective method of capture there which may adversely affect otters.

65 Thus, by issuing the contested permit, the Kingdom of Spain failed to fulfil the obligation arising out of Article 12(1)(a) of the directive to forestall adverse consequences for otters and created a risk of specimens of that species being deliberately captured.

66 The Spanish Government contends that the contested permit was issued for fox hunting, not otter hunting. It acknowledges the possibility of an indirect effect on otters provided that that animal species is to be found in the area concerned — a circumstance which has not, however, been established.

67 Furthermore, the Spanish Government considers that the stopped snare is a selective means of hunting both according to its principle, as the stop serves to prevent the captured animal's death, and as regards the conditions of use imposed by the contested permit such as the daily inspection of snares, the requirement that any animal which is not covered by that permit be immediately freed or the specific manner in which those snares are set.

— Findings of the Court

68 Under Article 12(1)(a) of the directive, Member States are to take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) to that directive in their natural range, prohibiting all forms of deliberate capture or killing.

69 With respect to the condition as to 'deliberate' action provided for in that provision, it is clear from a reading of the different language versions thereof that 'deliberate' refers to both the capture and the killing of protected animal species.

70 It must also be borne in mind that the Court has categorised as deliberate disturbance within the meaning of Article 12(1)(b) of the directive matters such as the use of mopeds on a beach notwithstanding warnings as to the presence of protected sea turtles' nests and the presence of pedalos and small boats in the sea area of the beaches concerned, and has held that a Member State fails to fulfil its obligations under Article 12(1)(b) and (d) of the directive where it does not take all the requisite specific measures to prevent the deliberate disturbance of the animal species concerned during its breeding period or the deterioration or destruction of

its breeding sites (see Case C-103/00 *Commission* v *Greece* [2002] ECR I-1147, paragraphs 36 and 39, and the Opinion of Advocate General Léger in that case, at point 57).

71 For the condition as to 'deliberate' action in Article 12(1)(a) of the directive to be met, it must be proven that the author of the act intended the capture or killing of a specimen belonging to a protected animal species or, at the very least, accepted the possibility of such capture or killing.

72 It is common ground, however, that the contested permit related to fox hunting. Accordingly, the permit in itself is not intended to allow the capture of otters.

73 Furthermore, it must be borne in mind that the presence of otters in the area concerned has not been formally proven, so that it has also not been established that by issuing the contested permit for fox hunting the Spanish authorities knew that they risked endangering otters.

74 It must therefore be held that the requisite criteria, as set out in paragraph 71 of this judgment, for fulfilling the condition relating that the capture or killing of a specimen belonging to a protected animal species is deliberate have not been met in the present case.

75 The Commission's action must therefore be dismissed.

Costs

76 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Kingdom of Spain has applied for costs and the Commission has been unsuccessful, the Commission must be ordered to pay the costs.

On those grounds, the Court (Second Chamber) hereby:

1. Dismisses the action;

2. Orders the Commission of the European Communities to pay the costs.

[Signatures]

JUDGMENT OF THE COURT (Second Chamber)

23 March 2006 *

In Case C-209/04,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 12 May 2004,

Commission of the European Communities, represented by M. van Beek and B. Schima, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Republic of Austria, represented by E. Riedl, J. Müller and K. Humer, acting as Agents, with an address for service in Luxembourg,

defendant,

* Language of the case: German.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, R. Schintgen, P. Kūris (Rapporteur), G. Arestis and J. Klučka, Judges,

Advocate General: J. Kokott,
Registrar: K. Sztranc, Administrator,

having regard to the written procedure and further to the hearing on 6 October 2005,

after hearing the Opinion of the Advocate General at the sitting on 27 October 2005,

gives the following

Judgment

1 By its application, the Commission of the European Communities asks the Court for a declaration that:

— by failing to include in the area of the Lauteracher Ried national nature reserve ('the Lauteracher Ried') that is classified as a special protection area ('SPA') the Soren and Gleggen-Köblern sites which, according to scientific criteria, are,

together with that SPA, among the most suitable territories in number and size for the purposes of Article 4(1) and (2) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1), as amended by Commission Directive 97/49/EC of 29 July 1997 (OJ 1997 L 223, p. 9) ('the Birds Directive'), and

— by failing, when authorising the planned construction of the federal S 18 Lake Constance dual carriageway ('the S 18 carriageway'), to comply properly and fully with the requirements laid down in Article 6(4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7) ('the Habitats Directive') in the case of execution of a project despite a negative assessment of the environmental implications for the site,

the Federal Republic of Austria has failed to fulfil its obligations under Article 4(1) and (2) of the Birds Directive and Article 6(4), in conjunction with Article 7, of the Habitats Directive.

Legal framework

The Act of Accession of the Republic of Austria to the European Union

2 The Act concerning the conditions of accession of the Republic of Austria, the Republic of Finland and the Kingdom of Sweden and the adjustments to the Treaties on which the European Union is founded (OJ 1994 C 241, p. 21, and OJ 1995 L 1, p. 1) ('the Act of Accession') was signed on 24 June 1994 and entered into force on 1 January 1995.

3 According to Article 2 of the Act of Accession, 'from the date of accession, the provisions of the original Treaties and the acts adopted by the institutions before accession shall be binding on the new Member States and shall apply in those States under the conditions laid down in those Treaties and in this Act'.

4 Article 168 of the Act of Accession provides:

'The new Member States shall put into effect the measures necessary for them to comply, from the date of accession, with the provisions of directives and decisions within the meaning of Article 189 of the EC Treaty and of Article 161 of the Euratom Treaty, and with recommendations and decisions within the meaning of Article 14 of the ECSC Treaty, unless a time-limit is provided for in the list of Annex XIX or in any other provisions of this Act.'

The Birds Directive

5 According to Article 1(1), the Birds Directive 'relates to the conservation of all species of naturally occurring birds in the wild state in the European territory of the Member States to which the Treaty applies. It covers the protection, management and control of these species and lays down rules for their exploitation'.

6 The corncrake (*Crex crex*) is a species added to Annex I to the Birds Directive ('Annex I') by Commission Directive 85/411/EEC of 25 July 1985 amending Directive 79/409 (OJ 1985 L 233, p. 33).

7 Article 4 of the Birds Directive provides:

'1. The species mentioned in Annex I shall be the subject of special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution.

In this connection, account shall be taken of:

(a) species in danger of extinction;

(b) species vulnerable to specific changes in their habitat;

(c) species considered rare because of small populations or restricted local distribution;

(d) other species requiring particular attention for reasons of the specific nature of their habitat.

Trends and variations in population levels shall be taken into account as a background for evaluations.

Member States shall classify in particular the most suitable territories in number and size as special protection areas for the conservation of these species, taking into account their protection requirements in the geographical sea and land area where this Directive applies.

2. Member States shall take similar measures for regularly occurring migratory species not listed in Annex I, bearing in mind their need for protection in the geographical sea and land area where this Directive applies, as regards their breeding, moulting and wintering areas and staging posts along their migration routes. ...

...

4. In respect of the protection areas referred to in paragraphs 1 and 2 above, Member States shall take appropriate steps to avoid pollution or deterioration of habitats or any disturbances affecting the birds, in so far as these would be significant having regard to the objectives of this Article. Outside these protection areas, Member States shall also strive to avoid pollution or deterioration of habitats.'

The Habitats Directive

8 Article 6(3) and the first paragraph of Article 6(4) of the Habitats Directive provide:

'3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in

combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.'

9 Article 7 of the directive provides:

'Obligations arising under Article 6(2), (3) and (4) of this Directive shall replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this Directive or the date of classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later.'

Background to the dispute

10 The Lauteracher Ried is situated in the Province of Vorarlberg. After the Republic of Austria acceded to the European Union, the Austrian Government notified the

Commission for the first time of the classification of that nature reserve as an SPA on 7 June 1995 and it subsequently submitted certain additional documents. The Soren and Gleggen-Köblern sites are not included within the boundaries of that SPA.

11 As regards the construction project for the S 18 carriageway, the procedure for determining the road line was commenced in 1992. Following a discussion held on 29 April 1992 with the administration of the district of Dornbirn, the project was completely revised in order to take account of the report drawn up by the Province of Vorarlberg's official expert for the protection of nature and landscapes. The procedure for presenting the project and hearing the parties concerned with a view to determining the road line began on 8 March 1994 pursuant to the 1971 Law on federal roads. It ended with the determination of the road line by order of 8 April 1997 of the Federal Minister for Economic Affairs. At that stage of the project, the Austrian authorities reached the conclusion that there were no alternative routes for the S 18 carriageway.

12 On 27 January 1999, the procedure for authorisation of the construction of the carriageway began. By decision of 6 July 2001, the project for construction of the carriageway was authorised by the administrations of the districts of Bregenz and Dornbirn, pursuant to the legislation of the Province of Vorarlberg. Given the abovementioned order of the Federal Minister for Economic Affairs, that decision could not adopt a road line other than the one which had been chosen.

13 That decision was the subject of an appeal to the government of the Province of Vorarlberg. On 21 February 2003, the government adopted a decision confirming the decision, but the execution of the government's decision was suspended on 29 August 2003 by the Verwaltungsgerichtshof (Administrative Court). The project for the construction of the S 18 carriageway is currently blocked and cannot proceed.

Pre-litigation procedure

14 Following a complaint, on 12 November 2001 the Commission sent a letter to the Austrian authorities concerning the insufficient classification, from an ornithological point of view, of the Lauteracher Ried SPA, the feared negative implications of the S 18 carriageway construction project for the corncrake and the other bird populations to be safeguarded within that area, and also other issues relating to the protection of that area.

15 After examining the Austrian Government's response, sent to the Commission on 1 February 2002, on 27 June 2002 the Commission sent the Republic of Austria a letter of formal notice. Not satisfied with the explanations provided by the Austrian Government, on 11 July 2003 the Commission issued a reasoned opinion calling upon the Republic of Austria to take the measures necessary to comply therewith within two months of its notification.

16 Taking the view that the arguments relied on by the Republic of Austria in its response of 26 September 2003 to the reasoned opinion were not convincing and considering that the infringement alleged was continuing, the Commission decided to bring the present action.

The action

17 The Commission puts forward two complaints in support of its action. First, it criticises the Republic of Austria for not having complied with the provisions of Article 4(1) and (2) of the Birds Directive concerning the procedure for selection and classification of an SPA. Second, it pleads that the requirements laid down in Article 6(4) of the Habitats Directive were not complied with when the project for the construction of the S 18 carriageway was authorised.

The first complaint: failure to comply with Article 4(1) and (2) of the Birds Directive

Arguments of the parties

18 By its first complaint, the Commission maintains that the current classification, and definition of the boundaries, of the Lauteracher Ried SPA do not comply with the requirements of protection and sustainable conservation of the bird species present in that area, particularly the corncrake and other migratory grassland-nesting species. According to the Commission, in order to meet the requirements of Article 4(1) and (2) of the Birds Directive, the surface area of that SPA must be expanded to include the Soren and Gleggen-Köblern sites.

19 In support of that complaint, the Commission submits, first, that the decisive factor for defining the boundaries of the SPA is the presence of bird species to be protected. According to the scientific information and the results of monitoring carried out between 2000 and 2002, those sites are not only habitats but also form part of the principal breeding ground for the corncrake and other migratory grassland-nesting species. The Commission also states that the meadows situated inside and around the Lauteracher Ried site offer, in terms of bird protection, a uniform natural habitat that is particularly appropriate structurally and they are used by the same bird populations. It adds that the corncrakes present in the Rhine Valley, in the territory of the Province of Vorarlberg, are a closely-knit group of birds.

20 Next, the Commission maintains that the obligation to designate as an SPA all areas which seem most suitable on the basis of ornithological criteria does not come to an end with the first declaration made. The objective of conservation of endangered

species requires re-examination of a declaration in the light of more recent scientific knowledge and a possible re-definition of the boundaries of an existing SPA.

21 Lastly, the fact that the Republic of Austria classified as protection areas the sites of Bangs and Matschels, which are also situated in the Province of Vorarlberg, as part of a conservation effort for the corncrake, in no way affects that Member State's obligation to do likewise for the Soren and Gleggen-Köblern sites, which are adjacent to the declared SPA.

22 The Republic of Austria states that the currently-defined boundaries of the Lauteracher Ried SPA constitute the best possible means of complying with the requirements of the Birds Directive for the protection and conservation of the corncrake and regularly-occurring migratory bird species in the Rhine Valley in the Province of Vorarlberg.

23 It submits that it has fulfilled its obligations under the Birds Directive by defining the boundaries for that SPA together with the Bangs and Matschels protection area for fauna, flora, habitats and birds, having thereby classified as an SPA and recognised as such the territories of the Rhine Valley situated in the Province of Vorarlberg which are the most suitable in number and size for the conservation of the corncrake referred to in Annex I and of regularly-occurring migratory species.

24 The Republic of Austria states that the boundaries of the SPA were defined on the basis of scientific evidence available at the time of the choice and classification of that area; that evidence is recognised as being reliable in the case-law of the Court of Justice and it led to the classification of that area alone as being the most important breeding ground for meadow birds in the Province of Vorarlberg.

25 It adds that, in classifying that area, it relied solely on the ornithological or ecological aspects which may be inferred from Article 4(1) and (2) of the Birds Directive. In that context, it maintains that an untouched natural setting essential for the development of the corncrake is concentrated only in the Lauteracher Ried SPA, and that that setting does not include the litter meadows situated in the Soren and Gleggen-Köblern sites.

26 According to the Republic of Austria, several criteria must be considered in order to determine the most suitable territories, in particular the fact that two species of birds occur in a given area or part of that area. However, that criterion alone is not decisive for compliance with the requirements of the Birds Directive. To be included in the most suitable territories within the meaning of that directive, the area must also satisfy each of a number of other ornithological or ecological criteria. It is also necessary to consider and assess whether the area is suitable in size and from a quantitative point of view, and whether the condition it is in and its environment are suitable. This aspect includes existing harm to the area due to recreational activities, management of the area or other factors, and the deterioration of the habitat resulting therefrom. According to the Republic of Austria, because of the existing pollution and constraints and the current quality of the two sites of Soren and Gleggen-Köblern, they do not meet the relevant criteria to be classified as an SPA under the Birds Directive.

27 In that context, the Republic of Austria states that the taking into account, if only indirectly, of socio-economic interests may play a role in the assessment of whether an area is suitable in size and adds that this is the case for interference with the legal rights of individuals.

28 According to the Republic of Austria, the complaint that it was obliged to amend subsequently and make constant adaptations to the Lauteracher Ried SPA has no legal basis. Such an obligation could be difficult to reconcile with the principle of legality of administrative actions and contrary to the Court of Justice's case-law.

29 The Republic of Austria adds that although the Soren and Gleggen-Köblern sites are not among the most suitable territories within the meaning of the fourth subparagraph of Article 4(1) of the Birds Directive, they are not entirely unprotected. In fact, during the appeal procedure relating to the project for the construction of the S 18 carriageway, they were subject to the protection scheme provided for in the second sentence of Article 4(4).

Findings of the Court

30 In order to decide the present dispute, it is appropriate to begin by recalling the principles governing the Member States' obligations concerning the choice and classification of SPAs as imposed by the Birds Directive.

31 It follows from the fourth subparagraph of Article 4(1) of that directive that the Member States must classify as SPAs the most suitable territories in number and size for the conservation of the protected species listed in Annex I. In doing so, they must take into account those species' protection requirements in the geographical sea and land area where that directive applies. Under Article 4(2), Member States must take similar measures for regularly-occurring migratory species not listed in Annex I as regards their breeding, moulting and wintering areas and staging posts along their migration routes.

32 According to the settled case-law of the Court, Article 4(1) and (2) of the Birds Directive requires the Member States to provide SPAs with a legal status protecting them that is capable, in particular, of ensuring both the survival and reproduction of the bird species listed in Annex I and the breeding, moulting and wintering of regularly-occurring migratory species not listed in Annex I (see Case C-166/97 *Commission* v *France* [1999] ECR I-1719, paragraph 21, and case-law cited).

33 The Court has also held that the Member States' margin of discretion in choosing the most suitable territories for classification as SPAs concerns not the appropriateness of classifying as SPAs the territories which appear the most suitable according to ornithological criteria, but only the application of those criteria for identifying the most suitable territories for conservation of the species listed in Annex I (see, inter alia, Case C-3/96 *Commission* v *Netherlands* [1998] ECR I-3031, paragraph 61).

34 It should also be borne in mind that, according to the results of scientific studies and a monitoring exercise which were submitted by the Commission during the procedure and have not been contested by the Austrian Government, in the years 2000 to 2002, respectively four or five, four and three singing male corncrakes were observed within the 580-hectare Lauteracher Ried SPA. The sightings concerning the Soren and Gleggen-Köblern sites, covering 64 and 352 hectares, were only slightly lower, the birds observed numbering four, two and three, respectively.

35 Moreover, as the Commission has maintained, without being contradicted on this point either, in 2001 there were likewise large numbers of migratory common snipe (*Gallinago gallinago*), Northern lapwings (*Vanellus vanellus*) and Eurasian curlews (*Numenius arquata*) breeding in the two sites not designated as SPAs by the Austrian authorities. Within the Lauteracher Ried SPA there were three to five pairs of common snipe nesting, 11 or 12 pairs of Northern lapwings and three pairs of Eurasian curlews. In the Soren and Gleggen-Köblern sites, respectively, there were three and three or four pairs of common snipe, six and nine pairs of Northern lapwings and one (probably) and eight pairs of Eurasian curlews.

36 It follows, as observed by the Advocate General in point 32 of her Opinion, that the Soren and Gleggen-Köblern sites are of at least comparable importance to the Lauteracher Ried SPA for both the corncrake and migratory bird species not listed in Annex I, such as the common snipe, Northern lapwing and Eurasian curlew. Moreover, the figures provided by the Austrian Government in the standard data

form relating to those last three species are reached only if account is taken also of the land situated outside that SPA.

37 As regards the Austrian Government's argument that the Soren and Gleggen-Köblern sites are not the most suitable ones for protecting the abovementioned bird species due to the existing pollution and constraints, as well as the condition and current quality of those sites, it should be borne in mind that, as just mentioned in paragraphs 34 and 35 of this judgment, those sites host, in a smaller area than the Lauteracher Ried SPA, a similar number of nesting birds to that observed in the SPA.

38 Accordingly, the Court finds that, on the basis of ornithological criteria, the Soren and Gleggen-Köblern sites, in the same way as the Lauteracher Ried SPA, are among the most suitable territories in number and size for classification as SPAs for the purposes of Article 4(1) and (2) of the Birds Directive.

39 This finding cannot be affected by the argument relied on by the Austrian Government to the effect that it is appropriate to take account, if only indirectly, of economic and social criteria in the necessary assessment of the characteristics of the area to be classified as an SPA.

40 According to the settled case-law of the Court, a Member State may not, when designating an SPA and defining its boundaries, take account of economic requirements as constituting a general interest superior to that represented by the ecological objective of the Birds Directive or as constituting imperative reasons of overriding public interest of the kind referred to in the first subparagraph of Article 6(4) of the Habitats Directive (see, in particular, Case C-44/95 *Royal Society for the Protection of Birds* [1996] ECR I-3805, paragraphs 31 and 42).

41 Regarding the Austrian Government's argument that the results of the on-site monitoring do not lead to the conclusion that the Soren and Gleggen-Köblern sites are suitable for the conservation of the bird species to be protected, the Court finds that that argument is not such as to provide scientific justification for excluding those sites from the SPA. On the contrary, the classification of those sites as SPAs should safeguard the conservation status of the corncrake, a species listed in Annex I, and other regularly-occurring migratory bird species, in accordance with the objectives of the Birds Directive.

42 Nor does the Court accept the Austrian Government's argument that the Commission is incorrect in maintaining that the Lauteracher Ried SPA must continually be amended and adapted, since such a requirement has no legal basis.

43 Although it is common ground that the obligation to classify the most suitable territories for establishing an SPA entered fully into force with respect to the Republic of Austria on 1 January 1995, the date of its accession to the European Union, such an obligation does not end on that date. Neither the Birds Directive nor the wording of Article 4 thereof contains the slightest indication that the effects of the obligation to transpose that directive were exhausted on that date. Moreover, as noted by the Advocate General in point 39 of her Opinion, it would hardly be compatible with the objective of effective protection of birds if outstanding areas for the conservation of the species to be protected were not brought under protection merely because the outstanding nature of a site came to light only after transposition of the Birds Directive.

44 As to the Austrian Government's argument that it relied on the study carried out in 1995 by the Federal Environment Agency in collaboration with BirdLife, entitled *Important Bird Areas in Österreich*, because it was the only reliable inventory and scientific assessment existing at the time the Lauteracher Ried site was selected and

classified as an SPA, it need merely be stated that, as rightly pointed out by the Commission, the obligation to classify is not limited by the state of scientific knowledge at any given time.

45 The case-file shows that other scientific ornithological studies and expert reports, as well as the results of monitoring more recent than that on which the classification of the Lauteracher Ried SPA was based, are available. Accordingly, it is on the basis of that evidence, the accuracy of which is not disputed by the Republic of Austria, that the classification of the SPA had to be reconsidered.

46 Nor can the Republic of Austria maintain that, having classified the Bangs and Matschels sites, where the corncrake is also present, as protection areas, it no longer has to classify the Soren and Gleggen-Köblern sites as SPAs.

47 As the Court has already held, Member States are obliged to classify as SPAs all the sites which, applying ornithological criteria, appear to be the most suitable for conservation of the species in question (see, inter alia, *Commission* v *Netherlands*, paragraph 62).

48 Lastly, regarding the Austrian Government's argument that the Soren and Gleggen-Köblern are not left entirely unprotected, suffice it to recall that Article 4(1) of the Directive requires Member States to classify as SPAs the most suitable territories in number and size for the conservation of the species mentioned in Annex I, an obligation which it is not possible to avoid by adopting other special conservation methods (*Commission* v *Netherlands*, paragraph 55).

49 In the light of the foregoing, the Court finds that first complaint put forward by the Commission is well founded.

The second complaint: failure to comply with the requirements of Article 6(4) of the Habitats Directive

50 By its second complaint, the Commission maintains that the Republic of Austria did not comply with its obligations under Article 6(4), in conjunction with Article 7, of the Habitats Directive when the project for the construction of the S 18 carriageway was authorised, having regard to the requirements for biotope and habitat protection set for the Lauteracher Ried SPA.

51 The Commission states, first, that no specific and detailed assessment in accordance with the objectives of the Birds Directive was carried out before May 2000. It maintains that, when the environmental study led to a negative opinion from the Province of Vorarlberg's official expert in May 2000, due to the implications of the project for the construction of the S 18 carriageway on the SPA, no study was undertaken to ascertain whether alternative solutions could be envisaged for the road line. Next, the Commission states that, after the decision authorising construction, taken on 6 July 2001, it was not directly informed of the compensatory measures taken to counter the adverse impact of construction. Lastly, the Commission states that it has not been established that all necessary compensatory measures have actually been taken to ensure that the overall coherence of Natura 2000 is protected.

52 The Republic of Austria contests all of the submissions put forward by the Commission in support of the second complaint.

The temporal applicability of the Habitats Directive

53 Since it follows from paragraph 11 of this judgment that certain events pertaining to the project for the construction of the S 18 carriageway occurred before the date on which the Republic of Austria acceded to the European Union, it is appropriate, before ruling on the alleged infringement of the Habitats Directive, to consider whether it is applicable to the facts of the dispute which gave rise to the Commission's action.

54 It is common ground that the project for the construction of the S 18 carriageway began in 1992. The procedure was suspended and then resumed on 8 March 1994, the date on which it was formally presented and made subject to an assessment procedure pursuant to the 1971 Law on federal roads.

55 The case-file also shows that the overall federal expert report was made public in the same year, that is, prior to 1 January 1995, when the Republic of Austria acceded to the European Union.

56 According to the Court's settled case-law, the principle that projects likely to have significant effects on the environment must be subjected to an environmental assessment does not apply where the application for authorisation for a project was formally lodged before the expiry of the time-limit for transposition of a directive (see, with respect to Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment (OJ 1985 L 175, p. 40), Case C-431/92 *Commission* v *Germany* [1995] ECR I-2189, paragraphs 29 and 32, and Case C-81/96 *Gedeputeerde Staten van Noord-Holland* [1998] ECR I-3923, paragraph 23).

57 The Court has held that that formal criterion is the only one which accords with the principle of legal certainty and preserves a directive's effectiveness. The reason for that is that a directive such as the Habitats Directive is primarily designed to cover large-scale projects which will most often require a long time to complete. It would therefore not be appropriate for the relevant procedures, which are already complex at national level and which were formally initiated prior to the date of the expiry of the period for transposing the directive, to be made more cumbersome and time-consuming by the specific requirements imposed by the directive and for situations already established to be affected by it (see, by analogy, *Gedeputeerde Staten van Noord-Holland*, paragraphs 23 and 24).

58 Both Directive 85/337 and the Habitats Directive pertain to the assessment of the effects of certain public and private projects on the environment. In both cases, the assessment procedure takes place before the project is finally decided upon. The results of that assessment must be taken into consideration when the decision on the project is made, and the decision may be amended depending on the results. The various phases of examination of a project are so closely connected that they represent a complex operation. The fact that the content of some requirements differs does not affect this assessment. It follows that this complaint must be considered as at the date on which the project was formally presented, namely the date referred to in paragraph 54 of this judgment.

59 Next, it should be borne in mind that, in accordance with the provisions of acts of accession, the rights and obligations resulting from Community law are, save where otherwise provided, immediately applicable in the new Member States (see, to that effect, Case C-179/00 *Weidacher* [2002] ECR I-501, paragraph 18).

60 It follows from the Act of Accession that the obligations under the Birds Directive and the Habitats Directive entered into force with respect to the Republic of Austria on 1 January 1995 and that no derogation or transitional period was granted to it.

61 Accordingly, the procedure for authorisation of the project for the construction of the S 18 carriageway was formally initiated prior to the date of accession of the Republic of Austria to the European Union.

62 It follows that, in the present case, in accordance with the case-law referred to in paragraph 56 of this judgment, the obligations under the Habitats Directive did not bind the Republic of Austria and that the project for the construction of the S 18 carriageway was not subject to the requirements laid down in that directive.

63 In the light of the foregoing, the Commission's second complaint is not well founded.

64 Consequently, the Court finds that, by failing to include in the Lauteracher Ried SPA the Soren and Gleggen-Köblern sites which, according to scientific criteria, are, together with that SPA, among the most suitable territories in number and size for the purposes of Article 4(1) and (2) of the Birds Directive, the Republic of Austria has failed to fulfil its obligations under those provisions of that directive.

Costs

65 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Under the first subparagraph of Article 69(3) of the same rules, the Court may nevertheless order that the costs be shared or that the parties bear their own costs where each party succeeds on some and fails on other heads, or where the

circumstances are exceptional. Since the Commission and the Republic of Austria have each been partially unsuccessful in this case, they should bear their own costs.

On those grounds, the Court (Second Chamber) hereby:

1. **Declares that, by failing to include in the special protection area at the Lauteracher Ried national nature reserve the Soren and Gleggen-Köblern sites which, according to scientific criteria, are, together with that special protection area, among the most suitable territories in number and size for the purposes of Article 4(1) and (2) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds, as amended by Commission Directive 97/49/EC of 29 July 1997, the Republic of Austria has failed to fulfil its obligations under those provisions of that directive;**

2. **Dismisses the remainder of the action;**

3. **Orders the Commission of the European Communities and the Republic of Austria to bear their own costs.**

ARRÊT DE LA COUR (cinquième chambre)

16 mars 2006 (*)

«Manquement d'État – Directive 92/43/CEE – Conservation des habitats naturels ainsi que de la faune et de la flore sauvages – Protection des espèces»

Dans l'affaire C-518/04,

ayant pour objet un recours en manquement au titre de l'article 226 CE, introduit le 21 décembre 2004,

Commission des Communautés européennes, représentée par MM. M. van Beek et M. Konstantinidis, en qualité d'agents, ayant élu domicile à Luxembourg,

partie requérante,

contre

République hellénique, représentée par Mme E. Skandalou, en qualité d'agent, ayant élu domicile à Luxembourg,

partie défenderesse,

LA COUR (cinquième chambre),

composée de M. J. Makarczyk, président de chambre, MM. R. Schintgen et J. Klučka (rapporteur), juges,

avocat général: M. A. Tizzano,

greffier: Mme C. Strömholm, administrateur,

vu la procédure écrite et à la suite de l'audience du 26 janvier 2006,

vu la décision prise, l'avocat général entendu, de juger l'affaire sans conclusions,

rend le présent

Arrêt

1 Par sa requête, la Commission des Communautés européennes demande à la Cour de constater que, en ne prenant pas les mesures nécessaires pour instaurer et mettre en œuvre un système efficace de protection stricte de la vipère Vipera schweizeri sur l'île de Milos afin d'éviter toute perturbation intentionnelle de cette espèce, notamment durant la période de reproduction, de dépendance et d'hibernation, ainsi que toute détérioration ou destruction des sites de reproduction ou des aires de repos, la République hellénique a manqué aux obligations qui lui incombent en vertu de l'article 12, paragraphe 1, sous b) et d), de la directive 92/43/CEE du Conseil, du 21 mai 1992, concernant la

conservation des habitats naturels ainsi que de la faune et de la flore sauvages (JO L 206, p. 7, ci-après la «directive»).

Le cadre juridique

2 L'article 12, paragraphe 1, de la directive dispose:

«Les États membres prennent les mesures nécessaires pour instaurer un système de protection stricte des espèces animales figurant à l'annexe IV point a), dans leur aire de répartition naturelle, interdisant:

[...]

b) la perturbation intentionnelle de ces espèces notamment durant la période de reproduction, de dépendance, d'hibernation et de migration;

[...]

d) la détérioration ou la destruction des sites de reproduction ou des aires de repos.»

3 La vipère Vipera schweizeri figure à l'annexe IV, sous a), de ladite directive en tant qu'espèce animale d'intérêt communautaire qui nécessite une protection stricte.

La procédure précontentieuse

4 Estimant que la République hellénique avait manqué aux obligations qui lui incombent en vertu de l'article 12, paragraphe 1, sous b) et d), de la directive, la Commission a engagé la procédure en manquement prévue à l'article 226 CE.

5 Après avoir mis la République hellénique en demeure de présenter ses observations, la Commission a, le 19 décembre 2003, émis un avis motivé invitant cet État membre à prendre les mesures nécessaires pour s'y conformer dans un délai de deux mois à compter de la notification de cet avis.

6 N'ayant reçu aucun élément d'information lui permettant de conclure que la République hellénique s'était conformée à ses obligations résultant de la directive, la Commission a décidé d'introduire le présent recours.

Sur le recours

Argumentation des parties

7 La Commission considère que la réglementation grecque n'assure pas une protection stricte de la vipère Vipera schweizeri en ce qu'elle se limiterait à introduire des principes généraux et des orientations ainsi qu'à fixer des règles isolées, sans instaurer un régime spécifique, préventif et juridiquement contraignant. À cet égard, elle invoque l'arrêt du 30 janvier 2002, Commission/Grèce (C-103/00, Rec. p. I-1147, points 29 et 30) ainsi que les conclusions de l'avocat général Léger (point 43) rendues dans la même affaire.

8 Le gouvernement hellénique ne conteste pas la nécessité de prendre des mesures aux fins de protéger l'espèce en question mais estime que le cadre législatif en vigueur, les différents programmes et activités

de gestion en cours ainsi qu'un projet d'arrêté interministériel sont suffisants pour assurer cette protection, notamment en prévoyant, préalablement à l'autorisation de certains projets, travaux et activités, l'évaluation de leur incidence sur l'environnement ainsi qu'en envisageant des actions spécifiques de protection.

9 Ledit gouvernement fait également valoir que le bon état de l'environnement et, en particulier, la stabilité dans le temps de la population des vipères concernées attestent de la qualité des mesures qui ont été adoptées.

10 La Commission rétorque que ces circonstances ne sauraient dispenser la République hellénique d'adopter un cadre juridique propre à instaurer une protection stricte de l'espèce Vipera schweizeri. La Commission se réfère, à cet égard, aux points 30 et 31 de l'arrêt Commission/Grèce, précité.

11 À l'audience, elle a fait également valoir que les mesures adoptées de manière isolée par la République hellénique ne permettent pas de garantir la protection de ladite espèce, dans la mesure où des mines seraient exploitées dans la zone regroupant les sites de reproduction et les aires de repos de cette même espèce et seraient à l'origine de perturbations intentionnelles de celle-ci. De même, des caprins et des bovins seraient laissés en pâture de manière excessive dans ladite zone, ce qui serait susceptible de nuire à la protection de l'espèce Vipera schweizeri.

Appréciation de la Cour

12 À titre liminaire, il convient de rappeler que, selon une jurisprudence constante, l'existence d'un manquement doit être appréciée en fonction de la situation de l'État membre telle qu'elle se présentait au terme du délai imparti dans l'avis motivé et que les changements intervenus par la suite ne sauraient être pris en compte par la Cour (voir, notamment, arrêts Commission/Grèce, précité, point 23, et du 19 juin 2003, Commission/France, C-161/02, Rec. p. I-6567, point 6).

13 Dès lors, il n'y a pas lieu d'examiner si le projet d'arrêté interministériel, dont le gouvernement hellénique a fait mention au cours de la procédure écrite et orale et qui, selon lui, a pour objet de codifier ou compléter des mesures de protection déjà en vigueur, satisfait, en ce qui concerne la vipère Vipera schweizeri, aux exigences de protection énoncées à l'article 12, paragraphe 1, sous b) et d), de la directive.

14 S'agissant des autres mesures visant, selon le gouvernement hellénique, à protéger cette espèce, il importe de rappeler que l'article 12, paragraphe 1, sous b) et d), de la directive impose l'adoption des mesures nécessaires pour instaurer un système de protection stricte des espèces animales figurant à l'annexe IV, sous a), de la directive dans leur aire de répartition naturelle, interdisant, d'une part, la perturbation intentionnelle desdites espèces, notamment durant la période de reproduction, et, d'autre part, la détérioration ou la destruction des sites de reproduction ou des aires de repos.

15 À cet égard, il convient de relever, en premier lieu, que l'île de Milos est une région essentielle pour la reproduction et la survie de l'espèce protégée Vipera schweizeri figurant à ladite annexe IV, sous a). En effet, d'une part, il est constant que la partie occidentale de Milos regroupe, à elle seule, plus de la moitié de la population mondiale de cette espèce. D'autre part, un des trois sites proposés par les autorités helléniques comme sites d'importance communautaire pour le réseau Natura 2000 aux fins de la protection de la vipère Vipera schweizeri est situé à Milos.

16 En deuxième lieu, un système de protection stricte, au sens de l'article 12, paragraphe 1, sous b) et d), de la directive, suppose l'adoption de mesures cohérentes et coordonnées, à caractère préventif, ainsi

que l'a relevé l'avocat général Léger dans ses conclusions dans l'affaire Commission/Grèce, précitée (points 43 et 44).

17 En troisième lieu, la loi-cadre grecque n° 1650/1986, relative à la protection de l'environnement, exige elle-même, d'une part, l'élaboration d'un plan de gestion, ou «étude environnementale spéciale», en vue de l'adoption ultérieure d'un décret présidentiel relatif à la protection efficace des espèces ainsi que de leurs habitats qui fixera les conditions, restrictions et interdictions nécessaires à cette protection, et, d'autre part, la création d'un organisme de gestion. À titre transitoire, cette loi-cadre prévoit que, jusqu'à l'adoption de ce décret, lesdites conditions, restrictions et interdictions peuvent être fixées par arrêté ministériel. Or, il est constant que, à l'expiration du délai fixé par l'avis motivé, toutes les mesures nécessaires n'avaient pas été prises en ce sens.

18 À cet égard, le gouvernement hellénique a reconnu, au cours de la procédure écrite, que les lignes directrices fixées par le cadre juridique actuellement en vigueur méritent, pour certaines, d'être précisées et a ajouté, à l'audience, que le projet d'arrêté interministériel ayant pour objet de codifier mais également de compléter les mesures prises en application de la loi-cadre n° 1650/1986 et d'assurer ainsi une protection plus spécifique et plus stricte de la partie occidentale de Milos était encore en cours d'adoption.

19 En quatrième lieu, s'agissant des autres éléments dudit cadre juridique, le gouvernement hellénique s'est contenté, lors de la procédure écrite et orale, d'énumérer une série d'actes législatifs, réglementaires et administratifs, sans indiquer ni reproduire aucune disposition spécifique en vigueur au moment de l'expiration du délai fixé par l'avis motivé susceptible de remplir les exigences imposées par l'article 12, paragraphe 1, sous b) et d), de la directive.

20 En conséquence, il y a lieu de constater que la République hellénique n'a pas adopté, dans le délai prescrit, un cadre juridique de nature à assurer, sur l'île de Milos, une protection stricte de la vipère Vipera schweizeri contre toute perturbation intentionnelle, notamment durant la période de reproduction, de dépendance et d'hibernation, ainsi que contre toute détérioration ou destruction de ses sites de reproduction ou aires de repos (voir, en ce sens, arrêt Commission/Grèce, précité, points 27 à 30).

21 Des circonstances telles que le bon état de l'environnement ou la stabilité de la population de l'espèce Vipera schweizeri, sur l'île de Milos, ne sauraient, par elles-mêmes, remettre en cause cette constatation (voir, en ce sens, arrêt Commission/Grèce, précité, point 31). Le recours de la Commission doit donc être accueilli.

22 Au vu de ce qui précède, il convient de constater que, en ne prenant pas, dans le délai prescrit, les mesures nécessaires pour instaurer et mettre en œuvre un système efficace de protection stricte de la vipère Vipera schweizeri sur l'île de Milos interdisant la perturbation intentionnelle de cette espèce, notamment durant la période de reproduction, de dépendance et d'hibernation, ainsi que toute détérioration ou destruction des sites de reproduction ou des aires de repos de ladite espèce, la République hellénique a manqué aux obligations qui lui incombent en vertu de l'article 12, paragraphe 1, sous b) et d), de la directive.

Sur les dépens

23 Aux termes de l'article 69, paragraphe 2, du règlement de procédure, toute partie qui succombe est condamnée aux dépens, s'il est conclu en ce sens. La Commission ayant conclu à la condamnation de

la République hellénique et celle-ci ayant succombé en ses moyens, il y a lieu de la condamner aux dépens.

Par ces motifs, la Cour (cinquième chambre) déclare et arrête:

1) **En ne prenant pas, dans le délai prescrit, les mesures nécessaires pour instaurer et mettre en œuvre un système efficace de protection stricte de la vipère Vipera schweizeri sur l'île de Milos interdisant la perturbation intentionnelle de cette espèce, notamment durant la période de reproduction, de dépendance et d'hibernation, ainsi que toute détérioration ou destruction des sites de reproduction ou des aires de repos de ladite espèce, la République hellénique a manqué aux obligations qui lui incombent en vertu de l'article 12, paragraphe 1, sous b) et d), de la directive 92/43/CEE du Conseil, du 21 mai 1992, concernant la conservation des habitats naturels ainsi que de la faune et de la flore sauvages.**

2) **La République hellénique est condamnée aux dépens.**

JUDGMENT OF THE COURT (Second Chamber)

10 January 2006 *

In Case C-98/03,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 28 February 2003,

Commission of the European Communities, represented by U. Wölker, acting as Agent, with an address for service in Luxembourg,

applicant,

v

Federal Republic of Germany, represented by M. Lumma and C. Schulze-Bahr, acting as Agents,

defendant,

* Language of the case: German.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, C. Gulmann (Rapporteur), R. Silva de Lapuerta, P. Kūris and G. Arestis, Judges,

Advocate General: A. Tizzano,
Registrar: M. Ferreira, Principal Administrator,

having regard to the written procedure and further to the hearing on 14 July 2005,

after hearing the Opinion of the Advocate General at the sitting on 24 November 2005,

gives the following

Judgment

1 By its application the Commission of the European Communities has brought an action for a declaration that:

— by failing, in respect of certain projects carried out outside special areas of conservation ('SACs') within the meaning of Article 4(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild

fauna and flora (OJ 1992 L 206, p. 7; 'the Directive'), to require compulsory assessment of the impact on the site, in accordance with Article 6(3) and (4) of that directive, whether or not such projects are capable of significantly affecting an SAC;

— by authorising emissions in an SAC, irrespective of whether they are likely to have a significant effect on that area;

— by derogating from the scope of the provisions concerning the protection of species in the case of certain non-deliberate effects on protected animals;

— by failing to ensure compliance with the criteria for derogation set out in Article 16 of the directive in the case of certain activities compatible with the conservation of the area;

— by retaining provisions on the application of pesticides which do not take sufficient account of the protection of species;

— by failing to notify fishery catch legislation and/or to ensure that such legislation contains adequate bans on fishing,

the Federal Republic of Germany has failed to fulfil its obligations under Article 6(3) and (4) and Articles 12, 13 and 16 of the Directive.

Legal background

Community law

2 The aim of the Directive, in accordance with Article 2(1), is 'to contribute towards ensuring bio-diversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the Treaty applies'.

3 Article 4 of the Directive lays down a procedure for designating sites as SACs, where species and habitats protected by the Directive are present.

4 As provided in the 10th recital in the preamble to the Directive, 'an appropriate assessment must be made of any plan or programme likely to have a significant effect on the conservation objectives of a site which has been designated or is designated in future.' That recital is expressed in Article 6(3) of the Directive which refers to subparagraph 4. Those subparagraphs provide:

'3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in

combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

5 According to Article 12(1) of the Directive:

'Member States shall take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) in their natural range, prohibiting:

(a) all forms of deliberate capture or killing of specimens of these species in the wild;

(b) deliberate disturbance of these species, particularly during the period of breeding, rearing, hibernation and migration;

(c) deliberate destruction or taking of eggs from the wild;

(d) deterioration or destruction of breeding sites or resting places.'

6 Article 13 of the Directive provides that:

'1. Member States shall take the requisite measures to establish a system of strict protection for the plant species listed in Annex IV(b), prohibiting:

(a) the deliberate picking, collecting, cutting, uprooting or destruction of such plants in their natural range in the wild;

(b) the keeping, transport and sale or exchange and offering for sale or exchange of specimens of such species taken in the wild, except for those taken legally before this Directive is implemented.

2. The prohibitions referred to in paragraph 1(a) and (b) shall apply to all stages of the biological cycle of the plants to which this Article applies.'

7 Article 16(1) of the Directive is worded as follows:

'Provided that there is no satisfactory alternative and the derogation is not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range, Member States may derogate from the provisions of Articles 12, 13, 14 and 15(a) and (b):

(a) in the interest of protecting wild fauna and flora and conserving natural habitats;

(b) to prevent serious damage, in particular to crops, livestock, forests, fisheries and water and other types of property;

(c) in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment;

(d) for the purpose of research and education, of repopulating and re-introducing these species and for the breeding operations necessary for these purposes, including the artificial propagation of plants;

(e) to allow, under strictly supervised conditions, on a selective basis and to a limited extent, the taking or keeping of certain specimens of the species listed in Annex IV in limited numbers specified by the competent national authorities.'

National law

8 The Federal Republic of Germany has, inter alia, transposed the Directive by the Federal Law on Nature protection of 21 September 1998 (Gesetz über Naturschutz und Landschaftspflege, BGBl. 1998 I, p. 2995) ('the BNatSchG 1998').

9 That law was subsequently repealed and replaced by the Federal Law on nature protection and countryside conservation of 25 March 2002 (Gestz über Naturschutz und der Landschaftspflege, BGBl. 2002 I, p. 1193) ('the BNatSchG 2002').

10 Paragraph 34(1) of the BNatSchG 2002 transposed into German law the duty laid down in the first sentence of Article 6(3) of the Directive to subject projects to an assessment of their implications for protected sites, for the purposes of the Directive.

11 Paragraph 10(1)(11) of the BNatSchG 2002 defines the concept of 'projects within the meaning of the law' as follows:

'(a) projects and measures planned within a site of Community importance or a European site for the protection of birds, in so far as they are subject to a decision by an authority or to notification to an authority or that they are carried out by an authority, and

(b) acts affecting nature and the countryside, within the meaning of Paragraph 18, in so far as they are subject to a decision by an authority or to notification to an authority or are carried out by an authority, and

(c) installations subject to an authorisation under the Federal law on protection against pollution and the use of water, which are subject to an authorisation or to approval under the Law on water use,

in so far as, separately or in conjunction with other projects or plans, they are likely to have a significant effect on a site of importance to the Community or a European site for the protection of birds ...'

12 Paragraph 18 of the BNatSchG 2002 provides:

'1. Acts affecting nature and the countryside, within the meaning of this Law, are changes of form or use of surface areas or changes to the level of the water table connected to the surface soil stratum which may alter to a considerable extent the capacity and functioning of the ecosystem or the countryside.

2. The use of soil for the purpose of agriculture, forestry and fishing shall not constitute an intervention where it takes account of the objectives and the principles of nature protection and countryside conservation. The use of soil for the purposes of agriculture, forestry and fishing does not, in principle, undermine the objectives and principles set out above, provided that it complies with the conditions in Paragraph 5(4) to (6) and the rules of professional practice under the Law on agriculture forestry and fishing and Paragraph 17(2) of the Federal Law on soil protection.'

13 Paragraph 36 of BNatSchG 2002 entitled 'Material nuisances' provides:

'If it is foreseeable that installations, subject to an authorisation under the Federal Law on protection against pollution, will cause emissions which, together with other installations or measures, will significantly affect, in the area of impact of that installation, the elements fundamentally necessary for the conservation of a site of Community importance or a European site for the protection of birds, and if the damage cannot be made good in accordance with Paragraph 19(2), the authorisation shall not be issued unless the conditions in the combined provisions of Paragraph 34 (3) and (4) are fulfilled. Paragraph 34(1) and (5) are applicable *mutatis mutandis.* Decisions shall be taken with the agreement of the authorities responsible for nature protection and conservation areas.'

14 The first sentence of Paragraph 39(2) of the BNatSchG 2002, entitled 'Relationship with other legislative provisions', provides:

'The laws on the protection of plants, the protection of animals, protection against epizootic diseases and the laws on forests, hunting and fishing shall not be affected either by the provisions of this section or by the laws adopted pursuant thereto.'

15 Paragraph 42(1) and (2) of the BNatSchG 2002 are designed to transpose the prohibitions in Articles 12 and 13 of the Directive.

16 Paragraph 43 of the BNatSchG 2002, entitled 'Derogations', provides, in subparagraph 4, that 'the prohibitions laid down in Paragraph 42(1) and (2) shall not apply to acts intending to use land for the purposes of agriculture, forestry or fishing and carried out in accordance with good professional practice and the requirements laid down in Paragraph 5(4) to (6); acts intending to process the products obtained in the course of those activities; acts designed to implement an act authorised under Paragraph 19, or an assessment of the effect on the environment within the framework of the Law on the assessment of environmental impact; acts to implement a measure authorised under Paragraph 30; provided that animals and their nesting and incubation sites, habitats and resting places, and plant species which are specifically protected, are not intentionally damaged as a result.'

17 The Directive was also transposed in the Federal Republic of Germany by way of a number of sectoral laws, including the Law on plant protection of 14 May 1998 (Planzenschutzgesetz, BGBl. 1998 I, p. 971, 'the PflSchG'), which provides in Paragraph 6(1):

'Pesticides must be used in accordance with good professional practice. Use shall be prohibited if it is foreseeable that it will produce harmful effects on humans or animals or the water table, or that it will produce other serious harmful effects, in particular, on the balance of nature. The competent authority shall order the measures necessary in order to satisfy the requirements mentioned in the first two sentences of this subparagraph.'

Pre-litigation procedure

18 On 10 April 2000, the Commission sent a letter of formal notice to the Federal Republic of Germany inviting on it to submit its observations on the implementation of Article 6(3) and (4) and Articles 12, 13 and 16 of the Directive.

19 After examining the reply sent to it by the Federal Republic of Germany on 11 August 2000, the Commission issued a reasoned opinion on 25 July 2001, calling on that Member State to take the measures necessary to comply with that opinion within two months of the date of its notification.

20 In that reasoned opinion the Commission found, referring in particular to the BNatSchG 1998, that the Federal Republic of Germany had failed to take the measures necessary in order to transpose the abovementioned provisions of the Directive.

21 After the expiry of the period prescribed in the reasoned opinion, the Federal Republic of Germany, by letter of 21 November 2001, challenged the complaints raised by the Commission.

22 Subsequently the BNatSchG 2002 entered into force.

23 In those circumstances, the Commission decided to bring the present proceedings.

Admissibility of the action

24 The German Government argues, as a preliminary issue, that the Commission's action is inadmissible for failing to take sufficient account of the new provisions introduced by the BNatSchG 2002 or other specific national provisions. The latter ensure that the contested provisions are applied in accordance with the Directive.

25 In that connection, it must be observed that the issue of whether or not the Commission has taken account of certain legislative changes in the assessment of the compatibility of German law with the Directive relates to the substance of the proceedings and, therefore, to the merits of the case and not to its admissibility.

26 The fact that, in its originating application the Commission bases its pleas on certain provisions of the BNatSchG 2002, mentioning the earlier provisions of the BNatSchG 1998 between brackets, while the reasoned opinion referred only to those earlier provisions, is not capable of rendering the action inadmissible.

27 Although it is true that the subject-matter of an action brought under Article 226 EC is delimited by the pre-litigation procedure and that, accordingly, the originating application cannot be based on provisions other than those stated in that procedure, that requirement cannot, however, go so far as to make it necessary for the national provisions mentioned in the reasoned opinion and those in the application to be completely identical. Where a change in the legislation occurred between those two procedural stages, it is sufficient that the system established by the legislation contested in the pre-litigation procedure has, on the whole, been maintained by the

new measures which were adopted by the Member State after the issue of the reasoned opinion and have been challenged in the application (Case C-221/03 *Commission* v *Belgium* [2005] ECR I-8307, paragraphs 38 and 39).

28 In this case, the provisions of the BNatSchG 2002 to which the Commission refers in its originating application are almost identical to the provisions in the BNatSchG 1998 that it criticises in its reasoned opinion.

29 It follows that the action is admissible.

The merits

30 In support of its application the Commission raises six complaints.

The first complaint

Arguments of the parties

31 The Commission complains that the Federal Republic of Germany has failed to fully transpose Article 6(3) and (4) of the Directive into its national law in so far as the definition of 'project', in Paragraph 10(1)(11)(b) and (c) of the BNatSchG 2002, which applies to projects undertaken outside the SACs, is too restrictive and

excludes the duty to carry out an assessment of the implications of certain acts and other activities which are potentially harmful to protected sites.

32 As regards projects within the meaning of Paragraph 10(1)(11)(b) of the BNatSchG 2002, the Commission submits that since they include only acts affecting nature and the countryside, within the meaning of Paragraph 18, certain projects likely to have a significant effect on protected sites are not subject to a prior assessment of the implications for the site in accordance with Article 6(3) and (4) of the Directive. Paragraph 18(1) covers only changes of form or use of surface areas, but fails to take account of any other activities or measures which do not concern the surface area of a protected site or those which do not result in any change, even where they are likely to have a significant effect on such a site. In fact, the term 'project', within the meaning of Paragraph 10(1)(11)(b) of the BNatSchG 2002, which refers to acts carried out outside the SACs, is narrower than that in Paragraph 10(1)(11)(a), which concerns projects carried out within an SAC. In its definition of measures to be subject to an assessment of the implications, the Directive does not distinguish between measures taken outside or inside a protected site.

33 Moreover, Paragraph 18(2) of BNatSchG 2002 excludes from the term 'project' within the meaning of Paragraph 10(1)(11)(b) the use of soil for the purposes of agriculture, forestry and fishing, where that project takes account of the objectives and principles of nature protection and countryside conservation.

34 Furthermore, as regards Paragraph 10(1)(11)(c) of the BNatSchG 2002, the Commission criticises the fact that the definition of 'project' is limited, on one hand, to installations subject to authorisation under the Federal Law on protection against pollution (Bundes-Immissionsschutzgestez, 'the BImSchG') and, on the other hand, to the use of water which is subject to authorisation or approval under the Law on water use (Wasserhaushaltsgesetz, 'the WHG'). Therefore, the installations

and uses of water not subject to authorisation or approval are excluded from the duty to carry out an assessment of the implications for the site laid down in Article 6 (3) of the Directive, regardless of whether or not they may have a significant impact on the protected sites.

35 The German Government submits, first of all, that the Commission interprets the term 'project' too widely, since it does not permit any limit on the duty to carry out an assessment of the implications that the activities referred to by German law may have on the sites. That term should be interpreted in the light of the specific definition in Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment (OJ 1985 L 175, p. 40).

36 Next, the German Government contends that the term 'act', within the meaning of Paragraph 18(1) of the BNatSchG 2002, requires a case by case assessment in the light of the objectives of the Directive. Therefore, in practice, Paragraph 18(1) does not limit the term 'project' with the meaning of the Directive. Paragraph 18(1) does not require a change of form or use of the surface area, but that there be an act where an activity has an effect on the surface area which impacts on the protected site.

37 As regards the derogation laid down in Paragraph 18(2) of the BNatSchG 2002, the German Government submits that it is a mandatory requirement of that provision that the objectives and principles of nature protection and countryside conservation have been taken into consideration, so that the use of soil for the purposes of agriculture, forestry and fishing does not constitute a project which must be subject to an assessment of its implications.

38 Finally, as regards Paragraph 10(1)(11)(c) of the BNatSchG 2002, the German Government states that the installations which are not subject to authorisation or approval under the BImSchG must themselves comply with requirements which take account of the Directive. The BImSchG requires, inter alia, verification that serious environmental damage which is preventable by the state of current technology is in fact prevented, and that the damage that cannot be avoided by current technology is reduced to the minimum. As regards the use of water which does not require an authorisation under the WHG, the German Government contends, in particular, that such use concerns very small quantities of water, which is compatible with Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy (OJ 2000 L 327, p. 1). If uses which do not have any significant impact on the status of a body of water are not taken into consideration under Directive 2000/60 they cannot have any significant impact on neighbouring SACs.

Findings of the Court

39 According to the first sentence of Article 6(3) of the Directive, any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, is to be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives.

40 The Court has already held that the requirement for an appropriate assessment of the implications of a plan or project is thus conditional on its being likely to have a significant effect on the site. In the light, in particular, of the precautionary principle, such a risk exists if it cannot be excluded on the basis of objective information that the plan or project will have a significant effect on the site concerned (see Case C-6/04 *Commission* v *United Kingdom* [2005] ECR I-9017, paragraph 54).

41 Therefore, the condition, to which the assessment of the implications of a plan or a project on a particular site is subject, which requires such an assessment to be carried out where there are doubts as to the existence of significant effects, does not permit that assessment to be avoided, as do Paragraph 10(1)(11)(b) of the BNatSchG 2002, read in conjunction with Paragraph 18, and Paragraph 10(1)(11)(c), in respect of certain categories of projects, on the basis of criteria which do not adequately ensure that those projects will not have a significant effect on the protected sites.

42 It should be noted, in particular, that Article 10(1)(11)(b) and (c) of the BNatSchG 2002 exclude from the assessment obligation (i) projects consisting of acts affecting nature and the countryside other than changes of form or use of surface areas or changes to the level of the water table connected to the surface soil stratum, and (ii) projects relating to installations or to use of water, on account of the fact that they are not subject to authorisation. It does not appear that those criteria excluding the duty to carry out an assessment are capable of ensuring that those projects are never likely have a significant effect on the protected sites.

43 As regards, in particular, installations not subject to authorisation under the BImSchG, the fact that that text requires verification, that serious environmental damage which may be prevented by current technology is in fact prevented, and that damage which cannot be prevented by current technology is reduced to the minimum, cannot be sufficient to ensure compliance with the duty laid down in Article 6(3) of the Directive. The duty of verification laid down by the BImSchG is not, in any event, capable of ensuring that a project relating to such an installation does not adversely affect the integrity of the protected site. In particular, the duty to verify whether serious environmental damage, which cannot be prevented by current technology, is reduced to the minimum, does not ensure that such a project will not give rise to such damage.

44 As regards the use of water not requiring an authorisation under the WHG, the fact that it concerns the use of small quantities of water does not in itself preclude the possibility that some of those uses are likely to have a significant effect on a protected site. Even assuming that such uses of water are not likely to have a significant effect on the status of a body of water, it does not follow that they are not likely to have a significant effect on neighbouring protected sites.

45 In the light of the foregoing, it must be held that the Federal Republic of Germany has failed to correctly transpose into its national law Article 6(3) of the Directive as regards certain projects undertaken outside the SACs.

The second complaint

Arguments of the parties

46 The Commission submits that Paragraph 36 of the BNatSchG 2002 does not correctly transpose Article 6(3) and (4) of the Directive, in so far as the authorisation for installations causing emissions is refused only where it is foreseeable that they directly affect an SAC situated in an area where those installations are operated.

47 It follows that material nuisances caused outside such an area are, however, not taken into account, contrary to those provisions of the Directive.

48 The German Government states that monitoring of material nuisance caused by air pollutants or noise from the area affected by the installation must be carried out on an individual basis taking account of local data and the various pollutants emitted by the installation. Further, in practice, an authorisation for a project involving material nuisance is issued only if it does not have any harmful effects on the areas protected by the Directive.

Findings of the Court

49 Since, under Paragraph 36 of the BNatSchG 2002, the authorisation of installations causing emissions is refused only where they appear likely to affect a protected site situated in the area of impact particularly of those installations, installations whose emissions affect a protected site situated outside such an area may be authorised without taking account of the effects of those emissions on such a site.

50 In that connection, it must be held that the system established by German law, so far as it covers emissions within an area of impact, as defined in technical circulars in accordance with general criteria on installations, do not appear to be capable of ensuring compliance with Article 6(3) and (4) of the Directive.

51 In the absence of established scientific criteria, which have not been mentioned by the German Government, which would a priori rule out emissions affecting a protected site situated outside the area of impact of the installation concerned having a significant effect on that site, the system put in place by national law in the field in question is not, in any event, capable of ensuring that the projects or plans relating to installations causing emissions which affect protected sites situated outside their area of impact do not adversely affect the integrity of those sites, within the meaning of Article 6(3) of the Directive.

52 Accordingly, it must be held that Article 6(3) of the Directive has not been properly transposed.

The third complaint

53 The Commission complains that the Federal Republic of Germany has failed to properly transpose the obligation in Article 12(1)(d) of the Directive to take the requisite measures to establish a system of strict protection for certain animals by prohibiting the deterioration or destruction of breeding sites or resting places. The Commission argues that that provision requires Member States to prohibit not only deliberate acts but also non-deliberate ones. It submits that Paragraph 43(4) of the BNatSchG 2002 fails to comply with Article 12(1)(d) of the Directive, in so far as it authorises a number of derogations from the rules protecting the sites 'provided that animals, including their nesting or incubation sites, habitat or resting places ... are not intentionally affected'.

54 The German Government observes that the transposition of Article 12(1)(d) of the Directive is limited over the whole territory of the Federal Republic of Germany to deliberate acts, which, it argues, is in accordance with that provision since it does not require inclusion of non-deliberate destruction or deterioration of those sites in the system of protection that it establishes. An interpretation which also prohibits non-deliberate acts is, in any event, contrary to the principle of proportionality.

55 The Court has already held that the acts referred to in Article 12(1)(d) of the Directive include non-deliberate acts (see *Commission* v *United Kingdom*, paragraphs 73 to 79). By not limiting the prohibition laid down in Article 12(1)(d) of the Directive to deliberate acts, which it has done in respect of acts referred to in

Article 12(1)(a) to (c), the Community legislature has demonstrated its intention to give breeding grounds or resting places increased protection against acts causing their deterioration or destruction. Given the importance of the objectives of protecting biodiversity which the Directive aims to achieve, it is by no means disproportionate that the prohibition laid down in Article 12(1)(d) is not limited to deliberate acts.

56 In those circumstances the complaint alleging that Article 12(1)(d) of the Directive has not been properly transposed must be accepted.

The fourth complaint

57 The Commission complains that the Federal Republic of Germany inserted in Paragraph 43(4) of the BNatSchG 2002 two derogations to the prohibitions laid down in Paragraph 42(1), which do not sufficiently take account of the conditions to which the derogations authorised by Article 16 of the Directive are subject. More specifically, the Commission refers to derogations in German law to the systems for the protection of species to which implementing measures for an act authorised in accordance with Paragraph 19 of the BNatSchG 2002 and implementing measures authorised under Paragraph 30 of that law are entitled.

58 The German Government replies that the acts and measures which are the subject of the two derogations laid down in Paragraph 43(4) of the BNatSchG 2002 are subject to administrative decisions and that in order to adopt such decisions the competent authorities are, in any event, bound to observe the conditions laid down in Article 16 of the Directive.

59 It is clear from the 4th and 11th recitals in the preamble to the Directive that the threatened habitats and species form part of the European Community's natural heritage and that the threats to them are often of a transboundary nature, so that the adoption of conservation measures is a common responsibility of all Member States. Accordingly, faithful transposition becomes particularly important in an instance such as the present one, where management of the common heritage is entrusted to the Member States in their respective territories (see *Commission* v *United Kingdom*, paragraph 25)

60 It follows that, in the context of the Directive, which lays down complex and technical rules in the field of environmental law, the Member States are under a particular duty to ensure that their legislation intended to transpose that directive is clear and precise (see *Commission* v *United Kingdom*, paragraph 26).

61 Accordingly, even assuming that the two derogations at issue in this case must be the subject of administrative decisions, on the issuing of which the competent authorities do in fact comply with the conditions to which Article 16 of the Directive subjects the authorisation of derogations, the fact remains that Paragraph 43(4) of the BNatSchG 2002 does not provide a legal framework consistent with the derogatory regime established by Article 16. That provision of national law does not submit the grant of the two derogations in question to all of the conditions laid down in Article 16 of the Directive. In that connection, it is sufficient to state that Paragraph 43(4) of the BNatSchG 2002 provides as the sole condition for authorisation for those derogations that animals, including their nesting or incubation sites, habitat or resting places and plant species which are particularly protected must not be subject to deliberate harm.

62 Therefore, the complaint alleging that Article 16 of the Directive has not been properly transposed into German law must be accepted.

The fifth complaint

63 The Commission refers to Paragraph 6(1) of the PflSchG, which prohibits the use of pesticides if it is foreseeable that they will produce effects harmful to human or animal health or the water table, or has other seriously harmful effects, in particular, on the balance of nature, the latter also covering plant and animal species within the meaning of Paragraph 2(6) of the PflSchG. The Commission argues that, by that prohibition, the Federal Republic of Germany has failed to transpose Articles 12, 13 and 16 of the Directive in a sufficiently clear and precise manner.

64 The German Government contests the merits of that complaint, arguing that the provision referred to by the Commission contains a general prohibition which facilitates compliance with the prohibitions laid down in Articles 12 and 13 of the Directive. It also refers to the fact that, according to Paragraph 6(1) of the PflSchG, pesticides must be used in accordance with good professional practice, and that the competent authority may order the measures necessary to fulfil the requirements also mentioned in that provision.

65 In that connection, as was pointed out in paragraph 60 of this judgment, the Member States are, in the context of the Directive, under a particular duty to ensure that their legislation intended to transpose that directive is clear and precise.

66 According to settled case-law, Articles 12, 13 and 16 of the Directive form a coherent body of provisions (see, *Commission* v *United Kingdom*, paragraph 112). Articles 12 and 13 require Member States to establish a system of strict protection for animal and plant species.

67 Paragraph 6(1) of the PflSchG, by listing the situations in which the use of pesticides is prohibited, does not express in a clear, specific and strict manner the measures laid down in Articles 12 and 13 of the Directive which prohibit protected species from being adversely affected.

68 In particular, it does not appear that the prohibition on using pesticides, where it is foreseeable that it will produce seriously harmful effects on the balance of nature, is as clear, precise and strict as the prohibition on the deterioration of breeding sites or resting places of protected animals laid down in Article 12(1)(d) of the Directive or the prohibition of the deliberate destruction in the wild of protected plants laid down in Article 13(1)(a) of the Directive.

69 Accordingly, the fifth complaint must be accepted in so far as it concerns Articles 12 and 13 of the Directive.

The sixth complaint

Arguments of the parties

70 The Commission complains that the Federal Republic of Germany has infringed Articles 12 and 16 of the Directive by failing to notify it of the fishery catch legislation or by failing to ensure that those provisions contain adequate bans on fishing.

71 The Commission argues that the legislation in three Länder is not in accordance with the Directive. Thus, in Bavaria, the fish known by the scientific name *coregonus oxyrhynchus* does not feature among the species protected all year round. In Brandenberg, that species and the mollusc *unio crassus* are not protected. In Bremen, the legislation does not include in the list of fishing bans the three species which must be protected in that Land, namely, the two species previously mentioned and the fish *acipenser sturio*. Furthermore, that legislation expressly authorises fishing of specimens of *acipenser sturio* which are at least 100 cm long and specimens of the species *coregonus oxyrhynchus* which are at least 30 cm long. Moreover, no information is available on any fishing bans in the Länder of Berlin, Hamburg, Mecklenburg-West Pomerania, Lower Saxony, North Rhine-Westphalia, Saarland, Saxony and Saxe-Anhalt. It cannot, therefore, be held that the legislation in those Länder contains the fishing bans necessary to satisfy the provisions of Articles 12 and 16 of the Directive.

72 The German Government contends that, although Federal law authorises the Länder to lay down more specific provisions on the right to fish, those provisions

must nevertheless be interpreted in accordance with the Directive. Where the provisions of the Länder on fishing contravene the protection of the species of fish and shellfish legally required by Community law, they are void on account of an infringement of Federal law. To that effect, the BNatSchG 2002 is a law which overrides the legislation of the Länder. The fishing ban laid down in Paragraph 42 (1)(1) of the BNatSchG 2002, which also concerns the species mentioned in Annex IV of the Directive is therefore applicable. Therefore, it is not necessary to notify the provisions of the Länder on that matter.

73 The German Government states that it will ensure that the provisions of the Länder on fishing will be amended forthwith, in so far as they do not comply with the conditions of the Directive and Federal law, as is the case, for example, of the legislation of the Land Bremen, which is complained of by the Commission.

Findings of the Court

74 It is common ground in this case that *coregonus oxyrhynchus*, *unio crassus* and *acipenser sturio*, which feature in Annex IV(a) to the Directive, are species found in Germany.

75 Those species must therefore be subject, in accordance with Article 12(1)(a) of the Directive, to a system of strict protection prohibiting all forms of deliberate capture or killing of members of those species in the wild.

76 It is clear from the file that, when the period set down in the reasoned opinion expired, Bremen's legislation authorised, inter alia, the capture of fish all year round so long as no fishing bans were issued. *Coregonus oxyrhynchus* is not the subject of a fishing ban. In Brandenburg neither that species nor *unio crassus* are the subject of a fishing ban. As to Bremen's legislation, the German Government has acknowledged that it is not in accordance with the Directive.

77 Although it is true, as the German Government observes, that Paragraph 42(1) of the BNatSchG 2002 prohibits, inter alia, the capture and killing of the animal species covered by a system of strict protection, such as those mentioned in paragraph 74 of this judgment, the fact remains that, under the first sentence of Paragraph 39(2) of that law on the protection of animals, hunting and fishing are not affected by the provisions of that section. That section includes Paragraph 42 of the BNatSchG 2002.

78 In those circumstances, it must be stated that the legislative framework existing in Germany, in which regional provisions which infringe Community law coexist with a Federal law which complies with it, does not ensure effectively, and in a clear and precise manner, in respect of the three animal species at issue in this case, the strict protection required by Article 12(1)(a) of the Directive, with respect to the prohibition of all forms of deliberate capture and killing of specimens of those species in the wild.

79 In this case, it is established that German law is not in accordance with Article 12(1)(a) of the Directive and does not fulfil the conditions for derogation laid down in Article 16 of the Directive.

80 As regards the rules on fishing in the other Länder, which have not been communicated to the Commission, it cannot be held that they do not satisfy the provisions of Articles 12 and 16 of the Directive, since no information is available on any fishing bans in those Länder, particularly since, as was stated in Paragraph 77 of this judgment, Paragraph 42(1)(1) of the BNatSchG 2002 prohibits the capture and killing of specimens of the species *coregonus oxyrhynchus*, *union crassus* and *acipenser sturio*.

81 In that connection, it must be observed that Article 23(3) of the Directive provides that Member States are to communicate to the Commission the main provisions of national law which they adopt in the field covered by this Directive. However, the Commission has not based its action on that provision.

82 It follows that the sixth complaint must be accepted within the limits set out in the preceding paragraphs of this judgment.

83 Accordingly, the Court finds that:

— by failing, in respect of certain projects carried out outside the SAC within the meaning of Article 4(1) of the Directive, to require compulsory assessment of the impact on the site, in accordance with Article 6(3) and (4) of the Directive whether or not such projects are capable of significantly affecting such an SAC;

— by authorising emissions in an SAC, irrespective of whether they are likely to have a significant effect on that area;

— by derogating from the scope of the provisions concerning the protection of species in the case of certain non-deliberate effects on protected animals;

— by failing to ensure compliance with the criteria for derogation set out in Article 16 of the Directive in the case of certain activities compatible with the conservation of the area;

— by retaining provisions on the application of pesticides which do not take sufficient account of the protection of species;

— by failing to ensure that legislation on fishing contains adequate bans on catches,

the Federal Republic of Germany has failed to fulfil its obligations under Article 6(3) and Articles 12, 13 and 16 of the Directive.

Costs

84 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission has applied for costs and the Federal Republic of Germany has been unsuccessful, the latter must be ordered to pay the costs.

On those grounds, the Court (Second Chamber) hereby rules:

1. — **By failing, in respect of certain projects carried out outside special areas of conservation within the meaning of Article 4(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, to require compulsory assessment of the impact on the site, in accordance with Article 6(3) and (4) of that directive, whether or not such projects are capable of significantly affecting a special area of conservation;**

— **by authorising emissions in a special area of conservation, irrespective of whether they are likely to have a significant effect on that area;**

— **by derogating from the scope of the provisions concerning the protection of species in the case of certain non-deliberate effects on protected animals;**

— **by failing to ensure compliance with the criteria for derogation set out in Article 16 of Directive 92/43 in the case of certain activities compatible with the conservation of the area;**

— **by retaining provisions on the application of pesticides which do not take sufficient account of the protection of species;**

— **by failing to ensure that legislation on fishing contains adequate bans on catches,**

the Federal Republic of Germany has failed to fulfil its obligations under Article 6(3) and Articles 12, 13 and 16 of Directive 92/43.

2. **Orders the Federal Republic of Germany to pay the costs.**

[Signatures]

JUDGMENT OF THE COURT (Second Chamber)

20 October 2005 *

In Case C-6/04,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 9 January 2004,

Commission of the European Communities, represented by M. van Beek and L. Flynn, acting as Agents, with an address for service in Luxembourg,

applicant,

v

United Kingdom of Great Britain and Northern Ireland, represented by C. Jackson, acting as Agent, and K. Smith, Barrister,

defendant,

* Language of the case: English.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, R. Schintgen, R. Silva de Lapuerta, G. Arestis and J. Klučka (Rapporteur), Judges,

Advocate General: J. Kokott,
Registrar: H. von Holstein, Deputy Registrar,

having regard to the written procedure and further to the hearing on 26 May 2005,

after hearing the Opinion of the Advocate General at the sitting on 9 June 2005,

gives the following

Judgment

1 By its action, the Commission of the European Communities requests the Court to declare that, by failing to transpose correctly the requirements of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7, 'the Habitats Directive'), the United Kingdom of Great Britain and Northern Ireland has failed to fulfil its obligations under that directive.

Legal context

Community legislation

2 According to Article 2(1) of the Habitats Directive, the aim of the directive is to contribute towards ensuring biodiversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the EC Treaty applies.

3 In accordance with Article 3(1) of the Habitats Directive, the Member States designate special areas of conservation ('SACs') with a view to maintaining or restoring, at a favourable conservation status, natural habitat types and habitats of species of Community interest. Those areas are to form part of a European ecological network under the title Natura 2000.

4 Article 6 of the Habitats Directive relates to the measures necessary in order to protect SACs. Surveillance of the conservation status of natural habitats and species of Community interest is governed by Article 11 of the directive. Articles 12 and 13 concern measures for protecting animal and plant species. Article 14 relates to the taking of specimens of species of wild fauna and flora. Article 15 prohibits certain indiscriminate means of capture or killing of some species of wild fauna. Article 16 sets out the circumstances in which the Member States may derogate, for specified purposes, from certain provisions of the directive.

5 Under Article 23(1) of the Habitats Directive, the Member States were to bring into force the laws, regulations and administrative provisions necessary to comply with the directive within two years of its notification and were forthwith to inform the Commission thereof. The directive was notified to the Member States on 10 June 1992.

National legislation

6 The principal instruments transposing the Habitats Directive in the United Kingdom that are relevant in the present case are the following:

— the Conservation (Natural Habitats, &c.) Regulations 1994 ('the 1994 Regulations'), which apply in England, Wales and Scotland;

— the Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 ('the 1995 Regulations'), which apply in Northern Ireland;

— the Nature Protection Ordinance 1991 as amended by the Nature Protection Ordinance (Amendment) Regulations 1995 ('the 1991 Ordinance'), which applies in Gibraltar;

— the Conservation of Seals Act 1970 ('the Conservation of Seals Act').

7 Regulation 3(2) of the 1994 Regulations provides that the Secretary of State, the Minister of Agriculture, Fisheries and Food and the nature conservation bodies are to exercise their functions under the enactments relating to nature conservation so as to secure compliance with the requirements of the Habitats Directive.

8 Regulation 3(4) of the 1994 Regulations provides that, without prejudice to the provision referred to in the preceding paragraph, every competent authority in the exercise of any of its functions is to have regard to the requirements of the Habitats Directive so far as they may be affected by the exercise of those functions.

Pre-litigation procedure

9 On 6 November 2000, the Commission sent to the United Kingdom a letter of formal notice in which it contended that certain provisions of the Habitats Directive had not been correctly transposed into that Member State's domestic law.

10 The United Kingdom authorities replied to the letter of formal notice by letter of 27 February 2001. They accepted that on two points, relating to offshore oil and gas activities and to the extension of the application of the Habitats Directive beyond territorial waters, the letter of formal notice was well founded, but contested most of the other complaints raised in it.

11 Since it was not persuaded by the explanations provided by the United Kingdom, on 18 July 2001 the Commission issued a reasoned opinion in which it repeated its complaints and called on the United Kingdom to take the necessary measures to comply with the reasoned opinion within two months of its receipt.

12 By letter of 27 November 2001 ('the letter of 27 November 2001') the United Kingdom informed the Commission, in response to the reasoned opinion, of its intention to amend its legislation in order to establish greater legal certainty and clarity on a number of points at issue in the reasoned opinion, while maintaining that in general the measures in force complied with the Habitats Directive.

13 Finally, by letter of 2 December 2003, the United Kingdom authorities informed the Commission of progress made in the process of implementing changes in national legislation to transpose the Habitats Directive better.

14 It was in those circumstances that the Commission decided to bring the present action.

The action

The method of transposing the Habitats Directive

Arguments of the parties

15 The Commission alleges that the United Kingdom has not transposed the Habitats Directive appropriately into its legal order. In particular, the Commission submits that the United Kingdom has wrongly adopted a general clause for the purpose of filling any gaps in the specific provisions designed to transpose it.

16 The United Kingdom maintains that it has correctly transposed the Habitats Directive by adopting, for its transposition, legislation which contains not only specific requirements but also general duties and administrative procedures. Those general duties must be read together with the specific requirements of that legislation, which they supplement, thereby ensuring that the directive is in fact implemented appropriately.

17 The United Kingdom authorities rely in particular on regulation 3(2) and (4) of the 1994 Regulations, the equivalent provisions of which are, for Northern Ireland, regulation 3(2) and (4) of the 1995 Regulations and, for Gibraltar, section 17A of the 1991 Ordinance. Those provisions require ministers, nature conservation bodies and all competent public authorities to exercise their functions so as to secure compliance with the requirements of the Habitats Directive.

18 The Commission submits, on the other hand, that the general clauses pleaded by the United Kingdom are not sufficiently precise to ensure transposition into national law of the specific obligations imposed by the directive.

19 In order to determine the scope of their rights and obligations, individuals must refer to the Habitats Directive each time, a situation which does not meet the requirements of legal certainty or the conditions with regard to specificity, precision and clarity required under the settled case-law of the Court.

20 The Commission adds that if the Court were to follow the logic of the United Kingdom's reasoning, the whole directive could presumably have been transposed by such a general clause. This would be at odds with the requirement of specificity repeatedly noted in the case-law on the transposition of directives.

Findings of the Court

21 Under the third paragraph of Article 249 EC, a directive is binding, as to the result to be achieved, upon each Member State to which it is addressed, but leaves to the national authorities the choice of form and methods for implementing the directive in question in domestic law. However, in accordance with settled case-law, while the transposition of a directive into domestic law does not necessarily require that the content of the directive be incorporated formally and verbatim in express, specific legislation and, depending on its content, a general legal context may be adequate for the purpose, that is on condition that that context does indeed guarantee the full application of the directive in a sufficiently clear and precise manner (see, inter alia, Case 363/85 *Commission* v *Italy* [1987] ECR 1733, paragraph 7, Case C-361/88 *Commission* v *Germany* [1991] ECR I-2567, paragraph 15, and Case C-58/02 *Commission* v *Spain* [2004] ECR I-621, paragraph 26).

22 In that regard, it is important in each individual case to determine the nature of the provision, laid down in a directive, to which the action for infringement relates, in order to gauge the extent of the obligation to transpose imposed on the Member States (see Case C-233/00 *Commission* v *France* [2003] ECR I-6625, paragraph 77).

23 The United Kingdom's argument that the most appropriate way of implementing the Habitats Directive is to confer specific powers on nature conservation bodies and to impose on them the general duty to exercise their functions so as to secure compliance with the requirements of that directive cannot be upheld.

24 First, it is to be remembered that the existence of national rules may render transposition by specific legislative or regulatory measures superfluous only if those rules actually ensure the full application of the directive in question by the national authorities.

25 Second, it is apparent from the 4th and 11th recitals in the preamble to the Habitats Directive that threatened habitats and species form part of the European Community's natural heritage and that the threats to them are often of a transboundary nature, so that the adoption of conservation measures is a common responsibility of all Member States. Consequently, as the Advocate General has observed in point 11 of her Opinion, faithful transposition becomes particularly important in an instance such as the present one, where management of the common heritage is entrusted to the Member States in their respective territories (see by analogy, in respect of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1), Case 262/85 *Commission* v *Italy* [1987] ECR 3073, paragraph 39, and Case C-38/99 *Commission* v *France* [2000] ECR I-10941, paragraph 53).

26 It follows that, in the context of the Habitats Directive, which lays down complex and technical rules in the field of environmental law, the Member States are under a particular duty to ensure that their legislation intended to transpose that directive is clear and precise, including with regard to the fundamental surveillance and monitoring obligations, such as those imposed on national authorities by Articles 11, 12(4) and 14(2) of the directive.

27 However, it is apparent on examination of the legislation relied upon by the United Kingdom that it is so general that it does not give effect to the Habitats Directive with sufficient precision and clarity to satisfy fully the demands of legal certainty (see, by analogy, Case 291/84 *Commission* v *Netherlands* [1987] ECR 3483, paragraph 15) and that it also does not establish a precise legal framework in the area concerned, such as to ensure the full and complete application of the directive and allow harmonised and effective implementation of the rules which it lays down (see, by analogy, the judgment of 10 March 2005 in Case C-531/03 *Commission* v *Germany*, not published in the ECR, paragraph 19).

28 It follows that the general duties laid down by the United Kingdom legislation cannot ensure that the provisions of the Habitats Directive referred to in the Commission's application are transposed satisfactorily and are not capable of filling any gaps in the specific provisions intended to achieve such transposition. Consequently, there remains no need to consider the United Kingdom's arguments based on the general duties contained in that legislation when analysing the specific complaints relied upon by the Commission.

The complaints raised by the Commission

The complaint alleging incomplete transposition of Article 6(2) of the Habitats Directive

29 In the light of information that the United Kingdom provided, the Commission, in its reply and at the hearing, abandoned its complaint alleging breach of Article 6(2) of the Habitats Directive with regard to England, Wales, Scotland and Northern Ireland, while maintaining it with regard to Gibraltar.

30 The Commission submits that, by merely protecting designated sites from any operation with potential to cause disturbance without also ensuring that deterioration due to neglect or inactivity is avoided, the United Kingdom has failed to implement Article 6(2) of the directive fully in Gibraltar.

31 The United Kingdom, without genuinely contesting the Commission's line of argument, contends that only non-natural deterioration is to be avoided.

32 In addition, it argues that the 1991 Ordinance set in place a complete and stringent enforcement regime. That regime adequately implements the Habitats Directive, particularly when it is read in conjunction with the general rule laid down in section 17A of the ordinance.

33 As to those submissions, it should first be noted that Article 6(2) of the Habitats Directive obliges the Member States to avoid the deterioration of natural habitats and the habitats of species.

34 As the Advocate General has observed in point 19 of her Opinion, it is clear that, in implementing Article 6(2) of the Habitats Directive, it may be necessary to adopt both measures intended to avoid external man-caused impairment and disturbance and measures to prevent natural developments that may cause the conservation status of species and habitats in SACs to deteriorate.

35 Second, at the end of the period laid down in the reasoned opinion, Article 6(2) of the Habitats Directive had not been formally reproduced in the legislation applicable in Gibraltar. Section 17G of the 1991 Ordinance, allowing the competent authorities to enter into site management agreements with the owners or occupiers of sites, appears to be the only provision applicable in Gibraltar for avoiding any deterioration.

36 It is clear that this provision confers only a non-mandatory power on those authorities and that it is not such as to avoid deterioration, contrary to the requirements of Article 6(2) of the Habitats Directive.

37 Accordingly, inasmuch as domestic law contains no express provision obliging the competent authorities to avoid the deterioration of natural habitats and the habitats of species, it involves an element of legal uncertainty as to the obligations with which those authorities must comply.

38 It follows from the foregoing that, in any event, Article 6(2) of the Habitats Directive has not been transposed clearly, precisely and completely in Gibraltar.

39 In those circumstances, the complaint alleging incomplete transposition of Article 6 (2) of the Habitats Directive must be held to be well founded as regards Gibraltar.

The complaint alleging incomplete transposition of Article 6(3) and (4) of the Habitats Directive

40 The Commission submits that United Kingdom legislation does not properly transpose these provisions in three specific areas: water abstraction plans and projects, land use plans and, in respect of Gibraltar, the review of existing planning rights.

— Water abstraction plans and projects

41 In the Commission's submission, no provision of domestic law requires water abstraction licences granted under Chapter II of Part II of the Water Resources Act

1991 to comply with the obligation, imposed by Article 6(3) of the Habitats Directive, to take account of the significant effects which water abstraction may have on sites forming part of a SAC. No such provisions exist in Northern Ireland or Gibraltar either. Thus, water abstraction activities, which may have a significant adverse effect on a SAC, are not fully covered or correctly controlled by the United Kingdom's implementing legislation.

42 The Commission adds that in its letter of 27 November 2001 the United Kingdom had indicated that the relevant provisions of the 1994 Regulations would be amended in order to clarify the rules relating to water abstraction activities.

43 The United Kingdom contends, on the other hand, that it has set up, in conjunction with the general clauses, a system which enables potentially damaging operations to be determined in advance for each site.

44 As to those submissions, Article 6(3) of the Habitats Directive provides that any plan or project not directly connected with or necessary to the management of a site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, must be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives.

45 In the present case, it is not disputed that, at the end of the period laid down in the reasoned opinion, no legal provision expressly required water abstraction plans and projects to be subject to such an assessment.

46 Furthermore, the system established by the United Kingdom legislation, inasmuch as it essentially provides that all water abstraction plans and projects which fall within the conditions laid down in Article 6(3) of the Habitats Directive are deemed in advance to be potentially damaging for the site concerned, does not appear to be capable of ensuring compliance with the requirements of that provision.

47 As the Advocate General has observed in point 33 of her Opinion, while this kind of advance assessment of potential risks can be based on concrete facts with regard to the site, that is not the case with regard to the projects themselves, contrary to the requirements of Article 6(3) of the Habitats Directive, under which an appropriate assessment of the project's implications for the site in question should be carried out. Consequently, in merely defining potentially damaging operations for each site concerned, the risk is run that certain projects which on the basis of their specific characteristics are likely to have an effect on the site are not covered.

48 Nor is it possible to uphold the United Kingdom's argument that, as regards Scotland, the Water Environment and Water Services Act 2003 has laid down, as part of the transposition of Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy (OJ 2000 L 327, p. 1), a framework for a comprehensive new system of water abstraction which introduces controls consistent with Article 6(2) and (3) of the Habitats Directive.

49 It is settled case-law that the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation obtaining in the Member State at the end of the period laid down in the reasoned opinion and that the Court cannot take account of any subsequent changes (see, inter alia, Case C-103/00 *Commission* v *Greece* [2002] ECR I-1147, paragraph 23, and Case C-323/01 *Commission* v *Italy* [2002] ECR I-4711, paragraph 8).

50 Having regard to the foregoing, it must be found that the United Kingdom has not transposed Article 6(3) and (4) of the Habitats Directive correctly as regards water abstraction plans and projects.

— Land use plans

51 The Commission submits that United Kingdom legislation does not clearly require land use plans to be subject to appropriate assessment of their implications for SACs in accordance with Article 6(3) and (4) of the Habitats Directive.

52 According to the Commission, although land use plans do not as such authorise development and planning permission must be obtained for development projects in the normal manner, they have great influence on development decisions. Therefore land use plans must also be subject to appropriate assessment of their implications for the site concerned.

53 The United Kingdom accepts that land use plans can be considered to be 'plans and projects' for the purposes of Article 6(3) of the Habitats Directive, but it disputes that they can have a significant effect on sites protected pursuant to the directive. It submits that they do not in themselves authorise a particular programme to be carried out and that, consequently, only a subsequent consent can adversely affect such sites. It is therefore sufficient to make just that consent subject to the procedure governing plans and projects.

54 As to those submissions, the Court has already held that Article 6(3) of the Habitats Directive makes the requirement for an appropriate assessment of the implications of a plan or project conditional on there being a probability or a risk that it will have a significant effect on the site concerned. In the light, in particular, of the precautionary principle, such a risk exists if it cannot be excluded on the basis of objective information that the plan or project will have a significant effect on the site concerned (see, to this effect, Case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging* [2004] ECR I-7405, paragraphs 43 and 44).

55 As the Commission has rightly pointed out, section 54A of the Town and Country Planning Act 1990, which requires applications for planning permission to be determined in the light of the relevant land use plans, necessarily means that those plans may have considerable influence on development decisions and, as a result, on the sites concerned.

56 It thus follows from the foregoing that, as a result of the failure to make land use plans subject to appropriate assessment of their implications for SACs, Article 6(3) and (4) of the Habitats Directive has not been transposed sufficiently clearly and precisely into United Kingdom law and, therefore, the action brought by the Commission must be held well founded in this regard.

— Review of existing planning rights in Gibraltar

57 The Commission submits that, so far as concerns Gibraltar, the competent authorities do not comply with the requirements of Article 6(3) of the Habitats Directive in that they are not obliged to review whether existing planning permits affect sites protected under the directive.

58 As the Advocate General rightly observes in point 55 of her Opinion, while it is true that such an obligation to carry out a subsequent review may be based on Article 6 (2) of the Habitats Directive, the fact remains that Article 6(3) of the directive contains no provision obliging the Member States to carry out a review of that kind.

59 On the contrary, it follows from the very wording of the latter provision that the procedure laid down must be applied before a Member State agrees to the carrying out of plans or projects likely to affect the site concerned.

60 It follows that this part of the complaint alleging incomplete transposition of Article 6(3) and (4) of the Habitats Directive cannot be upheld.

The complaint alleging failure to transpose Articles 11 and 14(2) of the Habitats Directive

61 The Commission alleges that the United Kingdom has failed to transpose into domestic law the surveillance obligations set out in these provisions. It maintains that, until those obligations have been clearly assigned to the competent authorities, it will be unable to establish whether the required surveillance is actually being carried out.

62 In support of this complaint, the Commission relies on the letter of 27 November 2001, in which the United Kingdom stated, first, that a surveillance obligation was implicitly imposed on the competent authorities and, secondly, that the 1994 Regulations, the 1995 Regulations and the 1991 Ordinance would be amended to provide greater legal certainty through provisions more specific than those of that legislation.

63 In the United Kingdom's submission, Articles 11 and 14(2) of the Habitats Directive simply provide that the Member States are to undertake surveillance, without imposing any specific requirement as to how it is to take place, or as to how such surveillance is to be provided for in national law. It further contends that the list of surveillance activities carried out in accordance with domestic legislation demonstrates that surveillance is being carried out effectively in the United Kingdom in accordance with Articles 11 and 14(2) of the directive.

64 The Commission replies that it never asserted that no surveillance of the conservation status of natural habitats and species was undertaken in the United Kingdom. It contends, on the other hand, that the surveillance obligation is neither clearly implemented in that Member State nor clearly assigned to a particular authority of the latter.

65 With regard to those submissions, first, as has already been stated in paragraph 26 of this judgment, the surveillance obligation is fundamental to the effectiveness of the Habitats Directive and it must be transposed in a detailed, clear and precise manner.

66 However, at the end of the period laid down in the reasoned opinion, no provision of domestic law imposed an obligation on the national authorities requiring the surveillance of natural habitats and species.

67 Second, the United Kingdom's argument that the list of surveillance activities carried out proves that surveillance is undertaken effectively cannot be upheld. As the Court has already held, the fact, should it be established, that a practice is in conformity with the requirements of a directive which concern protection cannot constitute a reason for not transposing that directive into the domestic law of the Member State concerned (see, to this effect, Case C-361/88 *Commission* v *Germany*, cited above, paragraph 24).

68 Accordingly, inasmuch as it is common ground that United Kingdom domestic law does not contain any statutory duty requiring the national authorities to undertake surveillance of the conservation status of natural habitats and species, that domestic law involves an element of legal uncertainty. Hence, it is not guaranteed that surveillance of their conservation status is undertaken systematically and on a permanent basis.

69 It follows that Articles 11 and 14(2) of the Habitats Directive have not been transposed completely, clearly and precisely in the United Kingdom.

70 Consequently, the complaint alleging failure to transpose Articles 11 and 14(2) of the Habitats Directive must be held to be well founded.

The complaint alleging incorrect transposition of Article 12(1)(d) of the Habitats Directive

71 The Commission submits that the United Kingdom has not transposed correctly the obligation to take the requisite measures to establish a system of strict protection for certain animal species by prohibiting deterioration or destruction of their breeding sites or resting places. National legislation uses the verb 'to damage' instead of the word 'deterioration' used in Article 12(1)(d) of the Habitats Directive.

72 First, in the Commission's submission the use of the verb 'to damage' means that the effects of deterioration resulting from neglect or inactivity on the part of the competent authorities are not covered. However, in its reply, the Commission went back on this argument, accepting that the provision does not require breeding sites

and resting places of the species concerned to be protected from deterioration due to neglect or inactivity on the part of the competent authorities. Accordingly, there is no longer any need to rule on this point.

73 Second, the Commission contends that by creating offences only for acts having the effect of harming or damaging the breeding sites or resting places of the species in question, without prohibiting their deterioration, the measures transposing the Habitats Directive introduce a condition, not provided for in Article 12(1)(d) thereof, linked to whether the harmful act is intentional.

74 The United Kingdom does not dispute that Article 12(1)(d) of the Habitats Directive requires activities which would lead to the deterioration or destruction of the sites concerned to be prohibited. On the other hand, it contests the Commission's interpretation of the national legislation, according to which transposition of the directive in the United Kingdom, with the exception of Gibraltar, is limited to deliberate or intentional acts.

75 As to those submissions, it is settled case-law that in an action for failure to fulfil obligations brought under Article 226 EC it is for the Commission to prove the allegation that the obligation has not been fulfilled and it may not rely on any presumption (see, inter alia, Case 96/81 *Commission* v *Netherlands* [1982] ECR 1791, paragraph 6, and Case C-194/01 *Commission* v *Austria* [2004] ECR I-4579, paragraph 34).

76 Accordingly, inasmuch as the United Kingdom contends that its domestic law in force is consistent with Article 12(1)(d) of the Habitats Directive, it is for the Commission, in order to prove that that provision has not been transposed completely, to put before the Court the evidence or arguments necessary in order for it to determine that there has been such a failure to fulfil obligations.

77 However, it does not appear from the documents before the Court that the Commission has put forward evidence or arguments capable of proving that the transposition of that provision is limited to deliberate or intentional acts. On the contrary, it appears that the criminal offence provided for by United Kingdom domestic law, which punishes acts consisting in damaging or destroying a site, is a strict liability offence not in any way requiring the damage or destruction to be deliberate or intentional.

78 In those circumstances, since the Commission has not proved that the United Kingdom, other than in respect of Gibraltar, has failed to fulfil its obligations under Article 12(1)(d) of the Habitats Directive, this part of the complaint cannot be upheld.

79 As regards Gibraltar, suffice it to state that the United Kingdom acknowledges that, by prohibiting only the deliberate damaging or destruction of breeding sites or resting places of the species concerned, the legislation applicable in Gibraltar does not satisfy the requirements of Article 12(1)(d). Accordingly this part of the complaint must be held to be well founded.

80 Third, the Commission states that the United Kingdom legislation as currently drafted would protect breeding sites and resting places only against activities having a direct effect on them, and does not take account of indirect impairment in accordance with the requirements of Article 12(1)(d) of the Habitats Directive.

81 This argument cannot be upheld. The Commission has adduced no evidence capable of proving that the United Kingdom has failed to fulfil its obligations in this regard.

82 It follows from the foregoing that the complaint alleging that Article 12(1)(d) of the Habitats Directive has been transposed incorrectly must be partially upheld.

The complaint alleging incomplete transposition of Articles 12(2) and 13(1) of the Habitats Directive

83 The Commission submits that the national measures intended to transpose the prohibition on the keeping, transport, sale or exchange of specimens of animal and plant species fail to comply with the temporal limitation laid down in those articles.

84 It need only be stated that the United Kingdom acknowledged, during the written procedure and at the hearing, that the derogations in force in its domestic law are broader than those envisaged by the Habitats Directive and that, consequently, the provisions in question have not been correctly transposed in that Member State.

85 Accordingly, the complaint alleging incomplete transposition of Articles 12(2) and 13(1) of the Habitats Directive must be held to be well founded.

The complaint alleging incorrect transposition of Article 12(4) of the Habitats Directive

86 The Commission submits that the United Kingdom's implementing measures contain no provision requiring the establishment of a monitoring system such as

that required in Article 12(4), in respect of the incidental capture and killing of certain animal species. In the absence of further information the Commission is unable to establish whether such monitoring is in fact carried out.

87 It need only be stated that the United Kingdom, first, has acknowledged that national legislation contains no provision designed to establish such a monitoring system and, second, accepted in its letter of 27 November 2001 that national legislation had to be amended so that such monitoring is expressly established.

88 In any event, it does not appear that such a measure was adopted within the period laid down in the reasoned opinion.

89 Accordingly, the complaint alleging that Article 12(4) of the Habitats Directive has been transposed incorrectly must be held to be well founded.

The complaint alleging incorrect transposition of Article 15 of the Habitats Directive

90 The Commission complains that the United Kingdom has failed to comply with its obligations under Article 15 of the Habitats Directive. First, it criticises that Member State for having prohibited only the methods expressly listed in Annex VI(a) and (b) to the directive, without imposing a general prohibition on the use of indiscriminate means. Second, the Commission submits that sections 1 and 10 of the Conservation of Seals Act prohibit the use of only two methods of killing seals, whilst providing for exemptions, in the form of licences granted by the Secretary of State, which appear to go beyond the derogations allowed by the directive.

— No general prohibition on all indiscriminate means

91 The Commission pleads that United Kingdom legislation contains no general prohibition on the use of all indiscriminate means capable of causing local disappearance of, or serious disturbance to, populations of the relevant species of wild fauna. The national legislation does not therefore preclude the emergence of as yet unknown means of indiscriminate capture and killing.

92 The United Kingdom contends that Article 15 of the directive has been transposed by regulation 41 of the 1994 Regulations, regulation 36(2) of the 1995 regulations and section 17V(2) of the 1991 Ordinance. It states that those provisions establish lists of every indiscriminate means of capture and killing of the protected species that is currently recorded in that Member State and that the lists are kept under review in order to be updated if necessary.

93 As to those submissions, Article 15 of the Habitats Directive provides that, in respect of the capture or killing of species of wild fauna listed in Annex V(a) thereto and in cases where, in accordance with Article 16, derogations are applied to the taking, capture or killing of species listed in Annex IV(a), Member States are to prohibit the use of all indiscriminate means capable of causing local disappearance of, or serious disturbance to, populations of such species.

94 That provision, as is apparent from its very wording, imposes a general obligation designed to prohibit the use of all indiscriminate means of capture or killing of the species of wild fauna concerned.

95 In the present case, it is not in dispute that, at the end of the period laid down in the reasoned opinion, domestic law did not impose a general prohibition of that kind.

96 Furthermore, as the Advocate General has observed in point 89 of her Opinion, the possibility of updating a list of prohibited methods is less effective than a general prohibition. Delay in updating the aforementioned lists would necessarily lead to lacunae in protection which are specifically intended to be prevented by means of the general prohibition in Article 15 of the Habitats Directive. This interpretation is all the more justified because domestic law contains no statutory duty to review the lists.

97 In those circumstances, it is not in any way guaranteed that all indiscriminate means capable of causing local disappearance of, or serious disturbance to, populations of the protected species are prohibited in the United Kingdom.

98 Therefore, it must be held that the United Kingdom has not transposed Article 15 of the Habitats Directive correctly as regards the prohibition on all indiscriminate means of capture or killing of the species of wild fauna concerned.

— Conservation of Seals Act

99 A preliminary point to note is that in its reply the Commission withdrew its complaint relating to the Conservation of Seals Act, on the basis of the fact that the United Kingdom had undertaken in its defence to adopt amending legislation in that regard. However, in its rejoinder the United Kingdom considered it necessary to alert the Commission that it would await the outcome of the present proceedings before amending its legislation. It was in those circumstances that at the hearing the Commission wished to maintain this complaint, and the United Kingdom did not contest this.

100 The Commission submits that, by prohibiting only two methods of killing seals and allowing licences to be granted on conditions which go beyond the derogations provided for by the Habitats Directive, the Conservation of Seals Act does not comply with Article 15 of the directive.

101 According to the United Kingdom, such an interpretation of the Conservation of Seals Act is incorrect. The Act simply supplements regulation 41 of the 1994 Regulations, which transposes Article 15 of the Habitats Directive, and it therefore provides additional protection for the various seal species.

102 As to those submissions, first, as has been held in paragraph 98 of this judgment, regulation 41 of the 1994 Regulations does not transpose Article 15 of the Habitats Directive correctly. Therefore, the United Kingdom's argument that the Conservation of Seals Act supplements regulation 41 of the 1994 Regulations cannot be upheld.

103 Second, even if the Conservation of Seals Act were to supplement the 1994 Regulations, it could be interpreted as meaning that only the two methods expressly mentioned by it are prohibited.

104 In those circumstances, the Conservation of Seals Act involves an element of legal uncertainty as to the methods of killing seals which are prohibited in the United Kingdom and it therefore does not ensure that Article 15 of the Habitats Directive is transposed correctly.

105 It follows from the foregoing that the complaint relating to incorrect transposition of Article 15 of the Habitats Directive must be upheld.

The complaint alleging incorrect transposition of Article 16 of the Habitats Directive

106 First, the Commission submits that the body of national provisions establishing derogations from Articles 12, 13, 14 and 15(a) and (b) of the Habitats Directive, which are set out in particular in regulation 40 of the 1994 Regulations, regulation 35 of the 1995 Regulations and section 17U of the 1991 Ordinance, does not comply with the two conditions specified in Article 16 of the directive. The Commission observes that, as provided in Article 16, a derogation may be granted only if there is no satisfactory alternative and the derogation is not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range.

107 It need only be stated (i) that the United Kingdom has accepted that any derogation granted pursuant to Article 16 of the directive must necessarily fulfil the two aforementioned conditions and (ii) that although that Member State has admitted that those conditions are not reproduced in the national legislation, no amendment designed to remedy that breach of obligations had been made at the end of the period laid down in the reasoned opinion.

108 This part of the complaint must therefore be upheld.

109 Second, the Commission submits that the specific derogations set out in regulations 40(3)(c) and 43(4) of the 1994 Regulations and in the equivalent provisions of the 1995 Regulations and the 1991 Ordinance go beyond the scope of Article 16 of the Habitats Directive. It states that the prohibitions laid down in order to transpose Articles 12, 13 and 16 of the directive are not applicable where the act in question is the result of a lawful operation.

110 The United Kingdom contends that since it transposed the requirements of Articles 12 and 13 of the Habitats Directive by making their infringement a criminal offence, it is necessary to exclude the application of such an offence in cases where persons act without criminal intent.

111 As to those submissions, Article 16 of the Habitats Directive defines in a precise manner the circumstances in which Member States may derogate from Articles 12, 13, 14 and 15(a) and (b) thereof, so that Article 16 must be interpreted restrictively.

112 Furthermore, as the Advocate General has observed in point 113 of her Opinion, Articles 12, 13 and 16 of the Habitats Directive form a coherent body of provisions intended to protect the populations of the species concerned, so that any derogation incompatible with the directive would infringe both the prohibitions set out in Articles 12 and 13 and the rule that derogations may be granted in accordance with Article 16.

113 The derogation at issue in the present case authorises acts which lead to the killing of protected species and to the deterioration or destruction of their breeding and resting places, where those acts are as such lawful. Therefore such a derogation, founded on the legality of the act, is contrary both to the spirit and purpose of the Habitats Directive and to the wording of Article 16 thereof.

114 Having regard to the foregoing, the action must be held well founded in this regard.

Failure to apply the Habitats Directive beyond the territorial waters of the United Kingdom

115 The Commission alleges that the United Kingdom has limited the application of the provisions which transpose the Habitats Directive into national law to just national territory and United Kingdom territorial waters. It contends that within their exclusive economic zones the Member States have an obligation to comply with Community law in the fields where they exercise sovereign powers and that the directive therefore applies beyond territorial waters. In particular, the Commission complains that the United Kingdom has not complied in its exclusive economic zone with its obligation to designate SACs under Article 4 of the directive or the obligation to provide species protection laid down in Article 12 of the directive.

116 The United Kingdom, without contesting the validity of this complaint, states, first, that in 2001 it adopted appropriate legislation so far as concerns the petroleum industry, namely the Offshore Petroleum Activities (Conservation of Habitats) Regulations 2001, and second, that it has prepared suitable legislation to extend the application of the Habitats Directive's requirements to the marine area beyond its territorial waters.

117 As the Advocate General has rightly observed in points 132 and 133 of her Opinion, it is common ground between the parties that the United Kingdom exercises sovereign rights in its exclusive economic zone and on the continental shelf and that the Habitats Directive is to that extent applicable beyond the Member States' territorial waters. It follows that the directive must be implemented in that exclusive economic zone.

118 Furthermore, it is common ground that the legislation to which the United Kingdom refers in its letter of 27 November 2001, which extends the application of the measures designed to transpose the requirements of the Habitats Directive beyond United Kingdom territorial waters, had not yet been adopted at the end of the period laid down in the reasoned opinion.

119 Consequently, the only national legislation in force at the end of that period was the Offshore Petroleum Activities (Conservation of Habitats) Regulations 2001. It is clear that those regulations concern only the petroleum industry and are therefore not capable by themselves of transposing the Habitats Directive beyond United Kingdom territorial waters.

120 The Commission's action must accordingly be held well founded in this regard.

121 In light of all the foregoing considerations, it must be held that, by failing to adopt, within the prescribed period, all the measures necessary in order to implement completely and correctly the requirements of the Habitats Directive, and in particular of:

— Article 6(2), as regards Gibraltar,

— Article 6(3) and (4), as regards water abstraction plans and projects and land use plans,

— Article 11,

— Article 12(1)(d), as regards Gibraltar,

— Article 12(2),

— Article 12(4),

— Article 13(1),

— Article 14(2),

— Article 15,

— Article 16,

— the whole of the Habitats Directive beyond its territorial waters,

the United Kingdom has failed to fulfil its obligations under that directive.

Costs

122 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission has applied for costs and the United Kingdom has been essentially unsuccessful, the United Kingdom must be ordered to pay the costs.

On those grounds, the Court (Second Chamber) hereby:

1. **Declares that, by failing to adopt, within the prescribed period, all the measures necessary in order to implement completely and correctly the requirements of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, and in particular of:**

   — **Article 6(2), as regards Gibraltar,**

   — **Article 6(3) and (4), as regards water abstraction plans and projects and land use plans,**

   — **Article 11,**

   — **Article 12(1)(d), as regards Gibraltar,**

   — **Article 12(2),**

   — **Article 12(4),**

   — **Article 13(1),**

— **Article 14(2),**

— **Article 15,**

— **Article 16,**

— **the whole of Directive 92/43 beyond its territorial waters,**

the United Kingdom of Great Britain and Northern Ireland has failed to fulfil its obligations under that directive;

2. **Dismisses the action as to the remainder;**

3. **Orders the United Kingdom of Great Britain and Northern Ireland to pay the costs.**

[Signatures]

JUDGMENT OF THE COURT (Second Chamber)

14 April 2005 *

In Case C-441/03,

ACTION under Article 226 EC for failure to fulfil obligations, brought on 16 October 2003,

Commission of the European Communities, represented by M. van Beek, acting as Agent, with an address for service in Luxembourg,

applicant,

v

Kingdom of the Netherlands, represented by H.G. Sevenster and N.A.J. Bel, acting as Agents,

defendant,

* Language of the case: Dutch.

THE COURT (Second Chamber),

composed of C.W.A. Timmermans, President of the Chamber, R. Silva de Lapuerta (Rapporteur), R. Schintgen, P. Kūris and G. Arestis, Judges,

Advocate General: J. Kokott,
Registrar: R. Grass,

having regard to the written procedure,

after hearing the Opinion of the Advocate General at the sitting on 3 February 2005,

gives the following

Judgment

1 By its application the Commission of the European Communities seeks from the Court a declaration that, by failing to bring into force within the prescribed periods the laws, regulations and administrative provisions necessary to comply with the requirements of Article 4(1) and (2) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1) and of Article 6(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7), in conjunction with Articles 2(2), 1

(a), (e) and (i), 6(2) to (4), 7, 11, 14 and 15 thereof, or, at the very least, by failing to notify those national provisions to it and by maintaining in force Article 13(4) of the Nature Conservancy Law (Natuurbeschermingswet), which is incompatible with Article 6(4) of Directive 92/43, the Kingdom of the Netherlands has failed to fulfil its obligations under those directives.

2 As a result of information communicated by the Netherlands Government in its defence the Commission has however found that Article 14 of Directive 92/43 had been properly transposed into domestic law, so that it withdrew, in its reply, the complaint relating to the incorrect transposition of that article.

Legal background

Community legislation

3 Directive 79/409 relates, as provided in Article 1(1) thereof, to the conservation of all species of naturally occurring birds in the wild state in the European territory of the Member States. It covers the protection, management and control of these species and lays down rules for their exploitation.

4 In accordance with Article 4(1) and (2) of Directive 79/409, the species mentioned in Annex I thereto are to be the subject of special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution, taking account of the particular situation of a certain number of species. As regards the conservation of those species, Member States are to classify

in particular the most suitable territories in number and size as special protection areas. Member States are also obliged to take similar measures for regularly occurring migratory species not listed in Annex I, bearing in mind their need for protection as regards their breeding, moulting and wintering areas and the staging posts along their migration routes. To this end, Member States are to pay particular attention to the protection of wetlands and particularly to wetlands of international importance.

5 Under Article 2(1) thereof, the aim of Directive 92/43 is to contribute towards ensuring biodiversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the EC Treaty applies. According to Article 2(2), measures taken pursuant to the Directive are to be designed to maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora of Community interest.

6 Article 6(2) to (4) of Directive 92/43 provides:

'2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the

integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

7 Article 11 of Directive 92/43 is worded as follows:

'Member States shall undertake surveillance of the conservation status of the natural habitats and species referred to in Article 2 with particular regard to priority natural habitat types and priority species.'

8 Article 15 of Directive 92/43 provides:

'In respect of the capture or killing of species of wild fauna listed in Annex V(a) and in cases where, in accordance with Article 16, derogations are applied to the taking,

capture or killing of species listed in Annex IV(a), Member States shall prohibit the use of all indiscriminate means capable of causing local disappearance of, or serious disturbance to, populations of such species, and in particular:

...'.

National legislation

9 As the Commission stated in its application, the Kingdom of the Netherlands has adopted the following measures in order to transpose Directive 92/43:

— Nature Conservancy Law (Natuurbeschermingswet);

— Decree providing for exceptions to and derogations from the Nature Conservancy Law (Besluit ontheffingen en vrijstellingen Natuurbeschermingswet);

— Action Plan for Nature (Natuurbeleidsplan) including the European Network of protected areas (ecologische hoofdstructuur EHS);

— Structural Plan for Green Spaces (Structuurschema Groene Ruimte);

— Town and Country Planning Law (Wet op de ruimtelijke ordening);

— Decree on protected native animal species (Besluit beschermde inheemse diersoorten);

— Regulation of the Minister for Agriculture, Nature Management and Fisheries (Regeling van de Minister van Landbouw, Natuurbeheer en Visserij) of 12 April 1995;

— list of endangered and vulnerable species within the meaning of Articles 1 and 3 of the Berne Convention on the Conservation of wildlife and natural habitats, drawn up by the Regulation of the Minister for Agriculture, Nature Management and Fisheries (Regeling van de Minister van Landbouw, Natuurbeheer en Visserij) of 27 January 1995;

— Law on endangered exotic animal and plant species (Wet bedreigde uitheemse dier- en plantensoorten);

— Regulation on management contracts and nature development (Regeling beheersovereenkomsten en natuurontwikkeling);

— Regulation to stimulate forest development of farm land (Regeling stimulering bosuitbreiding op landbouwgronden);

— Regulation providing for derogations from the Law on endangered exotic animal and plant species (Regeling ontheffingen Wet bedreigde uitheemse dier- en plantensoorten);

— Regulation designating endangered exotic animal and plant species (Regeling aanwijzing bedreigde uitheemse dier- en plantensoorten);

— Environment Management Law (Wet milieubeheer), and

— Flora and Fauna Law (Flora- en faunawet).

Pre-litigation procedure

10 By letter of formal notice of 24 October 2000 the Commission called on the Kingdom of the Netherlands to submit its observations concerning the transposition of Directives 79/409 and 92/43 into its national law. The Kingdom of the Netherlands replied by letter of 8 March 2001.

11 On 26 July 2001 the Commission sent a reasoned opinion to the Kingdom of the Netherlands in which it complained that the latter had incorrectly transposed a certain number of provisions of Directives 79/409 and 92/43, and invited the Kingdom of the Netherlands to comply with the reasoned opinion within two months from the date of its notification.

12 By letter of 11 October 2001, the Kingdom of the Netherlands sent to the Commission a draft law amending the Nature Conservancy Law. On 28 January 2002 a more detailed reply on that matter was sent to the Commission by the Netherlands authorities.

13 Taking the view that the Kingdom of the Netherlands had not fully transposed, within the prescribed periods, Directives 79/409 and 92/43, the Commission decided to bring the present proceedings.

The action

Arguments of the parties

14 The Commission puts forward the following seven complaints against the Kingdom of the Netherlands:

— the national legislation does not fully transpose Article 6(1) of Directive 92/43, in conjunction with Articles 1(a), (e) and (i) and 2(2) thereof;

— the national legislation has only partially transposed the requirements of Article 6(2) of Directive 92/43, in conjunction with Articles 1(a), (e) and (i) and 2(2) thereof;

— neither Articles 12 and 21(3) of the Nature Conservancy Law or the Environment Management Law, nor any other law, regulation or administrative provision in force in the Netherlands are in accordance with the requirements of Article 6(3) of Directive 92/43;

— neither Articles 12 and 21(3) of the Nature Conservancy Law or the Environment Management Law, nor any other law, regulation or administrative provision in force in the Netherlands adequately transpose Article 6(4) of Directive 92/43, in the situations covered by that provision; Article 13(4) of the Nature Conservancy Law is also incompatible with that provision;

— contrary to the requirements of Article 11 of Directive 92/43 a complete system for surveillance of sites has not been set up in the Netherlands;

— the prohibition of indiscriminate means set out in Article 15 of Directive 92/43 is not fully implemented in the provisions of the Decree providing for exceptions to and derogations from the Nature Conservancy Law;

— the measures necessary to fulfil the obligation to protect the habitat of the species of birds referred to in Article 4(1) and (2) of Directive 79/409 have not been adopted in the Netherlands.

15 As regards the third complaint, relating to the failure to transpose Article 6(3) of Directive 92/43 into Netherlands law, the Commission submits that the assessment which must be carried out on the basis of that provision must also cover the elements set out in Article 6(4). For the purposes of such an assessment there should

be an examination not only of whether a plan or project is likely adversely to affect the integrity of the site concerned, but also of whether alternative solutions exist, whether imperative reasons of overriding public interest require the operation to be carried out or whether compensatory measures must be taken. Furthermore, it is necessary to take account of the fact that a particular site may host a priority natural habitat type and/or a priority species.

16 In that connection, the Netherlands Government, while acknowledging that Article 6(3) of Directive 92/43 has not been fully transposed, rejects the Commission's interpretation of the definition of 'appropriate assessment' contained in that provision. It takes the view that, given the characteristics of the assessment process for plans or projects set out in that article, Article 6(4) and the elements in it are applicable only if it is clear from the assessment carried out under Article 6(3) that the plan or project may in fact adversely affect the integrity of the site. The Netherlands Government argues that it is only in such cases that it is necessary to go on to examine the elements mentioned in Article 6(4). If the assessment carried out under Article 6(3) showed that a plan or project does not affect the integrity of the site, there would then be no reason to add to the assessment obligation under that provision a further examination concerning the existence of the elements mentioned in Article 6(4).

17 As to the first, second, fourth and seventh complaints made by the Commission, the Kingdom of the Netherlands acknowledges that the provisions of Directives 79/409 and 92/43 which are the subject of the action have not been fully transposed into Netherlands law. In that connection, it states that on 19 December 2001 a draft law amending the Nature Conservancy Law was submitted to Parliament. That draft law is intended to ensure that those directives are fully transposed, particularly as regards the provisions on the basis of which the first, second, fourth and seventh complaints have been raised.

18 As to the fifth and sixth complaints the Netherlands Government contends that measures are planned in order to eliminate the legal lacunas pointed out by the Commission in its action.

Findings of the Court

19 Since the Kingdom of the Netherlands accepts that the first, second, fourth, fifth, sixth and seventh complaints are well founded, the application must be upheld in that regard.

20 As regards the third complaint, although the Kingdom of the Netherlands admits that it has not completely transposed Article 6(3) of Directive 92/43 into its domestic law, nevertheless it contests the Commission's complaint in so far as, according to the Commission, the appropriate assessment referred to in Article 6(3) must also cover the elements referred to in Article 6(4).

21 In that connection, in order to determine the scope of the obligation to carry out an appropriate assessment of a plan or project likely to affect a site which falls within the scope of Article 6(3) of Directive 92/43, it must be stated, as a preliminary point, that the protection scheme established by that article consists of several aspects designed to permit examination of the effects of such a plan or project, and various stages of assessment where the plan or project is likely to have serious repercussions on a protected site.

22 As the Advocate General stated in points 12 and 13 of her Opinion, this 'appropriate assessment' is not a merely formal process of examination, but must allow a detailed analysis which satisfies the conservation objectives of the site in question, as set out in Article 6, particularly as regards the protection of natural habitats and priority species.

23 As the Court stated in paragraphs 33 and 34 of its judgment in Case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging* [2004] ECR I-7405, it is clear from Article 6(3) of Directive 92/43 that in every case of a plan or project not directly connected with or necessary to the management of the site, but likely to have a significant effect thereon, either individually or in combination with other plans and projects, the competent authorities are required to carry out an appropriate assessment in that respect. That assessment must relate to the implications of the plan or project for the site in view of the site's conservation objectives.

24 In accordance with Article 6(3), it is only in the second stage, that is on completion of the appropriate assessment and in the light of the conclusions on the implications for the site in question of the plan or project, that the competent authorities adopt a decision on it.

25 It should be added that, in accordance with that provision, the competent authorities, when taking their decision, agree to the plan or project only after having ascertained that the planned operation does not adversely affect the integrity of the site concerned. Furthermore, those authorities must, if appropriate, obtain the opinion of the general public on that subject.

26 Within the procedural context thus outlined, it is only where the assessment required under Article 6(3) of Directive 92/43 is negative and in the absence of alternative solutions that, where the plan or project must nevertheless be carried out for imperative reasons of overriding public interest, the examination laid down in Article 6(4) must be undertaken. It is stated in Article 6(3) that the decision is to be adopted by the competent authorities 'subject to the provisions of paragraph 4'.

27 As to the examination which must be carried out within the framework of Article 6 (4), it should be noted that the complex factors to which it relates, such as the absence of alternative solutions and the existence of imperative reasons of overriding public interest, are intended to enable a Member State to take all compensatory measures to ensure that the overall coherence of Natura 2000 is preserved. Furthermore, where the site concerned hosts a priority natural habitat type and/or a priority species, only a limited number of such imperative reasons may be relied on in order to justify a plan or project nevertheless being carried out.

28 In those circumstances, having regard to the particular characteristics of each of the stages referred to in Article 6 of Directive 92/43, it must be held that the various requirements set out in Article 6(4) cannot constitute elements that the competent national authorities are obliged to take account of where they carry out an appropriate assessment provided for in Article 6(3).

29 Therefore, the complaint alleging that the Netherlands national legislation does not provide that the assessment referred to in Article 6(3) of Directive 92/43 must also be carried out with regard to the elements mentioned in Article 6(4) must be dismissed.

30 In the light of the foregoing, it must be held that, by failing to bring into force within the prescribed periods all the laws, regulations and administrative provisions necessary to comply with the requirements of Article 4(1) and (2) of Directive 79/409 and of Article 6(1) of Directive 92/43, in conjunction with Articles 2(2), 1(a), (e) and (i), 6(2) to (4), 7, 11 and 15 thereof and by maintaining in force Article 13(4) of the Nature Conservancy Law, which is incompatible with Article 6(4) of Directive 92/43, the Kingdom of the Netherlands has failed to fulfil its obligations under those directives.

Costs

31 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission has applied for costs and the Kingdom of the Netherlands has been unsuccessful, the latter must be ordered to pay the costs.

On those grounds the Court (Second Chamber) hereby:

1. **Declares that, by failing to bring into force within the prescribed periods all the laws, regulations and administrative provisions necessary to comply with the requirements of Article 4(1) and (2) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds and of Article 6(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, in conjunction with Articles 2 (2), 1(a), (e) and (i), 6(2) to (4), 7, 11 and 15 thereof and by maintaining in force Article 13(4) of the Nature Conservancy Law (Natuurbeschermingswet), which is incompatible with Article 6(4) of Directive 92/43, the Kingdom of the Netherlands has failed to fulfil its obligations under those directives;**

2. **Dismisses the remainder of the application;**

3. **Orders the Kingdom of the Netherlands to pay the costs.**

JUDGMENT OF THE COURT (Second Chamber)

13 January 2005 *

In Case C-117/03,

REFERENCE for a preliminary ruling under Article 234 EC from the Consiglio di Stato (Italy), made by order of 17 December 2002, received at the Court on 18 March 2003, in the proceedings

Società Italiana Dragaggi SpA and Others

v

Ministero delle Infrastrutture e dei Trasporti,

Regione Autonoma del Friuli-Venezia Giulia,

THE COURT (Second Chamber),

composed of: C.W.A. Timmermans, President of the Chamber, C. Gulmann (Rapporteur), J.-P. Puissochet, N. Colneric and J.N. Cunha Rodrigues, Judges,

* Language of the case: Italian.

Advocate General: J. Kokott,
Registrar: M. Múgica Arzamendi, Principal Administrator,

having regard to the written procedure and further to the hearing on 9 June 2004,

after considering the observations submitted on behalf of:

— Società Italiana Dragaggi SpA, acting in its own name and as agent of Associazione Temporanea di Imprese Mantovani SpA and HAM BV, by R. Titomanlio, avvocato,

— Regione Autonoma del Friuli-Venezia Giulia, by G. Marzi, avvocato,

— the French Republic, by C. Mercier, acting as Agent,

— the Kingdom of Sweden, by A. Kruse, acting as Agent,

— the Commission of the European Communities, by M. van Beek and L. Cimaglia, acting as Agents,

after hearing the Opinion of the Advocate General at the sitting on 8 July 2004,

gives the following

Judgment

1 The reference for a preliminary ruling relates to the interpretation of Articles 4(5), 6(3) and 21 of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7; 'the Directive').

2 The reference was submitted in proceedings between, first, Società Italiana Dragaggi SpA ('Dragaggi') amongst others and, second, the Ministero delle Infrastrutture e dei Trasporti (Ministry for Infrastructure and Transport) and the Regione Autonoma Friuli-Venezia Giulia (Autonomous Region of Friuli-Venezia Giulia) concerning the annulment, by the contracting authority, of a tender procedure relating to dredging works and the dumping of sediment on reclaimed land in the port of Monfalcone.

Legal context

Community law

3 The sixth recital in the preamble to the Directive states that, 'in order to ensure the restoration or maintenance of natural habitats and species of Community interest at a favourable conservation status, it is necessary to designate special areas of conservation in order to create a coherent European ecological network according to a specified timetable'.

4 According to Article 3(1) of the Directive, 'a coherent European ecological network of special areas of conservation shall be set up under the title Natura 2000. This network, composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range.'

5 Article 4 of the Directive is worded as follows:

'1. On the basis of the criteria set out in Annex III (Stage 1) and relevant scientific information, each Member State shall propose a list of sites indicating which natural habitat types in Annex I and which species in Annex II that are native to its territory the sites host. ...

The list shall be transmitted to the Commission, within three years of the notification of this Directive, together with information on each site. ...

2. On the basis of the criteria set out in Annex III (Stage 2) and in the framework both of each of the five biogeographical regions referred to in Article 1(c)(iii) and of the whole of the territory referred to in Article 2(1), the Commission shall establish, in agreement with each Member State, a draft list of sites of Community importance drawn from the Member States' lists identifying those which host one or more priority natural habitat types or priority species.

Member States whose sites hosting one or more priority natural habitat types and priority species represent more than 5% of their national territory may, in agreement with the Commission, request that the criteria listed in Annex III (Stage 2) be applied more flexibly in selecting all the sites of Community importance in their territory.

The list of sites selected as sites of Community importance, identifying those which host one or more priority natural habitat types or priority species, shall be adopted by the Commission in accordance with the procedure laid down in Article 21.

3. The list referred to in paragraph 2 shall be established within six years of the notification of this Directive.

4. Once a site of Community importance has been adopted in accordance with the procedure laid down in paragraph 2, the Member State concerned shall designate that site as a special area of conservation as soon as possible and within six years at most ...

5. As soon as a site is placed on the list referred to in the third subparagraph of paragraph 2 it shall be subject to Article 6(2), (3) and (4).'

6 Under paragraph 1 of Annex III (Stage 2) to the Directive, 'all the sites identified by the Member States in Stage 1 which contain priority natural habitat types and/or species will be considered as sites of Community importance'.

7 Article 6 of the Directive states:

'...

2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

8 Article 21 of the Directive provides that measures envisaged are to be adopted in accordance with a committee procedure.

9 Under Article 23, the Member States had to transpose the Directive into national law within two years of notification thereof. Notification took place on 10 June 1992.

National legislation

10 The Directive was transposed into Italian law by Decree No 357 of the President of the Republic of 8 September 1997 entitled 'Regulation implementing Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora' (GURI No 248, 'supplemento ordinario No 219/L', of 23 October 1997; 'Decree No 357/97').

11 Article 4 of Decree No 357/97 ties conservation measures for sites to establishment by the Commission of the list of sites of Community importance.

The main proceedings and the question referred for a preliminary ruling

12 On 14 May 2001 Dragaggi was awarded a contract relating to dredging works and the dumping of the sediment on reclaimed land in the port of Monfalcone.

13 Four months later the contracting authority annulled the entire tender procedure on the ground that the reclaimed land on which the sediment resulting from the works was intended to be deposited was classified as a site of Community interest, requiring an impact assessment under the relevant national legislation. According to the authority, such an assessment could not have a positive outcome.

14 Dragaggi challenged the legality of the decision annulling the tender procedure before the Tribunale Amministrativo Regionale del Friuli-Venezia Giulia (Regional Administrative Court of Friuli-Venezia Giulia, Italy). It contended in particular that the procedure for classifying as a site of Community importance the 'mouth of the Timavo' site where the reclaimed land in question was situated had not yet been completed. Although the Italian authorities had proposed a list of sites, including the site at the mouth of the Timavo, to the Commission, the latter had not yet adopted

the Community list under the third subparagraph of Article 4(2) of the Directive. Therefore, the obligation to carry out a prior assessment of projects that had significant implications for the site was not yet applicable.

15 In its judgment, the court rejected the argument alleging that the impact assessment procedure was not applicable to the project. According to the Tribunale Amministrativo Regionale del Friuli-Venezia Giulia, where a Member State has, as in the present instance, identified a site hosting a priority species and has included it in the list proposed to the Commission, that site must, under paragraph 1 of Schedule III (Stage 2) to the Directive, be considered to be of Community importance. Accordingly it is subject, pursuant to Article 4(5) of the Directive, to the protective measures referred to in Article 6(2), (3) and (4) thereof, and in particular to the impact assessment which is provided for in Article 6(3).

16 According to that court, this approach is the only one capable of giving logical meaning to the Directive which, inasmuch as it seeks to protect habitats or species in danger of disappearance and extinction, must be capable of applying directly, if only in order to provide a safeguard. Furthermore, the measures proposing the classification of the mouth of the Timavo as a priority site, in particular the decree of the Minister for the Environment of 3 April 2000, were not challenged.

17 Holding that an impact assessment was necessary, the Tribunale Amministrativo Regionale del Friuli-Venezia Giulia upheld Dragaggi's other complaints alleging that the persons concerned by the carrying out of the project had not been consulted, that alternative solutions to those defined in the project had not been considered before the tender procedure was annulled and that the competent authority had not considered the possibility of giving a positive assessment accompanied by conditions.

18 Dragaggi brought an appeal against the judgment of the Tribunale Amministrativo Regionale del Friuli-Venezia Giulia before the Consiglio di Stato (Council of State). In particular, it repeated before the Consiglio di Stato the argument that Article 4(5) of the Directive requires the protective measures envisaged in Article 6 of the Directive to be applied only once the Community list has been established. In its submission, this view is confirmed by Article 4 of Decree No 357/97 which provides that the protective measures must be adopted within three months following the inclusion of the site on the list established by the Commission.

19 The Consiglio di Stato observed that, inasmuch as the listing of sites of Community importance hosting priority habitats appeared to be a purely declaratory act that did not require the exercise of any discretion by the Community authority, the interpretation placed on Article 4(5) of the Directive by the Tribunale Amministrativo Regionale del Friuli-Venezia Giulia could not be considered to be manifestly unfounded.

20 In those circumstances the Consiglio di Stato decided to stay proceedings and refer the following question to the Court of Justice for a preliminary ruling:

'Is Article 4(5) of Directive 92/43 of 21 May 1992 to be interpreted as meaning that the measures under Article 6 and, in particular, under Article 6(3) of that directive are mandatory for the Member States only after final approval at Community level of the list of sites under Article 21 or, alternatively, in addition to determination of the ordinary commencement date of conservation measures, must a distinction be drawn between declaratory listing and determinative listing (including in the first category the listing of priority sites) with the result that, in order to ensure the

effectiveness of the directive, where a Member State identifies a site of Community importance sustaining priority natural habitat types or species, there must be considered to be an obligation to carry out an assessment of plans and projects with a significant effect on the site even before the Commission draws up the draft list of sites or the adoption of the final version of that list pursuant to Article 21 of the directive and, in fact, with effect from the drawing up of the national list?'

Consideration of the question referred

21 Pursuant to Article 4(5) of the Directive, the regime for the protection of special areas of conservation that is laid down in Article 6(2), (3) and (4) thereof applies to a site once it is placed, in accordance with the third subparagraph of Article 4(2), on the list of sites selected as sites of Community importance as adopted by the Commission under the procedure laid down in Article 21.

22 The fact that, according to paragraph 1 of Annex III (Stage 2) to the Directive, all the sites identified by the Member States in Stage 1 which contain priority natural habitat types and/or species will be considered as sites of Community importance cannot render the protection regime prescribed in Article 6(2), (3) and (4) of the Directive applicable to them before they appear, in accordance with the third subparagraph of Article 4(2), on the list of sites of Community importance adopted by the Commission.

23 The contrary proposition referred to by the Consiglio di Stato, that where a Member State has, as in the main proceedings, identified a site as hosting a priority habitat and has included it in the list proposed to the Commission pursuant to Article 4(1) of the Directive, that site must, in view of paragraph 1 of Annex III (Stage 2) to the Directive, be considered to be of Community importance and is therefore subject, pursuant to Article 4(5), to the protective measures referred to in Article 6(2), (3) and (4), cannot succeed.

24 First, this proposition clashes with the wording of Article 4(5) of the Directive, which expressly links application of those protective measures to the fact that the site concerned has been placed, in accordance with the third subparagraph of Article 4(2), on the list of sites of Community importance adopted by the Commission. Second, the proposition presupposes that, where a site has been identified by a Member State as hosting priority natural habitat types or priority species and has been referred to on the list proposed to the Commission pursuant to Article 4(1) of the Directive, the Commission is required to place it on the list of sites of Community importance which it adopts in accordance with the procedure laid down in Article 21 of the Directive and is mentioned in the third subparagraph of Article 4(2). If that were the case, the Commission would be precluded, when establishing, in agreement with each Member State, a draft list of sites of Community importance within the meaning of the first subparagraph of Article 4(2), from contemplating not including on the draft list any site proposed by a Member State as hosting priority natural habitat types or priority species, even if it were to consider, notwithstanding the contrary opinion of the Member State concerned, that a given site did not host priority natural habitat types and/or species as referred to in paragraph 1 of Annex III (Stage 2) to the Directive. Such a situation would be contrary, in particular, to the first subparagraph of Article 4(2) of the Directive, read in conjunction with paragraph 1 of Annex III (Stage 2).

25 It thus follows from the foregoing that, on a proper construction of Article 4(5) of the Directive, the protective measures prescribed in Article 6(2), (3) and (4) of the Directive are required only as regards sites which, in accordance with the third subparagraph of Article 4(2) of the Directive, are on the list of sites selected as sites of Community importance adopted by the Commission in accordance with the procedure laid down in Article 21 of the Directive.

26 This does not mean that the Member States are not to protect sites as soon as they propose them, under Article 4(1) of the Directive, as sites eligible for identification as sites of Community importance on the national list transmitted to the Commission.

27 If those sites are not appropriately protected from that moment, achievement of the objectives seeking the conservation of natural habitats and wild fauna and flora, as set out in particular in the sixth recital in the preamble to the Directive and Article 3(1) thereof, could well be jeopardised. Such a situation would be particularly serious as priority natural habitat types or priority species would be affected, for which, because of the threats to them, early implementation of conservation measures would be appropriate, as recommended in the fifth recital in the preamble to the Directive.

28 In the present instance, it should be remembered that the national lists of sites eligible for identification as sites of Community importance must contain sites which, at national level, have an ecological interest that is relevant from the point of view of the Directive's objective of conservation of natural habitats and wild fauna and flora (see Case C-371/98 *First Corporate Shipping* [2000] ECR I-9235, paragraph 22).

29 It is apparent, therefore, that in the case of sites eligible for identification as sites of Community importance that are mentioned on the national lists transmitted to the Commission and may include in particular sites hosting priority natural habitat types or priority species, the Member States are, by virtue of the Directive, required to take protective measures appropriate for the purpose of safeguarding that ecological interest.

30 The answer to the question referred must therefore be that:

— on a proper construction of Article 4(5) of the Directive, the protective measures prescribed in Article 6(2), (3) and (4) of the Directive are required only as regards sites which, in accordance with the third subparagraph of Article 4(2) of the Directive, are on the list of sites selected as sites of Community importance adopted by the Commission in accordance with the procedure laid down in Article 21 of the Directive;

— in the case of sites eligible for identification as sites of Community importance which are included in the national lists transmitted to the Commission and, in particular, sites hosting priority natural habitat types or priority species, the Member States are, by virtue of the Directive, required to take protective measures that are appropriate, from the point of view of the Directive's conservation objective, for the purpose of safeguarding the relevant ecological interest which those sites have at national level.

Costs

31 Since these proceedings are, for the parties to the main proceedings, a step in the action pending before the national court, the decision on costs is a matter for that court. Costs incurred in submitting observations to the Court, other than the costs of those parties, are not recoverable.

On those grounds, the Court (Second Chamber) rules as follows:

On a proper construction of Article 4(5) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, the protective measures prescribed in Article 6(2), (3) and (4) of that directive are required only as regards sites which, in accordance with the third subparagraph of Article 4(2) of the directive, are on the list of sites selected as sites of Community importance adopted by the Commission of the European Communities in accordance with the procedure laid down in Article 21 of the directive.

In the case of sites eligible for identification as sites of Community importance which are included in the national lists transmitted to the Commission and, in particular, sites hosting priority natural habitat types or priority species, the Member States are, by virtue of Directive 92/43, required to take protective measures that are appropriate, from the point of view of the directive's conservation objective, for the purpose of safeguarding the relevant ecological interest which those sites have at national level.

Signatures.

JUDGMENT OF THE COURT (Grand Chamber)

7 September 2004 *

In Case C-127/02,

REFERENCE for a preliminary ruling under Article 234 EC

from the Raad van State (Netherlands), made by decision of 27 March 2002, registered at the Court on 8 April 2002, in the proceedings brought by

Landelijke Vereniging tot Behoud van de Waddenzee,

Nederlandse Vereniging tot Bescherming van Vogels

against

Staatssecretaris van Landbouw, Natuurbeheer en Visserij,

* Language of the case: Dutch.

intervener:

Coöperatieve Producentenorganisatie van de Nederlandse Kokkelvisserij UA,

THE COURT (Grand Chamber),

composed of: V. Skouris, President, P. Jann, C.W.A. Timmermans, C. Gulmann (Rapporteur), J.-P. Puissochet and J.N. Cunha Rodrigues, Presidents of Chambers, R. Schintgen, S. von Bahr and R. Silva de Lapuerta, Judges,

Advocate General: J. Kokott,
Registrar: M.-F. Contet, Principal Administrator,

having regard to the written procedure and further to the hearing on 18 November 2003,

after considering the observations submitted on behalf of:

— Landelijke Vereniging tot Behoud van de Waddenzee, by C.A.M. Rombouts, advocaat,

— Nederlandse Vereniging tot Bescherming van Vogels, by A.J. Durville, advocaat,

— Coöperatieve Producentenorganisatie van de Nederlandse Kokkelvisserij UA, by G. van der Wal, advocaat,

— the Netherlands Government, by H.G. Sevenster and N.A.J. Bel, acting as Agents,

— the Commission of the European Communities, by G. Valero Jordana, acting as Agent, and J. Stuyck, avocat,

after hearing the Opinion of the Advocate General at the sitting on 29 January 2004,

gives the following

Judgment

1 The reference for a preliminary ruling concerns the interpretation of Article 6 of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7, 'the Habitats Directive').

2 The reference was made in proceedings between the Landelijke Vereniging tot Behoud van de Waddenzee (National association for conservation of the Waddenzee, 'the Waddenvereniging') and the Nederlandse Vereniging tot Bescherming van Vogels (Netherlands association for the protection of birds, 'the Vogelbeschermingsvereniging') on the one hand and the Staatssecretaris van Landbouw, Natuurbeheer en Visserij (Secretary of State for agriculture, nature conservation and fisheries, 'the Secretary of State') on the other in respect of licences which the latter issued to the Coöperatieve Producentenorganisatie van de Nederlandse Kokkelvisserij UA (Cooperative producers' association of Netherlands cockle fisheries, 'the PO Kokkelvisserij') for the mechanical fishing of cockles in the special protection area (SPA) of the Waddenzee, classified within the meaning of Article 4 of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1) ('the Birds Directive').

Legal framework

The Birds Directive

3 Article 4(1) and (2) of the Birds Directive requires Member States to classify as SPAs the territories satisfying the ornithological criteria established by those provisions.

4 Article 4(4) of the Birds Directive provides:

'In respect of the protection areas referred to in paragraphs 1 and 2 above, Member States shall take appropriate steps to avoid pollution or deterioration of habitats or

any disturbances affecting the birds, in so far as these would be significant having regard to the objectives of this article. Outside these protection areas, Member States shall also strive to avoid pollution or deterioration of habitats.'

The Habitats Directive

Article 6 of the Habitats Directive states :

'1. For special areas of conservation, Member States shall establish the necessary conservation measures involving, if need be, appropriate management plans specifically designed for the sites or integrated into other development plans, and appropriate statutory, administrative or contractual measures which correspond to the ecological requirements of the natural habitat types in Annex I and the species in Annex II present on the sites.

2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment

of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

6 Article 7 of the Habitats Directive states that 'obligations arising under Article 6(2), (3) and (4) of this Directive shall replace any obligations arising under the first sentence of Article 4(4) of [the Birds Directive] in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this Directive or the date of classification or recognition by a Member State under [the Birds Directive], where the latter date is later'.

National legislation

7 Under Article 12(1) of the Natuurbeschermingswet (Nature Conservation Law), it is prohibited to carry out, to have carried out or to allow actions which are harmful to the natural integrity or the scientific importance of a protected natural site or disfigure it, without authorisation by the Minister van Landbouw, Natuurbeheer en Visserij (Minister for Agriculture, nature conservation and fisheries, 'the Minister') or in breach of the conditions accompanying that authorisation. Under Article 12(2), activities harmful to the essential characteristics of a protected natural site, as set out in the designation decision, are always to be considered harmful to the natural integrity of such a site or its interest in natural science terms.

8 It is clear from the order of 17 November 1993 designating the Waddenzee as a national natural site and from the explanatory memorandum for that order, which is an integral part of it, that the policy of authorisations and revocations under the Natuurbeschermingswet is linked to that followed under the Planologische Kernbeslissing Waddenzee (Key planning decision for the Waddenzee, hereinafter 'the PKB Waddenzee'). According to that explanatory memorandum, applying the procedures of the Natuurbeschermingswet creates an adequate framework for controlling activities which might harm the main objective of the PKB Waddenzee, namely, sustainable protection and development of that sea as a natural site and, in particular, of feeding, nesting and resting areas for birds frequenting that site. Human activities for economic purposes are allowed subject to an adequate assessment in the light of the main objective. Activities envisaged in the Waddenzee must therefore be examined in the light of the abovementioned objective and policy guidelines and assessed in terms thereof.

9 The section in the PKB Waddenzee devoted to coastal fisheries management is implemented in the Government decision of 21 January 1993, namely, the Structuurnota Zee- en kustvisserij 'Vissen naar evenwicht' (Structure Document on Marine and Inshore Fisheries 'Fishing for equilibrium'). This establishes the policy for shellfish fishing, inter alia in the Waddenzee, for the years 1993 to 2003 and includes a number of restrictions as regards cockle fishing. Certain areas in the national natural site are permanently closed to cockle fishing and in years in which food is scarce, 60% of the average food requirement of birds in the form of cockles and mussels is reserved for them. While 100% of their average food requirement is not thus reserved, that is because they can also turn to alternative food sources (Baltic clams, surf clams and shore crabs).

10 Under the PKB Waddenzee, it follows from the precautionary principle that where the most reliable information available leaves obvious doubt as to the absence of possible significant adverse effects on the ecosystem, the benefit of the doubt will favour conservation of the Waddenzee. The order for reference makes clear that most of the available scientific studies consulted do not unequivocally indicate the existence of significant adverse effects on the ecosystem of the Waddenzee linked to mechanical cockle fishing.

The main action and the questions referred

11 By decisions of 1 July 1999 and 7 July 2000 ('the decisions at issue in the main action'), the Secretary of State issued licences to PO Kokkelvisserij, subject to certain conditions, to engage in mechanical cockle fishing in the Waddenzee SPA during the periods from 16 August to 25 November 1999 and 14 August to 30 November 2000 respectively.

12 The Waddenvereniging and the Vogelbeschermingsvereniging challenged those decisions before the Secretary of State, who, by decisions of 23 December 1999 and 19 February 2001, held that the complaints made against the decisions at issue in the main action were not founded and rejected the applications against them.

13 Those nature protection associations brought an action against those rejections before the Raad van State (Council of State). They claimed in essence that cockle fishing, as authorised by the decisions at issue in the main action, causes permanent damage to the geomorphology, flora and fauna of the Waddenzee's seabed. They also submitted that such fishing reduces the food stocks of birds which feed on shellfish, causing a decline in their populations, in particular for oystercatchers and eider ducks. The Waddenvereniging and the Vogelbeschermingsvereniging also claimed that those decisions were contrary to the Habitats and Birds Directives.

14 As regards the correct transposition of Article 6(2) to 6(4) of the Habitats Directive into Netherlands law, the Raad van State states that Article 12 of the Natuurbeschermingswet, although not expressly intended to implement the obligations laid down in Article 6(2) of the Habitats Directive, may be interpreted in a manner consistent with that provision. Similarly, the Natuurbeschermingswet does not contain rules which implement Article 6(3) and (4) of that directive. Nor are there generally binding rules intended to implement the provisions of those two paragraphs which are otherwise applicable to the Waddenzee.

15 The national court also states that according to the Waddenvereniging and the Vogelbeschermingsvereniging, in view of the expansion of cockle fishing in the Waddenzee SPA, there is a 'plan or project' which should be subject to 'appropriate assessment' in accordance with Article 6(3) of the Habitats Directive whereas the Secretary of State contends that the activity in question, inasmuch as it has been

carried on for many years without any intensification, falls within Article 6(2) of that directive.

16 As regards the relationship between Article 6(2) and 6(3) of the Habitats Directive, the Waddenvereniging and the Vogelbeschermingsvereniging submit that although the activity for which licences were granted must be described as a 'plan' or 'project' within the meaning of Article 6(3), it must nevertheless be examined in the light of Article 6(2). It is therefore appropriate to consider whether Article 6(3) must be regarded as a specific application of the rules in Article 6(2), so that those two paragraphs must be applied cumulatively, or as a provision with a separate, independent purpose, so that Article 6(2) relates to existing use while Article 6(3) applies to new plans or projects.

17 The Raad van State asks under what conditions an 'appropriate assessment' of the effect of the plan or project on the site concerned must be carried out. In addition, it asks what the criteria are on the basis of which it must be determined whether 'appropriate steps' or an 'appropriate assessment' are concerned, also in the light of the requirement laid down in Article 6(3) of the Habitats Directive for the competent authorities to agree to a plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned.

18 Finally, the national court considers it relevant to know whether Article 6(2) and (3) of the Habitats Directive has direct effect.

19 In those circumstances, the Raad van State decided to stay the proceedings and to refer the following questions to the Court of Justice for a preliminary ruling:

'1. (a) Are the words "plan or project" in Article 6(3) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora to be interpreted as also covering an activity which has already been carried on for many years but for which an authorisation is in principle granted each year for a limited period, with a fresh assessment being carried out on each occasion as to whether, and if so in which sections of the area, the activity may be carried on?

(b) If the answer to Question 1(a) is in the negative, must the relevant activity be regarded as a "plan or project" if the intensity of this activity has increased over the years or an increase in it is made possible by the authorisations?

2. (a) If it follows from the answer to Question 1 that there is a "plan or project" within the meaning of Article 6(3) of the Habitats Directive, is Article 6(3) of the Habitats Directive to be regarded as a special application of the rules in Article 6(2) or as a provision with a separate, independent purpose in the sense that, for example:

(i) Article 6(2) relates to existing use and Article 6(3) to new plans or projects, or

(ii) Article 6(2) relates to management measures and Article 6(3) to other decisions, or

(iii) Article 6(3) relates to plans or projects and Article 6(2) to other activities?

(b) If Article 6(3) of the Habitats Directive is to be regarded as a special application of the rules in Article 6(2), can the two subparagraphs be applicable cumulatively?

3. (a) Is Article 6(3) of the Habitats Directive to be interpreted as meaning that there is a "plan or project" once a particular activity is likely to have an effect on the site concerned (and an "appropriate assessment" must then be carried out to ascertain whether or not the effect is "significant") or does this provision mean that an "appropriate assessment" has to be carried out only where there is a (sufficient) likelihood that a "plan or project" will have a significant effect?

(b) On the basis of which criteria must it be determined whether or not a plan or project within the meaning of Article 6(3) of the Habitats Directive not directly connected with or necessary to the management of the site is likely to have a significant effect thereon, either individually or in combination with other plans or projects?

4. (a) When Article 6(3) of the Habitats Directive is applied, on the basis of which criteria must it be determined whether or not there are "appropriate steps" within the meaning of Article 6(2) or an "appropriate assessment", within the meaning of Article 6(3), in connection with the certainty required before agreeing to a plan or project?

(b) Do the terms "appropriate steps" or "appropriate assessment" have independent meaning or, in assessing these terms, is account also to be taken of Article 174(2) EC and in particular the precautionary principle referred to therein?

(c) If account must be taken of the precautionary principle referred to in Article 174(2) EC, does that mean that a particular activity, such as the cockle fishing in question, can be authorised where there is no obvious doubt as to the absence of a possible significant effect or is that permissible only where there is no doubt as to the absence of such an effect or where the absence can be ascertained?

5. Do Article 6(2) or Article 6(3) of the Habitats Directive have direct effect in the sense that individuals may rely on them in national courts and those courts must provide the protection afforded to individuals by the direct effect of Community law, as was held inter alia in Case C-312/93 *Peterbroeck* [1995] ECR I-4599?'

20 By order of 28 April 2004, the application by PO Kokkelvisserij to be allowed to submit written observations in response to the Advocate General's Opinion or otherwise to be given an opportunity to respond to that Opinion was rejected.

The questions referred

First question

Question 1(a)

21 By Question 1(a), the national court in essence asks whether mechanical cockle fishing which has been carried on for many years but for which a licence is granted annually for a limited period, with each licence entailing a new assessment both of the possibility of carrying on that activity and of the site where it may take place, falls within the concept of 'plan' or 'project' within the meaning of Article 6(3) of the Habitats Directive.

22 The 10th recital in the preamble to the Habitats Directive states that 'an appropriate assessment must be made of any plan or programme likely to have a significant effect on the conservation objectives of a site which has been designated or is designated in future'. That recital finds expression in Article 6(3) of the Directive, which provides inter alia that a plan or project likely to have a significant effect on the site concerned cannot be authorised without a prior assessment of its effects.

23 The Habitats Directive does not define the terms 'plan' and 'project'.

24 By contrast, Council Directive 85/337/EEC of 27 June 1985 on the assessment of the effects of certain public and private projects on the environment (OJ 1985 L 175, p. 40), the sixth recital in the preamble to which states that development consent for projects which are likely to have significant effects on the environment should be granted only after prior assessment of the likely significant environmental effects of these projects has been carried out, defines 'project' as follows in Article 1(2):

'— the execution of construction works or of other installations or schemes,

— other interventions in the natural surroundings and landscape including those involving the extraction of mineral resources.'

25 An activity such as mechanical cockle fishing is within the concept of 'project' as defined in the second indent of Article 1(2) of Directive 85/337.

26 Such a definition of 'project' is relevant to defining the concept of plan or project as provided for in the Habitats Directive, which, as is clear from the foregoing, seeks, as does Directive 85/337, to prevent activities which are likely to damage the environment from being authorised without prior assessment of their impact on the environment.

27 Therefore, an activity such as mechanical cockle fishing is covered by the concept of plan or project set out in Article 6(3) of the Habitats Directive.

28 The fact that the activity has been carried on periodically for several years on the site concerned and that a licence has to be obtained for it every year, each new issuance of which requires an assessment both of the possibility of carrying on that activity and of the site where it may be carried on, does not in itself constitute an obstacle to considering it, at the time of each application, as a distinct plan or project within the meaning of the Habitats Directive.

29 The answer to Question 1(a) must therefore be that mechanical cockle fishing which has been carried on for many years but for which a licence is granted annually for a limited period, with each licence entailing a new assessment both of the possibility of carrying on that activity and of the site where it may be carried on, falls within the concept of 'plan' or 'project' within the meaning of Article 6(3) of the Habitats Directive.

Question 1(b)

30 In the light of the reply to Question 1(a), there is no need to reply to Question 1(b).

Second question

31 By its second question, the national court in essence asks what the relationship is between Article 6(2) and Article 6(3) of the Habitats Directive.

32 It should be recalled that Article 6(2) of the Habitats Directive, in conjunction with Article 7 thereof, requires Member States to take appropriate steps to avoid, in SPAs, the deterioration of habitats and significant disturbance of the species for which the areas have been designated.

33 Article 6(3) of the Habitats Directive provides that the competent national authorities are to authorise a plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon only after having ascertained, by means of an appropriate assessment of the implications of that plan or project for the site, that it will not adversely affect the integrity of the site.

34 That provision thus establishes a procedure intended to ensure, by means of a preliminary examination, that a plan or project which is not directly connected with or necessary to the management of the site concerned but likely to have a significant effect on it is authorised only to the extent that it will not adversely affect the integrity of that site.

35 The fact that a plan or project has been authorised according to the procedure laid down in Article 6(3) of the Habitats Directive renders superfluous, as regards the

action to be taken on the protected site under the plan or project, a concomitant application of the rule of general protection laid down in Article 6(2).

36 Authorisation of a plan or project granted in accordance with Article 6(3) of the Habitats Directive necessarily assumes that it is considered not likely adversely to affect the integrity of the site concerned and, consequently, not likely to give rise to deterioration or significant disturbances within the meaning of Article 6(2).

37 Nevertheless, it cannot be precluded that such a plan or project subsequently proves likely to give rise to such deterioration or disturbance, even where the competent national authorities cannot be held responsible for any error. Under those conditions, application of Article 6(2) of the Habitats Directive makes it possible to satisfy the essential objective of the preservation and protection of the quality of the environment, including the conservation of natural habitats and of wild fauna and flora, as stated in the first recital in the preamble to that directive.

38 The answer to the second question must therefore be that Article 6(3) of the Habitats Directive establishes a procedure intended to ensure, by means of a preliminary examination, that a plan or project which is not directly connected with or necessary to the management of the site concerned but likely to have a significant effect on it is authorised only to the extent that it will not adversely affect the integrity of that site, while Article 6(2) of the Habitats Directive establishes an obligation of general protection consisting in avoiding deterioration and disturbances which could have significant effects in the light of the Directive's objectives, and cannot be applicable concomitantly with Article 6(3).

Third question

Question 3(a)

39 According to the first sentence of Article 6(3) of the Habitats Directive, any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, is to be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives.

40 The requirement for an appropriate assessment of the implications of a plan or project is thus conditional on its being likely to have a significant effect on the site.

41 Therefore, the triggering of the environmental protection mechanism provided for in Article 6(3) of the Habitats Directive does not presume — as is, moreover, clear from the guidelines for interpreting that article drawn up by the Commission, entitled 'Managing Natura 2000 Sites: The provisions of Article 6 of the "Habitats" Directive (92/43/EEC)' — that the plan or project considered definitely has significant effects on the site concerned but follows from the mere probability that such an effect attaches to that plan or project.

42 As regards Article 2(1) of Directive 85/337, the text of which, essentially similar to Article 6(3) of the Habitats Directive, provides that 'Member States shall adopt all measures necessary to ensure that, before consent is given, projects likely to have significant effects on the environment ... are made subject to an assessment with regard to their effects', the Court has held that these are projects which are likely to

have significant effects on the environment (see to that effect Case C-117/02 *Commission* v *Portugal* [2004] ECR I-5517, paragraph 85).

43 It follows that the first sentence of Article 6(3) of the Habitats Directive subordinates the requirement for an appropriate assessment of the implications of a plan or project to the condition that there be a probability or a risk that the latter will have significant effects on the site concerned.

44 In the light, in particular, of the precautionary principle, which is one of the foundations of the high level of protection pursued by Community policy on the environment, in accordance with the first subparagraph of Article 174(2) EC, and by reference to which the Habitats Directive must be interpreted, such a risk exists if it cannot be excluded on the basis of objective information that the plan or project will have significant effects on the site concerned (see, by analogy, inter alia Case C-180/96 *United Kingdom* v *Commission* [1998] ECR I-2265, paragraphs 50, 105 and 107). Such an interpretation of the condition to which the assessment of the implications of a plan or project for a specific site is subject, which implies that in case of doubt as to the absence of significant effects such an assessment must be carried out, makes it possible to ensure effectively that plans or projects which adversely affect the integrity of the site concerned are not authorised, and thereby contributes to achieving, in accordance with the third recital in the preamble to the Habitats Directive and Article 2(1) thereof, its main aim, namely, ensuring biodiversity through the conservation of natural habitats and of wild fauna and flora.

45 In the light of the foregoing, the answer to Question 3(a) must be that the first sentence of Article 6(3) of the Habitats Directive must be interpreted as meaning that any plan or project not directly connected with or necessary to the management

of the site is to be subject to an appropriate assessment of its implications for the site in view of the site's conservation objectives if it cannot be excluded, on the basis of objective information, that it will have a significant effect on that site, either individually or in combination with other plans or projects.

Question 3(b)

46 As is clear from the first sentence of Article 6(3) of the Habitats Directive in conjunction with the 10th recital in its preamble, the significant nature of the effect on a site of a plan or project not directly connected with or necessary to the management of the site is linked to the site's conservation objectives.

47 So, where such a plan or project has an effect on that site but is not likely to undermine its conservation objectives, it cannot be considered likely to have a significant effect on the site concerned.

48 Conversely, where such a plan or project is likely to undermine the conservation objectives of the site concerned, it must necessarily be considered likely to have a significant effect on the site. As the Commission in essence maintains, in assessing the potential effects of a plan or project, their significance must be established in the light, inter alia, of the characteristics and specific environmental conditions of the site concerned by that plan or project.

49 The answer to Question 3(b) must therefore be that, pursuant to the first sentence of Article 6(3) of the Habitats Directive, where a plan or project not directly connected with or necessary to the management of a site is likely to undermine the site's conservation objectives, it must be considered likely to have a significant effect on that site. The assessment of that risk must be made in the light inter alia of the characteristics and specific environmental conditions of the site concerned by such a plan or project.

Fourth question

50 By Questions 4(a) to 4(c), the national court in essence asks the Court to clarify the concepts of 'appropriate steps' within the meaning of Article 6(2) of the Habitats Directive and 'appropriate assessment' within the meaning of Article 6(3) thereof and the conditions under which an activity such as mechanical cockle fishing may be authorised.

51 In the light of the context of the main action, as well as the foregoing observations, and in particular the answers to the first two questions, there is no need, as stated in point 116 of the Advocate General's Opinion, to answer the fourth question as regards Article 6(2) of the Habitats Directive.

52 As regards the concept of 'appropriate assessment' within the meaning of Article 6(3) of the Habitats Directive, it must be pointed out that the provision does not define any particular method for carrying out such an assessment.

53 None the less, according to the wording of that provision, an appropriate assessment of the implications for the site concerned of the plan or project must precede its approval and take into account the cumulative effects which result from the combination of that plan or project with other plans or projects in view of the site's conservation objectives.

54 Such an assessment therefore implies that all the aspects of the plan or project which can, either individually or in combination with other plans or projects, affect those objectives must be identified in the light of the best scientific knowledge in the field. Those objectives may, as is clear from Articles 3 and 4 of the Habitats Directive, in particular Article 4(4), be established on the basis, inter alia, of the importance of the sites for the maintenance or restoration at a favourable conservation status of a natural habitat type in Annex I to that directive or a species in Annex II thereto and for the coherence of Natura 2000, and of the threats of degradation or destruction to which they are exposed.

55 As regards the conditions under which an activity such as mechanical cockle fishing may be authorised, given Article 6(3) of the Habitats Directive and the answer to the first question, it lies with the competent national authorities, in the light of the conclusions of the assessment of the implications of a plan or project for the site concerned, to approve the plan or project only after having made sure that it will not adversely affect the integrity of that site.

56 It is therefore apparent that the plan or project in question may be granted authorisation only on the condition that the competent national authorities are convinced that it will not adversely affect the integrity of the site concerned.

57 So, where doubt remains as to the absence of adverse effects on the integrity of the site linked to the plan or project being considered, the competent authority will have to refuse authorisation.

58 In this respect, it is clear that the authorisation criterion laid down in the second sentence of Article 6(3) of the Habitats Directive integrates the precautionary principle (see Case C-157/96 *National Farmers' Union and Others* [1998] ECR I-2211, paragraph 63) and makes it possible effectively to prevent adverse effects on the integrity of protected sites as the result of the plans or projects being considered. A less stringent authorisation criterion than that in question could not as effectively ensure the fulfilment of the objective of site protection intended under that provision.

59 Therefore, pursuant to Article 6(3) of the Habitats Directive, the competent national authorities, taking account of the conclusions of the appropriate assessment of the implications of mechanical cockle fishing for the site concerned, in the light of the site's conservation objectives, are to authorise such activity only if they have made certain that it will not adversely affect the integrity of that site. That is the case where no reasonable scientific doubt remains as to the absence of such effects (see, by analogy, Case C-236/01 *Monsanto Agricoltura Italia and Others* [2003] ECR I-8105, paragraphs 106 and 113).

60 Otherwise, mechanical cockle fishing could, where appropriate, be authorised under Article 6(4) of the Habitats Directive, provided that the conditions set out therein are satisfied.

61 In view of the foregoing, the answer to the fourth question must be that, under Article 6(3) of the Habitats Directive, an appropriate assessment of the implications for the site concerned of the plan or project implies that, prior to its approval, all the

aspects of the plan or project which can, by themselves or in combination with other plans or projects, affect the site's conservation objectives must be identified in the light of the best scientific knowledge in the field. The competent national authorities, taking account of the appropriate assessment of the implications of mechanical cockle fishing for the site concerned in the light of the site's conservation objectives, are to authorise such an activity only if they have made certain that it will not adversely affect the integrity of that site. That is the case where no reasonable scientific doubt remains as to the absence of such effects.

Fifth question

62 In the light of the finding in paragraph 51 above, it is not necessary to consider the fifth question in so far as it relates to Article 6(2) of the Habitats Directive.

63 It is therefore appropriate to consider that question only in so far as it concerns Article 6(3) of the Habitats Directive.

64 By its fifth question, the national court asks in essence whether, when a national court is called on to ascertain the lawfulness of an authorisation for a plan or project within the meaning of Article 6(3) of the Habitats Directive, it may examine whether the limits of discretion of the competent national authorities laid down by that provision have been complied with even though it has not been transposed into the legal order of the Member State concerned despite the expiry of the time-limit laid down for that purpose.

65 It should be recalled that the obligation of a Member State to take all the measures necessary to achieve the result prescribed by a directive is a binding obligation imposed by the third paragraph of Article 249 EC and by the directive itself. That duty to take all appropriate measures, whether general or particular, is binding on all the authorities of Member States including, for matters within their jurisdiction, the courts (see Case C-72/95 *Kraaijeveld and Others* [1996] ECR I-5403, paragraph 55).

66 As regards the right of an individual to rely on a directive and of the national court to take it into consideration, it would be incompatible with the binding effect attributed to a directive by Article 249 EC to exclude, in principle, the possibility that the obligation which it imposes may be relied on by those concerned. In particular, where the Community authorities have, by directive, imposed on Member States the obligation to pursue a particular course of conduct, the effectiveness of such an act would be weakened if individuals were prevented from relying on it before their national courts, and if the latter were prevented from taking it into consideration as an element of Community law in order to rule whether the national legislature, in exercising the choice open to it as to the form and methods for implementation, has kept within the limits of its discretion set by the directive (see *Kraaijeveld and Others*, paragraph 56). That also applies to ascertaining whether, failing transposition into national law of the relevant provision of the directive concerned, the national authority which has adopted the contested measure has kept within the limits of its discretion set by that provision.

67 More particularly, as regards the limits of discretion set by Article 6(3) of the Habitats Directive, it follows from that provision that in a case such as that in the main action, the competent national authorities, taking account of the conclusions of the appropriate assessment of the implications of mechanical cockle fishing for the site concerned in the light of the site's conservation objectives, are to authorise

such an activity only if they have made certain that it will not adversely affect the integrity of that site, that being the case if there remains no reasonable scientific doubt as to the absence of such effects (see paragraph 59 above).

68 Such a condition would therefore not be observed were the national authorities to authorise that activity in the face of uncertainty as to the absence of adverse effects for the site concerned.

69 It follows that Article 6(3) of the Habitats Directive may be taken into account by the national court in determining whether a national authority which has granted an authorisation relating to a plan or project has kept within the limits of the discretion set by the provision in question.

70 Consequently, the answer to the fifth question must be that where a national court is called on to ascertain the lawfulness of an authorisation for a plan or project within the meaning of Article 6(3) of the Habitats Directive, it can determine whether the limits on the discretion of the competent national authorities set by that provision have been complied with, even though it has not been transposed into the legal order of the Member State concerned despite the expiry of the time-limit laid down for that purpose.

Costs

71 Since these proceedings are, for the parties to the main proceedings, a step in the action pending before the national court, the decision on costs is a matter for that court. Costs incurred in submitting observations to the Court, other than the costs of those parties, are not recoverable.

On those grounds, the Court (Grand Chamber) rules as follows:

1. **Mechanical cockle fishing which has been carried on for many years but for which a licence is granted annually for a limited period, with each licence entailing a new assessment both of the possibility of carrying on that activity and of the site where it may be carried on, falls within the concept of 'plan' or 'project' within the meaning of Article 6(3) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora.**

2. **Article 6(3) of Directive 92/43 establishes a procedure intended to ensure, by means of a preliminary examination, that a plan or project which is not directly connected with or necessary to the management of the site concerned but likely to have a significant effect on it is authorised only to the extent that it will not adversely affect the integrity of that site, while Article 6(2) of that directive establishes an obligation of general protection consisting in avoiding deterioration and disturbances which could have significant effects in the light of the Directive's objectives, and cannot be applicable concomitantly with Article 6(3).**

3. (a) **The first sentence of Article 6(3) of Directive 92/43 must be interpreted as meaning that any plan or project not directly connected with or necessary to the management of the site is to be subject to an appropriate assessment of its implications for the site in view of the site's conservation objectives if it cannot be excluded, on the basis of objective information, that it will have a significant effect on that site, either individually or in combination with other plans or projects.**

   (b) **Pursuant to the first sentence of Article 6(3) of Directive 92/43, where a plan or project not directly connected with or necessary to the**

management of a site is likely to undermine the site's conservation objectives, it must be considered likely to have a significant effect on that site. The assessment of that risk must be made in the light inter alia of the characteristics and specific environmental conditions of the site concerned by such a plan or project.

4. **Under Article 6(3) of Directive 92/43, an appropriate assessment of the implications for the site concerned of the plan or project implies that, prior to its approval, all the aspects of the plan or project which can, by themselves or in combination with other plans or projects, affect the site's conservation objectives must be identified in the light of the best scientific knowledge in the field. The competent national authorities, taking account of the appropriate assessment of the implications of mechanical cockle fishing for the site concerned in the light of the site's conservation objectives, are to authorise such an activity only if they have made certain that it will not adversely affect the integrity of that site. That is the case where no reasonable scientific doubt remains as to the absence of such effects.**

5. **Where a national court is called on to ascertain the lawfulness of an authorisation for a plan or project within the meaning of Article 6(3) of Directive 92/43, it can determine whether the limits on the discretion of the competent national authorities set by that provision have been complied with, even though it has not been transposed into the legal order of the Member State concerned despite the expiry of the time-limit laid down for that purpose.**

ARRÊT DE LA COUR (cinquième chambre)
15 juillet 2004 (1)

«Manquement d'État – Conservation des habitats naturels – Faune et flore sauvages»

Dans l'affaire C-407/03,

Commission des Communautés européennes, représentée par MM. M. van Beek et M. Huttunen, en qualité d'agents, ayant élu domicile à Luxembourg,

partie requérante,

contre

République de Finlande, représentée par Mme A. Guimaraes-Purokoski, en qualité d'agent,

partie défenderesse,

ayant pour objet de faire constater que, en ne prévoyant pas dans sa législation une sécurité juridique suffisante encadrant l'obligation d'effectuer pour tout projet, y compris ceux faisant l'objet d'une évaluation des incidences sur l'environnement, l'évaluation appropriée, visée à l'article 6, paragraphe 3, de la directive 92/43/CEE du Conseil, du 21 mai 1992, concernant la conservation des habitats naturels ainsi que de la faune et de la flore sauvages (JO L 206, p. 7), la république de Finlande a manqué aux obligations qui lui incombent en vertu de ladite directive,

LA COUR (cinquième chambre),

composée de M. C. Gulmann, président de chambre, M. S. von Bahr et Mme R. Silva de Lapuerta (rapporteur), juges,

avocat général: Mme J. Kokott,
greffier: M. R. Grass,

vu la décision prise, l'avocat général entendu, de juger l'affaire sans conclusions,

rend le présent

Arrêt

1
Par requête déposée au greffe de la Cour le 29 septembre 2003, la Commission des Communautés européennes a introduit, en vertu de l'article 226 CE, un recours visant à faire constater que, en ne prévoyant pas dans sa législation une sécurité juridique suffisante encadrant l'obligation d'effectuer pour tout projet, y compris ceux faisant l'objet d'une évaluation des incidences sur l'environnement, l'évaluation appropriée, visée à l'article 6, paragraphe 3, de la directive 92/43/CEE du Conseil, du 21 mai 1992, concernant la conservation des habitats naturels ainsi que de la faune et de la flore sauvages (JO L 206, p. 7, ci-après la «directive»), la république de Finlande a manqué aux obligations qui lui incombent en vertu de ladite directive.

2
La directive a pour objet de favoriser le maintien de la biodiversité par la conservation des habitats naturels ainsi que de la faune et de la flore sauvages dans les États membres. Conformément aux dispositions de la directive, ces mêmes États désignent des zones spéciales de conservation en vue du maintien ou du rétablissement, dans un état de conservation favorable, des habitats naturels d'intérêt communautaire.

3
L'article 6 de la directive impose un certain nombre d'obligations aux autorités nationales si celles-ci approuvent des projets ou des programmes qui sont susceptibles d'affecter une zone spéciale de conservation. Le paragraphe 3 de cet article prévoit que tout plan ou projet non directement lié ou nécessaire à la gestion du site mais susceptible d'affecter ce site de manière significative, individuellement ou en conjugaison avec d'autres plans et projets, fait l'objet d'une évaluation appropriée de ses incidences sur le site eu égard aux objectifs de conservation de ce site et que, compte tenu des conclusions de l'évaluation des incidences sur le site et sous réserve des dispositions du paragraphe 4, les autorités nationales compétentes ne marquent leur accord sur ce plan ou projet qu'après s'être assurées qu'il ne portera pas atteinte à l'intégrité du site concerné et après avoir pris, le cas échéant, l'avis du public.

4
La mise en œuvre de l'article 6 de la directive est régie en Finlande par l'article 65 de la loi n° 1096/1996 sur la protection de la nature (ci-après la «loi sur la protection de la nature»). Par ailleurs, la loi nº 468/1994 concernant l'évaluation des incidences sur l'environnement prévoit des dispositions relatives à la planification et à la prise de décision de projets susceptibles d'avoir des répercussions sur l'environnement.

5
Après avoir reçu une plainte concernant l'impact d'un projet de ligne à haute tension sur des sites proposés par la république de Finlande comme sites d'importance communautaire au sens de la directive et désignés par cet État membre comme zones spéciales de conservation, la Commission a adressé à celui-ci, par lettre du 16 février 2000, une demande de renseignements concernant les incidences du projet en cause sur ces sites.

6
N'ayant pas jugé satisfaisantes les réponses fournies par la république de Finlande, la Commission lui a adressé une lettre de mise en demeure en date du 10 avril 2001. Ultérieurement, elle a adressé à ce même État membre une lettre de mise en demeure complémentaire, datée du 24 octobre 2001, dans laquelle elle relevait que l'article 65 de la loi sur la protection de la nature exemptait des obligations prévues à l'article 6, paragraphe 3, de la directive tous les projets auxquels la procédure d'évaluation des incidences sur l'environnement est applicable.

7

Par lettre datée du 26 juin 2002, la Commission a adressé à la république de Finlande un avis motivé. Par lettres des 27 août 2002 et 2 juillet 2003, cet État membre lui a répondu qu'il avait l'intention de modifier l'article 65, premier alinéa, de la loi sur la protection de la nature et a précisé les initiatives qu'il entendait prendre à cette fin. Estimant que le gouvernement finlandais ne lui avait pas fourni d'éléments démontrant qu'il avait mis sa législation en conformité avec l'article 6, paragraphe 3, de la directive, la Commission a décidé d'introduire le présent recours.

8
Le gouvernement finlandais admet le bien-fondé du recours. Selon lui, il est vrai que la loi sur la protection de la nature n'indique pas avec suffisamment de clarté que les projets qui font l'objet des procédures d'évaluation de l'incidence sur l'environnement en général doivent aussi être soumis à une évaluation au sens de la directive.

9
Dans ces conditions, il y a lieu de considérer comme fondé le recours introduit par la Commission.

10
En conséquence, il convient de constater que, en ne prévoyant pas dans sa législation une sécurité juridique suffisante encadrant l'obligation d'effectuer une évaluation appropriée pour tout projet, y compris ceux faisant l'objet d'une évaluation des incidences sur l'environnement, la république de Finlande a manqué aux obligations qui lui incombent en vertu de l'article 6, paragraphe 3, de la directive.

Sur les dépens

11
Aux termes de l'article 69, paragraphe 2, du règlement de procédure, toute partie qui succombe est condamnée aux dépens, s'il est conclu en ce sens. La Commission ayant conclu à la condamnation de la république de Finlande et celle-ci ayant succombé en ses moyens, il y a lieu de la condamner aux dépens.

Par ces motifs,

LA COUR (cinquième chambre)

déclare et arrête:

1)

En ne prévoyant pas dans sa législation une sécurité juridique suffisante encadrant l'obligation d'effectuer une évaluation appropriée pour tout projet, y compris ceux faisant l'objet d'une évaluation des incidences sur l'environnement, la république de Finlande a manqué aux obligations qui lui incombent en vertu de l'article 6, paragraphe 3, de la directive 92/43/CEE du Conseil, du 21 mai 1992, concernant la conservation des habitats naturels ainsi que de la faune et de la flore sauvages.

2)

La république de Finlande est condamnée aux dépens.

Gulmann von Bahr Silva de Lapuerta

Ainsi prononcé en audience publique à Luxembourg, le 15 juillet 2004.

JUDGMENT OF THE COURT (Third Chamber)
20 March 2003 *

In Case C-143/02,

Commission of the European Communities, represented by G. Valero Jordana and R. Amorosi, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Italian Republic, represented by U. Leanza, acting as Agent, and M. Fiorilli, avvocato dello Stato, with an address for service in Luxembourg,

defendant,

* Language of the case: Italian.

APPLICATION for a declaration that, in adopting legislation transposing Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7), which:

— excludes from the scope of the rules on the assessment of the implications for the environment projects other than those listed in the Italian legislation implementing directives on environmental impact assessment that are likely to have a significant effect on sites of Community importance,

— fails to impose upon the competent authorities of the Member State any obligation to take appropriate steps in respect of special protection areas to avoid the deterioration of natural habitats and of the habitats of species or disturbance of the species for which the areas were designated, in so far as such disturbance could be significant in relation to the objectives of Directive 92/43,

— fails to provide that the conservation measures referred to in Article 6(2) of that directive apply to the sites referred to in Article 5(1) of that directive,

the Italian Republic has failed to fulfil its obligations under Articles 5, 6 and 7 of that directive,

THE COURT (Third Chamber),

composed of: J.-P. Puissochet, President of the Chamber, C. Gulmann (Rapporteur) and F. Macken, Judges,

Advocate General: P. Léger,
Registrar: R. Grass,

having regard to the report of the Judge-Rapporteur,

after hearing the Opinion of the Advocate General at the sitting on 9 January 2003,

gives the following

Judgment

1 By application lodged at the Court Registry on 17 April 2002, the Commission of the European Communities brought an action under Article 226 EC in which it sought a declaration that, in adopting legislation transposing Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7) ('the habitats directive'), which:

— excludes from the scope of the rules on the assessment of the implications for the environment projects other than those listed in the Italian legislation implementing directives on environmental impact assessment that are likely to have a significant effect on sites of Community importance,

— fails to impose upon the competent authorities of the Member State any obligation to take appropriate steps in respect of special protection areas to avoid the deterioration of natural habitats and of the habitats of species or disturbance of the species for which the areas were designated, in so far as such disturbance could be significant in relation to the objectives of the habitats directive,

— fails to provide that the conservation measures referred to in Article 6(2) of that directive apply to the sites referred to in Article 5(1) of that directive,

the Italian Republic has failed to fulfil its obligations under Articles 5, 6 and 7 of that directive.

The law

2 Article 5 of the habitats directive provides:

'1. In exceptional cases where the Commission finds that a national list as referred to in Article 4(1) fails to mention a site hosting a priority natural habitat

type or priority species which, on the basis of relevant and reliable scientific information, it considers to be essential for the maintenance of that priority natural habitat type or for the survival of that priority species, a bilateral consultation procedure shall be initiated between that Member State and the Commission for the purpose of comparing the scientific data used by each.

2. If, on expiry of a consultation period not exceeding six months, the dispute remains unresolved, the Commission shall forward to the Council a proposal relating to the selection of the site as a site of Community importance.

3. The Council, acting unanimously, shall take a decision within three months of the date of referral.

4. During the consultation period and pending a Council decision, the site concerned shall be subject to Article 6(2).'

3 Article 6(2) to (4) of the habitats directive provide:

'2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

4 Article 7 of the habitats directive provides:

'Obligations arising under Article 6(2), (3) and (4) of this Directive shall replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4(1) or similarly

recognised under Article 4(2) thereof, as from the date of implementation of this Directive or the date of classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later.'

Pre-litigation procedure

5 Considering that Decree No 357 of the President of the Republic of 8 September 1997 (GURI No 248, Ordinary Supplement No 219/L of 23 October 1997, 'the presidential decree'), notified to it by the Italian authorities, did not bring about a correct implementation of the habitats directive, the Commission sent a letter of formal notice to the Italian Republic on 4 April 2000 requesting it to submit its observations in that regard.

6 By letter of 27 June 2000, the Italian Government forwarded to the Commission a note from the Ministry of the Environment stating that it was already aware of the shortcomings pointed out by the Commission and that it had identified other issues likely to give rise to serious problems when it came to applying the presidential decree, and submitting that, for a year, it had been in consultations with the regional authorities with a view to amending the text of that decree.

7 On 8 September 2000, the Italian Government sent to the Commission a further note from the Ministry of the Environment dated 29 August 2000 stating that the draft legislation amending the presidential decree had been approved and that any subsequent amendment made during the revision and adoption process would be notified to the Commission.

8 Since it received no further information concerning the adoption of the legislation amending the presidential decree, the Commission issued a reasoned opinion to the Italian Republic on 25 July 2001 repeating the complaints set out in the letter of formal notice and requesting that Member State to adopt the measures necessary to comply with that opinion within a period of two months from the date of its notification.

9 As the Commission received no reply from the Italian authorities, it decided to bring the present action.

The action

10 The Italian Republic does not deny the complaints alleged against it. Indeed, it intended, in line with the Commission's proposals, to amend Articles 5 and 6 of the presidential decree in particular, concerning respectively the assessment of the implications for the environment of certain projects and the protection of areas other than special protection areas, and to insert into that decree an Article 4b transposing Article 5 of the habitats directive. However, the question of the competent authority to act in the matter gives rise to conflict between the regions and the Italian State.

11 It suffices to point out, in that regard, that according to settled case-law, the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation prevailing in the Member State at the end of the period laid down in the reasoned opinion (see, *inter alia*, Case C-148/00 *Commission* v *Italy* [2001] ECR I-9823, paragraph 7) and that a Member State

cannot rely on provisions, practices or circumstances in its own legal order to justify failure to implement a directive within the prescribed period (see, to that effect, Case C-276/98 *Commission* v *Portugal* [2001] ECR I-1699, paragraph 20 and Case C-392/01 *Commission* v *Spain* [2002] ECR I-11111, paragraph 9).

12 Article 6(3) of the habitats directive does not allow projects not directly connected with or necessary to the management of sites to be excluded from the scope of the directive where they are likely to have a significant effect on those sites. Article 7 of that directive provides, in particular, that Article 6(2) applies to special protection areas designated under Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1). As for Article 5 of the habitats directive, this provides that during the period of bilateral consultation between the Member State and the Commission, and pending a Council decision, the site concerned is to be subject to the scheme of protection laid down by Article 6(2) of that directive.

13 Since Articles 5, 6 and 7 of the habitats directive were not fully implemented within the period prescribed by the reasoned opinion, the action brought by the Commission must be regarded as well founded.

14 Therefore, in adopting a measure transposing the habitats directive which:

— excludes from the scope of the rules on the assessment of the implications for the environment projects other than those listed in the Italian legislation implementing directives on environmental impact assessment that are likely to have a significant effect on sites of Community importance,

— fails to impose upon the competent authorities of the Member State any obligation to take appropriate steps in respect of special protection areas to avoid the deterioration of natural habitats and of the habitats of species or disturbance of the species for which the areas were designated, in so far as such disturbance could be significant in relation to the objectives of the habitats directive,

— fails to provide that the conservation measures referred to in Article 6(2) of that directive apply to the sites referred to in Article 5(1) of that directive,

the Italian Republic has failed to fulfil its obligations under Articles 5, 6 and 7 of that directive.

Costs

15 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission has applied for costs to be awarded against the Italian Republic and the latter has been unsuccessful, the Italian Republic must be ordered to pay the costs.

On those grounds,

THE COURT (Third Chamber)

hereby:

1. Declares that, in adopting a measure transposing Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, which:

— excludes from the scope of the rules on the assessment of the implications for the environment projects other than those listed in the Italian legislation implementing directives on environmental impact assessment that are likely to have a significant effect on sites of Community importance,

— fails to impose upon the competent authorities of the Member State any obligation to take appropriate steps in respect of special protection areas to avoid the deterioration of natural habitats and of the habitats of species or disturbance of the species for which the areas were designated, in so far as such disturbance could be significant in relation to the objectives of Directive 92/43,

— fails to provide that the conservation measures referred to in Article 6(2) of that directive apply to the sites referred to in Article 5(1) of that directive,

the Italian Republic has failed to fulfil its obligations under Articles 5, 6 and 7 of that directive;

2. Orders the Italian Republic to pay the costs.

Puissochet Gulmann Macken

Delivered in open court in Luxembourg on 20 March 2003.

R. Grass — Registrar

J.-P. Puissochet — President of the Third Chamber

JUDGMENT OF THE COURT (Sixth Chamber)

13 February 2003 *

In Case C-75/01,

Commission of the European Communities, represented by R.B. Wainwright and J. Adda, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Grand Duchy of Luxembourg, represented by J. Faltz, acting as Agent,

defendant,

* Language of the case: French.

APPLICATION for a declaration that, by failing to take all the necessary measures to implement fully and correctly Articles 1, 4(5), 5(4), 6, 7, 12(1)(b) and (c), 12(2), 12(4), 13(1)(b) and 13(2), 14, 15, 16(1), 22(b) and (c), and 23(2) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7) in conjunction with Annexes I, II, IV, V and VI to that directive, the Grand Duchy of Luxembourg has failed to fulfil its obligations under the directive and under the third paragraph of Article 249 EC,

THE COURT (Sixth Chamber),

composed of: J.-P. Puissochet, President of the Chamber, C. Gulmann (Rapporteur), V. Skouris, F. Macken and N. Colneric, Judges,

Advocate General: A. Tizzano,
Registrar: R. Grass,

having regard to the report of the Judge-Rapporteur,

after hearing the Opinion of the Advocate General at the sitting on 29 January 2002,

gives the following

Judgment

1 By application lodged at the Court Registry on 14 February 2001, the Commission of the European Communities brought an action pursuant to Article 226 EC for a declaration that, by failing to take all the necessary measures to implement fully and correctly Articles 1, 4(5), 5(4), 6, 7, 12(1)(b) and (c), 12(2), 12(4), 13(1)(b) and 13(2), 14, 15, 16(1), 22(b) and (c), and 23(2) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7, hereinafter 'the Directive') in conjunction with Annexes I, II, IV, V and VI to that directive, the Grand Duchy of Luxembourg has failed to fulfil its obligations under the Directive and under the third paragraph of Article 249 EC.

The Directive

2 Article 1 of the Directive defines the principal terms used. In particular, Article 1(m) defines specimen as 'any animal or plant, whether alive or dead, of the species listed in Annex IV and Annex V, any part or derivative thereof, as well as any other goods which appear, from an accompanying document, the packaging or a mark or label, or from any other circumstances, to be parts or derivatives of animals or plants of those species'.

3 Article 4 of the Directive establishes a procedure in several stages for designating as special areas of conservation ('SACs') sites which host the species and habitats protected by the Directive. Under Article 4(1), each Member State must propose a list of sites indicating which natural habitat types in Annex I and which species in Annex II that are native to its territory the sites host. The list must be sent to the Commission, together with information on each site, within three years of notification of the Directive.

4 Under Article 4(5) of the Directive, once a site is placed on the list of sites of Community importance drawn up by the Commission it falls subject to the provisions of Article 6(2), (3) and (4).

5 Article 5(1) and (4) of the Directive provides:

'1. In exceptional cases where the Commission finds that a national list as referred to in Article 4(1) fails to mention a site hosting a priority natural habitat type or priority species which, on the basis of relevant and reliable scientific information, it considers to be essential for the maintenance of that priority natural habitat type or for the survival of that priority species, a bilateral consultation procedure shall be initiated between that Member State and the Commission for the purpose of comparing the scientific data used by each.

...

4. During the consultation period and pending a Council decision, the site concerned shall be subject to Article 6(2).'

6 Article 6 of the Directive provides:

'1. For special areas of conservation, Member States shall establish the necessary conservation measures involving, if need be, appropriate management plans specifically designed for the sites or integrated into other development plans, and appropriate statutory, administrative or contractual measures which correspond to the ecological requirements of the natural habitat types in Annex I and the species in Annex II present on the sites.

2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

7 Under Article 7 of the Directive, '[o]bligations arising under Article 6(2), (3) and (4) of this directive shall replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this directive or the date of classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later'.

8 Under Article 11 of the Directive, 'Member States shall undertake surveillance of the conservation status of the natural habitats and species referred to in Article 2 with particular regard to priority natural habitat types and priority species'.

9 Article 12(1)(b) and (c), (2) and (4) of the Directive reads as follows:

'1. Member States shall take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV (a) in their natural range, prohibiting:

...

(b) deliberate disturbance of these species, particularly during the period of breeding, rearing, hibernation and migration;

(c) deliberate destruction or taking of eggs from the wild;

...

2. For these species, Member States shall prohibit the keeping, transport and sale or exchange, and offering for sale or exchange, of specimens taken from the wild, except for those taken legally before this directive is implemented.

...

4. Member States shall establish a system to monitor the incidental capture and killing of the animal species listed in Annex IV (a). In the light of the information gathered, Member States shall take further research or conservation measures as required to ensure that incidental capture and killing does not have a significant negative impact on the species concerned.'

10 Article 13(1)(b) and (2) provides:

'1. Member States shall take the requisite measures to establish a system of strict protection for the plant species listed in Annex IV (b), prohibiting:

...

(b) the keeping, transport and sale or exchange and offering for sale or exchange of specimens of such species taken in the wild, except for those taken legally before this directive is implemented.

2. The prohibitions referred to in paragraph 1(a) and (b) shall apply to all stages of the biological cycle of the plants to which this Article applies.'

11 Article 14 of the Directive provides:

'1. If, in the light of the surveillance provided for in Article 11, Member States deem it necessary, they shall take measures to ensure that the taking in the wild of specimens of species of wild fauna and flora listed in Annex V as well as their exploitation is compatible with their being maintained at a favourable conservation status.

2. Where such measures are deemed necessary, they shall include continuation of the surveillance provided for in Article 11. Such measures may also include in particular:

— regulations regarding access to certain property,

— temporary or local prohibition of the taking of specimens in the wild and exploitation of certain populations,

— regulation of the periods and/or methods of taking specimens,

— application, when specimens are taken, of hunting and fishing rules which take account of the conservation of such populations,

— establishment of a system of licences for taking specimens or of quotas,

— regulation of the purchase, sale, offering for sale, keeping for sale or transport for sale of specimens,

— breeding in captivity of animal species as well as artificial propagation of plant species, under strictly controlled conditions, with a view to reducing the taking of specimens [in] the wild,

— assessment of the effect of the measures adopted.'

12 Article 15 of the Directive reads as follows:

'In respect of the capture or killing of species of wild fauna listed in Annex V (a) and in cases where, in accordance with Article 16, derogations are applied to the taking, capture or killing of species listed in Annex IV (a), Member States shall prohibit the use of all indiscriminate means capable of causing local disappearance of, or serious disturbance to, populations of such species, and in particular:

(a) use of the means of capture and killing listed in Annex VI (a);

(b) any form of capture and killing from the modes of transport referred to in Annex VI (b).'

13 Article 16(1) of the Directive provides:

'Provided that there is no satisfactory alternative and the derogation is not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range, Member States may derogate from the provisions of Articles 12, 13, 14 and 15(a) and (b):

(a) in the interest of protecting wild fauna and flora and conserving natural habitats;

(b) to prevent serious damage, in particular to crops, livestock, forests, fisheries and water and other types of property;

(c) in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment;

(d) for the purpose of research and education, of repopulating and re-introducing these species and for the breeding operations necessary for these purposes, including the artificial propagation of plants;

(e) to allow, under strictly supervised conditions, on a selective basis and to a limited extent, the taking or keeping of certain specimens of the species listed in Annex IV in limited numbers specified by the competent national authorities.'

14 Article 22(b) and (c) of the Directive provides:

'In implementing the provisions of this directive, Member States shall:

...

(b) ensure that the deliberate introduction into the wild of any species which is not native to their territory is regulated so as not to prejudice natural habitats within their natural range or the wild native fauna and flora and, if they consider it necessary, prohibit such introduction. The results of the assessment undertaken shall be forwarded to the committee for information;

(c) promote education and general information on the need to protect species of wild fauna and flora and to conserve their habitats and natural habitats.'

15 Under Article 23(2) of the Directive, the laws, regulations and administrative provisions which the Member States must adopt in order to comply with the Directive must contain a reference to the Directive or be accompanied by such reference on the occasion of their official publication.

The pre-litigation procedure

16 On 29 April 1999, having concluded that the various measures transposing the Directive into Luxembourg law communicated to it failed to conform to Articles 1, 4, 5, 6, 7, 8, 12, 13, 14, 15, 16, 18, 22 and 23 of the Directive, the Commission gave the Grand Duchy of Luxembourg formal notice to submit its observations.

17 In his letter of reply of 13 July 1999, addressed to the Commission ('the letter of reply') the Minister for the Environment of the Grand Duchy of Luxembourg stated that various national laws and regulations could help to attain certain of the Directive's objectives and that the Law of 21 May 1999 on regional planning (*Mémorial* A 1999, p. 1402, hereinafter 'the Regional Planning Law'), the draft Grand-Ducal regulation on biodiversity and the Law of 11 August 1982 on the protection of nature and natural resources (*Mémorial* A 1999, p. 1486, hereinafter 'the Nature Protection Law') would shortly ensure that the Directive's objectives were fully met. The letter also expressly disputed certain of the Commission's complaints.

18 The Commission was not satisfied by the observations submitted to it by the Grand Duchy of Luxembourg in its letter of reply and on 21 January 2000 issued a reasoned opinion in which it observed that, by failing to take all the necessary measures to implement fully and correctly Articles 1, 4(5), 5(4), 6, 7, 12(1)(b) and (c), 12(2), 12(4), 13(1)(b) and 13(2), 14, 15, 16(1), 22(b) and (c), and 23(2) of the Directive in conjunction with Annexes I, II, IV, V and VI to the Directive, the Grand Duchy of Luxembourg had failed to fulfil its obligations under the Directive and under the third paragraph of Article 249 EC. The Commission therefore called upon the Grand Duchy to adopted the measures required to comply with the reasoned opinion within two months of its notification.

19 By letter of 6 April 2000, the Luxembourg authorities acknowledged that, in order to transpose the Directive into national law, it would be necessary to supplement or amend its existing legislation.

20 Finding that the Grand Duchy of Luxembourg had failed to adopt the necessary measures to comply with the reasoned opinion within the time specified therein, the Commission brought the present action.

The action

21 In its defence the Luxembourg Government merely indicates that a draft law transposing the Directive was approved by the government in council on 23 February 2001 and asks the Court to dismiss the action.

Incomplete transposition of Article 1 of the Directive

22 The Commission points out that, in its letter of formal notice, it observed that there were no provisions of Luxembourg law that had as their object or effect the correct, complete and precise transposition of the definitions set out in Article 1 of the Directive and that the Luxembourg authorities did not dispute that complaint in the letter of reply.

23 On this point, it should be borne in mind that the letter of reply stated that the Article 1 definitions were to be included in a sectoral plan provided for by the Regional Planning Law.

24 However, it appears that no such measure was adopted within the period of time specified in the reasoned opinion.

25 The complaint of incomplete transposition of Article 1 of the Directive must therefore be regarded as well founded.

Failure to transpose Article 4(5) of the Directive

26 According to the Commission, the transposing provisions notified by the Luxembourg authorities do not have the object or effect of transposing Article 4(5) of the Directive. Thus, sites of Community importance are not

automatically brought within the protection regime provided for in Article 6(2), (3) and (4) of the Directive. The letter of reply disputes this complaint but only to the extent that the Commission charged the Grand Duchy of Luxembourg with having failed to put in place a system for applying the protection regime provided for in Article 6(2) to sites of Community importance.

27 It is important to bear in mind that, according to the letter of reply, the administrative practice in Luxembourg of refusing the necessary authorisation for certain projects falling within the scope of the Nature Protection Law is an appropriate means of ensuring that the nuisances mentioned in Article 6(2) of the Directive do not occur on the sites referred to in Article 4(5). The Luxembourg Government has, however, acknowledged its failure as regards application of Article 6(3) and (4) of the Directive to sites of Community importance.

28 Now, according to the settled case-law of the Court of Justice relating to the obligations incumbent upon Member States in the transposition of Community directives, mere administrative practices, which by their nature are alterable at will by the authorities and are not given the appropriate publicity, cannot be regarded as constituting the proper fulfilment of obligations arising under the EC Treaty (see, in particular, Case C-159/99 *Commission* v *Italy* [2001] ECR I-4007, paragraph 32, and Case C-394/00 *Commission* v *Ireland* [2002] ECR I-581, paragraph 11).

29 Given the foregoing, the Commission's complaint of failure to transpose Article 4(5) of the Directive must be upheld.

Failure to transpose Article 5(4) of the Directive

30 The Commission argues that no laws in Luxembourg make the sites referred to in Article 5(4) of the Directive subject to the protection regime provided for by Article 6(2). The Luxembourg authorities dispute this complaint in the letter of reply.

31 As is clear from the letter of reply, the Luxembourg Government maintains, in essence, that the administrative practice of refusing the necessary authorisation for certain projects falling within the scope of the Nature Protection Law is an appropriate means of ensuring that the nuisances mentioned in Article 6(2) of the Directive do not occur on the sites referred to in Article 5(4).

32 However, having regard to the case-law of the Court mentioned in paragraph 28 of the present judgment, that argument must be rejected.

33 It is also submitted in the letter of reply that the Grand Duchy of Luxembourg has, in any event, probably already included in the list sent to the Commission pursuant to Article 4(1) of the Directive all the sites within its territory which are essential to maintaining certain types of habitat present in its territory and that, consequently, there would be no need to have recourse to the procedure laid down in Article 5(4) of the Directive.

34 That submission cannot be upheld either because, in any event, it cannot be ruled out that the Commission might find, pursuant to Article 5(1) of the Directive, that the list sent by the Grand Duchy of Luxembourg omits a site which it regards as essential to the preservation of a given priority natural habitat type or the survival of a given priority species and that the bilateral consultation procedure will therefore have to be initiated, during the currency of which the site in question will, in accordance with Article 5(4), have to be made subject to the protection regime laid down in Article 6(2).

35 Consequently, the complaint of failure to transpose Article 5(4) of the Directive must be regarded as well founded.

Failure to transpose Article 6 of the Directive

Article 6(1) of the Directive

36 The Commission complains that the Grand Duchy of Luxembourg has failed to transpose this provision.

37 In the letter of reply, the Luxembourg Government acknowledged that failure.

38 The complaint of non-transposition of Article 6(1) of the Directive must therefore be upheld.

Article 6(2) of the Directive

39 The Commission observes that, subject to exceptional ministerial derogation based on public interest, Article 14 of the Nature Protection Law prohibits the reduction, destruction or modification of certain types of biotope. A provision such as that, however, does not appear adequate to ensure that all habitats falling within SACs benefit from the protection provided for. The Commission also emphasises that the provisions of the Nature Protection Law envisage only certain types of disturbance. In particular, under Article 12 it is possible to prevent only certain types of disturbance in forests. There is therefore a lack of any general measure, binding upon third parties, making it possible to prevent, in SACs, disturbance of species which could have a significant effect on those species, in relation to the objectives of the Directive. The Commission also points out that, in the letter of reply, infringement of this aspect of the Directive is expressly disputed.

40 It is submitted in the letter of reply that Article 14 of the Nature Protection Law protects all biotopes, including those forming part of an SAC and that it is incorrect to say that this law contemplates only certain types of disturbance: Article 23, which has a general scope, prohibits disturbance of fauna and Articles 21 and 22 prohibit any kind of unjustified exploitation, use, mutilation or destruction of wild plants and animals that are not protected by means of a more stringent set of national rules. Moreover, the Nature Protection Law is backed by a ministerial circular, whose very purpose is to transpose the Directive, and this states that any degradation of habitats and disturbance of protected species must be avoided by means of rigorous application of the Nature Protection Law.

41 It should be borne in mind that, subject to exceptional ministerial derogation based on public interest, Article 14 of the Nature Protection Law prohibits the reduction, destruction or modification of biotopes such as ponds, fens, marshlands, land covered in reeds and rushes, hedgerows, scrub and groves.

42 A provision such as that, which makes express reference to certain types of biotope only does not appear to be capable of ensuring, as is required by Article 6(2) of the Directive, that all natural habitats and habitats of species found within SACs are protected against acts liable to deteriorate them.

43 In so far as concerns protection against deterioration, as provided for by Article 6(2) of the Directive, it is plain that, whilst certain provisions of the Nature Protection Law pleaded in the present case, and in particular Articles 12 and 23, may contribute to the prevention of certain types of disturbance, the fact remains that they are incapable of completely transposing Article 6(2) of the Directive because they do not cover all types of disturbance that are significant in relation to the objectives of the Directive of the species for which the SACs are designated.

44 As regards the ministerial circular to which the Luxembourg Government refers, it must be held that, in light of the case-law mentioned in paragraph 28 of the present judgment, it is not capable of ensuring proper transposition of Article 6(2).

45 It follows that the complaint of incomplete transposition of Article 6(2) of the Directive must be regarded as well founded.

Article 6(3) and (4) of the Directive

46 The Commission maintains that the Luxembourg legislation sent to it contains no provision for an assessment to be carried out of the effects on protected sites in all the cases mentioned in Article 6(3) of the Directive. Furthermore, Luxembourg law fails to ensure that projects and plans are approved by the competent authority only after the authority has satisfied itself that the project or plan will not compromise the integrity of the site in question. As far as Article 6(4) of the Directive is concerned, the Commission argues that no provision of national law requires that alternative solutions be pursued before approval is given to projects regarded as having an adverse effect on protected sites. Luxembourg law also fails to provide for the adoption of compensatory measures where such projects are authorised.

47 It is appropriate to observe that these complaints were already formulated in the same terms in the letter of formal notice and that, in the letter of reply, the Luxembourg Government acknowledged that the existing provisions of national law were inadequate as regards Article 6(3) and (4) of the Directive.

48 That being so, the Court must also uphold this aspect of the Commission's action.

Failure to transpose Article 7 of the Directive

49 The Commission submits that no provision of Luxembourg law provides for the application of Article 6(2), (3) and (4) of the Directive to special protection areas designated under Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1), as is required by Article 7 of the Directive. The arguments put forward in the letter of reply also fail to persuade that Article 7 has been transposed.

50 It should be borne in mind that the letter of reply states that the sectoral plan which it anticipated drawing up would provide a precise legal framework, in particular as regards special protection areas classified under Directive 79/409.

51 Given that, and taking particular account of what is stated in paragraph 24 of the present judgment, it must be held that the complaint of failure to transpose Article 7 of the Directive is well founded.

Inadequate transposition of Article 12(1)(b) and (c), (2) and (4) of the Directive

52 The Commission maintains, first of all, that Article 12(1)(b) of the Directive has been incompletely transposed into Luxembourg law because none of the national

transposing provisions communicated to it prohibits the deliberate disturbance of the species concerned during the migration period. Secondly, none of the provisions has as its object or effect the complete transposition of Article 12(1)(c) of the Directive. Thirdly, the national provisions communicated to the Commission fail to prohibit the exchange and the offering for exchange of specimens of the species concerned, as is required by Article 12(2) of the Directive. Fourthly, no provision of Luxembourg law ensures that the definition of 'animal' in national law is as broad as that of 'specimen' within the meaning of the Directive. Lastly, none of the provisions communicated has as its object or effect the transposition of Article 12(4) of the Directive. According to the Commission, the arguments to the contrary set out in the letter of reply cannot be accepted.

Article 12(1)(b) of the Directive

53 As the Commission rightly observes, Article 23 of the Nature Protection Law, which the Luxembourg Government regards as conforming to Article 12(1)(b) of the Directive, is incapable of transposing the latter provision fully because, whilst prohibiting the disturbance of fauna during the periods of breeding, rearing and hibernation, the prohibition fails expressly to mention the migration period.

54 Consequently, the complaint of inadequate transposition of Article 12(1)(b) of the Directive must be regarded as well founded.

Article 12(1)(c) of the Directive

55 The letter of reply maintains that Article 12(1)(c) of the Directive has been transposed into national law by Article 17 of the Nature Protection Law and Article 6 of the Convention on the Conservation of European Wildlife and Natural Habitats, signed in Bern on 19 September 1979 and approved by the Law of 26 November 1981 (*Mémorial* A 1981, p. 2130), to which the Community became a party by Council Decision 82/72/EEC of 3 December 1981 (OJ 1982 L 38, p. 1) (hereinafter 'the Bern Convention'). Article 17 of the Nature Protection Law provides that animals which are the subject of complete protection may not be disturbed, killed, hunted, captured, kept in captivity or tamed, at any stage of their development. As regards Article 6 of the Bern Convention, that provision prohibits the deliberate destruction or taking of eggs from the wild or keeping these eggs even if empty.

56 In this connection, it should be pointed out that Article 17 of the Nature Protection Law does not expressly mention the collection of eggs in the wild. The prohibition in Article 17 on keeping in captivity animals which are the subject of complete protection at any stage of their development does not appear to include with sufficient certainty the collection of eggs in the wild, particularly as, under Article 144 et seq. of the Nature Protection Law, this prohibition is one that is backed by criminal sanction.

57 As regards Article 6(d) of the Bern Convention, which prohibits the deliberate destruction or taking of eggs from the wild or keeping such eggs, it is appropriate to point out that that provision applies only to the species listed in Annex II to the convention, which does not include certain of the species listed in Annex IV (a) to the Directive, to which Article 12 of the Directive refers.

58 It follows that Article 12(1)(c) of the Directive has not been correctly transposed into Luxembourg law.

Article 12(2) of the Directive

59 The letter of reply states that, in so far as it prohibits the keeping of animals which receive complete protection, Article 17 of the Nature Protection Law also precludes the exchange of such animals. Indeed, to exchange something which may not be held is impossible. Moreover, Article 15 of the Nature Protection Law, read together with the Grand-Ducal Regulation of 8 April 1986 on the Complete and Partial Protection of Certain Species of Wild Animal (*Mémorial* A 1986, p. 1174), provides for the classification of rare wild animals for the purposes of their conservation, without restriction to indigenous species. In addition, Article 20 of the Nature Protection Law extends the definition of animal beyond the meaning conferred by national law.

60 The Luxembourg Government's argument cannot be accepted.

61 Indeed, the prohibition, laid down in Article 17 of the Nature Protection Law, on keeping animals which receive complete protection would not seem to include the exchange or the offering for exchange of such animals, the concept of keeping being distinct from that of exchanging or offering for exchange, particularly from the viewpoint of a system of criminal sanctions, such as that mentioned in paragraph 56 of the present judgment.

62 As regards the meaning of the term animal in Luxembourg law, it must be held that, in any event, the law on which the Luxembourg Government relies in the letter of reply does not include within the definition of animal 'any... derivative [of any animal]... as well as any other goods which appear, from an accompanying document, the packaging or a mark or label, or from any other

circumstances, to be... derivatives of animals... of those species', as is provided for in Article 1(m) of the Directive, which defines the meaning of specimen as it appears, in particular, in Article 12(2) of the Directive.

63 Article 12(2) of the Directive has not, therefore, been correctly transposed into Luxembourg law.

Article 12(4) of the Directive

64 It is appropriate to recall that the Luxembourg Government acknowledged in the letter of reply that there had yet to be established in Luxembourg law a monitoring system such as that provided for by Article 12(4) of the Directive.

65 It also appears that no such monitoring system was adopted within the period of time laid down in the reasoned opinion.

66 It thus appears that Article 12(4) of the Directive has not been transposed into the internal legal system of the defendant Member State.

67 In light of the foregoing, it must be held that the complaint of inadequate transposition of Article 12(1)(b) and (c), (2) and (4) of the Directive is well founded.

Inadequate transposition of Article 13(1)(b) and (2) of the Directive

Article 13(1)(b) of the Directive

68 The Commission submits that, despite the arguments advanced by the Luxembourg authorities in the letter of reply, Article 13(1)(b) of the Directive has not been completely transposed into Luxembourg law, which neither prohibits the keeping, exchange or offering for sale or exchange of specimens of the plant species protected under that provision nor ensures that the prohibitions laid down in the provision apply also to the non-indigenous species protected under it.

69 The letter of reply states that the sale of plants which receive complete protection is prohibited by Article 16 of the Nature Protection Law and that, in so far as is necessary, keeping such plants is prohibited by Article 5 of the Bern Convention. Moreover, Article 15 of the Nature Protection Law does not exclude the protection of non-indigenous species. In this connection it would be sufficient to incorporate the species concerned into the Grand-Ducal Regulation of 19 August 1989 on the Complete and Partial Protection of Certain Species of Wild Flower (*Mémorial* A 1989, p. 1102, hereinafter 'the Wild Flower Regulation'). Article 20 of the Nature Protection Law extends the definition of plant beyond the meaning conferred by national law.

70 It should be observed that whilst Article 16 of the Nature Protection Law prohibits the sale of plants that receive complete protection, it does not prohibit the possession, exchange or offering for sale or exchange of such plants. Article 5 of the Bern Convention provides that each contracting party must, as appropriate, prohibit the possession of protected species. However, it does not appear that

the Luxembourg authorities have adopted any supplementary measure further defining application of the Bern Convention as regards this point. As far as this aspect is concerned, therefore, Article 13(1)(b) of the Directive has not been properly transposed into Luxembourg law.

71 As regards the complaint that Luxembourg law fails to ensure that the prohibitions laid down in Article 13(1)(b) of the Directive apply to the non-indigenous plant species protected by the Directive, it is important to recall that the Luxembourg Government itself has acknowledged that the non-indigenous plant species covered by Article 13(1)(b) are not protected by Article 15 of the Nature Protection Law, read together with the Wild Flower Regulation. Also, Article 20 of the law provides that the plants and animals protected under approved and published international conventions may be purchased, imported, offered for sale, exported or held only pursuant to the relevant provisions of such conventions. However, Article 20 is, in any event, incapable of ensuring as such the protection of non-indigenous species provided for by Article 13(1)(b) of the Directive. Moreover, the Luxembourg Government has provided no further information as to which international conventions are relevant in the matter.

72 It follows that Article 13(1)(b) of the Directive has not been properly transposed into Luxembourg law.

Article 13(2) of the Directive

73 According to the Commission, the Luxembourg Government's assertion that Article 13(2) of the Directive has been transposed by Article 16 of the Nature

Protection Law, which extends the prohibitions laid down in that provision to parts of the plants concerned, fails to establish that the definition of plant in national law is as broad as that of specimen given in Article 1(m) of the Directive, particularly in so far as concerns the inclusion of any part of or derivative obtained from a plant and any other goods which appear, from an accompanying document, the packaging or a mark or label, or from any other circumstances, to be parts of derivatives of plants of those species.

74 It is important to bear in mind that, under Article 13(2) of the Directive, the prohibitions referred to in Article 13(1)(a) and (b) apply to all stages of the biological cycle of the plants to which Article 13 applies.

75 Even if the definition of plant in national law is narrower than that of specimen in Article 1(m), the Court finds that the Commission has failed to demonstrate why that should be inconsistent with Article 13(2) of the Directive, which makes no direct reference to specimens but instead refers to Article 13(1)(b) which does refer to specimens and lays down precise prohibitions in relation to specimens of protected specimens.

76 Consequently, the complaint of incomplete transposition of Article 13(2) of the Directive, as formulated by the Commission, must be rejected.

77 In view of the foregoing, the complaint of incomplete transposition of Article 13(1)(b) of the Directive must be upheld.

Non-transposition of Article 14 of the Directive

78 The Commission maintains that Article 14 of the Directive is not optional but contains an unconditional obligation of surveillance of the species listed in Annex V together with an obligation to take appropriate measures to ensure that those species are maintained at a favourable conservation status where the competent authorities deem it necessary, that is to say where surveillance reveals that, without such measures, the conservation status of the species would be endangered.

79 In the letter of reply, the Luxembourg authorities acknowledged that national law fails to provide for the surveillance obligation relating to completely and partially protected species or the associated obligation to adopt appropriate measures to ensure that those species are maintained at a favourable conservation status. They have acknowledged the need to modify the law on this point.

80 It therefore appears that the taking in the wild of specimens of species of wild fauna and flora listed in Annex V to the Directive as well as their exploitation is not coupled in Luxembourg law with an obligation to adopt, where their conservation status so warrants, appropriate measures to ensure that those species are maintained at a favourable conservation status.

81 The complaint of non-transposition of Article 14 of the Directive must therefore be regarded as well founded.

Incorrect transposition of Article 15 of the Directive

82 The Commission maintains that the transposition measures communicated to it by the Grand Duchy of Luxembourg fail to ensure the correct transposition of Article 15 of the Directive. It refutes the reasoning put forward in the letter of reply in support of the contrary view.

83 Indeed, the letter of reply states that, since the Grand Duchy of Luxembourg intended to avail itself of the derogation provided for by Article 16 of the Directive, it was necessary for it to transpose Article 15 of the Directive. The means of capture and killing mentioned in Article 15(a) and (b) of the Directive are exactly the same as those provided for in and prohibited by the Bern Convention. They are also prohibited, without exception, by the rules on hunting and fishing. Moreover, the Luxembourg Government has stated that the arrêté grand-ducal du 10 mars 1959 ayant pour objet la destruction des animaux malfaisants et nuisibles (Grand-Ducal Decree of 10 March 1959 on the elimination of harmful animals and vermin, hereinafter 'the Grand-Ducal Decree'), which imposes no restriction on the means of destruction used, is to be repealed by a new Grand-Ducal regulation of which a draft already exists.

84 It is important to bear in mind that Annex VI (a) to the Directive, to which Article 15 refers, includes amongst the prohibited methods and means of capture and killing traps which are non-selective according to their principle or their conditions of use and smoking out. However, in so far as it authorises the destruction of animals of the species listed in Annex V (a) to the Directive such as the marten and polecat, by means of smoking out with terriers or with the aid of traps, which, moreover, are not expressly required to be selective, the Grand-Ducal Decree is inconsistent with Article 15 of the Directive. Furthermore, it is not apparent from the file that the Grand-Ducal Decree was repealed within the period laid down in the reasoned opinion.

85 It follows that, in any event, the complaint of incorrect transposition of Article 15 of the Directive must be regarded as well founded.

Unsatisfactory transposition of Article 16(1) of the Directive

86 According to the Commission, the transposition measures mentioned in the letter of reply are unsatisfactory as regards Article 16(1) of the Directive.

87 As far as concerns Article 26 of the Nature Protection Law, which provides that the competent minister may grant derogations from Articles 13 to 18 of that law for scientific purposes or in the public interest, it should be observed that the grant of such derogations has not been made conditional upon there being no other satisfactory solution, as is required by Article 16(1) of the Directive.

88 As regards Article 9 of the Bern Convention, even if that provision makes the grant of derogations from the protection rules laid down in the convention subject to the same conditions as those specified in Article 16(1) of the Directive, and in particular the condition that there be no other satisfactory solution, the fact that that system of derogations and that implemented by Article 26 of the Nature Protection Law coexist in Luxembourg's national law is, in any event, contrary to Article 16(1) of the Directive because that situation in fact creates in this case an ambiguity liable to render compliance with Article 16(1) less than certain.

89 The complaint of unsatisfactory transposition of Article 16(1) of the Directive must therefore be upheld.

Incorrect transposition of Article 22(b) and (c) of the Directive

Article 22(b) of the Directive

90 In reply to the complaint of incorrect transposition of Article 22(b) of the Directive, as formulated in the letter of formal notice, the Luxembourg authorities state that that provision was transposed by Article 25 of the Nature Protection Law, which prohibits the introduction of non-indigenous species into the wild except with the authorisation of the competent minister, to which appropriate conditions may be attached.

91 In this connection it should be observed that Article 25 of the Nature Protection Law does not make the grant of the ministerial authorisation referred to in that provision conditional upon satisfaction of the requirements of Article 22(b) of the Directive, particularly the requirement that authorisation should be granted only where no harm would be caused to natural habitats.

92 Consequently, Article 25 of the Nature Protection Law does not correctly transpose Article 22(b) of the Directive. The Commission's complaint in this regard must therefore be regarded as well founded.

Article 22(c) of the Directive

93 The letter of reply maintains that Article 22(c) of the Directive, which is designed to promote education and general information on the need to protect species of wild fauna and flora and to conserve natural habitats, is transposed by Article 3(3) of the Bern Convention, by Article 13 of the Convention on Biological Diversity concluded in Rio de Janeiro on 5 June 1992 and approved by the Law of 4 March 1994 (*Mémorial* A 1994, p. 429), to which the European Community became a party by Council Decision 93/626/EEC of 25 October 1993 concerning the conclusion of the Convention on Biological Diversity (OJ 1993 L 309, p. 1), and by the Law of 10 August 1992 on freedom of access to environmental information and rights of action of associations for the protection of nature and the environment (*Mémorial* A 1992, p. 2204).

94 Whilst it maintains that the Law of 10 August 1992 just mentioned contains no provision for actively supplying the public with information, the Commission acknowledges that Article 3(3) of the Bern Convention and Article 13 of the Convention on Biological Diversity are in principle capable of transposing Article 22(c) of the Directive satisfactorily. Nevertheless, the institution objects that the Grand Duchy of Luxembourg has failed to show that its legal system includes the principle of direct effect of the so-called self-executing provisions of international conventions that are properly approved and published.

95 Since it is not disputed that the provisions of the Bern Convention and of the Convention on Biological Diversity just mentioned are capable of satisfactorily transposing Article 22(c) of the Directive, the Court must confine itself to considering whether those provisions have in fact been incorporated into Luxembourg law.

96 There is no doubt that the provisions have been incorporated in the present case. Indeed the conventions in question were approved by laws of the Grand Duchy of Luxembourg and require no further measures to be taken in order for them to achieve their full effect in the internal legal system of that Member State.

97 That being so, the complaint of incorrect transposition of Article 22(c) of the Directive must be rejected.

98 In view of the foregoing, the Court must uphold the complaint of inappropriate transposition of Article 22(b) of the Directive.

Infringement of Article 23(2) of the Directive

99 The Commission maintains that the Grand Duchy of Luxembourg has infringed Article 23(2) of the Directive in that the transposition measures which that Member State adopted after the Directive's entry into force and communicated to the Commission contain no reference to the Directive or were not accompanied by any such reference when officially published.

100 The letter of reply states that the essential purpose of the proposed sectoral plan provided for by the Regional Planning Law is the implementation of Directives 79/409 and 92/43 and that a list of all national measures transposing the Directive is to be published in the *Mémorial*.

101 However, it is apparent that no such list has been published within the period laid down in the reasoned opinion.

102 It follows that the complaint of infringement of Article 23(2) of the Directive is well founded.

103 In light of the foregoing, it must be held that, by failing to take all the necessary measures to implement fully and correctly Articles 1, 4(5), 5(4), 6, 7, 12(1)(b) and (c), 12(2), 12(4), 13(1)(b), 14, 15, 16(1), 22(b) and 23(2) of the Directive in conjunction with Annexes I, II, IV, V and VI to the Directive, the Grand Duchy of Luxembourg has failed to fulfil its obligations under the Directive.

Costs

104 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if there has been an application to that effect. Since the Commission has applied for costs and the Grand Duchy of Luxembourg has been unsuccessful in the majority of its pleas, the latter must be ordered to pay the costs.

On those grounds,

THE COURT (Sixth Chamber),

hereby:

1. **Declares that, by failing to take all the necessary measures to implement fully and correctly Articles 1, 4(5), 5(4), 6, 7, 12(1)(b) and (c), 12(2), 12(4), 13(1)(b), 14, 15, 16(1), 22(b) and 23(2) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora in conjunction with Annexes I, II, IV, V and VI to that directive, the Grand Duchy of Luxembourg has failed to fulfil its obligations under that directive;**

2. **Orders the Grand Duchy of Luxembourg to pay the costs.**

Puissochet Gulmann Skouris

Macken Colneric

Delivered in open court in Luxembourg on 13 February 2003.

JUDGMENT OF THE COURT (Sixth Chamber)

30 January 2002 *

In Case C-103/00,

Commission of the European Communities, represented by R. Wainwright and P. Panayotopoulos, acting as Agents, with an address for service in Luxembourg,

applicant,

v

Hellenic Republic, represented by A. Samoni-Rantou and P. Skandalou, acting as Agents, with an address for service in Luxembourg,

defendant,

APPLICATION for a declaration that, by failing to adopt or, in the alternative, to notify to the Commission, within the prescribed time-limit, the requisite measures to establish and implement an effective system of strict protection for the sea turtle *Caretta caretta* on Zakinthos (Greece) so as to avoid any disturbance of the species during its breeding period and any activity which might bring about deterioration or destruction of its breeding sites, the Hellenic Republic has failed

* Language of the case: Greek.

to fulfil its obligations under the EC Treaty and under Article 12(1)(b) and (d) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7),

THE COURT (Sixth Chamber),

composed of: F. Macken, President of the Chamber, C. Gulmann (Rapporteur), J.-P. Puissochet, R. Schintgen and J.N. Cunha Rodrigues, Judges,

Advocate General: P. Léger,
Registrar: L. Hewlett, Administrator,

having regard to the Report for the Hearing,

after hearing oral argument from the parties at the hearing on 12 July 2001,

after hearing the Opinion of the Advocate General at the sitting on 25 October 2001,

gives the following

Judgment

1 By application lodged at the Court Registry on 17 March 2000, the Commission of the European Communities brought an action under Article 226 EC for a declaration that, by failing to adopt or, in the alternative, to notify to the Commission, within the prescribed time-limit, the requisite measures to establish and implement an effective system of strict protection for the sea turtle *Caretta caretta* on Zakinthos (Greece) so as to avoid any disturbance of the species during its breeding period and any activity which might bring about deterioration or destruction of its breeding sites, the Hellenic Republic has failed to fulfil its obligations under the EC Treaty and Article 12(1)(b) and (d) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7, the 'Directive').

The relevant provisions

2 Article 2(1) of the Directive states that the aim of the Directive is to contribute towards ensuring bio-diversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the Treaty applies.

3 Article 2(2) states that measures taken pursuant to the Directive are to be designed to maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora of Community interest.

4 Article 12(1) provides:

'Member States shall take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV(a) in their natural range, prohibiting:

(a) all forms of deliberate capture or killing of specimens of these species in the wild;

(b) deliberate disturbance of these species, particularly during the period of breeding, rearing, hibernation and migration;

(c) deliberate destruction or taking of eggs from the wild;

(d) deterioration or destruction of breeding sites or resting places.'

5 The sea turtle *Caretta caretta* is one of the species listed in Annex IV(a) of the Directive.

6 Under Article 23(1), Member States are to bring into force the laws, regulations and administrative provisions necessary to comply with the Directive within two years of its notification, and to forthwith inform the Commission thereof. Since notification of the Directive took place in June 1992, the relevant time-limit expired in June 1994.

Pre-litigation procedure

7 The deterioration in the conservation conditions for the sea turtle *Caretta caretta* on the island of Zakinthos was criticised by non-governmental organisations. In addition, by a letter of 3 July 1998, the Commission requested information from the Greek authorities on measures for the protection of that species on the island.

8 On 16 and 17 July 1998, Commission officials went on a mission to Zakinthos to verify whether any measures for the protection of the sea turtle *Caretta caretta* had in fact been implemented. In the course of the mission, they visited the beaches at Laganas, Kalamaki, Sekania, Dafni and Gerakas, the places where that species lays its eggs. They found that the protective measures at all of the places visited were inadequate, in particular:

— there was no supervision and there were no notices on the beaches;

— there were pedalos and boats in the sea area where their use is prohibited;

— there were a significant number of beach umbrellas and deck-chairs on various beaches (Kalamaki, Gerakas, Dafni);

— there were illegal buildings and recent works on the beach at Dafni.

9 In response to the Commission's letter of 3 July 1998, the Greek authorities, by letter of 22 July 1998, referred *inter alia* to port regulations adopted during the first half of the 1990s, to the implementation of programmes for monitoring sea turtles and to public information and awareness campaigns.

10 The Commission took the view that the Hellenic Republic had not taken the requisite measures to introduce an effective system of protection for the sea turtle *Caretta caretta* at Zakinthos and, consequently, had failed to fulfil its obligations under Article 12(1)(b) and (d) of the Directive. By letter of 2 December 1998, it therefore gave the Greek Government formal notice to submit its observations on the matter.

11 The Greek authorities replied in a letter of 17 March 1999, stating that a draft presidential decree on the creation of a marine park of Zakinthos had been submitted to the Greek Council of State for finalisation. They also informed the Commission that they had established a committee charged with drafting a special presidential decree, of general nature, containing financial provisions applicable to all the protected natural regions in Greece. In addition, they notified

the Commission of their intention to draft a third presidential decree on compensatory measures for the marine park of Zakinthos. In the same letter, the Greek authorities also announced a series of measures such as, in particular, the demolition of all illegal buildings on the beaches, the establishment of a national land register, the prohibition of vehicle access to the beaches, the replacement of the current lighting which disturbs the sea turtles, and the removal of deck-chairs and beach umbrellas. They also stated that a contract had been signed on the construction of a high-speed patrol boat for the use of the Zakinthos port police for the purpose of ensuring compliance with the planned measures.

12 The Commission concluded that the Greek authorities had still not adopted the measures needed to introduce an effective system of protection for the sea turtle *Caretta caretta* on Zakinthos by creating the appropriate institutional framework or taking measures at the sites to protect that species. By letter of 15 June 1999, the Commission therefore delivered a reasoned opinion to the Hellenic Republic in which it reiterated the complaints contained in its letter of formal notice and requested that Member State to comply with the reasoned opinion within two months from the date of its notification.

13 On 24 and 25 August 1999, Commission officials carried out another mission to Zakinthos, in which they once again inspected the principal beaches used for breeding by the sea turtle *Caretta caretta*. They noted, in particular, a certain amount of progress in comparison with the situation prevailing at the time of their earlier mission, including *inter alia* the presence of supervisors and notices on the beaches, the publication and distribution of information pamphlets and the fact that a high-speed patrol boat had been put into service. However, they also found that:

— there were pedalos and small boats in Sea Area A at Gerakas and Dafni;

— pedalos and small boats were moored in Sea Area B at Kalamaki;

— there were beach umbrellas and deck-chairs on various beaches (Gerakas, Dafni, Kalamaki, Laganas) in numbers clearly exceeding the number permitted by the draft presidential decree on the creation of the marine park of Zakinthos;

— the number of illegal buildings on the beach at Dafni had increased;

— mopeds were being driven on the sand beach to the east of Laganas;

— supervisory measures on certain beaches were inadequate.

14 On 29 October 1999, the Greek authorities replied to the reasoned opinion by informing the Commission that a budget of GRD 30 million for a public information programme and for the supervision, cleaning and protection of the sand beaches on the biotope of the bay of Laganas on Zakinthos had been approved for the summer of 1999. The Greek authorities also stated that the beach umbrellas had been removed from the beach at Dafni and that the number of beach umbrellas on the beach at Gerakas had been considerably reduced so as not to exceed the limit fixed for that beach by the draft presidential decree on the creation of the marine park of Zakinthos.

15 Since the Commission did not receive any other information to lead it to conclude that the Hellenic Republic had complied with its obligations under the Directive, it decided to bring the present action.

Substance

16 The Commission states that the sea turtle *Caretta caretta* only lays eggs every two or three years. In Greece, the laying season starts at the end of May and finishes at the end of August. The turtle leaves the sea at night and moves towards the driest area of the beach, where it digs a hole of 40 to 60 centimetres in which it lays an average of 120 eggs. The Commission explains that two months later the eggs hatch and the baby turtles then crawl onto the sand and head towards the sea. The baby turtles are very vulnerable and a large number of them die.

17 The Commission emphasises the fact that the bay of Laganas on Zakinthos is a vital breeding region, perhaps even the most important in the Mediterranean, for the sea turtle *Caretta caretta*. Given the significance of the bay of Laganas, the Greek authorities have proposed that the region be classified as one of the sites of Community importance for the Natura 2000 network.

18 The Commission's principal complaint is that the Hellenic Republic has infringed its obligations under the Treaty and Article 12(1)(b) and (d) of the Directive, first, by failing to adopt a legislative framework which would ensure the strict protection of the sea turtle *Caretta caretta* against any deliberate disturbance during its breeding period and against any deterioration or destruction of its breeding sites and, second, by failing to take specific measures to prevent such nuisances.

Legislative provisions for the protection of the Caretta caretta species

19 According to the Commission, the Greek Government has not adopted an institutional framework within the prescribed time-limit capable of ensuring the effective long-term protection of the sea turtle *Caretta caretta*.

20 The Greek Government claims that by issuing a presidential decree on 22 December 1999 which classifies the land and sea regions of the bay of Laganas and the Strofada islands as a national marine park and the costal areas of the communes of Zakinthos and Laganas as a regional park (FEK D'906/22.12.1999, the 'Decree of 1999'), it has instituted a system of strict protection for the sea turtle *Caretta caretta*.

21 The Greek Government submits that, over the last 20 years, measures have been progressively taken to ensure the protection of that species on the island of Zakinthos. It refers to various laws, regulations and administrative measures adopted to that end from 1980 onwards. The Decree of 1999 constitutes only the most recent measure in a process of progressive implementation of a system of strict protection for that species.

22 According to the Greek Government, the lack of grounds for the Commission's action is also demonstrated by the nesting figures available for the sea turtle *Caretta caretta* on the bay of Laganas over the last 15 years. These figures do not show that the number of nests has decreased.

23 It should be observed in this regard that the Court has consistently held that the question whether there has been a failure to fulfil obligations must be examined on the basis of the position in which the Member State found itself at the end of the period laid down in the reasoned opinion and the Court cannot take account of any subsequent changes (see, *inter alia*, Case C-166/97 *Commission* v *France* [1999] ECR I-1719, paragraph 18, and Case C-220/99 *Commission* v *France* [2001] ECR I-5831, paragraph 33).

24 The Decree of 1999, on which the Greek Government has based a significant part of its pleadings, was adopted after the expiry of the two-month time-limit laid down in the reasoned opinion.

25 Consequently, it is not necessary to examine whether the system of protection for the sea turtle *Caretta caretta* provided for by that decree meets the protection requirements set out in Article 12(1)(b) and (d) of the Directive.

26 As regards the other measures which, according to the Greek Government, are intended to implement an effective system of protection for that species, it must be remembered that Article 12(1)(b) and (d) of the Directive require that the requisite measures be taken to establish a system of strict protection for the animal species listed in Annex IV(a) of that Directive in their natural habitats, prohibiting the deliberate disturbance of those species, particularly during the period of breeding, rearing, hibernation and migration, and the deterioration or destruction of breeding sites or resting places.

27 First, it is undisputed that the bay of Laganas is a vital breeding region for the protected species *Caretta caretta*.

28 Second, according to the findings of the Greek Council of State in a report in 1999 annexed to the draft presidential decree establishing the marine park of Zakinthos, the provisions in force at that time did not ensure, to the extent necessary, the effective protection of the sea and land areas of the bay of Laganas. In particular, given the pressure and the erosion caused to the breeding beaches at Dafni, Gerakas and Kalamaki by the construction of access routes to those beaches and given the noise resulting from human activity, the Council of State recommended the prohibition not only of the opening of new access routes to those beaches, but also of the creation of infrastructure such as kiosks, tents or parking facilities. The Greek Government does not contest those matters.

29 Third, it should be observed that during the pre-litigation period, the Greek Government particularly stressed that the adoption of a decree creating a marine park at Zakinthos would introduce a system of strict protection for the sea turtle *Caretta caretta*. In its defence, the Greek Government claimed that, in respect of that species, the Decree of 1999 met the protection objectives set out in Article 12 of the Directive. In its rejoinder, the Greek Government submitted, for the first time, that the requisite measures to establish a system of strict protection for that species pursuant to Article 12(1)(b) and (d) of the Directive had been taken prior to 14 August 1999, the date on which the time-limit set by the Commission expired. However, in the oral hearing, the Greek Government admitted that the Decree of 1999 had established a system creating stricter protection than had been afforded by the system of protection previously in force. It should also be observed that, when asked by the Court to identify, and submit the wording of, the specific provisions in force in their legal system on 14 August 1999 which it

believed met the requirements laid down by Article 12(1)(b) and (d) of the Directive, the Greek Government merely listed a series of laws, regulations and administrative measures without referring to any specific provisions capable of meeting those requirements.

30 In the light of the foregoing, it must be held that the Greek Government did not adopt a legal framework within the prescribed time-limit which was capable of ensuring strict protection for the sea turtle *Caretta caretta* against any deliberate disturbance during the breeding period and against any deterioration or destruction of its breeding sites. Consequently, the Commission's application must be granted on this point.

31 The fact that it does not appear that the number of nests of that species has decreased over the last 15 years does not, of itself, call this finding into question.

Specific measures for the protection of the Caretta caretta species

32 The Commission points out that, during a visit to the breeding beaches of the sea turtle *Caretta caretta* on the island of Zakinthos at the end of August 1999, its officials reported *inter alia* the use of mopeds on the sand beach to the east of Laganas, the presence of pedalos and small boats in the sea around Gerakas and Dafni and the presence of illegal buildings on the beach at Dafni.

33 The Greek Government does not dispute the accuracy of those findings.

34 It is undisputed that the use of mopeds on a beach used for breeding by the *Caretta caretta* turtle is, particularly owing to the noise pollution, liable to disturb that species during the laying period, the incubation period and the hatching of the eggs, as well as during the baby turtles' migration to the sea. It is also established that the presence of small boats near the breeding beaches constitutes a source of danger to the life and physical well-being of the turtles.

35It is apparent from the documents before the Court that at the time the facts were ascertained by the Commission's officials, the use of mopeds on the breeding beaches was prohibited and notices indicating the presence of turtle nests on the beaches had been erected. As regards the sea area around Gerakas and Dafni, it had been classified as an absolute protection area and special notices had been erected there.

36 It follows that the use of mopeds on the sand beach to the east of Laganas and the presence of pedalos and small boats in the sea area around Gerakas and Dafni constitute the deliberate disturbance of the species in question during its breeding period for the purposes of Article 12(1)(b) of the Directive.

37 Moreover, the acts were not isolated occurrences. As regards the use of mopeds on the breeding beaches, this is clear from the Greek Government's assertion that nocturnal supervision of the eastern part of beach at Laganas was, at the material time, particularly difficult to ensure owing to the length of the beach, the high number of access points and the low number of supervisors. As far as the presence of small boats in the relevant sea area is concerned, it should be noted that these were observed on two visits to Zakinthos by Commission officials, as stated at paragraphs 8 and 13 of this judgment.

38 Finally, there is no doubt that the presence of buildings on a breeding beach such as the one at Dafni is liable to lead to the deterioration or destruction of the breeding site within the meaning of Article 12(1)(d) of the Directive.

39 It must, therefore, be held that the Hellenic Republic did not take, within the prescribed time-limit, all the requisite specific measures to prevent the deliberate disturbance of the sea turtle *Caretta caretta* during its breeding period and the deterioration or destruction of its breeding sites. Consequently, the Commission's application must also be granted on this point.

40 In the light of the foregoing, the Court finds that by failing to take, within the prescribed time-limit, the requisite measures to establish and implement an effective system of strict protection for the sea turtle *Caretta caretta* on Zakinthos so as to avoid any disturbance of the species during its breeding period and any activity which might bring about deterioration or destruction of its breeding sites, the Hellenic Republic has failed to fulfil its obligations under Article 12(1)(b) and (d) of the Directive.

Costs

41 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. Since the Commission has applied for costs and the Hellenic Republic has been unsuccessful, the latter must be ordered to pay the costs.

On those grounds,

THE COURT (Sixth Chamber)

hereby:

1. **Declares that by failing to take, within the prescribed time-limit, the requisite measures to establish and implement an effective system of strict protection for the sea turtle *Caretta caretta* on Zakinthos so as to avoid any disturbance of the species during its breeding period and any activity which might bring about deterioration or destruction of its breeding sites, the Hellenic Republic has failed to fulfil its obligations under Article 12(1)(b) and (d) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora;**

2. **Orders the Hellenic Republic to pay the costs.**

Macken Gulmann Puissochet

Schintgen Cunha Rodrigues

Delivered in open court in Luxembourg on 30 January 2002.

R. Grass F. Macken

Registrar President of the Sixth Chamber

JUDGMENT OF THE COURT (Sixth Chamber)

7 December 2000 *

In Case C-374/98,

Commission of the European Communities, represented by P. Stancanelli, of its Legal Service, and O. Couvert-Castéra, a national civil servant on secondment to that Legal Service, acting as Agents, with an address for service in Luxembourg at the office of C. Gómez de la Cruz, also of the Legal Service, Wagner Centre, Kirchberg,

applicant,

v

French Republic, represented by K. Rispal-Bellanger, Head of Subdirectorate in the Legal Affairs Directorate of the Ministry of Foreign Affairs, and R. Nadal, Assistant Foreign Affairs Secretary in that Directorate, acting as Agents, with an address for service in Luxembourg at the French Embassy, 8B Boulevard Joseph II,

defendant,

* Language of the case: French.

APPLICATION for a declaration, first, that, by failing to classify the Basses Corbières site, France, as a special protection area for the conservation of certain species of birds listed in Annex I to Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1) and of certain migratory species not listed in that Annex, and by also failing to adopt special conservation measures concerning their habitat, contrary to Article 4(1) and (2) of that directive, and, second, that, by failing to take appropriate steps in relation to the Basses Corbières to avoid disturbance of the species protected on that site and deterioration of their habitat likely to have a significant effect, as a result of the opening and working of limestone quarries in the municipalities of Tautavel and Vingrau, France, contrary to Article 6(2) to (4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7), the French Republic has failed to fulfil its obligations under the EC Treaty,

THE COURT (Sixth Chamber),

composed of: C. Gulmann (Rapporteur), President of the Sixth Chamber, V. Skouris and R. Schintgen, Judges,

Advocate General: S. Alber,
Registrar: D. Louterman-Hubeau, Principal Administrator,

having regard to the Report for the Hearing,

after hearing oral argument from the parties at the hearing on 16 December 1999, during which the Commission was represented by O. Couvert-Castéra and

the French Republic by A. Maitrepierre, Chargé de Mission in the Legal Affairs Directorate of the Ministry of Foreign Affairs, acting as Agent,

after hearing the Opinion of the Advocate General at the sitting on 15 February 2000,

gives the following

Judgment

1 By application lodged at the Court Registry on 16 October 1998, the Commission of the European Communities brought an action under Article 169 of the EC Treaty (now Article 226 EC) for a declaration, first, that, by failing to classify the Basses Corbières site, France, as a special protection area ('SPA') for the conservation of certain species of birds listed in Annex I to Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1; 'the birds directive') and of certain migratory species not listed in that Annex, and by also failing to adopt special conservation measures concerning their habitat, contrary to Article 4(1) and (2) of that directive, and, second, that, by failing to take appropriate steps in relation to the Basses Corbières to avoid disturbance of the species protected on that site and deterioration of their habitat likely to have a significant effect, as a result of the opening and working of limestone quarries within the municipalities of Tautavel and Vingrau, France, contrary to Article 6(2) to (4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7; 'the habitats directive'), the French Republic has failed to fulfil its obligations under the EC Treaty.

Legislative background

2 Article 4 of the birds directive provides:

'1. The species mentioned in Annex I shall be the subject of special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution.

In this connection, account shall be taken of:

(a) species in danger of extinction;

(b) species vulnerable to specific changes in their habitat;

(c) species considered rare because of small populations or restricted local distribution;

(d) other species requiring particular attention for reasons of the specific nature of their habitat.

Trends and variations in population levels shall be taken into account as a background for evaluations.

Member States shall classify in particular the most suitable territories in number and size as special protection areas for the conservation of these species, taking into account their protection requirements in the geographical sea and land area where this directive applies.

2. Member States shall take similar measures for regularly occurring migratory species not listed in Annex I, bearing in mind their need for protection in the geographical sea and land area where this directive applies, as regards their breeding, moulting and wintering areas and staging posts along their migration routes. To this end, Member States shall pay particular attention to the protection of wetlands and particularly to wetlands of international importance.

3. [...]

4. In respect of the protection areas referred to in paragraphs 1 and 2 above, Member States shall take appropriate steps to avoid pollution or deterioration of habitats or any disturbances affecting the birds, in so far as these would be significant having regard to the objectives of this Article. Outside these protection areas, Member States shall also strive to avoid pollution or deterioration of habitats.'

3 Article 7 of the habitats directive provides that obligations arising under Article 6(2), (3) and (4) of that directive are to 'replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this Directive or the date of

classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later'.

4 Article 6(2) to (4) of the habitats directive provide:

'2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

5 Article 23(1) of the habitats directive provides that Member States are to bring into force the laws, regulations and administrative provisions necessary to comply with that directive within two years of its notification. The directive having been notified in June 1992, that period expired in June 1994.

The pre-litigation procedure

6 On 2 July 1996, the Commission sent the French Government a letter of formal notice in respect of failure to comply with Article 4 of the birds directive, as amended by the habitats directive, in relation to the Basses Corbières site which straddles the Aude and Pyrénées-Orientales départements. In that letter, the Commission maintained, first, that, having regard to its importance for the conservation of wild birds, particularly the Bonelli's eagle, the Basses Corbières site should have been classified as an SPA, and, second, that the opening and working of limestone quarries on that site had caused its deterioration without the required conditions being met.

7 In its reply of 28 November 1996, the French Government argued that the French authorities had recognised the interest of the site in question by passing a special conservation measure designed to protect the Bonelli eagle, namely a prefectoral decree on the conservation of the biotope of that species within the Vingrau and Tautavel municipalities. The Government, moreover, referred to the fact that a classification of those territories as an SPA was envisaged. It also stated that the

OMYA company had been working a limestone deposit in the Tautavel municipality for many years. The exhaustion of the deposit in that municipality had led the company to submit a request for authorisation to extend the working of the deposit into the neighbouring municipality of Vingrau. In that respect, the French Government argued that a judgment of the Administrative Court of Appeal of Bordeaux, which had annulled the prefectoral decree granting OMYA permission to build the quarrying installation in the Vingrau municipality, was capable of meeting the requirements of the birds directive.

8 By letter of 19 December 1997, the Commission delivered a reasoned opinion in which it held, first, that, by failing to classify the Basses Corbières site as an SPA for the conservation of certain species of birds listed in Annex I to the birds directive and of certain migratory species not listed in that Annex, and by also failing to adopt special conservation measures concerning their habitat, contrary to Article 4(1) and (2) of that directive, and, secondly, that, by failing to take appropriate steps in relation to the Basses Corbières to avoid disturbance of the species protected on that site and deterioration of their habitat, likely to have a significant effect, as a result of the opening and working of limestone quarries in the municipalities of Tautavel and Vingrau, contrary to Article 6(2) to (4) of the habitats directive, the French Republic had failed to fulfil its obligations under the EC Treaty. The Commission called upon the French Republic to take the necessary measures to comply with that reasoned opinion within two months from its notification.

9 By letter of 22 July 1998, the French authorities sent their reply to the reasoned opinion. They indicated in particular that a very full impact study had enabled the effects of the quarries in question on the attainment of the Community objectives to be assessed. In the light of that study, compensatory measures for reducing the effects of the project on habitats, species and landscape had been put into operation. In their letter, the French authorities also referred to the fact that a decision of the Conseil d'État, France, of 18 December 1996 and a decision of the Tribunal Administratif (Administrative Court) of Montpellier, France, of January 1998 confirmed the authorisations granted to the OMYA company to operate

and to set up a classified installation. The authorities also stated that a mediation mission was in progress between opponents and supporters of the operation of the Vingrau quarry and that, at the end of that mission, they would open a procedure for classifying the site as an SPA.

Substance

10 The Commission charges the French Republic with:

— first, not having classified the Basses Corbières site as an SPA;

— second, not having taken sufficient special conservation measures concerning the habitat of the species referred to in Annex I to the birds directive and of migratory species which frequent that site;

— third, not having taken appropriate steps to avoid disturbances in that site affecting those species and a deterioration of their habitat.

The classification as an SPA

11 The Commission states that the ornithological richness of the Basses Corbières site, which is situated in a migration corridor of European importance, caused the

French authorities to enter it as an important area for the conservation of wild birds (zone importante pour la conservation des oiseaux sauvages; 'ZICO'), and that the area thus designated as a ZICO amounts to 47 400 hectares. The Basses Corbières site both shelters several species listed in Annex I to the birds directive, particularly a pair of Bonelli's eagles, of which there are about 20 pairs in France, and constitutes an important area for the migration of birds of prey.

12 The French Government acknowledges that the classification of the Basses Corbières as an SPA has been delayed on account of fierce local controversy. Nevertheless, thanks to the work of a mediator sent by the French Government, it had been possible to classify a major part of the Basses Corbières site as an SPA. The French Government further argues that, under Article 4 of the birds directive, as interpreted by the Court of Justice, it is for the Government to classify as SPAs the territories which appear to it to be the most suitable in number and size for the conservation of birds. The French authorities were therefore not required to classify the whole of the area listed in the national inventory of ZICOs as SPAs. The Government also maintains that Bonelli's eagle is the most remarkable species of the area in terms of ornithological interest. As for migratory species, it claims that the area is more one of passage than of stopping or feeding. Certain species might, it is true, be observed on a migratory halt in that area for a resting or feeding period. However, the Basses Corbières region does not contain large gathering areas as is the case on coastal lakes.

13 In this connection, it should first be noted that, according to the settled case-law of the Court, a Member State may not plead provisions, practices or circumstances existing in its internal legal system in order to justify a failure to comply with the obligations and time-limits laid down in a directive (see, *inter alia*, Case C-166/97 *Commission* v *France* [1999] ECR I-1719, paragraph 13).

14 Second, it is well settled case-law that the question whether a Member State has failed to fulfil its obligations must be determined by reference to the situation

prevailing in that State at the end of the period laid down in the reasoned opinion (*Commission* v *France*, cited above, paragraph 18). On that point, it is undisputed that no part of the Basses Corbières site had been classified as an SPA before the expiry of the period laid down by the reasoned opinion.

15 Third, it is undisputed that the Basses Corbières site contains natural areas of particular ornithological interest, at least because of the presence of Bonelli's eagle, which is a species listed in Annex I to the birds directive. In that respect it should be noted that, in January 1999, the French authorities classified two nesting areas of Bonelli's eagle, representing a total area of around 360 hectares and already referred to by two prefectoral decrees for conserving the biotope of that species, as SPAs. One of those areas extends over the municipalities of Tautavel and Vingrau, the other over the municipalities of Maury, Planèzes and Raziguières.

16 However, it has not been shown that there are migratory species justifying the classification of the Basses Corbières site as an SPA by virtue of Article 4(2) of the birds directive. All the species mentioned for that purpose by the Commission as migratory species, such as the honey buzzard, the black kite, the kite, the Egyptian vulture, the short-toed eagle, the marsh harrier, the hen harrier and Montagu's harrier are listed in Annex I to the birds directive, whereas Article 4(2) of that directive applies only to migratory species not listed in Annex I.

17 Therefore, without there being any need in this case to consider what area the SPA in the Basses Corbières should cover for the obligations arising under the birds directive to be met, it must be concluded that the French Republic has not, within the prescribed period, classified any territory in the Basses Corbières site as an SPA within the meaning of Article 4(1) of the birds directive. The Commission's application must therefore be upheld on that point, within the limits stated above.

The special conservation measures

18 As regards the special conservation measures required by Article 4(1) of the birds directive, the Commission maintains that the measures adopted by the French authorities for the Basses Corbières site are insufficient. In particular, the three prefectoral decrees for conserving the biotope of Bonelli's eagle on that site, although they mention wild bird species other than Bonelli's eagle in their annexes, refer only to that latter species in their provisions and provide for specific measures only in respect of the latter. Those decrees do not, the Commission submits, ensure sufficient and complete protection of all the bird species required to be protected in that site by the birds directive, either in relation to the protection regime established or in relation to its geographical extent.

19 According to the French Government, those three decrees for the protection of the biotope ensure complete protection of the bird species present in the areas concerned. In that respect, it states in particular that the protection measures laid down by those decrees for the whole of those areas consist essentially of a prohibition on all forms of rock climbing from 15 January to 30 June and more generally a prohibition on all works which might adversely affect the integrity of the biotope. It maintains that such measures meet the objectives of conserving not only the most remarkable species of the Basses Corbières, namely Bonelli's eagle, but also the other species characteristic of that biotope. It also maintains that the areas defined by the decrees protecting the biotope correspond to biotopes generally favourable to rock species sharing their territory with Bonelli's eagle.

20 As regards the alleged insufficiency of the protection regime arising from the special conservation measures adopted by the French authorities, it should be noted in any event that, even though the three decrees for protecting the biotope are all aimed primarily at ensuring the conservation of the biotope of Bonelli's

eagle, and thus the protection of that species, their provisions nevertheless benefit all wild birds frequenting the areas covered by that legislation, by laying down in some detail the prohibition of activities capable of adversely affecting the integrity of the biotopes in question.

21 Moreover, there is nothing in the documents before the Court to show that the regime established by the three decrees for protecting the biotope is insufficient in relation to the conservation requirements of any of the bird species present in the areas covered by those decrees.

22 The complaint that the protection regime arising from the special conservation measures adopted by the French authorities is insufficient must therefore be rejected.

23 As regards the complaint that the geographical extent of those special conservation measures is insufficient, it should be noted that the Groupe Ornithologique du Roussillon ('GOR') filed a proposal in March 1999 that sectors situated in the Basses Corbières ZICO should be classified as an SPA. That file shows that the area extending over 950 hectares from the Serre de Vingrau-Tautavel to the Trou de Cavall was regarded as being suitable for classification as an SPA. That area falls entirely within the ZICO LR 07 which corresponds to the Basse Corbières site as referred to by the Commission in this case and was delimited in 1991, at the request of the Ministry of the Environment, by the GOR and the Groupe de Recherche et d'Information sur les Vertébrés et leur Environnement.

24 According to the GOR, which the French Government recognises as a naturalist association independent of the administration that has shown scientific seriousness and objectivity for many years, that area, which has already suffered deterioration around 1990, must be regarded as classifiable as an SPA

particularly on account of the presence of large birds of prey such as Bonelli's eagle, the golden eagle, the peregrine and the eagle owl, and of a corvid such as the red-billed chough. The presence of those species in the area in question is of fairly long standing, as the various documents submitted to the Court in this case show. The golden eagle, which has been living in this area since January 1998, appears to be the most recently-arrived species.

25 It should also be noted that the inventory of areas which are of great importance for the conservation of wild birds, more commonly known under the acronym IBA (Inventory of Important Bird Areas in the European Community) includes the area in question. The Court of Justice has held that that inventory, although not legally binding on the Member States concerned, contains scientific evidence making it possible to assess whether a Member State has complied with its obligation to classify as SPAs the most suitable territories in number and size for conservation of the protected species (Case C-3/96 *Commission* v *Netherlands* [1998] ECR I-3031, paragraphs 69 and 70).

26 It follows from the general scheme of Article 4 of the birds directive that, where a given area fulfils the criteria for classification as an SPA, it must be made the subject of special conservation measures capable of ensuring, in particular, the survival and reproduction of the bird species mentioned in Annex I to that directive.

27 In this case, the maps with the Court's file show that, of the three decrees for protecting the biotope issued in relation to the Basses Corbières area, only one refers to the area indicated by the GOR as requiring classification as an SPA, and that the decree in question covers only part of that area. Moreover, the 231 hectares protected by that decree are not entirely included in that area.

28 Furthermore, it does not appear that the part of the area indicated by the GOR which lies outside the scope of the decree in question is subject to any special conservation measures whatsoever.

29 In those circumstances, in the absence of any evidence capable of reopening the question whether the GOR's proposal that the 950-hectare area extending from the Serre de Vingrau-Tautavel to the Trou de Cavall should be classified as an SPA is well founded, it must be held that, since a considerable part of that area does not benefit from a special conservation regime, the special conservation measures taken by the French authorities are insufficient in their geographical extent.

30 Therefore, without there being any need in this case to consider whether other parts of the Basses Corbières area are suitable for classification as SPAs, it appears that the French Republic has failed to fulfil its obligations under Article 4(1) of the birds directive by not taking sufficient special conservation measures as to their geographical extent. It follows that the Commission's application must also be upheld on this point, within the limits specified above.

The disturbance and deterioration caused by the limestone quarries of Vingrau and Tautavel

31 According to the Commission — given that, as from the implementation date of the habitats directive, namely 10 June 1994, the obligations under Article 6(2) to (4) of that directive were substituted, pursuant to Article 7 thereof, for the obligations under the first sentence of Article 4(4) of the birds directive — those

obligations under the habitats directive have had to be complied with since that date in the case of the Basses Corbières site, even if the latter has not yet been classified as an SPA under Article 4(1) and (2) of the birds directive.

32 In reply to the Court's question on that point, the Commission maintains that, since Article 7 of the habitats directive does not in any way amend Article 4(1) and (2) of the birds directive, the grounds which led the Court to extend the protection regime under the first sentence of Article 4(4) of the birds directive to areas not classified as SPAs are equally relevant in relation to the protection regime under Article 6(2) to (4) of the habitats directive, which replaced it. The Commission further argues that, if the provisions of Article 7 of the habitats directive had to be interpreted as being intended to make the obligations under Article 6(2) to (4) applicable only to SPAs actually classified as such by the national authorities pursuant to Article 4(1) and (2) of the birds directive, the result would be a duality in the protection schemes that would be hard to justify. The protection regime laid down in the birds directive is, the Commission submits, stricter than that under the habitats directive, and it would be paradoxical to place areas of ornithological interest that have not been the subject of a national classification measure such as an SPA under a stricter protection scheme than that applicable to areas which have actually been classified as SPAs by Member States.

33 The Commission states that the realisation of the project to open and work limestone quarries in the territory of the Vingrau and Tautavel municipalities within the Basses Corbières site is likely to cause disturbance to the species present in that site and a deterioration of their habitat. It argues that, for Bonelli's eagle in particular, the opening of the quarries involves the disappearance of part of its hunting territory and risks disturbing its reproduction on account of the visual and noise pollution connected with the quarries' activity.

34 The Commission also argues that in this case, even if, for determining the areas due to benefit from the special protection regime, one were to take only those

classified as SPAs by the French authorities and which correspond to the territories covered by the two decrees for protecting the biotope referred to in paragraph 15 of this judgment, it appears that the quarrying project of the OMYA company is likely significantly to affect those areas, which are of undisputed ornithological interest.

35 The Commission maintains that, in those circumstances, an appropriate assessment of the impact of the project on the conservation of the site concerned should have been carried out. The impact study prior to the authorisation to operate quarries, dated 1994, did not meet that requirement.

36 The French Republic also infringed the obligation to adopt appropriate compensatory measures. The Commission submits that the cultivation of prey for Bonelli's eagle, the scientific monitoring of that species, the construction of a merlon and a plan for managing the natural environment, besides the fact that they do not concern the other bird species requiring protection, cannot compensate for the disturbance and deterioration caused, since the latter have not been assessed.

37 Since there had been no appropriate assessment of the impact of the quarries project on the site to be classified as an SPA in the municipality of Vingrau and, moreover, a negative impact was far from being excluded, the Commission claims that the French authorities should have refused to give their agreement to that project without demonstrating that there was no alternative solution and that a major public interest was capable of justifying the project. In that respect, the Commission states that several reports emanating from qualified universities conclude that solutions do exist which are equivalent to that of the Vingrau deposit. In any event, neither the OMYA company nor the French authorities had seriously studied those other solutions.

38 The French Government maintains that the Commission does not present any scientific or other evidence to demonstrate that the quarries create significant

disturbance for the pair of Bonelli's eagles or for the other species. In any event, the Government denies that the opening and operation of the quarries are capable of entailing serious consequences for the species present in the site. In that respect, it argues, first, that none of the scientific studies carried out concluded that operation of the quarries might involve such consequences for the wild birds and in particular Bonelli's eagle; second, that such operation was preceded by a detailed impact study which concluded that the project had no significant effect on the environment; and, finally, that important precautionary measures designed to avoid potential negative effects of the project on the environment have been put into operation.

39 The French Government states that Bonelli's eagle was present before the Tautavel quarry began operating in 1968, and that it has since maintained itself on the site without the working of the limestone noticeably causing a disturbance of the species. Nothing in the monitoring of that species, carried out by local bird protection associations independent of the administration, supports the conclusion that moving the Tautavel workings to Vingrau might have negative effects, the nesting area of Bonelli's eagle being in any event unaffected by either of the working sites.

40 Concerning the hunting area of Bonelli's eagle, the French Government points out that, in the impact study referred to above, it is stated, first, that the area needed for working the quarries should not unduly disturb the habits of that species, which has a hunting territory of several square kilometres, and, secondly, that precautionary measures to encourage proliferation of the small prey upon which that eagle feeds have been taken.

41 As regards possible alternative solutions to the deposit currently being worked by the OMYA company in the Vingrau and Tautavel municipalities, the French

Government claims that they have been seriously studied by that company but are not equivalent to that deposit.

42 In reply to the question put by the Court as to the applicability of Article 6(2) to (4) of the habitats directive to areas not yet classified as SPAs, the French Government, which acknowledges that it has not pleaded the inapplicability of those provisions to the Basses Corbières area, maintains that the substitution of the obligations contained therein for those in the first sentence of Article 4(4) of the birds directive, as provided for in Article 7 of the habitats directive, concerns only areas already classified as SPAs under the birds directive.

43 It first needs to be considered whether Article 6(2) to (4) of the habitats directive apply to areas which have not been classified as SPAs but should have been so classified.

44 In that respect, it is important to note that the text of Article 7 of the habitats directive expressly states that Article 6(2) to (4) of the directive apply, in substitution for the first sentence of Article 4(4) of the birds directive, to the areas classified under Article 4(1) or (2) of the latter directive.

45 It follows that, on a literal interpretation of that passage of Article 7 of the habitats directive, only areas classified as SPAs fall under the influence of Article 6(2) to (4) of that directive.

46 Moreover, the text of Article 7 of the habitats directive states that Article 6(2) to (4) of that directive replace the first sentence of Article 4(4) of the birds directive

as from the date of implementation of the habitats directive or the date of classification by a Member State under the birds directive, where the latter date is later. That passage of Article 7 appears to support the interpretation to the effect that the application of Article 6(2) to (4) presupposes the classification of the area concerned as an SPA.

47 It is clear, therefore, that areas which have not been classified as SPAs but should have been so classified continue to fall under the regime governed by the first sentence of Article 4(4) of the birds directive.

48 The Commission's arguments to the contrary cannot be accepted.

49 Thus, the fact that, as the case law of the Court of Justice shows (see, in particular, Case C-355/90 *Commission* v *Spain* [1993] ECR I-4221, paragraph 22), the protection regime under the first sentence of Article 4(4) of the birds directive applies to areas that have not been classified as SPAs but should have been so classified does not in itself imply that the protection regime referred to in Article 6(2) to (4) of the habitats directive replaces the first regime referred to in relation to those areas.

50 Moreover, as regards the Commission's argument concerning a duality of applicable regimes, it should be noted that the fact that the areas referred to in the previous paragraph of this judgment are, under the first sentence of Article 4(4) of the birds directive, made subject to a regime that is stricter than that laid down by Article 6(2) to (4) of the habitats directive in relation to areas classified as SPAs does not appear to be without justification.

51 As the Advocate General points out in paragraph 99 of his Opinion, a Member State cannot derive an advantage from its failure to comply with its Community obligations.

52 In that respect, if it were lawful for a Member State, which, in breach of the birds directive, has failed to classify as an SPA a site which should have been so classified, to rely on Article 6(3) and (4) of the habitats directive, that State might enjoy such an advantage.

53 Since no formal measure for classifying such a site as an SPA exists, it is particularly difficult for the Commission, in accordance with Article 155 of the EC Treaty (now Article 211 EC), to carry out effective monitoring of the application by Member States of the procedure laid down by Article 6(3) and (4) of the habitats directive and to establish, in appropriate cases, the existence of possible failures to fulfil the obligations arising thereunder. In particular, the risk is significantly increased that plans or projects not directly connected with or necessary to the management of the site, and affecting its integrity, may be accepted by the national authorities in breach of that procedure, escape the Commission's monitoring and cause serious, or irreparable ecological damage, contrary to the conservation requirements of that site.

54 Natural or legal persons entitled to assert before the national courts interests connected with the protection of nature, and especially wild bird life, which in this case means primarily environmental protection organisations, would face comparable difficulties.

55 A situation of this kind would be likely to endanger the attainment of the objective of special protection for wild bird life set forth in Article 4 of the birds

directive, as interpreted by the case-law of the Court (see, in particular, Case C-44/95 *Royal Society for the Protection of Birds* [1996] ECR I-3805, paragraphs 23 and 25).

56 As the Advocate General has, essentially argued in paragraph 102 of his Opinion, the duality of the regimes applicable, respectively, to areas classified as SPAs and those which should have been so classified gives Member States an incentive to carry out classifications, in so far as they thereby acquire the possibility of using a procedure which allows them, for imperative reasons of overriding public interest, including those of a social or economic nature, and subject to certain conditions, to adopt a plan or project adversely affecting an SPA.

57 It follows from the above that Article 6(2) to (4) of the habitats directive do not apply to areas which have not been classified as SPAs but should have been so classified.

58 The complaint alleging infringement of Article 6(2) to (4) of the habitats directive must therefore be rejected.

59 It must therefore be held that, by not classifying any part of the Basses Corbières site as an SPA and by not adopting special conservation measures for that site sufficient in their geographical extent, the French Republic has failed to fulfil its obligations under Article 4(1) of the birds directive.

60 The remainder of the application must be dismissed.

Costs

61 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for in the successful party's pleadings. However, under the first paragraph of Article 69(3), the Court may order that the costs be shared or that the parties bear their own costs where each party succeeds on some and fails on other heads. Since the Commission has been only partially unsuccessful, the parties must be ordered to bear their own costs.

On those grounds,

THE COURT (Sixth Chamber)

hereby:

1. Declares that, by not classifying any part of the Basses Corbières site as a special protection area and by not adopting special conservation measures for that site sufficient in their geographical extent, the French Republic has failed to fulfil its obligations under Article 4(1) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds;

2. Dismisses the remainder of the application;

3. Orders the parties to bear their own costs.

JUDGMENT OF THE COURT

7 November 2000 *

In Case C-371/98,

REFERENCE to the Court under Article 177 of the EC Treaty (now Article 234 EC) by the Queen's Bench Division (Divisional Court) of the High Court of Justice of England and Wales for a preliminary ruling in the proceedings pending before that court between

The Queen

and

Secretary of State for the Environment, Transport and the Regions,

ex parte First Corporate Shipping Ltd,

interveners:

World Wide Fund for Nature UK (WWF)

and

Avon Wildlife Trust,

* Language of the case: English.

on the interpretation of Articles 2(3) and 4(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7),

THE COURT,

composed of: G.C. Rodríguez Iglesias, President, C. Gulmann (Rapporteur), M. Wathelet, V. Skouris (Presidents of Chambers), D.A.O. Edward, J.-P. Puissochet, P. Jann, L. Sevón and R. Schintgen, Judges,

Advocate General: P. Léger,
Registrar: H.A. Rühl, Principal Administrator,

after considering the written observations submitted on behalf of:

— First Corporate Shipping Ltd, by G. Barling QC, M. Shaw and M. Hoskins, Barristers, instructed by Arnheim Tite & Lewis, Solicitors,

— World Wide Fund for Nature UK (WWF) and Avon Wildlife Trust, by P. Sands and J.H. Marks, Barristers, instructed by Leigh Day & Co., Solicitors,

— the United Kingdom Government, by J.E. Collins, Assistant Treasury Solicitor, acting as Agent, and Richard Drabble QC,

— the Finnish Government, by H. Rotkirch and T. Pynnä, Valtionasiamiehet, acting as Agents,

— the Commission of the European Communities, by R.B. Wainwright, Principal Legal Adviser, and P. Stancanelli, of its Legal Service, acting as Agents,

having regard to the Report for the Hearing,

after hearing the oral observations of First Corporate Shipping Ltd, World Wide Fund for Nature UK (WWF) and Avon Wildlife Trust, the United Kingdom Government, the Finnish Government and the Commission at the hearing on 7 December 1999,

after hearing the Opinion of the Advocate General at the sitting on 7 March 2000,

gives the following

Judgment

1 By order of 21 July 1998, received at the Court on 16 October 1998, the Queen's Bench Division (Divisional Court) of the High Court of Justice of England and Wales referred to the Court for a preliminary ruling under Article 177 of the EC Treaty (now Article 234 EC) a question on the interpretation of Articles 2(3) and

4(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7, hereinafter 'the Habitats Directive').

2 The question arose in proceedings brought by First Corporate Shipping Ltd (hereinafter 'FCS') for judicial review of the act by which the Secretary of State for the Environment, Transport and the Regions indicated that he was minded to propose the Severn Estuary to the Commission of the European Communities as a site eligible for designation as a special area of conservation (SAC) under Article 4(1) of the Habitats Directive.

The Community legislation

3 According to Article 2 of the Habitats Directive:

'1. The aim of this Directive shall be to contribute towards ensuring biodiversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the Treaty applies.

2. Measures taken pursuant to this Directive shall be designed to maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora of Community interest.

3. Measures taken pursuant to this Directive shall take account of economic, social and cultural requirements and regional and local characteristics.'

4 Article 4 of the Habitats Directive states:

'1. On the basis of the criteria set out in Annex III (Stage 1) and relevant scientific information, each Member State shall propose a list of sites indicating which natural habitat types in Annex I and which species in Annex II that are native to its territory the sites host. For animal species ranging over wide areas these sites shall correspond to the places within the natural range of such species which present the physical or biological factors essential to their life and reproduction. For aquatic species which range over wide areas, such sites will be proposed only where there is a clearly identifiable area representing the physical and biological factors essential to their life and reproduction. Where appropriate, Member States shall propose adaptation of the list in the light of the results of the surveillance referred to in Article 11.

The list shall be transmitted to the Commission, within three years of the notification of this Directive, together with information on each site. That information shall include a map of the site, its name, location, extent and the data resulting from application of the criteria specified in Annex III (Stage 1) provided in a format established by the Commission in accordance with the procedure laid down in Article 21.

2. On the basis of the criteria set out in Annex III (Stage 2) and in the framework both of each of the five biogeographical regions referred to in Article 1(c)(iii) and of the whole of the territory referred to in Article 2(1), the Commission shall establish, in agreement with each Member State, a draft list of sites of

Community importance drawn from the Member States' lists identifying those which host one or more priority natural habitat types or priority species.

Member States whose sites hosting one or more priority natural habitat types and priority species represent more than 5% of their national territory may, in agreement with the Commission, request that the criteria listed in Annex III (Stage 2) be applied more flexibly in selecting all the sites of Community importance in their territory.

The list of sites selected as sites of Community importance, identifying those which host one or more priority natural habitat types or priority species, shall be adopted by the Commission in accordance with the procedure laid down in Article 21.

3. The list referred to in paragraph 2 shall be established within six years of the notification of this Directive.

4. Once a site of Community importance has been adopted in accordance with the procedure laid down in paragraph 2, the Member State concerned shall designate that site as a special area of conservation as soon as possible and within six years at most, establishing priorities in the light of the importance of the sites for the maintenance or restoration, at a favourable conservation status, of a natural habitat type in Annex I or a species in Annex II and for the coherence of Natura 2000, and in the light of the threats of degradation or destruction to which those sites are exposed.

5. As soon as a site is placed on the list referred to in the third subparagraph of paragraph 2 it shall be subject to Article 6(2), (3) and (4).'

5 Annex III to the Habitats Directive reads as follows:

'Criteria for selecting sites eligible for identification as sites of Community importance and designation as special areas of conservation

Stage 1: Assessment at national level of the relative importance of sites for each natural habitat type in Annex I and each species in Annex II (including priority natural habitat types and priority species)

A. *Site assessment criteria for a given natural habitat type in Annex 1*

(a) Degree of representativity of the natural habitat type on the site.

(b) Area of the site covered by the natural habitat type in relation to the total area covered by that natural habitat type within national territory.

(c) Degree of conservation of the structure and functions of the natural habitat type concerned and restoration possibilities.

(d) Global assessment of the value of the site for conservation of the natural habitat type concerned.

B. *Site assessment criteria for a given species in Annex II*

(a) Size and density of the population of the species present on the site in relation to the populations present within national territory.

(b) Degree of conservation of the features of the habitat which are important for the species concerned and restoration possibilities.

(c) Degree of isolation of the population present on the site in relation to the natural range of the species.

(d) Global assessment of the value of the site for conservation of the species concerned.

C. On the basis of these criteria, Member States will classify the sites which they propose on the national list as sites eligible for identification as sites of Community importance according to their relative value for the conservation of each natural habitat type in Annex I or each species in Annex II.

D. That list will show the sites containing the priority natural habitat types and priority species selected by the Member States on the basis of the criteria in A and B above.

...'

6 Article 6(2), (3) and (4) of the Habitats Directive provides:

'2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or

economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

The main proceedings and the question referred for a preliminary ruling

7 FCS is the statutory port authority for the port of Bristol, on the Severn Estuary, and owns considerable land in the neighbourhood of the port. Since acquiring the port, FCS has invested, in partnership with other undertakings, nearly GBP 220 million in capital in developing its facilities. It employs 495 permanent full-time employees. The number of workers employed at the port, including FCS's own employees, is between 3 000 and 5 000.

8 The Secretary of State indicated that he was minded to propose the Severn Estuary to the Commission as a site eligible for designation as an SAC under Article 4(1) of the Habitats Directive, most of the intertidal part of the estuary having already been classified as a special protection area under Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1). FCS thereupon applied to the Queen's Bench Division (Divisional Court) of the High Court of Justice of England and Wales for leave to apply for judicial review.

9 FCS submitted before that court that Article 2(3) of the Habitats Directive obliged the Secretary of State to take account of economic, social and cultural requirements when deciding which sites should be proposed to the Commission pursuant to Article 4(1) of that directive.

10 The Secretary of State contended that, in the light of the Court's reasoning in Case C-44/95 *R* v *Secretary of State for the Environment, ex parte Royal Society for the Protection of Birds* [1996] ECR I-3805, he could not take economic, social and cultural requirements into account when deciding which sites should be proposed to the Commission pursuant to Article 4(1) of the Habitats Directive.

11 In those circumstances, the High Court of Justice stayed proceedings and referred the following question to the Court for a preliminary ruling:

'Is a Member State entitled or obliged to take account of the considerations laid down in Article 2(3) of Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7), namely, economic, social and cultural requirements and regional and local characteristics, when deciding which sites to propose to the Commission pursuant to Article 4(1) of that Directive and/or in defining the boundaries of such sites?'

The question referred for a preliminary ruling

12 It should be noted that the question of interpretation referred for a preliminary ruling relates only to Stage 1 of the procedure for classifying natural sites as SACs laid down by Article 4(1) of the Habitats Directive.

13 Under that provision, on the basis of the criteria set out in Annex III (Stage 1) together with relevant scientific information, each Member State is to propose and transmit to the Commission a list of sites, indicating which natural habitat types in Annex I and native species in Annex II are to be found there.

14 Annex III to the Habitats Directive, which deals with the criteria for selecting sites eligible for identification as sites of Community importance and designation as SACs, sets out, as regards Stage 1, criteria for the assessment at national level of the relative importance of sites for each natural habitat type in Annex I and each species in Annex II.

15 Those assessment criteria are defined exclusively in relation to the objective of conserving the natural habitats or the wild fauna and flora listed in Annexes I and II respectively.

16 It follows that Article 4(1) of the Habitats Directive does not as such provide for requirements other than those relating to the conservation of natural habitats and of wild fauna and flora to be taken into account when choosing, and defining the boundaries of, the sites to be proposed to the Commission as eligible for identification as sites of Community importance.

17 FCS submits that identifying and defining the boundaries of the sites to be notified to the Commission with a view to designation as SACs, as required by Article 4(1) of the Habitats Directive, constitute a measure taken pursuant to the directive within the meaning of Article 2(3). It follows that Article 2(3) imposes an obligation on a Member State to take account of economic, social and cultural requirements and regional and local characteristics when it applies the criteria in Annex III to the directive when drawing up the list of sites to be transmitted to the Commission.

18 According to the Finnish Government, it is open to a Member State, when proposing its list of sites to the Commission, to take account of economic, social and cultural requirements and regional and local characteristics, provided that it does not compromise realisation of the Habitats Directive's nature protection objectives. The Government observes that there may, for example, be such a large number of sites eligible to be considered of Community importance within the territory of a Member State that that State is entitled to exclude some of them from its list of proposed sites without jeopardising realisation of those objectives.

19 It should be noted that the first subparagraph of Article 3(1) of the Habitats Directive provides for the setting up of a coherent European ecological network of SACs to be known as 'Natura 2000', composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, to enable them to be maintained or, where appropriate, restored at a favourable conservation status in their natural range.

20 Moreover, Article 4 of the Habitats Directive sets out the procedure for classifying natural sites as SACs, divided into several stages with corresponding legal effects, which is intended in particular to enable the Natura 2000 network to be realised, as provided for by Article 3(2) of the directive.

21 In particular, the first subparagraph of Article 4(2) prescribes that the Commission is to establish, on the basis of the lists drawn up by the Member States and in agreement with each Member State, a draft list of sites of Community importance.

22 To produce a draft list of sites of Community importance, capable of leading to the creation of a coherent European ecological network of SACs, the Commission

must have available an exhaustive list of the sites which, at national level, have an ecological interest which is relevant from the point of view of the Habitats Directive's objective of conservation of natural habitats and wild fauna and flora. To that end, that list is drawn up on the basis of the criteria laid down in Annex III (Stage 1) to the directive.

23 Only in that way is it possible to realise the objective, in the first subparagraph of Article 3(1) of the Habitats Directive, of maintaining or restoring the natural habitat types and the species' habitats concerned at a favourable conservation status in their natural range, which may lie across one or more frontiers inside the Community. It follows from Article 1(e) and (i), read in conjunction with Article 2(1), of the directive that the favourable conservation status of a natural habitat or a species must be assessed in relation to the entire European territory of the Member States to which the Treaty applies. Having regard to the fact that, when a Member State draws up the national list of sites, it is not in a position to have precise detailed knowledge of the situation of habitats in the other Member States, it cannot of its own accord, whether because of economic, social or cultural requirements or because of regional or local characteristics, delete sites which at national level have an ecological interest relevant from the point of view of the objective of conservation without jeopardising the realisation of that objective at Community level.

24 In particular, if the Member States could take account of economic, social and cultural requirements and regional and local characteristics when selecting and defining the boundaries of the sites to be included in the list which, pursuant to Article 4(1) of the Habitats Directive, they must draw up and transmit to the Commission, the Commission could not be sure of having available an exhaustive list of sites eligible as SACs, with the risk that the objective of bringing them together into a coherent European ecological network might not be achieved.

25 The answer to the national court's question must therefore be that, on a proper construction of Article 4(1) of the Habitats Directive, a Member State may not

take account of economic, social and cultural requirements or regional and local characteristics, as mentioned in Article 2(3) of that directive, when selecting and defining the boundaries of the sites to be proposed to the Commission as eligible for identification as sites of Community importance.

Costs

26 The costs incurred by the United Kingdom and Finnish Governments and by the Commission, which have submitted observations to the Court, are not recoverable. Since these proceedings are, for the parties to the main proceedings, a step in the proceedings pending before the national court, the decision on costs is a matter for that court.

On those grounds,

THE COURT

in answer to the question referred to it by the the Queen's Bench Division (Divisional Court) of the High Court of Justice of England and Wales by order of 21 July 1998, hereby rules:

On a proper construction of Article 4(1) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora,

a Member State may not take account of economic, social and cultural requirements or regional and local characteristics, as mentioned in Article 2(3) of that directive, when selecting and defining the boundaries of the sites to be proposed to the Commission as eligible for identification as sites of Community importance.

JUDGMENT OF THE COURT (Fifth Chamber)

6 April 2000 *

In Case C-256/98,

Commission of the European Communities, represented by P. Stancanelli, of its Legal Service, and O. Couvert-Castéra, a national civil servant on secondment to that Legal Service, acting as Agents, with an address for service in Luxembourg at the office of C. Gómez de la Cruz, also of the Legal Service, Wagner Centre, Kirchberg,

applicant,

v

French Republic, represented by K. Rispal-Bellanger, Head of Subdirectorate in the Legal Affairs Directorate of the Ministry of Foreign Affairs, and R. Nadal, Assistant Foreign Affairs Secretary in that Directorate, acting as Agents, with an address for service in Luxembourg at the French Embassy, 8B Boulevard Joseph II,

defendant,

* Language of the case: French.

APPLICATION for a declaration that, by not adopting all the laws, regulations and administrative measures necessary to comply with Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7), in that it has omitted to take the measures necessary to comply with Article 6 thereof, the French Republic has failed to fulfil its obligations under that Directive and under the third paragraph of Article 189 of the EC Treaty (now the third paragraph of Article 249 EC),

THE COURT (Fifth Chamber),

composed of: D.A.O. Edward, President of the Chamber, J.C. Moitinho de Almeida, C. Gulmann (Rapporteur), J.-P. Puissochet and P. Jann, Judges,

Advocate General: N. Fennelly,
Registrar: D. Louterman-Hubeau, Principal Administrator,

having regard to the Report for the Hearing,

after hearing oral argument from the parties at the hearing on 24 June 1999,

after hearing the Opinion of the Advocate General at the sitting on 16 September 1999,

gives the following

Judgment

1 By application lodged at the Court Registry on 15 July 1998, the Commission of the European Communities brought an action under Article 169 of the EC Treaty (now Article 226 EC) for a declaration that, by not adopting the laws, regulations and administrative measures necessary to comply with Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ 1992 L 206, p. 7; hereinafter 'the Directive'), in that it has omitted to take the measures necessary to comply with Article 6 thereof, the French Republic has failed to fulfil its obligations under that Directive and under the third paragraph of Article 189 of the EC Treaty (now the third paragraph of Article 249 EC).

The applicable legislation

2 Article 2(1) of the Directive states that the aim of that measure is to contribute towards ensuring bio-diversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the Treaty applies.

3 Article 2(2) states that measures taken pursuant to the Directive are to be designed to maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora of Community interest.

4 According to the sixth recital in the preamble to the Directive, it is necessary, in order to ensure the restoration or maintenance of natural habitats and species of Community interest at a favourable conservation status, to designate special areas of conservation in order to create a coherent European ecological network in accordance with a specified timetable.

5 Pursuant to Article 3(1) of the Directive, that network — termed 'Natura 2000' — is to comprise, not only those special areas of conservation, but also areas which the Member States have designated as 'special protection areas' pursuant to Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1; hereinafter 'the Wild Birds Directive').

6 Article 1(l) of the Directive defines a special area of conservation as 'a site of Community importance designated by the Member States through a statutory, administrative and/or contractual act where the necessary conservation measures are applied for the maintenance or restoration, at a favourable conservation status, of the natural habitats and/or the populations of the species for which the site is designated'.

7 Article 4 of the Directive lays down a three-stage procedure for the designation of special areas of conservation. Pursuant to Article 4(1), each Member State is to propose a list of sites and to indicate both the natural habitat types and the native species (of those listed, respectively, in Annexes I and II to the Directive) which those sites host. That list, together with information on each site, is to be transmitted to the Commission within three years of notification of the Directive.

8 Pursuant to Article 4(2) of the Directive, the Commission is to establish — on the basis of the criteria set out in Annex III to the Directive, and in agreement with each Member State — a draft list of sites of Community importance. The list of sites selected as sites of Community importance is to be adopted by the Commission in accordance with the procedure laid down in Article 21 of the

Directive. Pursuant to Article 4(3), the list is to be established within six years of notification of the Directive.

9 Article 4(4) provides that once a site has been adopted as a site of Community importance in accordance with the procedure laid down in Article 4(2), the Member State concerned is to designate it as a special area of conservation as soon as possible (within six years at most), establishing priorities in the light of the importance of the site for the maintenance or restoration, at a favourable conservation status, of a natural habitat type in Annex I or a species in Annex II and for the coherence of Natura 2000, and in the light of the threats of degradation or destruction to which such a site is exposed.

10 Article 4(5) provides that as soon as a site is placed on the list of sites of Community importance drawn up by the Commission, it is subject to the provisions of Article 6(2), (3) and (4).

11 Article 6 of the Directive provides:

'1. For special areas of conservation, Member States shall establish the necessary conservation measures involving, if need be, appropriate management plans specifically designed for the sites or integrated into other development plans, and appropriate statutory, administrative or contractual measures which correspond to the ecological requirements of the natural habitat types in Annex I and the species in Annex II present on the sites.

2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so

far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.'

12 Article 7 provides:

'Obligations arising under Article 6(2), (3) and (4) of this Directive shall replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this Directive or the date of classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later.'

13 Article 23(1) provides that Member States are to bring into force the laws, regulations and administrative provisions necessary to comply with the Directive within two years of its notification and immediately to inform the Commission thereof. Since the Directive was notified to the French Republic on 5 June 1992, the period prescribed for its implementation in France expired on 5 June 1994.

The pre-litigation procedure

14 Since the French Government failed to communicate by 5 June 1994 the measures adopted to comply with the Directive, the Commission took the view that, in the absence of any other evidence to suggest that the necessary measures had indeed been adopted, the French Republic had failed to fulfil its obligations under the Directive. Accordingly, by letter of 9 August 1994, it sent the French Government formal notice to submit its comments in that regard within two months, in accordance with the procedure laid down in Article 169 of the Treaty.

15 By letter of 16 February 1995, the French Government informed the Commission that the Directive had been transposed into national law by Circular No 38 of 21 January 1993, supplemented by Circular No 24 of 28 January 1994. It also stated that the legal implications of the assessment of projects in accordance with Article 6(3) and (4) were under consideration, as was a draft decree concerning the list of habitats.

16 Under cover of a letter dated 18 April 1995, the French Government sent the Commission a copy of Law No 95-101 of 2 February 1995 concerning more stringent measures for the protection of the environment (*Journal Officiel de la République Française* of 3 February 1995, p. 1840). Appended was a table illustrating the provisions, both of the Directive and of the Wild Birds Directive, which were thereby transposed into national law. In addition, the French Government stated that a decree specifically concerning the Directive was under consideration at departmental level in the ministries responsible.

17 In the light both of the table relating to Law No 95-101 and the other information provided in the various letters from the French authorities, the Commission concluded that the Directive had only partly been transposed into national law and that additional measures were needed to ensure its full implementation, particularly with respect to Article 6.

18 When communication of those transposition measures was not forthcoming, the Commission sent the French Government by letter of 21 September 1995 a reasoned opinion calling upon it to adopt the measures necessary to comply with the Directive within two months of such notification.

19 Under cover of a letter dated 30 October 1995, the French Government sent the Commission a copy of Decree No 95-631 of 5 May 1995 on the conservation of natural habitats and habitats of wild species of Community interest (JORF of 7 May 1995, p. 7612). However, the Commission was unable on that basis to conclude that the Directive had been wholly transposed into French national law. Nevertheless, since the reasoned opinion of 21 September 1995 had neglected to

mention the letter of 18 April 1995 from the French authorities to the Commission, a complementary reasoned opinion was delivered by letter of 31 October 1997.

20 In the complementary reasoned opinion, the Commission expressed the view that, in failing to transpose Article 6 of the Directive into national law, the French Republic was denying future sites of Community importance a suitable regulatory framework which was in conformity with Community law. Pursuant to Article 4(5) of the Directive, such protection must be accorded to a site of that nature as soon as it is placed on the list referred to in the third subparagraph of Article 4(2). Secondly, the Commission maintained that, in neglecting to transpose Article 6(2), (3) and (4) of the Directive, the French Republic was also depriving the special protection areas designated earlier under the Wild Birds Directive of a suitable regulatory framework which is in conformity with Community law, contrary to the requirements of Article 7 of the Directive.

21 The Commission also noted that the information provided by the French Government indicated that the French authorities were contemplating the use of management projects, in accordance with Article 6(1) of the Directive. However, the French Government was silent as to the procedures and measures by which the requirements laid down in that provision would be satisfied. Article 6(1) clearly states that by the deadline set for compliance with the Directive — 5 June 1994 — a regulatory framework must be in place for the establishment of the conservation measures needed to meet the ecological requirements referred to in Annexes I and II to the Directive and which involve management projects and the appropriate statutory, administrative or contractual measures.

22 The Commission adds that, although French law already makes provision for the protection of nature in the form of measures and bodies of rules which were brought to the Commission's knowledge when it was notified of the special protection areas under the Wild Birds Directive, the French authorities have not specified which provisions, in their view, meet the objectives of the Directive and, in particular, of Article 6(1) and (2) thereof.

23 On receiving no communication thereafter regarding the adoption of measures to transpose the Directive into national law, the Commission decided to bring the present proceedings.

24 The Commission bases its application on the same complaints as were raised in the complementary reasoned opinion.

The complaints concerning the transposition into national law of Article 6(1) and (2) of the Directive

25 As regards the transposition into French law of Article 6(1) and (2) of the Directive, the Commission states in its application that the French authorities failed to communicate to it the measures which, in their view, satisfy the objectives of those provisions.

26 In its defence, the French Government refers to a number of French legal provisions which, in its view, constitute an adequate range of legislative, regulatory and contractual measures for ensuring that the objectives of the Directive, particularly of the above provisions, are realised in full.

27 The Commission acknowledges in its reply that French law includes measures designed to enable the obligations created by those provisions to be met. It maintains, however, that nowhere in French law are the French authorities expressly obliged to apply conservation and protection measures to special areas of conservation, in accordance with Article 6(1) and (2) of the Directive. According to the Commission, the very least required under the Directive, if Article 6(1) and (2) thereof are to be correctly transposed into national law, is the incorporation into French law, not only of legal instruments to ensure the

protection of special areas of conservation, but also — especially since the latter instruments were not specifically designed for the implementation of the Directive — of an express provision of general application requiring the French authorities to use those instruments in the situations envisaged and in accordance with the criteria set out in the Directive. Not only would such provision facilitate the transposition of the Directive into French law, it would also offer individuals greater legal certainty by lending more substance to their right to rely before the courts on failure by the competent authorities to comply with the obligation to adopt appropriate measures of protection.

28 It is clear from the foregoing that, both in the reasoned opinion and in the application, the Commission essentially imputes to the French Republic a failure to establish a legal framework to accommodate the measures necessary to ensure the protection of special areas of conservation, such measures being understood in the sense of measures defined by the national legislation and designed to take effect at the same time as the adoption, in accordance with Article 23, of the general measures necessary to ensure compliance with the Directive.

29 In its reply, the Commission amended its grounds of complaint to focus on the question of the existence in Community law of an obligation incumbent on Member States to incorporate in their laws express provisions requiring the competent national authorities to apply the conservation and protection measures provided for in Article 6(1) and (2) of the Directive to special areas of conservation.

30 It should be noted, however, that the amendment goes beyond a mere restatement, albeit in greater detail, of the initial complaints, thereby raising submissions before the Court which were not put forward during the pre-litigation procedure or in the application initiating the proceedings.

31 Those submissions are inadmissible because they are contrary to Article 38(1)(c) of the Rules of Procedure, under which the parties are required to state the subject-matter of the proceedings in the application initiating proceedings. Even though Article 42 of those Rules allows, subject to specific conditions, the introduction of new pleas in law, it is not permissible for a party to alter the very subject-matter of the proceedings. It follows that the merits of an application must be determined solely in the light of the submissions made in the application initiating the proceedings (see Case 232/78 *Commission* v *France* [1979] ECR 2729, paragraph 3).

32 Since the Commission must be deemed to have withdrawn its complaints in relation to Article 6(1) and (2) of the Directive, as initially formulated, the application must to that extent be dismissed as inadmissible.

33 Consequently, there is no need to consider the question — which, moreover, was not addressed during the proceedings — whether Member States were under an obligation to transpose the provisions at issue, particularly Article 6(1) of the Directive, into national law before the Commission adopted the list of sites of Community interest pursuant to the third subparagraph of Article 4(2) of the Directive.

The complaint concerning the transposition into national law of Article 6(3) and (4) of the Directive

34 First, as regards Article 6(3) of the Directive, the French Government admits that under the existing rules of French law relating to the prior assessment of the environmental implications of a development plan or project, the competent authorities are not able in all cases to refuse authorisation on the grounds that the findings of such an assessment were negative. The French Government states that, with a view to complying with the Directive on that point, it is preparing supplementary legislation.

35 However, the French Government disputes the Commission's assertions that its legislation does not enable the competent national authorities to comply fully with the obligation laid down in Article 6(3) of the Directive to carry out a prior assessment of the implications for the environment of any plan or project not directly connected with or necessary to the management of the site but likely nevertheless to have a significant effect thereon, citing in that respect Law No 76-629 of 10 July 1976 on the protection of nature (JORF of 12 and 13 July 1976, p. 4203).

36 It is common ground that there has long been provision in French law, notably in the rules provided for by Law No 76-629, for compulsory environmental impact assessments along the lines indicated by the Directive. Nevertheless, it is for the national authorities responsible for the transposition of the Directive into French law to make sure that those rules do indeed guarantee, with sufficient clarity and precision, the full implementation of Article 6(3).

37 However, as regards two of the three facets of French law as it stands which, in the view of the Commission, precludes full compliance with the obligations imposed by the Directive, the transposition into French law is not sufficiently clear and precise.

38 That does not apply to the first point raised by the Commission. As regards its assertion that the rules in force in France do not guarantee an assessment in the case of 'plans' likely to have a significant effect on sites, the Advocate General has properly pointed out in paragraphs 32 to 34 of his Opinion both that the Directive fails to define the term 'plan' and that French law (Article 2 of Law No 76-629) requires an environmental impact assessment in the case of both 'projets d'aménagement' (development projects) and 'documents d'urbanisme' (town planning). It cannot be regarded as established, therefore, that the French legislation in force does not satisfactorily transpose into national law the term 'plan' referred to in Article 6(3) of the Directive.

39 On the other hand, as regards the Commission's uncontested statement that, contrary to the Directive, the position in France is that the environmental impact assessment may be waived in the case of certain projects because of their low cost or their purpose, it should be noted that such exemptions cannot be justified in terms of the discretion of Member States implied, according to the French Government, by the expression 'likely to have a significant effect [on the site]'. On this point, it is enough to note that, in any event, that provision cannot authorise a Member State to enact national legislation which allows the environmental impact assessment obligation for development plans to be waived because of the low costs entailed or the particular type of work planned.

40 Lastly, as regards the Commission's statement that, contrary to the requirements of Article 6(3) of the Directive, there is no provision in French law which couples the obligation to make an environmental impact assessment with consideration of the 'site's conservation objectives', it should be noted that none of the provisions to which the French Government refers in its pleadings requires the assessment to determine the environmental impact of development plans in the light of the site's particular conservation objectives. It must be concluded, therefore, that those implications of Article 6(3) have not been transposed into French law with sufficient clarity and precision.

41 It follows that, as regards two of the three facets examined in paragraphs 38 to 40 above, Article 6(3) of the Directive has not been transposed into French law in a sufficiently clear and precise manner. Consequently, the action brought by the Commission is well founded in this respect.

42 Secondly, as regards the transposition into French law of Article 6(4) of the Directive, the Commission claims that the French Republic has not implemented the substantive conditions laid down in that provision, concerning the carrying out of a plan or project notwithstanding a negative assessment of the impact on the site, in cases where there are no alternative solutions.

43 On that point, it is enough to note that the French Government acknowledges that it has not adopted the measures necessary to comply with Article 6(4) of the Directive.

44 In the light of the foregoing, it must be held that, by not adopting within the period prescribed all the laws, regulations and administrative provisions necessary to comply with Article 6(3) and (4) of the Directive, the French Republic has failed to fulfil its obligations under that Directive.

Costs

45 Under Article 69(2) of the Rules of Procedure, the unsuccessful party is to be ordered to pay the costs if they have been applied for. However, under the first paragraph of Article 69(3), the Court may order that the parties each bear their own costs where each party has succeeded on some and failed on other heads. Since both the Commission and the French Republic have been partially unsuccessful in their pleadings, they must be ordered to bear their own costs.

On those grounds,

THE COURT (Fifth Chamber),

hereby:

1. **Declares that, by not adopting within the period prescribed all the laws, regulations and administrative measures necessary to comply with Article 6(3) and (4) of Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, the French Republic has failed to fulfil its obligations under that Directive;**

2. **Dismisses the remainder of the action;**

3. **Orders each of the parties to bear its own costs.**

JUDGMENT OF THE COURT
19 May 1998 *

In Case C-3/96,

Commission of the European Communities, represented by W. Wils, of its Legal Service, acting as Agent, with an address for service in Luxembourg at the office of C. Gómez de la Cruz, of its Legal Service, Wagner Centre, Kirchberg,

applicant,

v

Kingdom of the Netherlands, represented by M. A. Fierstra and J. S. van den Oosterkamp, Deputy Legal Advisers in the Ministry of Foreign Affairs, acting as Agents, with an address for service in Luxembourg at the Netherlands Embassy, 5 Rue C. M. Spoo,

defendant,

supported by

Federal Republic of Germany, represented by E. Röder, Ministerialrat in the Federal Ministry of Economic Affairs, and S. Maass, Regierungsrätin in that ministry, acting as Agents, D-53107 Bonn,

intervener,

* Language of the case: Dutch.

APPLICATION for a declaration that, by failing sufficiently to designate special protection areas within the meaning of Article 4(1) of Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ 1979 L 103, p. 1), the Kingdom of the Netherlands has failed to comply with its obligations under that directive and Articles 5 and 189 of the EC Treaty,

THE COURT,

composed of: G. C. Rodríguez Iglesias, President, C. Gulmann (Rapporteur), H. Ragnemalm, M. Wathelet and R. Schintgen (Presidents of Chambers), J. C. Moitinho de Almeida, P. J. G. Kapteyn, J. L. Murray, D. A. O. Edward, G. Hirsch and P. Jann, Judges,

Advocate General: N. Fennelly,
Registrar: H. von Holstein, Deputy Registrar,

having regard to the Report for the Hearing,

after hearing oral argument from the parties at the hearing on 15 July 1997,

after hearing the Opinion of the Advocate General at the sitting on 9 October 1997,

gives the following

Judgment

1 By application lodged at the Court Registry on 5 January 1996 the Commission of the European Communities brought an action under Article 169 of the EC Treaty for a declaration that, by failing sufficiently to designate special protection areas within the meaning of Article 4(1) of Council Directive 79/409/EEC of 2 April

1979 on the conservation of wild birds (OJ 1979 L 103, p. 1, hereinafter 'the Directive'), the Kingdom of the Netherlands had failed to fulfil its obligations under that directive and Articles 5 and 189 of the EC Treaty.

2 By order of the President of the Court of 15 July 1996 the Federal Republic of Germany was granted leave to intervene in support of the form of order sought by the defendant State.

3 Article 2 of the Directive provides that Member States are to 'take the requisite measures to maintain the population of [all species of naturally occurring birds in the wild state in the European territory of the Member States to which the Treaty applies] at a level which corresponds in particular to ecological, scientific and cultural requirements, while taking account of economic and recreational requirements, or to adapt the population of these species to that level'.

4 Article 3 of the Directive provides:

'1. In the light of the requirements referred to in Article 2, Member States shall take the requisite measures to preserve, maintain or re-establish a sufficient diversity and area of habitats for all the species of birds referred to in Article 1.

2. The preservation, maintenance and re-establishment of biotopes and habitats shall include primarily the following measures:

(a) creation of protected areas;

(b) upkeep and management in accordance with the ecological needs of habitats inside and outside the protected zones;

(c) re-establishment of destroyed biotopes;

(d) creation of biotopes.'

Article 4(1) of the Directive reads as follows:

'1. The species mentioned in Annex I shall be the subject of special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution.

In this connection, account shall be taken of:

(a) species in danger of extinction;

(b) species vulnerable to specific changes in their habitat;

(c) species considered rare because of small populations or restricted local distribution;

(d) other species requiring particular attention for reasons of the specific nature of their habitat.

Trends and variations in population levels shall be taken into account as a background for evaluations.

Member States shall classify in particular the most suitable territories in number and size as special protection areas for the conservation of these species, taking into account their protection requirements in the geographical sea and land area where this Directive applies.'

6 Annex I to the Directive was replaced by the Annex to Commission Directive 85/411/EEC of 25 July 1985 amending Directive 79/409 (OJ 1985 L 233, p. 33).

7 Since it considered in particular that the Kingdom of the Netherlands had not classified a sufficient number of special protection areas (hereinafter 'SPAs') for the species of birds referred to in Annex I to the Directive, the Commission, on 25 September 1989, gave the Netherlands Government formal notice to submit its observations within two months.

8 By letter of 29 December 1989 the Netherlands Government denied the alleged infringement. It submitted essentially that it was not in breach of its obligations under Article 4(1) of the Directive, in that it had classified as SPAs a sufficient number of suitable territories for conservation of the species referred to in Annex I, taking into account the balance between the interests of conservation of protected species and economic and recreational interests, and that it had also introduced other instruments for the protection of birds.

9 Since those explanations did not cause it to alter its position on the alleged failure to fulfil obligations, the Commission sent the Netherlands Government on 14 June 1993 a reasoned opinion requiring the Kingdom of the Netherlands, within two months from notification of the opinion, to take the necessary action on the complaint of not having classified as SPAs sufficient territories to ensure effective protection of the species mentioned in Annex I to the Directive.

10 The Netherlands Government states that it replied to the reasoned opinion by letter of 1 December 1993. The Commission asserts, however, that it never received that reply.

Admissibility

11 The Kingdom of the Netherlands challenges the admissibility of the application on several grounds.

Failure to take account of reply by the Kingdom of the Netherlands to the reasoned opinion

12 The Netherlands Government submits that, by omitting to take account of its reply to the reasoned opinion, the Commission failed to respect its right to a fair hearing, so that the action is inadmissible.

13 The Commission replies that, even supposing it did receive that letter, the fact that its application to the Court does not take account of the Netherlands Government's reply to the reasoned opinion cannot constitute a ground of inadmissibility. The period set in the reasoned opinion serves merely to give the Member State to which it is addressed a last opportunity to conform with the Commission's point of view. Besides, the only new element in the letter, which was brought to its knowledge during the present proceedings, was the statement that three more territories had been classified as SPAs in the meantime. The Commission says that it did in fact take that into account in its application.

14 The Court points out that the procedure laid down in Article 169 of the Treaty comprises two consecutive stages, the pre-litigation or administrative stage and the contentious stage before the Court (see the order in Case C-266/94 *Commission* v *Spain* [1995] ECR I-1975, paragraph 15).

15 Under the first paragraph of Article 169, '[i]f the Commission considers that a Member State has failed to fulfil an obligation under this Treaty, it shall deliver a reasoned opinion on the matter after giving the State concerned the opportunity to submit its observations'.

16 The aim of the pre-litigation procedure is thus to give the Member State an opportunity to justify its position or, as the case may be, to comply of its own accord with the requirements of the Treaty. If that attempt to reach a settlement proves unsuccessful, the Member State is requested to comply with its obligations as set out in the reasoned opinion which concludes the pre-litigation procedure provided for in Article 169, within the period prescribed in that opinion (see *inter alia* Case 74/82 *Commission* v *Ireland* [1984] ECR 317, paragraph 13, and Case 85/85 *Commission* v *Belgium* [1986] ECR 1149, paragraph 11).

17 As the Court has previously held, the proper conduct of the pre-litigation procedure constitutes an essential guarantee intended by the Treaty not only to protect the rights of the Member State concerned but also to ensure that any contentious procedure will have a clearly defined dispute as its subject-matter (see the order in *Commission* v *Spain*, cited above, paragraph 17, and the judgment in Case C-159/94 *Commission* v *France* [1997] ECR I-5815, paragraph 15).

18 It should be borne in mind that the subject-matter of an action for failure to fulfil obligations is determined by the Commission's reasoned opinion (see Case 154/85 *Commission* v *Italy* [1987] ECR 2717, paragraph 6).

19 In the present case, it is not disputed that the reasoned opinion and the procedure leading up to it were properly conducted.
