WORKSHOP ON THE INTERACTION BETWEEN THE EIA AND THE NATURE DIRECTIVES

413DV142 Trier, 13-15 November 2013

Background Documentation

A. European Nature Protection Law

	EU Documents:	
01	DIRECTIVE 2009/147/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 30 November 2009 on the conservation of wild birds (Birds Directive)	
02	COUNCIL REGULATION (EC) No 1782/2003 of 29 September 2003 establishing common rules for direct support schemes under the common agricultural policy and establishing certain support schemes for farmers and amending Regulations (EEC) No 2019/93, (EC) No 1452/2001, (EC) No 1453/2001, (EC) No 1454/2001, (EC) No 1868/94, (EC) No 1251/1999, (EC) No 1254/1999, (EC) No 1673/2000, (EEC) No 2358/71 and (EC) No 2529/2001	
03	COUNCIL REGULATION (EC) No 338/97 of 9 December 1996 on the protection of species of wild fauna and flora by regulating trade therein	
04	COUNCIL DIRECTIVE 92/43/EEC of May 1992 on the conservation of natural habitats and of wild fauna and flora (Habitats Directive)	
05	COUNCIL DECISION 82/72/EEC of 3 December 1981 concerning the conclusion of the Convention on the conservation of European wildlife and natural habitats (Bern Convention)	
06	Guidance document on hunting under Council Directive 79/409/EEC on the conservation of wild birds "The Birds Directive"	
07	MANAGING NATURA 2000 SITES: The provisions of Article 6 of the 'Habitats' Directive 92/43/EEC	
08	Guidance document on Article 6(4) of the 'Habitats Directive' 92/43/EEC	
09	The implementation of the Birds and Habitats Directives in estuaries and coastal zones	
10	Wind energy developments and Natura 2000	
11	Guidance document on the strict protection of animal species of Community interest under the Habitats Directive 92/43/EEC	
12	Natura 2000 and forests 'Challenges and opportunities'	
13	Sustainable tourism and Natura 2000: Guidelines, initiatives and good practices in Europe	
14	Guidelines for the establishment of the Natura 2000 network in the	

	marine environment: Application of the Habitats and Birds Directives	
15	Appendix 1 : Marine Habitat types definitions. Update of "Interpretation Manual of European Union Habitats"	
16	Appendix 2: Lists of existing marine Habitat types and Species for different Member States	
17	Appendix 3: Examples of the technique of the use of matrix as a management tool for decision-making.	
18	Appendix 4 I: Good experiences and examples of implementation of Natura 2000 in the marine environment including LIFE fund actions in the marine environment	
19	Appendix 4 II: LIFE and the marine environment: Promoting sustainable management of Europe's seas	
20	Appendix 5: Bibliography	
	Selected CJEU Case Law	
21	C-258/11 Judgment of the Court (Third Chamber) of 11 April 2013. Peter Sweetman and Others v An Bord Pleanála. Reference for a preliminary ruling: Supreme Court - Ireland.	
22	C-43/10 Judgment of the Court (Grand Chamber) of 11 September 2012. Nomarchiaki Aftodioikisi Aitoloakarnanias and Others v Ypourgos Perivallontos, Chorotaxias kai Dimosion ergon and Others.	
23	C-340/10 Judgment of the Court (Fourth Chamber) of 15 March 2012, European Commission v Republic of Cyprus.	
24	C-182/10 Judgment of the Court (Fourth Chamber) of 16 February 2012, Marie-Noëlle Solvay and Others v Région wallonne.	
25	C-404/09 Judgment of the Court (Fourth Chamber) of 24 November 2011, European Commission v Kingdom of Spain.	
26	C-383/09 Judgment of the Court (Fourth Chamber) of 9 June 2011, European Commission v French Republic.	
27	C-308/08 Judgment of the Court (Fourth Chamber) of 20 May 2010, European Commission v Kingdom of Spain.	
28	C-241/08 Judgment of the Court (Second Chamber) of 4 March 2010, European Commission v French Republic.	
29	C-226/08 Judgment of the Court (Second Chamber) of 14 January 2010, Stadt Papenburg v Bundesrepublik Deutschland.	
30	C-418/04 Judgment of the Court (Second Chamber) of 13 December	

	2007, Commission of the European Communities v Ireland.	
31	C-179/06 Judgment of the Court (Fourth Chamber) of 4 October 2007, Commission of the European Communities v Italian Republic.	
32	C-304/05 Judgment of the Court (Fourth Chamber) of 20 September 2007, Commission of the European Communities v Italian Republic.	
33	C-235/04 Judgment of the Court (Second Chamber) of 28 June 2007, Commission of the European Communities v Kingdom of Spain.	
34	C-342/05 Judgment of the Court (Second Chamber) of 14 June 2007, Commission of the European Communities v Republic of Finland.	
35	C-508/04 Judgment of the Court (Fourth Chamber) of 10 May 2007, Commission of the European Communities v Republic of Austria.	
36	C-183/05 Judgment of the Court (Second Chamber) of 11 January 2007, Commission of the European Communities v Ireland.	
37	C-418/05 P Order of the Court (Sixth Chamber) of 7 November 2006, Centro Provincial de Jóvenes Agricultores de Jaén (ASAJA) and Others v Council of the European Union.	
38	C-239/04 Judgment of the Court (Second Chamber) of 26 October 2006, Commission of the European Communities v Portuguese Republic.	
39	C-244/05 Judgment of the Court (Second Chamber) of 14 September 2006, Bund Naturschutz in Bayern eV and Others v Freistaat Bayern.	
40	C-191/05 Judgment of the Court (Second Chamber) of 13 July 2006, Commission of the European Communities v Portuguese Republic.	
41	C-221/04 Judgment of the Court (Second Chamber) of 18 May 2006, Commission of the European Communities v Kingdom of Spain.	
42	C-209/04 Judgment of the Court (Second Chamber) of 23 March 2006, Commission of the European Communities v Republic of Austria.	
43	C-518/04 Judgment of the Court (Fifth Chamber) of 16 March 2006, Commission of the European Communities v Hellenic Republic.	

44	C-98/03 Judgment of the Court (Second Chamber) of 10 January 2006, Commission of the European Communities v Federal Republic of Germany.	
45	C-6/04 Judgment of the Court (Second Chamber) of 20 October 2005, Commission of the European Communities v United Kingdom of Great Britain and Northern Ireland.	
46	C-441/03 Judgment of the Court (Second Chamber) of 14 April 2005, Commission of the European Communities v Kingdom of the Netherlands.	
47	C-117/03 Judgment of the Court (Second Chamber) of 13 January 2005, Società Italiana Dragaggi SpA and Others v Ministero delle Infrastrutture e dei Trasporti and Regione Autonoma Friuli Venezia Giulia.	
48	C-127/02 Judgment of the Court (Grand Chamber) of 7 September 2004, Landelijke Vereniging tot Behoud van de Waddenzee and Nederlandse Vereniging tot Bescherming van Vogels v Staatssecretaris van Landbouw, Natuurbeheer en Visserij.	
49	C-407/03 Judgment of 15 July 2004, Commission v Finland.	
50	C-143/02 Judgment of the Court (Third Chamber) of 20 March 2003, Commission of the European Communities v Italian Republic.	
51	C-75/01 Judgment of the Court (Sixth Chamber) of 13 February 2003, Commission of the European Communities v Grand Duchy of Luxemburg.	
52	C-103/00 Judgment of the Court (Sixth Chamber) of 30 January 2002, Commission of the European Communities v Hellenic Republic.	
53	C-374/98 Judgment of the Court (Sixth Chamber) of 7 December 2000, Commission of the European Communities v French Republic.	
54	C-371/98 Judgment of the Court of 7 November 2000, The Queen v Secretary of State for the Environment, Transport and the Regions, ex parte First Corporate Shipping Ltd, interveners: World Wide Fund for Nature UK (WWF) and Avon Wildlife Trust.	
55	C-256/98 Judgment of the Court (Fifth Chamber) of 6 April 2000, Commission of the European Communities v French Republic.	
56	C-3/96 Judgment of the Court of 19 May 1998, Commission of the European Communities v Kingdom of the Netherlands.	
57	C-44/95 Judgment of the Court of 11 July 1996, Regina v Secretary of State for the Environment, ex parte: Royal Society for the Protection of Birds.	

58	C-57/89 Judgment of the Court of 28 February 1991. Commission of the European Communities v Federal Republic of Germany.	
59	C-396/92 Judgment of the Court of 9 August 1994. Bund Naturschutz in Bayern e.V. and Richard Stahnsdorf and others v Freistaat Bayern, Stadt Vilsbiburg and Landkreis Landshut.	

B. Environmental Impact Assessment

	EU Documents:	
60	Proposal for a DIRECTIVE OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 26 October 2012 amending Directive 2011/92/EU on the assessment of the effects of certain public and private projects on the environment	
61	DIRECTIVE 2011/92/EU OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 13 December 2011 on the assessment of the effects of certain public and private projects on the environment	
62	DIRECTIVE 2003/35/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 26 May 2003 providing for public participation in respect of the drawing up of certain plans and programmes relating to the environment and amending with regard to public participation and access to justice	
63	DIRECTIVE 2001/42/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 27 June 2001 on the assessment of the effects of certain plans and programmes on the environment (SEA Directive)	
	Selected CJEU Case Law	
64	C-128/09 Judgment of the Court (Grand Chamber) of 18 October 2011, Antoine Boxus and Willy Roua (C-128/09), Guido Durlet and Others (C-129/09), Paul Fastrez and Henriette Fastrez (C-130/09), Philippe Daras (C-131/09), Association des riverains et habitants des communes proches de l'aéroport BSCA (Brussels South Charleroi Airport) (ARACh) (C-134/09 and C-135/09), Bernard Page (C-134/09) and Léon L'Hoir and Nadine Dartois (C-135/09) v Région wallonne.	
65	C-75/08 Judgment of the Court (Second Chamber) of 30 April 2009, The Queen, on the application of Christopher Mellor v Secretary of State for Communities and Local Government.	
66	C-142/07 Judgment of the Court (Third Chamber) of 25 July 2008, Ecologistas en Acción-CODA v Ayuntamiento de Madrid.	
67	C-156/07 Order of the Court (Sixth Chamber) of 10 July 2008, Salvatore Aiello and Others v Regione Lombardia and Others.	
68	C-215/06 Judgment of the Court (Second Chamber) of 3 July 2008,	

	Commission of the European Communities v Ireland.	
69	C-508/03 Judgment of the Court (First Chamber) of 4 May 2006, Commission of the European Communities v United Kingdom of Great Britain and Northern Ireland.	
70	C-290/03 Judgment of the Court (First Chamber) of 4 May 2006, The Queen, on the application of: Diane Barker v London Borough of Bromley.	
71	C-227/01 Judgment of the Court (Second Chamber) of 16 September 2004, Commission of the European Communities v Kingdom of Spain.	
72	C-87/02 Judgment of the Court (First Chamber) of 10 June 2004, Commission of the European Communities v Italian Republic.	
73	C-201/02 Judgment of the Court (Fifth Chamber) of 7 January 2004, The Queen, on the application of Delena Wells v Secretary of State for Transport, Local Government and the Regions.	
74	C-230/00 Judgment of the Court (Third Chamber) of 14 June 2001, Commission of the European Communities v Kingdom of Belgium.	
75	C-392/96 Judgment of the Court (Fifth Chamber) of 21 September 1999, Commission of the European Communities v Ireland.	
76	C-435/97 Judgment of the Court (Sixth Chamber) of 16 September 1999, World Wildlife Fund (WWF) and Others v Autonome Provinz Bozen and Others.	
77	C-301/95 Judgment of the Court (Sixth Chamber) of 22 October 1998, Commission of the European Communities v Federal Republic of Germany.	
78	C-72/95 Judgment of the Court of 24 October 1996, Aannemersbedrijf P.K. Kraaijeveld BV e.a. v Gedeputeerde Staten van Zuid-Holland.	
79	C-133/94 Judgment of the Court (Sixth Chamber) of 2 May 1996, Commission of the European Communities v Kingdom of Belgium.	
80	C-431/92 Judgment of the Court of 11 August 1995, Commission of the European Communities v Federal Republic of Germany.	
81	C-186/91 Judgment of the Court of 10 March 1993, Commission of the European Communities v Kingdom of Belgium.	
82	C-360/87 Judgment of the Court of 28 February 1991, Commission of the European Communities v Italian Republic.	
83	C-96/81 Judgment of the Court of 25 May 1982, Commission of the European Communities v Kingdom of the Netherlands.	
84	C-103/88 Judgment of the Court of 22 June 1989, Fratelli Costanzo SpA v	

	Comune di Milano.	
85	C-427/07 Judgment of the Court (Second Chamber) of 16 July 2009. Commission of the European Communities v Ireland.	
86	C-205/08 Judgment of the Court (Second Chamber) of 10 December 2009. Umweltanwalt von Kärnten v Kärntner Landesregierung.	
87	C-263/08 Judgment of the Court (Second Chamber) of 15 October 2009. Djurgården-Lilla Värtans Miljöskyddsförening v Stockholms kommun genom dess marknämnd.	
88	C-115/09 Judgment of the Court (Fourth Chamber) of 12 May 2011. Bund für Umwelt und Naturschutz Deutschland, Landesverband Nordrhein-Westfalen eV v Bezirksregierung Arnsberg.	
89	C-420/11 Judgment of the Court (Fourth Chamber) of 14 March 2013. Jutta Leth v Republik Österreich and Land Niederösterreich.	
90	C-244/12 Judgment of the Court (Fifth Chamber) of 21 March 2013. Salzburger Flughafen GmbH v Umweltsenat.	
	International Case law	
91	INTERNATIONAL COURT OF JUSTICE JUDGMENT OF 20 APRIL 2010, PULP MILLS ON THE RIVER URUGUAY (ARGENTINA v. URUGUAY)	
92	INTERNATIONAL COURT OF JUSTICE JUDGMENT OF 25 SEPTEMBER 1997 CASE CONCERNING THE GABCIKOVO-NAGYMAROS PROJECT (HUNGARYISLOVAKIA)	
93	REPORTS OF INTERNATIONAL ARBITRAL AWARDS of 16 April 1938 and 11 March 1941, Trail smelter case (United States, Canada)	

C. The Role of the National Judge in the European Judicial System and the Procedures of the CJEU

	EU Documents	
94	Selected articles from the consolidated versions of the Treaty on European Union and the Treaty on the functioning of the European Union, including Statute of the Court of Justice of the European Union (OJ C 83 of 30 March 2010, p.1)

IV

(Acts adopted before 1 December 2009 under the EC Treaty, the EU Treaty and the Euratom Treaty)

DIRECTIVE 2009/147/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

of 30 November 2009

on the conservation of wild birds

(codified version)

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty establishing the European Community, and in particular Article 175(1) thereof,

Having regard to the proposal from the Commission,

Having regard to the opinion of the European Economic and Social Committee [1],

Acting in accordance with the procedure laid down in Article 251 of the Treaty [2],

Whereas:

(1) Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds [3] has been substantially amended several times [4]. In the interests of clarity and rationality the said Directive should be codified.

(2) Decision No 1600/2002/EC of the European Parliament and of the Council of 22 July 2002 laying down the Sixth Community Environment Action Programme [5] calls for specific action for biodiversity, including to protect birds and their habitats.

(3) A large number of species of wild birds naturally occurring in the European territory of the Member States are declining in number, very rapidly in some cases. This decline represents a serious threat to the conservation of the natural environment, particularly because of the biological balances threatened thereby.

(4) The species of wild birds naturally occurring in the European territory of the Member States are mainly migratory species. Such species constitute a common heritage and effective bird protection is typically a trans-frontier environment problem entailing common responsibilities.

(5) The conservation of the species of wild birds naturally occurring in the European territory of the Member States is necessary in order to attain the Community's objectives regarding the improvement of living conditions and sustainable development.

(6) The measures to be taken must apply to the various factors which may affect the numbers of birds, namely the repercussions of man's activities and in particular the destruction and pollution of their habitats, capture and killing by man and the trade resulting from such practices; the stringency of such measures should be adapted to the particular situation of the various species within the framework of a conservation policy.

(7) Conservation is aimed at the long-term protection and management of natural resources as an integral part of the heritage of the peoples of Europe. It makes it possible to control natural resources and governs their use on the basis of the measures necessary for the maintenance and adjustment of the natural balances between species as far as is reasonably possible.

(8) The preservation, maintenance or restoration of a sufficient diversity and area of habitats is essential to the conservation of all species of birds. Certain species of birds should be the subject of special conservation measures concerning their habitats in order to ensure their survival and reproduction in their area of distribution. Such measures must also take account of migratory species and be coordinated with a view to setting up a coherent whole.

---

[1] Opinion of 10 June 2009 (not yet published in the Official Journal).
[2] Opinion of the European Parliament of 20 October 2009 (not yet published in the Official Journal) and Council Decision of 26 November 2009.
[3] OJ L 103, 25.4.1979, p. 1.
[4] See Annex VI, Part A.
[5] OJ L 242, 10.9.2002, p. 1.

(9) In order to prevent commercial interests from exerting a possible harmful pressure on exploitation levels, it is necessary to impose a general ban on marketing and to restrict all derogation to those species whose biological status so permits, account being taken of the specific conditions obtaining in the different regions.

(10) Because of their high population level, geographical distribution and reproductive rate in the Community as a whole, certain species may be hunted, which constitutes acceptable exploitation where certain limits are established and respected, as such hunting must be compatible with maintenance of the population of these species at a satisfactory level.

(11) The various means, devices or methods of large-scale or non-selective capture or killing and hunting with certain forms of transport must be banned because of the excessive pressure which they exert or may exert on the numbers of the species concerned.

(12) Because of the importance which may be attached to certain specific situations, provision should be made for the possibility of derogations on certain conditions and subject to monitoring by the Commission.

(13) The conservation of birds and, in particular, migratory birds still presents problems which call for scientific research. Such research will also make it possible to assess the effectiveness of the measures taken.

(14) Care should be taken in consultation with the Commission to see that the introduction of any species of wild bird not naturally occurring in the European territory of the Member States does not cause harm to local flora and fauna.

(15) The Commission will every three years prepare and transmit to the Member States a composite report based on information submitted by the Member States on the application of national provisions introduced pursuant to this Directive.

(16) The measures necessary for the implementation of this Directive should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission ([1]).

(17) In particular, the Commission should be empowered to amend certain Annexes in the light of scientific and technical progress. Since those measures are of general scope and are designed to amend non-essential elements of this Directive, they must be adopted in accordance with the regulatory procedure with scrutiny provided for in Article 5a of Decision 1999/468/EC.

(18) This Directive should be without prejudice to the obligations of the Member States relating to the time limits for transposition into national law of the directives set out in Annex VI, Part B,

HAVE ADOPTED THIS DIRECTIVE:

Article 1

1. This Directive relates to the conservation of all species of naturally occurring birds in the wild state in the European territory of the Member States to which the Treaty applies. It covers the protection, management and control of these species and lays down rules for their exploitation.

2. It shall apply to birds, their eggs, nests and habitats.

Article 2

Member States shall take the requisite measures to maintain the population of the species referred to in Article 1 at a level which corresponds in particular to ecological, scientific and cultural requirements, while taking account of economic and recreational requirements, or to adapt the population of these species to that level.

Article 3

1. In the light of the requirements referred to in Article 2, Member States shall take the requisite measures to preserve, maintain or re-establish a sufficient diversity and area of habitats for all the species of birds referred to in Article 1.

2. The preservation, maintenance and re-establishment of biotopes and habitats shall include primarily the following measures:

(a) creation of protected areas;

(b) upkeep and management in accordance with the ecological needs of habitats inside and outside the protected zones;

(c) re-establishment of destroyed biotopes;

(d) creation of biotopes.

([1]) OJ L 184, 17.7.1999, p. 23.

Article 4

1. The species mentioned in Annex I shall be the subject of special conservation measures concerning their habitat in order to ensure their survival and reproduction in their area of distribution.

In this connection, account shall be taken of:

(a) species in danger of extinction;

(b) species vulnerable to specific changes in their habitat;

(c) species considered rare because of small populations or restricted local distribution;

(d) other species requiring particular attention for reasons of the specific nature of their habitat.

Trends and variations in population levels shall be taken into account as a background for evaluations.

Member States shall classify in particular the most suitable territories in number and size as special protection areas for the conservation of these species in the geographical sea and land area where this Directive applies.

2. Member States shall take similar measures for regularly occurring migratory species not listed in Annex I, bearing in mind their need for protection in the geographical sea and land area where this Directive applies, as regards their breeding, moulting and wintering areas and staging posts along their migration routes. To this end, Member States shall pay particular attention to the protection of wetlands and particularly to wetlands of international importance.

3. Member States shall send the Commission all relevant information so that it may take appropriate initiatives with a view to the coordination necessary to ensure that the areas provided for in paragraphs 1 and 2 form a coherent whole which meets the protection requirements of these species in the geographical sea and land area where this Directive applies.

4. In respect of the protection areas referred to in paragraphs 1 and 2, Member States shall take appropriate steps to avoid pollution or deterioration of habitats or any disturbances affecting the birds, in so far as these would be significant having regard to the objectives of this Article. Outside these protection areas, Member States shall also strive to avoid pollution or deterioration of habitats.

Article 5

Without prejudice to Articles 7 and 9, Member States shall take the requisite measures to establish a general system of protection for all species of birds referred to in Article 1, prohibiting in particular:

(a) deliberate killing or capture by any method;

(b) deliberate destruction of, or damage to, their nests and eggs or removal of their nests;

(c) taking their eggs in the wild and keeping these eggs even if empty;

(d) deliberate disturbance of these birds particularly during the period of breeding and rearing, in so far as disturbance would be significant having regard to the objectives of this Directive;

(e) keeping birds of species the hunting and capture of which is prohibited.

Article 6

1. Without prejudice to paragraphs 2 and 3, Member States shall prohibit, for all the bird species referred to in Article 1, the sale, transport for sale, keeping for sale and the offering for sale of live or dead birds and of any readily recognisable parts or derivatives of such birds.

2. The activities referred to in paragraph 1 shall not be prohibited in respect of the species referred to in Annex III, Part A, provided that the birds have been legally killed or captured or otherwise legally acquired.

3. Member States may, for the species listed in Annex III, Part B, allow within their territory the activities referred to in paragraph 1, making provision for certain restrictions, provided that the birds have been legally killed or captured or otherwise legally acquired.

Member States wishing to grant such authorisation shall first of all consult the Commission with a view to examining jointly with the latter whether the marketing of specimens of such species would result or could reasonably be expected to result in the population levels, geographical distribution or reproductive rate of the species being endangered throughout the Community. Should this examination prove that the intended authorisation will, in the view of the Commission, result in any one of the aforementioned species being thus endangered or in the possibility of their being thus endangered, the Commission shall forward a reasoned recommendation to the Member State concerned stating its opposition to the marketing of the species in question. Should the Commission consider that no such risk exists, it shall inform the Member State concerned accordingly.

The Commission's recommendation shall be published in the *Official Journal of the European Union*.

Member States granting authorisation pursuant to this paragraph shall verify at regular intervals that the conditions governing the granting of such authorisation continue to be fulfilled.

Article 7

1. Owing to their population level, geographical distribution and reproductive rate throughout the Community, the species listed in Annex II may be hunted under national legislation. Member States shall ensure that the hunting of these species does not jeopardise conservation efforts in their distribution area.

2. The species referred to in Annex II, Part A may be hunted in the geographical sea and land area where this Directive applies.

3. The species referred to in Annex II, Part B may be hunted only in the Member States in respect of which they are indicated.

4. Member States shall ensure that the practice of hunting, including falconry if practised, as carried on in accordance with the national measures in force, complies with the principles of wise use and ecologically balanced control of the species of birds concerned and that this practice is compatible as regards the population of these species, in particular migratory species, with the measures resulting from Article 2.

They shall see in particular that the species to which hunting laws apply are not hunted during the rearing season or during the various stages of reproduction.

In the case of migratory species, they shall see in particular that the species to which hunting regulations apply are not hunted during their period of reproduction or during their return to their rearing grounds.

Member States shall send the Commission all relevant information on the practical application of their hunting regulations.

Article 8

1. In respect of the hunting, capture or killing of birds under this Directive, Member States shall prohibit the use of all means, arrangements or methods used for the large-scale or non-selective capture or killing of birds or capable of causing the local disappearance of a species, in particular the use of those listed in Annex IV, point (a).

2. Moreover, Member States shall prohibit any hunting from the modes of transport and under the conditions mentioned in Annex IV, point (b).

Article 9

1. Member States may derogate from the provisions of Articles 5 to 8, where there is no other satisfactory solution, for the following reasons:

(a) — in the interests of public health and safety,

— in the interests of air safety,

— to prevent serious damage to crops, livestock, forests, fisheries and water,

— for the protection of flora and fauna;

(b) for the purposes of research and teaching, of re-population, of re-introduction and for the breeding necessary for these purposes;

(c) to permit, under strictly supervised conditions and on a selective basis, the capture, keeping or other judicious use of certain birds in small numbers.

2. The derogations referred to in paragraph 1 must specify:

(a) the species which are subject to the derogations;

(b) the means, arrangements or methods authorised for capture or killing;

(c) the conditions of risk and the circumstances of time and place under which such derogations may be granted;

(d) the authority empowered to declare that the required conditions obtain and to decide what means, arrangements or methods may be used, within what limits and by whom;

(e) the controls which will be carried out.

3. Each year the Member States shall send a report to the Commission on the implementation of paragraphs 1 and 2.

4. On the basis of the information available to it, and in particular the information communicated to it pursuant to paragraph 3, the Commission shall at all times ensure that the consequences of the derogations referred to in paragraph 1 are not incompatible with this Directive. It shall take appropriate steps to this end.

Article 10

1. Member States shall encourage research and any work required as a basis for the protection, management and use of the population of all species of bird referred to in Article 1. Particular attention shall be paid to research and work on the subjects listed in Annex V.

2. Member States shall send the Commission any information required to enable it to take appropriate measures for the coordination of the research and work referred to in paragraph 1.

Article 11

Member States shall see that any introduction of species of bird which do not occur naturally in the wild state in the European territory of the Member States does not prejudice the local flora and fauna. In this connection they shall consult the Commission.

Article 12

1. Member States shall forward to the Commission every three years, starting from 7 April 1981, a report on the implementation of national provisions taken under this Directive.

2. The Commission shall prepare every three years a composite report based on the information referred to in paragraph 1. That part of the draft report covering the information supplied by a Member State shall be forwarded to the authorities of the Member State in question for verification. The final version of the report shall be forwarded to the Member States.

Article 13

Application of the measures taken pursuant to this Directive may not lead to deterioration in the present situation as regards the conservation of the species of birds referred to in Article 1.

Article 14

Member States may introduce stricter protective measures than those provided for under this Directive.

Article 15

Such amendments as are necessary for adapting Annexes I and V to technical and scientific progress shall be adopted. Those measures, designed to amend non-essential elements of this Directive, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 16(2).

Article 16

1. The Commission shall be assisted by the Committee for Adaptation to Technical and Scientific Progress.

2. Where reference is made to this paragraph, Article 5a(1) to (4) and Article 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

Article 17

Member States shall communicate to the Commission the texts of the main provisions of national law which they adopt in the field governed by this Directive.

Article 18

Directive 79/409/EEC, as amended by the acts listed in Annex VI, Part A, is repealed, without prejudice to the obligations of the Member States relating to the time limits for transposition into national law of the Directives set out in Annex VI, Part B.

References to the repealed Directive shall be construed as references to this Directive and shall be read in accordance with the correlation table in Annex VII.

Article 19

This Directive shall enter into force on the 20th day following its publication in the *Official Journal of the European Union*.

Article 20

This Directive is addressed to the Member States.

Done at Brussels, 30 November 2009.

ANNEX I

GAVIIFORMES

Gaviidae

- *Gavia stellata*
- *Gavia arctica*
- *Gavia immer*

PODICIPEDIFORMES

Podicipedidae

- *Podiceps auritus*

PROCELLARIIFORMES

Procellariidae

- *Pterodroma madeira*
- *Pterodroma feae*
- *Bulweria bulwerii*
- *Calonectris diomedea*
- *Puffinus puffinus mauretanicus (Puffinus mauretanicus)*
- *Puffinus yelkouan*
- *Puffinus assimilis*

Hydrobatidae

- *Pelagodroma marina*
- *Hydrobates pelagicus*
- *Oceanodroma leucorhoa*
- *Oceanodroma castro*

PELECANIFORMES

Pelecanidae

- *Pelecanus onocrotalus*
- *Pelecanus crispus*

Phalacrocoracidae

- *Phalacrocorax aristotelis desmarestii*
- *Phalacrocorax pygmeus*

CICONIIFORMES

Ardeidae

- *Botaurus stellaris*
- *Ixobrychus minutus*
- *Nycticorax nycticorax*
- *Ardeola ralloides*
- *Egretta garzetta*
- *Egretta alba (Ardea alba)*
- *Ardea purpurea*

Ciconiidae

- *Ciconia nigra*
- *Ciconia ciconia*

Threskiornithidae

- *Plegadis falcinellus*
- *Platalea leucorodia*

PHOENICOPTERIFORMES

Phoenicopteridae

- *Phoenicopterus ruber*

ANSERIFORMES

Anatidae

- *Cygnus bewickii (Cygnus columbianus bewickii)*
- *Cygnus cygnus*
- *Anser albifrons flavirostris*
- *Anser erythropus*
- *Branta leucopsis*
- *Branta ruficollis*
- *Tadorna ferruginea*
- *Marmaronetta angustirostris*
- *Aythya nyroca*
- *Polysticta stelleri*
- *Mergus albellus (Mergellus albellus)*
- *Oxyura leucocephala*

FALCONIFORMES

Pandionidae

- *Pandion haliaetus*

Accipitridae

- *Pernis apivorus*
- *Elanus caeruleus*
- *Milvus migrans*
- *Milvus milvus*
- *Haliaeetus albicilla*
- *Gypaetus barbatus*
- *Neophron percnopterus*
- *Gyps fulvus*
- *Aegypius monachus*
- *Circaetus gallicus*
- *Circus aeruginosus*
- *Circus cyaneus*
- *Circus macrourus*
- *Circus pygargus*
- *Accipiter gentilis arrigonii*
- *Accipiter nisus granti*
- *Accipiter brevipes*
- *Buteo rufinus*
- *Aquila pomarina*
- *Aquila clanga*
- *Aquila heliaca*
- *Aquila adalberti*

Aquila chrysaetos

ANNEX IV

(a) — Snares (with the exception of Finland and Sweden for the capture of *Lagopus lagopus lagopus* and *Lagopus mutus* north of latitude 58° N), limes, hooks, live birds which are blind or mutilated used as decoys, tape recorders, electrocuting devices,

— artificial light sources, mirrors, devices for illuminating targets, sighting devices for night shooting comprising an electronic image magnifier or image converter,

— explosives,

— nets, traps, poisoned or anaesthetic bait,

— semi-automatic or automatic weapons with a magazine capable of holding more than two rounds of ammunition;

(b) — aircraft, motor vehicles,

— boats driven at a speed exceeding five kilometres per hour. On the open sea, Member States may, for safety reasons, authorise the use of motor-boats with a maximum speed of 18 kilometres per hour. Member States shall inform the Commission of any authorisations granted.

ANNEX V

(a) National lists of species in danger of extinction or particularly endangered species, taking into account their geographical distribution.

(b) Listing and ecological description of areas particularly important to migratory species on their migratory routes and as wintering and nesting grounds.

(c) Listing of data on the population levels of migratory species as shown by ringing.

(d) Assessing the influence of methods of taking wild birds on population levels.

(e) Developing or refining ecological methods for preventing the type of damage caused by birds.

(f) Determining the role of certain species as indicators of pollution.

(g) Studying the adverse effect of chemical pollution on population levels of bird species.

ANNEX VI

PART A

REPEALED DIRECTIVE WITH LIST OF ITS SUCCESSIVE AMENDMENTS

(referred to in Article 18)

Council Directive 79/409/EEC (OJ L 103, 25.4.1979, p. 1)	
1979 Act of Accession, Annex I, point XIII.1.F (OJ L 291, 19.11.1979, p. 111)	
Council Directive 81/854/EEC (OJ L 319, 7.11.1981, p. 3)	
Commission Directive 85/411/EEC (OJ L 233, 30.8.1985, p. 33)	
1985 Act of Accession, Annex I, points X.1.(h) and X.6 (OJ L 302, 15.11.1985, p. 218)

COUNCIL REGULATION (EC) No 338/97

of 9 December 1996

on the protection of species of wild fauna and flora by regulating trade therein

THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty establishing the European Community, and in particular Article 130s (1) thereof,

Having regard to the proposal from the Commission [1],

Having regard to the opinion of the Economic and Social Committee [2],

Acting in accordance with the procedure laid down in Article 189c of the Treaty [3],

(1) Whereas Regulation (EEC) No 3626/82 [4] applies the Convention on International Trade in Endangered Species of Wild Fauna and Flora in the Community with effect from 1 January 1984; whereas the purpose of the Convention is to protect endangered species of fauna and flora through controls on international trade in specimens of those species;

(2) Whereas, in order to improve the protection of species of wild fauna and flora which are threatened by trade or likely to be so threatened, Regulation (EEC) No 3626/82 must be replaced by a Regulation taking account of the scientific knowledge acquired since its adoption and the current structure of trade; whereas, moreover, the abolition of controls at internal borders resulting from the Single Market necessitates the adoption of stricter trade control measures at the Community's external borders, with documents and goods being checked at the customs office at the border where they are introduced;

(3) Whereas the provisions of this Regulation do not prejudice any stricter measures which may be taken or maintained by Member States, in compliance with the Treaty, in particular with regard to the holding of specimens of species covered by this Regulation;

(4) Whereas it is necessary to lay down objective criteria for the inclusion of species of wild fauna and flora in the Annexes to this Regulation;

---

(1) OJ No C 26, 3.2.1992, p. 1, and OJ No C 131, 12.5.1994, p. 1.
(2) OJ No C 223, 31.8.1992, p. 19.
(3) Opinion of the European Parliament of 15 December 1995 (OJ No C 17, 22.1.1996, p. 430). Common position of the Council of 26 February 1996 (OJ No C 196, 6.7.1996, p. 58) and Decision of the European Parliament of 18 September 1996 (OJ No C 320, 28. 10. 1996).
(4) OJ No L 384, 31.12.1982, p. 1. Regulation as last amended by Commission Regulation (EC) No 558/95 (OJ No L 57, 15.3.1995, p. 1).

▼B

(5) Whereas the implementation of this Regulation necessitates the application of common conditions for the issue, use and presentation of documents relating to authorization of the introduction into the Community and the export or re-export from the Community of specimens of the species covered by this Regulation; whereas it is necessary to lay down specific provisions relating to the transit of specimens through the Community;

(6) Whereas it is for a management authority of the Member State of destination, assisted by the scientific authority of that Member State and, where appropriate, taking into account any opinion of the Scientific Review Group, to decide on the requests for introduction of specimens into the Community;

(7) Whereas it is necessary to supplement the provisions on re-export with a consultation procedure, in order to limit the risk of infringement;

(8) Whereas, in order to guarantee effective protection of species of wild fauna and flora, additional restrictions may be imposed on the introduction of specimens into, and the export thereof from, the Community; whereas, with regard to live specimens, these restrictions may be supplemented by restrictions at Community level on the holding or movement of such specimens within the Community;

(9) Whereas it is necessary to lay down specific provisions applicable to captive-born and bred, or artificially propagated specimens, to specimens which are personal or household effects, and to non-commercial loans, donations or exchanges between registered scientists and scientific institutions;

(10) Whereas there is a need, in order to ensure the broadest possible protection for species covered by this Regulation, to lay down provisions for controlling trade and movement of specimens within the Community, and the conditions for housing specimens; whereas the certificates issued under this Regulation, which contribute to controlling these activities, must be governed by common rules on their issue, validity and use;

(11) Whereas measures should be taken to minimize the adverse effects on live specimens of transport to their destination, from or within the Community;

▼B

(12) Whereas, to ensure effective controls and to facilitate customs procedures, customs offices should be designated, with trained personnel responsible for carrying out the necessary formalities and corresponding checks where specimens are introduced into the Community, in order to assign them a customs-approved treatment or use within the meaning of Council Regulation (EEC) No 2913/92 of 12 October 1992 establishing the Community Customs Code ([1]), or where they are exported or re-exported from the Community; whereas there should also be facilities guaranteeing that live specimens are adequately housed and cared for;

(13) Whereas the implementation of this Regulation also calls for the designation of management and scientific authorities by the Member States;

(14) Whereas informing the public and making them aware of the provisions of this Regulation, particularly at border crossing points, is likely to encourage compliance with these provisions;

(15) Whereas, in order to ensure effective enforcement of this Regulation, Member States should closely monitor compliance with its provisions and, to that end, cooperate closely between themselves and with the Commission; whereas this requires the communication of information relating to the implementation of this Regulation;

(16) Whereas the monitoring of levels of trade in the species of wild fauna and flora covered by this Regulation is of crucial importance for assessing the effects of trade on the conservation status of species; whereas detailed annual reports should be drawn up in a common format;

(17) Whereas, in order to guarantee compliance with this Regulation, it is important that Member States impose sanctions for infringements in a manner which is both sufficient and appropriate to the nature and gravity of the infringement;

(18) Whereas it is essential to lay down a Community procedure enabling the implementing provisions and amendments to the Annexes of this Regulation to be adopted within a suitable period; whereas a Committee must be set up to permit close and effective cooperation between the Member States and the Commission in this field;

(19) Whereas the multitude of biological and ecological aspects to be considered in the implementation of this Regulation requires the setting up of a Scientific Review Group, whose opinions will be forwarded by the Commission to the Committee and the management bodies of the Member States, to assist them in making their decisions,

([1]) OJ No L 302, 19.10.1992, p. 1. Regulation as last amended by the 1994 Act of Accession.

▼B

HAS ADOPTED THIS REGULATION:

Article 1

Object

The object of this Regulation is to protect species of wild fauna and flora and to guarantee their conservation by regulating trade therein in accordance with the following Articles.

This Regulation shall apply in compliance with the objectives, principles and provisions of the Convention defined in Article 2.

Article 2

Definitions

For the purposes of this Regulation:

(a) 'Committee' shall mean the Committee on Trade in Wild Fauna and Flora, established under Article 18;

(b) 'Convention' shall mean the Convention on International Trade in Endangered Species of Wild Fauna and Flora (Cites);

(c) 'country of origin' shall mean the country in which a specimen was taken from the wild, captive-bred or artificially propagated;

(d) 'import notification' shall mean the notification given by the importer or his agent or representative, at the time of the introduction into the Community of a specimen of a species included in Annexes C or D, on a form prescribed by the Commission in accordance with the procedure laid down in Article 18;

(e) 'introduction from the sea' shall mean the introduction into the Community of any specimen which was taken in, and is being introduced directly from, the marine environment not under the jurisdiction of any State, including the air-space above the sea and the sea-bed and subsoil beneath the sea;

(f) 'issuance' shall mean the completion of all procedures involved in preparing and validating a permit or certificate and its delivery to the applicant;

(g) 'management authority' shall mean a national administrative authority designated, in the case of a Member State, in accordance with Article 13(1)(a) or, in the case of a third country party to the Convention, in accordance with Article IX of the Convention;

(h) 'Member State of destination' shall mean the Member State of destination mentioned in the document used to export or re-export a specimen; in the event of introduction from the sea, it shall mean the Member State within whose jurisdiction the place of destination of a specimen lies;

(i) 'offering for sale' shall mean offering for sale and any action that may reasonably be construed as such, including advertising or causing to be advertised for sale and invitation to treat;

(j) 'personal or household effects' shall mean dead specimens, parts and derivatives thereof, that are the belongings of a private individual and that form, or are intended to form, part of his normal goods and chattels;

▼B

(k) ‘place of destination’ shall mean the place at which at the time of introduction into the Community, it is intended that specimens will normally be kept; in the case of live specimens, this shall be the first place where specimens are intended to be kept following any period of quarantine or other confinement for the purposes of sanitary checks and controls;

(l) ‘population’ shall mean a biologically or geographically distinct total number of individuals;

(m) ‘primarily commercial purposes’ shall mean all purposes the non-commercial aspects of which do not clearly predominate;

(n) ‘re-export from the Community’ shall mean export from the Community of any specimen that has previously been introduced;

(o) ‘reintroduction into the Community’ shall mean introduction into the Community of any specimen that has previously been exported or re-exported;

(p) ‘sale’ shall mean any form of sale. For the purposes of this Regulation, hire, barter or exchange shall be regarded as sale; cognate expressions shall be similarly construed;

(q) ‘scientific authority’ shall mean a scientific authority designated, in the case of a Member State, in accordance with Article 13(1)(b) or, in the case of a third country party to the Convention, in accordance with Article IX of the Convention;

(r) ‘Scientific Review Group’ shall mean the consultative body established under Article 17;

(s) ‘species’ shall mean a species, subspecies or population thereof;

(t) ‘specimen’ shall mean any animal or plant, whether alive or dead, of the species listed in Annexes A to D, any part or derivative thereof, whether or not contained in other goods, as well as any other goods which appear from an accompanying document, the packaging or a mark or label, or from any other circumstances, to be or to contain parts or derivatives of animals or plants of those species, unless such parts or derivatives are specifically exempted from the provisions of this Regulation or from the provisions relating to the Annex in which the species concerned is listed by means of an indication to that effect in the Annexes concerned.

A specimen will be considered to be a specimen of a species listed in Annexes A to D if it is, or is part of or derived from, an animal or plant at least one of whose ‘parents’ is of a species so listed. In cases where the ‘parents’ of such an animal or plant are of species listed in different Annexes, or of species only one of which is listed, the provisions of the more restrictive Annex shall apply. However, in the case of specimens of hybrid plants, if one of the ‘parents’ is of a species listed in Annex A, the provisions of the more restrictive Annex shall apply only if that species is annotated to that effect in the Annex;

(u) ‘trade’ shall mean the introduction into the Community, including introduction from the sea, and the export and re-export therefrom, as well as the use, movement and transfer of possession within the Community, including within a Member State, of specimens subject to the provisions of this Regulation;

▼B

(v) ‘transit’ shall mean the transport of specimens between two points outside the Community through the territory of the Community which are shipped to a named consignee and during which any interruption in the movement arises only from the arrangements necessitated by this form of traffic;

(w) ‘worked specimens that were acquired more than 50 years previously’ shall mean specimens that were significantly altered from their natural raw state for jewellery, adornment, art, utility, or musical instruments, more than 50 years before the entry into force of this Regulation and that have been, to the satisfaction of the management authority of the Member State concerned, acquired in such conditions. Such specimens shall be considered as worked only if they are clearly in one of the aforementioned categories and require no further carving, crafting or manufacture to effect their purpose;

(x) ‘checks at the time of introduction, export, re-export and transit’ shall mean documentary checks on the certificates, permits and notifications provided for in this Regulation and — in cases where Community provisions so provide or in other cases by representative sampling of the consignments — examination of the specimens, where appropriate accompanied by the taking of samples with a view to analysis or more detailed checks.

Article 3

Scope

1. Annex A shall contain:

(a) the species listed in Appendix I to the Convention for which the Member States have not entered a reservation;

(b) any species:

(i) which is, or may be, in demand for utilization in the Community or for international trade and which is either threatened with extinction or so rare that any level of trade would imperil the survival of the species;

or

(ii) which is in a genus of which most of the species or which is a species of which most of the subspecies are listed in Annex A in accordance with the criteria in subparagraphs (a) or (b)(i) and whose listing in the Annex is essential for the effective protection of those taxa.

2. Annex B shall contain:

(a) the species listed in Appendix II to the Convention, other than those listed in Annex A, for which the Member States have not entered a reservation;

(b) the species listed in Appendix I to the Convention for which a reservation has been entered;

▼B

(c) any other species not listed in Appendices I or II to the Convention:

(i) which is subject to levels of international trade that might not be compatible:

— with its survival or with the survival of populations in certain countries, or

— with the maintenance of the total population at a level consistent with the role of the species in the ecosystems in which it occurs:

or

(ii) whose listing in the Annex for reasons of similarity in appearance to other species listed in Annex A or Annex B, is essential in order to ensure the effectiveness of controls on trade in specimens of such species;

(d) species in relation to which it has been established that the introduction of live specimens into the natural habitat of the Community would constitute an ecological threat to wild species of fauna and flora indigenous to the Community.

3. Annex C shall contain:

(a) the species listed in Appendix III to the Convention, other than those listed in Annexes A or B, for which the Member States have not entered a reservation;

(b) the species listed in Appendix II to the Convention for which a reservation has been entered.

4. Annex D shall contain:

(a) species not listed in Annexes A to C which are imported into the Community in such numbers as to warrant monitoring;

(b) the species listed in Appendix III to the Convention for which a reservation has been entered.

5. Where the conservation status of species covered by this Regulation warrants their inclusion in one of the Appendices to the Convention, the Member States shall contribute to the necessary amendments.

Article 4

Introduction into the Community

1. The introduction into the Community of specimens of the species listed in Annex A shall be subject to completion of the necessary checks and the prior presentation, at the border customs office at the point of introduction, of an import permit issued by a management authority of the Member State of destination.

▼B

The import permit may be issued only in accordance with the restrictions established pursuant to paragraph 6 and when the following conditions have been met:

(a) the competent scientific authority, after considering any opinion by the Scientific Review Group, has advised that the introduction into the Community:

(i) would not have a harmful effect on the conservation status of the species or on the extent of the territory occupied by the relevant population of the species;

(ii) is taking place:

— for one of the purposes referred to in Article 8(3)(e), (f) and (g), or

— for other purposes which are not detrimental to the survival of the species concerned;

(b) (i) the applicant provides documentary evidence that the specimens have been obtained in accordance with the legislation on the protection of the species concerned which, in the case of import from a third country of specimens of a species listed in the Appendices to the Convention, shall be an export permit or re-export certificate, or copy thereof, issued in accordance with the Convention by a competent authority of the country of export or re-export;

(ii) however, the issuance of import permits for species listed in Annex A in accordance with Article 3(1)(a) shall not require such documentary evidence, but the original of any such import permit shall be withheld from the applicant pending presentation of the export permit or re-export certificate;

(c) the competent scientific authority is satisfied that the intended accommodation for a live specimen at the place of destination is adequately equipped to conserve and care for it properly;

(d) the management authority is satisfied that the specimen is not to be used for primarily commercial purposes;

(e) the management authority is satisfied, following consultation with the competent scientific authority, that there are no other factors relating to the conservation of the species which militate against issuance of the import permit; and

(f) in the case of introduction from the sea, the management authority is satisfied that any live specimen will be so prepared and shipped as to minimize the risk of injury, damage to health or cruel treatment.

2. The introduction into the Community of specimens of the species listed in Annex B shall be subject to completion of the necessary checks and the prior presentation, at the border customs office at the point of introduction, of an import permit issued by a management authority of the Member State of destination.

▼B

The import permit may be issued only in accordance with the restrictions established pursuant to paragraph 6 and when:

(a) the competent scientific authority, after examining available data and considering any opinion from the Scientific Review Group, is of the opinion that the introduction into the Community would not have a harmful effect on the conservation status of the species or on the extent of the territory occupied by the relevant population of the species, taking account of the current or anticipated level of trade. This opinion shall be valid for subsequent imports as long as the abovementioned aspects have not changed significantly;

(b) the applicant provides documentary evidence that the intended accommodation for a live specimen at the place of destination is adequately equipped to conserve and care for it properly;

(c) the conditions referred to in paragraph 1(b)(i), (e) and (f) have been met.

3. The introduction into the Community of specimens of the species listed in Annex C shall be subject to completion of the necessary checks and the prior presentation, at the border customs office at the point of introduction, of an import notification and:

(a) in the case of export from a country mentioned in relation to the species concerned in Annex C, the applicant shall provide documentary evidence, by means of an export permit issued in accordance with the Convention by an authority of that country competent for the purpose, that the specimens have been obtained in accordance with the national legislation on the conservation of the species concerned; or

(b) in the case of export from a country not mentioned in relation to the species concerned in Annex C or re-export from any country, the applicant shall present an export permit, a re-export certificate or a certificate of origin issued in accordance with the Convention by an authority of the exporting or re-exporting country competent for the purpose.

4. The introduction into the Community of specimens of the species listed in Annex D shall be subject to completion of the necessary checks and the prior presentation of an import notification at the border customs office at the point of introduction.

5. The conditions for the issuance of an import permit as referred to in paragraph 1(a) and (d) and in paragraph 2(a), (b) and (c) shall not apply to specimens for which the applicant provides documentary evidence:

(a) that they had previously been legally introduced into or acquired in the Community and that they are, modified or not, being reintroduced into the Community; or

(b) that they are worked specimens that were acquired more than 50 years previously.

▼M14

6. In consultation with the countries of origin concerned, in accordance with the regulatory procedure referred to in Article 18(2) and taking account of any opinion from the Scientific Review Group, the Commission may establish general restrictions, or restrictions relating to certain countries of origin, on the introduction into the Community:

▼B

(a) on the basis of the conditions referred to in paragraph 1(a)(i) or (e), of specimens of species listed in Annex A;

(b) on the basis of the conditions referred to in paragraph 1(e) or paragraph 2(a), of specimens of species listed in Annex B; and

(c) of live specimens of species listed in Annex B which have a high mortality rate during shipment or for which it has been established that they are unlikely to survive in captivity for a considerable proportion of their potential life span; or

(d) of live specimens of species for which it has been established that their introduction into the natural environment of the Community presents an ecological threat to wild species of fauna and flora indigenous to the Community.

The Commission shall on a quarterly basis publish a list of such restrictions, if any, in the *Official Journal of the European Communities*.

▼M14

7. Where special cases of transhipment, air transfer or rail transport occur following introduction into the Community, derogations from completion of the checks and presentations of import documents at the border customs office at the point of introduction which are referred to in paragraphs 1 to 4 shall be granted by the Commission in order to permit such checks and presentations to be made at another customs office designated in accordance with Article 12(1).

Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

▼B

Article 5

Export or re-export from the Community

1. The export or re-export from the Community of specimens of the species listed in Annex A shall be subject to completion of the necessary checks and the prior presentation, at the customs office at which the export formalities are completed, of an export permit or re-export certificate issued by a management authority of the Member State in which the specimens are located.

2. An export permit for specimens of the species listed in Annex A may be issued only when the following conditions have been met:

(a) the competent scientific authority has advised in writing that the capture or collection of the specimens in the wild or their export will not have a harmful effect on the conservation status of the species or on the extent of the territory occupied by the relevant population of the species;

▼B

(b) the applicant provides documentary evidence that the specimens have been obtained in accordance with the legislation in force on the protection of the species in question; where the application is made to a Member State other than the Member State of origin, such documentary evidence shall be furnished by means of a certificate stating that the specimen was taken from the wild in accordance with the legislation in force on its territory;

(c) the management authority is satisfied that:

(i) any live specimen will be so prepared and shipped as to minimize the risk of injury, damage to health or cruel treatment; and

(ii) — the specimens of species not listed in Annex I to the Convention will not be used for primarily commercial purposes, or

— in the case of export to a State party to the Convention of specimens of the species referred to in Article 3(1)(a) of this Regulation, an import permit has been issued;

and

(d) the management authority of the Member State is satisfied, following consultation with the competent scientific authority, that there are no other factors relating to the conservation of the species which militate against issuance of the export permit.

3. A re-export certificate may be issued only when the conditions referred to in paragraph 2 (c) and (d) have been met and when the applicant provides documentary evidence that the specimens:

(a) were introduced into the Community in accordance with the provisions of this Regulation;

(b) if introduced into the Community before the entry into force of this Regulation, were introduced in accordance with the provisions of Regulation (EEC) No 3626/82; or

(c) if introduced into the Community before 1984, entered international trade in accordance with the provisions of the Convention; or

(d) were legally introduced into the territory of a Member State before the provisions of the Regulations referred to in (a) and (b) or of the Convention became applicable to them, or became applicable in that Member State.

4. The export or re-export from the Community of specimens of the species listed in Annexes B and C shall be subject to completion of the necessary checks and the prior presentation, at the customs office at which the export formalities are completed, of an export permit or re-export certificate issued by a management authority of the Member State in whose territory the specimens are located.

▼B

An export permit may be issued only when the conditions referred to in paragraph 2 (a), (b), (c) (i) and (d) have been met.

A re-export certificate may be issued only when the conditions referred to in paragraph 2 (c) (i) and (d) and in paragraph 3 (a) to (d) have been met.

▼M14

5. Where an application for a re-export certificate concerns specimens introduced into the Community under an import permit issued by another Member State, the management authority must first consult the management authority which issued the permit. The consultation procedures and the cases in which consultation is necessary shall be established by the Commission. Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

▼B

6. The conditions for the issuance of an export permit or re-export certificate as referred to in paragraph 2 (a) and (c) (ii) shall not apply to:

(i) worked specimens that were acquired more than 50 years previously; or

(ii) dead specimens and parts and derivatives thereof for which the applicant provides documentary evidence that they were legally acquired before the provisions of this Regulation, or of Regulation (EEC) No 3626/82 or of the Convention became applicable to them.

7. (a) The competent scientific authority in each Member State shall monitor the issuance of export permits by that Member State for specimens of species listed in Annex B and actual exports of such specimens. Whenever such scientific authority determines that the export of specimens of any such species should be limited in order to maintain that species throughout its range at a level consistent with its role in the ecosystem in which it occurs, and well above the level at which that species might become eligible for inclusion in Annex A in accordance with Article 3 (1) (a) or (b) (i), the scientific authority shall advise the competent management authority, in writing, of suitable measures to be taken to limit the issuance of export permits for specimens of that species

▼M14

(b) Whenever a management authority is advised of the measures referred to in (a), it shall inform and send comments to the Commission which shall, if appropriate, recommend restrictions on exports of the species concerned in accordance with the regulatory procedure referred to in Article 18(2).

▼B

Article 6

Rejection of applications for permits and certificates referred to in Articles 4, 5 and 10

1. When a Member State rejects an application for a permit or certificate in a case of significance in respect of the objectives of this Regulation, it shall immediately inform the Commission of the rejection and of the reasons for rejection.

2. The Commission shall communicate information received in accordance with paragraph 1 to the other Member States in order to ensure uniform application of this Regulation.

3. When an application is made for a permit or certificate relating to specimens for which such an application has previously been rejected, the applicant must inform the competent authority to which the application is submitted of the previous rejection.

4. (a) Member States shall recognize the rejection of applications by the competent authorities of the other Member States, where such rejection is based on the provisions of this Regulation.

(b) However, this need not apply where the circumstances have significantly changed or where new evidence to support an application has become available. In such cases, if a management authority issues a permit or certificate, it shall inform the Commission thereof, stating the reasons for issuance.

Article 7

Derogations

1. *Specimens born and bred in captivity or artificially propagated*

(a) Save where Article 8 applies, specimens of species listed in Annex A that have been born and bred in captivity or artificially propagated shall be treated in accordance with the provisions applicable to specimens of species listed in Annex B.

(b) In the case of artificially propagated plants, the provisions of Articles 4 and 5 may be waived under special conditions laid down by the Commission, relating to:

(i) the use of phytosanitary certificates;

(ii) trade by registered commercial traders and by the scientific institutions referred to in paragraph 4 of this Article; and

(iii) trade in hybrids.

▼M14

(c) The criteria for determining whether a specimen has been born and bred in captivity or artificially propagated and whether for commercial purposes, as well as the special conditions referred to in (b), shall be specified by the Commission. Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

▼B

2. *Transit*

(a) By way of derogation from Article 4, where a specimen is in transit through the Community, checks and presentation at the border customs office at the point of introduction of the prescribed permits, certificates and notifications shall not be required.

(b) In the case of species listed in the Annexes in accordance with Article 3 (1) and Article 3 (2) (a) and (b), the derogation referred to in (a) shall apply only where a valid export or re-export document provided for by the Convention, relating to the specimens that it accompanies and specifying the destination of the specimens, has been issued by the competent authorities of the exporting or re-exporting third country.

▼M14

(c) If the document referred to in (b) has not been issued before export or re-export, the specimen must be seized and may, where applicable, be confiscated unless the document is submitted retrospectively in compliance with the conditions specified by the Commission. Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

3. *Personal and household effects*

By way of derogation from Articles 4 and 5, the provisions therein shall not apply to dead specimens, parts and derivatives of species listed in Annexes A to D which are personal or household effects being introduced into the Community, or exported or re-exported therefrom, in compliance with provisions that shall be specified by the Commission. Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

4. *Scientific institutions*

The documents referred to in Articles 4, 5, 8 and 9 shall not be required in the case of non-commercial loans, donations and exchanges between scientists and scientific institutions, registered by the management authorities of the States in which they are located, of herbarium specimens and other preserved, dried or embedded museum specimens, and of live plant material, bearing a label, the model for which has been determined in accordance with the regulatory procedure referred to in Article 18(2) or a similar label issued or approved by a management authority of a third country.

▼B

Article 8

Provisions relating to the control of commercial activities

1. The purchase, offer to purchase, acquisition for commercial purposes, display to the public for commercial purposes, use for commercial gain and sale, keeping for sale, offering for sale or transporting for sale of specimens of the species listed in Annex A shall be prohibited.

▼B

2. Member States may prohibit the holding of specimens, in particular live animals of the species listed in Annex A.

3. In accordance with the requirements of other Community legislation on the conservation of wild fauna and flora, exemption from the prohibitions referred to in paragraph 1 may be granted by issuance of a certificate to that effect by a management authority of the Member State in which the specimens are located, on a case-by-case basis where the specimens:

(a) were acquired in, or were introduced into, the Community before the provisions relating to species listed in Appendix I to the Convention or in Annex C1 to Regulation (EEC) No 3626/82 or in Annex A became applicable to the specimens; or

(b) are worked specimens that were acquired more than 50 years previously; or

(c) were introduced into the Community in compliance with the provisions of this Regulation and are to be used for purposes which are not detrimental to the survival of the species concerned; or

(d) are captive-born and bred specimens of an animal species or artificially propagated specimens of a plant species or are parts or derivatives of such specimens; or

(e) are required under exceptional circumstances for the advancement of science or for essential biomedical purposes pursuant to Council Directive 86/609/EEC of 24 November 1986 on the approximation of laws, regulations and administrative provisions of the Member States regarding the protection of animals used for experimental and other scientific purposes ([1]) where the species in question proves to be the only one suitable for those purposes and where there are no specimens of the species which have been born and bred in captivity; or

(f) are intended for breeding or propagation purposes from which conservation benefits will accrue to the species concerned; or

(g) are intended for research or education aimed at the preservation or conservation of the species; or

(h) originate in a Member State and were taken from the wild in accordance with the legislation in force in that Member State.

▼M14

4. General derogations from the prohibitions referred to in paragraph 1 based on the conditions referred to in paragraph 3, as well as general derogations with regard to species listed in Annex A in accordance with point (ii) of Article 3(1)(b) may be defined by the Commission. Any such derogations must be in accordance with the requirements of other Community legislation on the conservation of wild fauna and flora. Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

([1]) OJ No L 358, 18.12.1986, p. 1.

▼B

5. The prohibitions referred to in paragraph 1 shall also apply to specimens of the species listed in Annex B except where it can be proved to the satisfaction of the competent authority of the Member State concerned that such specimens were acquired and, if they originated outside the Community, were introduced into it, in accordance with the legislation in force for the conservation of wild fauna and flora.

6. The competent authorities of the Member States shall have discretion to sell any specimen of the species listed in Annexes B to D they have confiscated under this Regulation, provided that it is not thus returned directly to the person or entity from whom it was confiscated or who was party to the offence. Such specimens may then be treated for all purposes as if they had been legally acquired.

Article 9

Movement of live specimens

1. Any movement within the Community of a live specimen of a species listed in Annex A from the location indicated in the import permit or in any certificate issued in compliance with this Regulation shall require prior authorization from a management authority of the Member State in which the specimen is located. In other cases of movement, the person responsible for moving the specimen must be able, where applicable, to provide proof of the legal origin of the specimen.

2. Such authorization shall:

(a) be granted only when the competent scientific authority of such Member State or, where the movement is to another Member State, the competent scientific authority of the latter, is satisfied that the intended accommodation for a live specimen at the place of destination is adequately equipped to conserve and care for it properly;

(b) be confirmed by issuance of a certificate; and

(c) where applicable, be immediately communicated to a management authority of the Member State in which the specimen is to be located.

3. However, no such authorization shall be required if a live animal must be moved for the purpose of urgent veterinary treatment and is returned directly to its authorized location.

4. Where a live specimen of a species listed in Annex B is moved within the Community, the holder of the specimen may relinquish it only after ensuring that the intended recipient is adequately informed of the accommodation, equipment and practices required to ensure the specimen will be properly cared for.

5. When any live specimens are transported into, from or within the Community or are held during any period of transit or transhipment, they shall be prepared, moved and cared for in a manner such as to minimize the risk of injury, damage to health or cruel treatment and, in the case of animals, in conformity with Community legislation on the protection of animals during transport.

▼M14

6. The Commission may establish restrictions on the holding or movement of live specimens of such species in relation to which restrictions on introduction into the Community have been established in accordance with Article 4(6). Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

▼B

Article 10

Certificates to be issued

On receiving an application, together with all the requisite supporting documents, from the person concerned and provided that all the conditions governing their issuance have been fulfilled, a management authority of a Member State may issue a certificate for the purposes referred to in Article 5 (2) (b), 5 (3) and (4), Article 8 (3) and Article 9 (2) (b).

Article 11

Validity of and special conditions for permits and certificates

1. Without prejudice to stricter measures which the Member States may adopt or maintain, permits and certificates issued by the competent authorities of the Member States in accordance with this Regulation shall be valid throughout the Community.

2. (a) However, any such permit or certificate, as well as any permit or certificate issued on the basis of it, shall be deemed void if a competent authority or the Commission, in consultation with the competent authority which issued the permit or certificate, establishes that it was issued on the false premise that the conditions for its issuance were met.

(b) Specimens situated in the territory of a Member State and covered by such documents shall be seized by the competent authorities of that Member State and may be confiscated.

3. Any permit or certificate issued in accordance with this Regulation may stipulate conditions and requirements imposed by the issuing authority to ensure compliance with the provisions thereof. Where such conditions or requirements need to be incorporated in the design of permits or certificates, Member States shall inform the Commission thereof.

4. Any import permit issued on the basis of a copy of the corresponding export permit or re-export certificate shall be valid for the introduction of specimens into the Community only when accompanied by the original of the valid export permit or re-export certificate.

▼M14

5. The Commission shall establish time limits for the issuance of permits and certificates. Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

▼B

Article 12

Places of introduction and export

1. Member States shall designate customs offices for carrying out the checks and formalities for the introduction into and export from the Community, in order to assign to them a customs-approved treatment or use, within the meaning of Regulation (EEC) No 2913/92, of specimens of species covered by this Regulation and shall state which offices are specifically intended to deal with live specimens.

2. All offices designated in accordance with paragraph 1 shall be provided with sufficient and adequately trained staff. Member States shall ensure that accommodation is provided in accordance with relevant Community legislation as regards the transport and accommodation of live animals and that, where necessary, adequate steps are taken for live plants.

3. All offices designated in accordance with paragraph 1 shall be notified to the Commission which shall publish a list of them in the *Official Journal of the European Communities*.

▼M14

4. In exceptional cases and in accordance with the criteria defined by the Commission, a management authority may authorise the introduction into the Community or the export or re-export therefrom at a customs office other than one designated in accordance with paragraph 1. Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

▼B

5. Member States shall ensure that at border crossing-points the public are informed of the implementing provisions of this Regulation.

Article 13

Management and scientific authorities and other competent authorities

1. (a) Each Member State shall designate a management authority with primary responsibility for implementation of this Regulation and for communication with the Commission:

(b) Each Member State may also designate additional management authorities and other competent authorities to assist in implementation, in which case the primary management authority shall be responsible for providing the additional authorities with all the information required for correct application of this Regulation.

2. Each Member State shall designate one or more scientific authorities with appropriate qualifications whose duties shall be separate from those of any designated management authority.

▼B

3. (a) Not later than three months before the date of application of this Regulation, Member States shall forward the names and addresses of the designated management authorities, other authorities competent to issue permits or certificates and scientific authorities to the Commission, which shall publish this information in the *Official Journal of the European Communities* within a month.

(b) Each management authority referred to in paragraph 1 (a) shall, if so requested by the Commission, communicate to it within two months the names and specimen signatures of people authorized to sign permits or certificates, and impressions of the stamps, seals or other devices used to authenticate permits or certificates.

(c) Member States shall communicate to the Commission any changes in the information already provided, not later than two months after the implementation of such change.

Article 14

Monitoring of compliance and investigation of infringements

1. (a) The competent authorities of the Member States shall monitor compliance with the provisions of this Regulation.

(b) If, at any time, the competent authorities have reason to believe that these provisions are being infringed, they shall take the appropriate steps to ensure compliance or to instigate legal action.

(c) Member States shall inform the Commission and, in the case of species listed in the Appendices to the Convention, the Convention Secretariat of any steps taken by the competent authorities in relation to significant infringements of this Regulation, including seizures and confiscations.

2. The Commission shall draw the attention of the competent authorities of the Member States to matters whose investigation it considers necessary under this Regulation. Member States shall inform the Commission and, in the case of species listed in the Appendices to the Convention, the Convention Secretariat of the outcome of any subsequent investigation.

3. (a) An enforcement group shall be established consisting of the representatives of each Member State's authorities with responsibility for ensuring the implementation of the provisions of this Regulation. The group shall be chaired by the representative of the Commission.

(b) The enforcement group shall examine any technical question relating to the enforcement of this Regulation raised by the chairman, either on his own initiative or at the request of the members of the group or the committee.

(c) The Commission shall convey the opinions expressed in the enforcement group to the committee.

▼B

Article 15

Communication of information

1. The Member States and the Commission shall communicate to one another the information necessary for implementing this Regulation.

The Member States and the Commission shall ensure that the necessary steps are taken to make the public aware and inform it of the provisions regarding implementation of the Convention and of this Regulation and of the latter's implementing measures.

2. The Commission shall communicate with the Convention Secretariat so as to ensure that the Convention is effectively implemented throughout the territory to which this Regulation applies.

3. The Commission shall immediately communicate any advice from the Scientific Review Group to the management authorities of the Member States concerned.

4. (a) The management authorities of the Member States shall communicate to the Commission before 15 June each year all the information relating to the preceding year required for drawing up the reports referred to in Article VIII.7 (a) of the Convention and equivalent information on international trade in all specimens of species listed in Annexes A, B and C and on introduction into the Community of specimens of species listed in Annex D. ►M14 The information to be communicated and the format for its presentation shall be specified by the Commission in accordance with the regulatory procedure referred to in Article 18(2). ◄

(b) On the basis of the information referred to in (a), the Commission shall publish before 31 October each year a statistical report on the introduction into, and the export and re-export from, the Community of specimens of the species to which this Regulation applies and shall forward to the Convention Secretariat information on the species to which the Convention applies.

(c) Without prejudice to Article 20, the management authorities of the Member States shall, before 15 June of each second year, and for the first time in 1999, communicate to the Commission all the information relating to the preceding two years required for drawing up the reports referred to in Article VIII.7 (b) of the Convention and equivalent information on the provisions of this Regulation that fall outside the scope of the Convention. ►M14 The information to be communicated and the format for its presentation shall be specified by the Commission in accordance with the regulatory procedure referred to in Article 18(2). ◄

(d) On the basis of the information referred to in (c), the Commission shall, before 31 October of each second year, and for the first time in 1999, draw up a report on the implementation and enforcement of this Regulation.

▼M14

5. With a view to the preparation of amendments to the Annexes, the competent authorities of the Member States shall forward all relevant information to the Commission. The Commission shall specify the information required, in accordance with the regulatory procedure referred to in Article 18(2).

▼B

►C1 6. Without prejudice to Council Directive 90/313/EEC ◄ of 7 June 1990 on the freedom of access to information on the environment [1], the Commission shall take appropriate measures to protect the confidentiality of information obtained in implementation of this Regulation.

Article 16

Sanctions

1. Member States shall take appropriate measures to ensure the imposition of sanctions for at least the following infringements of this Regulation:

(a) introduction into, or export or re-export from, the Community of specimens without the appropriate permit or certificate or with a false, falsified or invalid permit or certificate or one altered without authorization by the issuing authority;

(b) failure to comply with the stipulations specified on a permit or certificate issued in accordance with this Regulation;

(c) making a false declaration or knowingly providing false information in order to obtain a permit or certificate;

(d) using a false, falsified or invalid permit or certificate or one altered without authorization as a basis for obtaining a Community permit or certificate or for any other official purpose in connection with this Regulation;

(e) making no import notification or a false import notification;

(f) shipment of live specimens not properly prepared so as to minimize the risk of injury, damage to health or cruel treatment;

(g) use of specimens of species listed in Annex A other than in accordance with the authorization given at the time of issuance of the import permit or subsequently;

(h) trade in artificially propagated plants contrary to the provisions laid down in accordance with Article 7(1)(b);

(i) shipment of specimens into or out of or in transit through the territory of the Community without the appropriate permit or certificate issued in accordance with this Regulation and, in the case of export or re-export from a third country party to the Convention, in accordance therewith, or without satisfactory proof of the existence of such permit or certificate;

(j) purchase, offer to purchase, acquisition for commercial purposes, use for commercial gain, display to the public for commercial purposes, sale, keeping for sale, offering for sale or transporting for sale of specimens in contravention of Article 8;

(k) use of a permit or certificate for any specimen other than one for which it was issued;

[1] OJ No L 158, 23.6.1990, p. 56.

▼B

(l) falsification or alteration of any permit or certificate issued in accordance with this Regualation;

(m) failure to disclose rejection of an application for a Community import, export or re-export permit or certificate, in accordance with Article 6 (3).

2. The measures referred to in paragraph 1 shall be appropriate to the nature and gravity of the infringement and shall include provisions relating to the seizure and, where appropriate, confiscation of specimens.

3. Where a specimen is confiscated, it shall be entrusted to a competent authority of the Member State of confiscation which:

(a) following consultation with a scientific authority of that Member State, shall place or otherwise dispose of the specimen under conditions which it deems to be appropriate and consistent with the purposes and provisions of the Convention and this Regulation; and

(b) in the case of a live specimen which has been introduced into the Community, may, after consultation with the State of export, return the specimen to that State at the expense of the convicted person.

4. Where a live specimen of a species listed in Annex B or C arrives at a point of introduction into the Community without the appropriate valid permit or certificate, the specimen must be seized and may be confiscated or, if the consignee refuses to acknowledge the specimen, the competent authorities of the Member State responsible for the point of introduction may, if appropriate, refuse to accept the shipment and require the carrier to return the specimen to its place of departure.

Article 17

The Scientific Review Group

1. A Scientific Review Group is hereby established, consisting of the representatives of each Member State's scientific authority or authorities and chaired by the representative of the Commission.

2. (a) The Scientific Review Group shall examine any scientific question relating to the application of this Regulation — in particular concerning Article 4 (1) (a), (2) (a) and (6) — raised by the chairman, either on his own initiative or at the request of the members of the Group or the Committee.

(b) The Commission shall convey the opinions of the Scientific Review Group to the Committee.

▼M9

Article 18

1. The Commission shall be assisted by a committee.

2. Where reference is made to this Article, Articles 5 and 7 of Decision 1999/468/EC ([1]) shall apply, having regard to the provisions of Article 8 thereof.

([1]) Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission (OJ L 184, 17.7.1999, p. 23).

▼**M9**

The period laid down in Article 5(6) of Decision 1999/468/EC shall be set at three months. As regards the Committee's tasks referred to in points 1 and 2 of Article 19, if, on the expiry of a period of three months from the date of referral to the Council, the Council has not acted, the proposed measures shall be adopted by the Commission.

▼**M14**

3. Where reference is made to this paragraph, Article 5a(1) to (4) and Article 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

4. Where reference is made to this paragraph, Article 5a(1) to (4) and (5)(b) and Article 7 of Decision 1999/468/EC shall apply, having regard to the provisions of Article 8 thereof.

The time limits laid down in Article 5a(3)(c) and (4)(b) and (e) of Decision 1999/468/EC shall be set at one month, one month and two months respectively.

Article 19

1. In accordance with the regulatory procedure referred to in Article 18(2), the Commission shall adopt the measures referred to in Article 4(6), Article 5(7)(b), Article 7(4), Article 15(4)(a) and (c), Article 15(5) and Article 21(3).

The Commission shall determine the design of the documents referred to in Articles 4, 5, 7(4) and 10 in accordance with the regulatory procedure referred to in Article 18(2).

2. The Commission shall adopt the measures referred to in Article 4(7), Article 5(5), Article 7(1)(c), (2)(c) and (3), Article 8(4), Article 9(6), Article 11(5) and Article 12(4). Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

3. The Commission shall lay down uniform conditions and criteria for:

(a) the issue, validity and use of the documents referred to in Articles 4, 5, 7(4) and 10;

(b) the use of phytosanitary certificates referred to in Article 7(1)(b)(i);

(c) the establishment of procedures, where necessary, for marking specimens in order to facilitate identification and ensure enforcement of the provisions.

Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

▼M14

4. The Commission shall adopt, where necessary, additional measures to implement resolutions of the Conference of the Parties to the Convention, decisions or recommendations of the Standing Committee of the Convention and recommendations of the Convention Secretariat. Those measures, designed to amend non-essential elements of this Regulation, by supplementing it, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(3).

5. The Commission shall amend Annexes A to D except in the case of amendments to Annex A which do not result from decisions of the Conference of the Parties to the Convention. Those measures, designed to amend non-essential elements of this Regulation, shall be adopted in accordance with the regulatory procedure with scrutiny referred to in Article 18(4).

▼B

Article 20

Final provisions

Each Member State shall notify the Commission and the Convention Secretariat of the provisions which it adopts specifically for the implementation of this Regulation and of all legal instruments used and measures taken for its implementation and enforcement.

The Commission shall communicate this information to the other Member States.

Article 21

1. Regulation (EEC) No 3626/82 is hereby repealed.

2. Until the measures provided for in points 1 and 2 of Article 19 have been adopted, Member States may maintain or continue to apply the measures adopted in accordance with Regulation (EEC) No 3626/82 and Commission Regulation (EEC) No 3418/83 of 28 November 1983 laying down provisions for the uniform issue and use of the documents required for the implementation in the Community of the Convention on International Trade in Endangered Species of Wild Fauna and Flora ([1]).

▼M14

3. Two months before this Regulation is implemented the Commission, in accordance with the regulatory procedure referred to in Article 18(2) and in consultation with the Scientific Review Group:

▼B

(a) must check that there is no justification for restrictions on the introduction into the Community of the species listed in Annex C1 to Regulation (EEC) No 3626/82 which are not included in Annex A to this Regulation;

(b) shall adopt a Regulation amending Annex D into a representative list of species meeting the criteria laid down in Article 3 (4) (a).

([1]) OJ No L 344, 7.12.1983, p. 1.

▼B

Article 22

This Regulation shall enter into force on the date of its publication in the *Official Journal of the European Communities*.

It shall apply from 1 June 1997.

Articles 12, 13, 14 (3), 16, 17, 18, 19 and 21(3) shall apply from the date of entry into force of this Regulation.

This Regulation shall be binding in its entirety and directly applicable in all Member States.

▼**M17**

ANNEX

Notes on interpretation of Annexes A, B, C and D

1. Species included in these Annexes A, B, C and D are referred to:

   (a) by the name of the species; or

   (b) as being all of the species included in a higher taxon or designated part thereof.

2. The abbreviation 'spp.' is used to denote all species of a higher taxon.

3. Other references to taxa higher than species are for the purposes of information or classification only.

4. Species printed in bold in Annex A are listed there in consistency with their protection as provided for by Council Directive 2009/147/EC ([1]) or Council Directive 92/43/EEC ([2]).

5. The following abbreviations are used for plant taxa below the level of species:

   (a) 'ssp.' is used to denote subspecies;

   (b) 'var(s).' is used to denote variety (varieties); and

   (c) 'fa.' is used to denote forma.

6. The symbols '(I)', '(II)' and '(III)' placed against the name of a species or higher taxon refer to the Appendices to the Convention in which the species concerned are listed as indicated in notes 7 to 9. Where none of these annotations appears, the species concerned are not listed in the Appendices to the Convention.

7. (I) against the name of a species or higher taxon indicates that the species or higher taxon concerned is included in Appendix I to the Convention.

8. (II) against the name of a species or higher taxon indicates that the species or higher taxon concerned is included in Appendix II to the Convention.

9. (III) against the name of a species or higher taxon indicates that it is included in Appendix III to the Convention. In this case the country with respect to which the species or higher taxon is included in Appendix III is also indicated.

10. 'Cultivar' means, following the definition of the 8th edition of the *International Code of Nomenclature for Cultivated Plants*, an assemblage of plants that (a) has been selected for a particular character or combination of characters, (b) is distinct, uniform, and stable in these characters, and (c) when propagated by appropriate means, retains those characters. No new taxon of a cultivar can be regarded as such until its category name and circumscription has been formally published in the latest edition of the International Code of Nomenclature for Cultivated Plants.

11. Hybrids may be specifically included in the Appendices but only if they form distinct and stable populations in the wild. Hybrid animals that have in their previous four generations of the lineage one or more specimens of species included in Annex A or B shall be subject to the provisions of this Regulation just as if they were full species, even if the hybrid concerned is not specifically included in the Annexes.

([1]) OJ L 20, 26.1.2010, p. 7.
([2]) OJ L 206, 22.7.1992, p. 7.

▼**M17**

12. When a species is included in Annex A, B or C, all parts and derivatives of the species are also included in the same Annex unless the species is annotated to indicate that only specific parts and derivatives are included. In accordance with Article 2(t) of this Regulation, the symbol '#' followed by a number placed against the name of a species or higher taxon included in Annex B or C designates parts or derivatives which are specified in relation thereto for the purposes of the Regulation as follows:

#1 Designates all parts and derivatives, except:

(a) seeds, spores and pollen (including pollinia);

(b) seedling or tissue cultures obtained *in vitro*, in solid or liquid media, transported in sterile containers;

(c) cut flowers of artificially propagated plants; and

(d) fruits and parts and derivatives thereof of artificially propagated plants of the genus *Vanilla*.

#2 Designates all parts and derivatives, except:

(a) seeds and pollen; and

(b) finished products packaged and ready for retail trade.

#3 Designates whole and sliced roots and parts of roots.

#4 Designates all parts and derivatives, except:

(a) seeds (including seedpods of Orchidaceae), spores and pollen (including pollinia). The exemption does not apply to seeds from Cactaceae spp. exported from Mexico, and to seeds from *Beccariophoenix madagascariensis* and *Neodypsis decaryi* exported from Madagascar;

(b) seedling or tissue cultures obtained *in vitro*, in solid or liquid media, transported in sterile containers;

(c) cut flowers of artificially propagated plants;

(d) fruits and parts and derivatives thereof of naturalised or artificially propagated plants of the genus *Vanilla* (Orchidaceae) and of the family Cactaceae;

(e) stems, flowers, and parts and derivatives thereof of naturalised or artificially propagated plants of the genera *Opuntia* subgenus *Opuntia* and *Selenicereus* (Cactaceae); and

(f) finished products of *Euphorbia antisyphilitica* packaged and ready for retail trade.

#5 Designates logs, sawn wood and veneer sheets.

#6 Designates logs, sawn wood, veneer sheets and plywood.

▼**M17**

#7 Designates logs, wood-chips, powder and extracts.

#8 Designates underground parts (i.e. roots, rhizomes): whole, parts and powdered.

#9 Designates all parts and derivatives, except those bearing a label 'Produced from *Hoodia* spp. material obtained through controlled harvesting and production in collaboration with the CITES Management Authorities of Botswana/Namibia/South Africa under agreement No BW/NA/ZA xxxxxx'.

#10 Designates logs, sawn wood, veneer sheets, including unfinished wood articles used for the fabrication of bows for stringed musical instruments.

#11 Designates logs, sawn wood, veneer sheets, plywood, powder and extracts.

#12 Designates logs, sawn wood, veneer sheets, plywood and essential oil, excluding finished products packaged and ready for retail trade.

#13 Designates the kernel (also known as 'endosperm', 'pulp' or 'copra') and any derivative thereof.

13. As none of the species or higher taxa of FLORA included in Annex A is annotated to the effect that its hybrids shall be treated in accordance with the provisions of Article 4(1) of the Regulation, this means that artificially propagated hybrids produced from one or more of these species or taxa may be traded with a certificate of artificial propagation, and that seeds and pollen (including pollinia), cut flowers, seedling or tissue cultures obtained *in vitro*, in solid or liquid media, transported in sterile containers of these hybrids are not subject to the provisions of the Regulation.

14. Urine, faeces and ambergris which are waste products and gained without the manipulation of the animal concerned are not subject to the provisions of the Regulation.

15. In respect of fauna species listed in Annex D, the provisions shall apply only to live specimens and whole, or substantially whole, dead specimens except for taxa which are annotated as follows to show that other parts and derivatives are also covered:

§ 1 Any whole, or substantially whole, skins, raw or tanned.

§ 2 Any feathers or any skin or other part with feathers on it.

16. In respect of flora species listed in Annex D, the provisions shall apply only to live specimens except for taxa which are annotated as follows to show that other parts and derivatives are also covered:

§ 3 Dried and fresh plants, including, where appropriate; leaves, roots/rootstock, stems, seeds/spores, bark and fruits.

§ 4 Logs, sawn wood and veneer sheets.

(1) Population of Argentina (listed in Annex B):

For the exclusive purpose of allowing international trade in wool sheared from live vicuñas of the populations included in Annex B, in cloth and in derived manufactured products and other handicraft artefacts. The reverse side of the cloth must bear the logotype adopted by the range States of the species, which are signatories to the Convenio paragraph la Conservación y Manejo de la Vicuña, and the selvages the words 'VICUÑA-ARGENTINA'. Other products must bear a label including the logotype and the designation 'VICUÑA-ARGENTINA-ARTESANÍA'. All other specimens shall be deemed to be specimens of species included in Annex A and the trade in them shall be regulated accordingly.

(2) Population of Bolivia (listed in Annex B):

For the exclusive purpose of allowing international trade in wool sheared from live vicuñas and in cloth and items made thereof, including luxury handicrafts and knitted articles. The reverse side of the cloth must bear the logotype adopted by the range States of the species, which are signatories to the Convenio paragraph la Conservación y Manejo de la Vicuña, and the selvages the words 'VICUÑA-BOLIVIA'. Other products must bear a label including the logotype and the designation 'VICUÑA-BOLIVIA-ARTESANÍA'. All other specimens shall be deemed to be specimens of species included in Annex A and the trade in them shall be regulated accordingly.

(3) Population of Chile (listed in Annex B):

For the exclusive purpose of allowing international trade in wool sheared from live vicuñas of the populations included in Annex B, and in cloth and items made thereof, including luxury handicrafts and knitted articles. The reverse side of the cloth must bear the logotype adopted by the range States of the species, which are signatories to the Convenio paragraph la Conservación y Manejo de la Vicuña, and the selvages the words 'VICUÑA-CHILE'. Other products must bear a label including the logotype and the designation 'VICUÑA-CHILE-ARTESANÍA'. All other specimens shall be deemed to be specimens of species included in Annex A and the trade in them shall be regulated accordingly.

(4) Population of Peru (listed in Annex B):

For the exclusive purpose of allowing international trade in wool sheared from live vicuñas and in the stock extant at the time of the ninth meeting of the Conference of the Parties (November 1994) of 3 249 kg of wool, and in cloth and items made thereof, including luxury handicrafts and knitted articles. The reverse side of the cloth must bear the logotype adopted by the range States of the species, which are signatories to the Convenio paragraph la Conservación y Manejo de la Vicuña, and the selvages the words 'VICUÑA-PERU'. Other products must bear a label including the logotype and the designation 'VICUÑA-PERU-ARTESANÍA'. All other specimens shall be deemed to be specimens of species included in Annex A and the trade in them shall be regulated accordingly.

(5) All species are listed in Appendix II except *Balaena mysticetus, Eubalaena* spp., *Balaenoptera acutorostrata* (except population of West Greenland), *Balaenoptera bonaerensis, Balaenoptera borealis, Balaenoptera edeni, Balaenoptera musculus, Balaenoptera omurai, Balaenoptera physalus, Megaptera novaeangliae, Orcaella brevirostris, Orcaella heinsohni, Sotalia* spp., *Sousa* spp., *Eschrichtius robustus, Lipotes vexillifer, Caperea marginata, Neophocaena phocaenoides, Phocoena sinus, Physeter macrocephalus, Platanista* spp., *Berardius* spp., *Hyperoodon* spp., which are listed in Appendix I. Specimens of the species listed in Appendix II to the Convention, including products and derivatives other than meat products for commercial purposes, taken by the people of Greenland under licence granted by the competent authority concerned, shall be treated as belonging to Annex B. A zero annual export quota is established for live specimens from the Black Sea population of *Tursiops truncatus* removed from the wild and traded for primarily commercial purposes.

(6) Populations of Botswana, Namibia, South Africa and Zimbabwe (listed in Annex B):

For the exclusive purpose of allowing: (a) trade in hunting trophies for non-commercial purposes; (b) trade in live animals to appropriate and acceptable destinations as defined in Resolution Conf. 11.20 for Botswana and Zimbabwe and for *in situ* conservation programmes for Namibia and South Africa; (c) trade in hides; (d) trade in hair; (e) trade in leather goods for commercial or non-commercial purposes for Botswana, Namibia and South Africa and for non-commercial purposes for Zimbabwe; (f) trade in individually marked and certified Ekipas incorporated in finished jewellery for non-commercial purposes for Namibia and ivory carvings for non-commercial purposes for Zimbabwe; (g) trade in registered raw ivory (for Botswana, Namibia, South Africa and Zimbabwe whole tusks and pieces) subject to the following: (i) only registered government-owned stocks, originating in the State (excluding seized ivory and ivory of unknown origin); (ii) only to trading partners that have been verified by the Secretariat, in consultation with the Standing Committee, to have sufficient national legislation and domestic trade controls to ensure that the imported ivory will not be re-exported and will be managed in accordance with all requirements of Resolution Conf. 10.10 (Rev. CoP14) concerning domestic manufacturing and trade; (iii) not before the Secretariat has verified the prospective importing countries and the registered government-owned stocks; (iv) raw ivory pursuant to the conditional sale of registered government-owned ivory stocks agreed at COP12 which are 20 000 kg (Botswana), 10 000 kg (Namibia), 30 000 kg (South Africa); (v) in addition to the quantities agreed at CoP12, government-owned ivory from Botswana, Zimbabwe, Namibia and South Africa registered by the 31 January 2007 and verified by the Secretariat may be traded and despatched, with the ivory in (g)(iv) in a single sale per destination under strict supervision of the Secretariat; (vi) the proceeds of the trade are used exclusively for elephant conservation and community conservation and development programmes within or adjacent to the elephant range; and (vii) the additional quantities specified in (g)(v) shall be traded only after the Standing Committee has agreed that the above conditions have been met; (h) no further proposals to allow trade in elephant ivory from populations already on Annex B shall be submitted to the Conference of the Parties for the period from CoP14 and ending nine years from the date of

the single sale of ivory that is to take place in accordance with provisions in paragraph (g)(i), (g)(ii), (g)(iii), (g)(vi), and (g)(vii). In addition, such further proposals shall be dealt with in accordance with Decisions 14.77 and 14.78. On a proposal from the Secretariat, the Standing Committee can decide to cause this trade to cease partially or completely in the event of non-compliance by exporting or importing countries, or in the case of proven detrimental impacts of the trade on other elephant populations. All other specimens shall be deemed to be specimens of species included in Annex A and the trade in them shall be regulated accordingly.

([7]) The following species are the only ones considered to be included in Appendix II: *Agalychnis annae*, *Agalychnis callidryas*, *Agalychnis moreletii*, *Agalychnis saltator* and *Agalychnis spurrelli*.

([8]) This listing includes the newly described taxon *Scleropages inscriptus*.

([9]) The following are not subject to the provisions of this Regulation:
Fossils;
Coral sand, that is to say, material consisting entirely or in part of finely crushed fragments of dead coral no larger than 2 mm in diameter and which may also contain, amongst other things, the remains of Foraminifera, mollusc and crustacean shell, and coralline algae;
Coral fragments (including gravel and rubble), that is to say, unconsolidated fragments of broken finger-like dead coral and other material between 2 and 30 mm measured in any direction.

([10]) Trade of specimens with source code A is allowed only if specimens traded possess cataphylls.

([11]) Artificially propagated specimens of the following hybrids and/or cultivars are not subject to the provisions of this Regulation:
Hatiora x *graeseri*
Schlumbergera x *buckleyi*
Schlumbergera russelliana x *Schlumbergera truncata*
Schlumbergera orssichiana x *Schlumbergera truncata*
Schlumbergera opuntioides x *Schlumbergera truncata*
Schlumbergera truncata (cultivars)
Cactaceae spp. colour mutants grafted on the following grafting stocks: *Harrisia*'Jusbertii', *Hylocereus trigonus* or *Hylocereus undatus*
Opuntia microdasys (cultivars)

([12]) Artificially propagated hybrids of Cymbidium, Dendrobium, Phalaenopsis and Vanda are not subject to the provisions of this Regulation, when specimens are readily recognisable as artificially propagated and do not show any signs of having been collected in the wild such as mechanical damage or strong dehydration resulting from collection, irregular growth and heterogeneous size and shape within a taxon and shipment, algae or other epiphyllous organisms adhering to leaves, or damage by insects or other pests; and

(a) when shipped in non-flowering state, the specimens must be traded in shipments consisting of individual containers (such as cartons, boxes, crates or individual shelves of CC-containers) each containing 20 or more plants of the same hybrid; the plants within each container must exhibit a high degree of uniformity and healthiness; and the shipment must be accompanied by documentation, such as an invoice, which clearly states the number of plants of each hybrid; or

(b) when shipped in flowering state, with at least one fully open flower per specimen, no minimum number of specimens per shipment is required but specimens must be professionally processed for commercial retail sale, e.g. labelled with printed labels or packaged with printed packages indicating the name of the hybrid and the country of final processing. This should be clearly visible and allow easy verification. Plants not clearly qualifying for the exemption must be accompanied by appropriate CITES documents.

([13]) Artificially propagated specimens of cultivars of *Cyclamen persicum* are not subject to the provisions of this Regulation. However, the exemption does not apply to such specimens traded as dormant tubers.

([14]) Artificially propagated hybrids and cultivars of *Taxus cuspidata*, live, in pots or other small containers, each consignment being accompanied by a label or document stating the name of the taxon or taxa and the text 'artificially propagated', are not subject to the provisions of this Regulation.

COUNCIL DIRECTIVE 92/43/EEC

of 21 May 1992

on the conservation of natural habitats and of wild fauna and flora

THE COUNCIL OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Economic Community, and in particular Article 130s thereof,

Having regard to the proposal from the Commission ([1]),

Having regard to the opinion of the European Parliament ([2]),

Having regard to the opinion of the Economic and Social Committee ([3]),

Whereas the preservation, protection and improvement of the quality of the environment, including the conservation of natural habitats and of wild fauna and flora, are an essential objective of general interest pursued by the Community, as stated in Article 130r of the Treaty;

Whereas the European Community policy and action programme on the environment (1987 to 1992) ([4]) makes provision for measures regarding the conservation of nature and natural resources;

Whereas, the main aim of this Directive being to promote the maintenance of biodiversity, taking account of economic, social, cultural and regional requirements, this Directive makes a contribution to the general objective of sustainable development; whereas the maintenance of such biodiversity may in certain cases require the maintenance, or indeed the encouragement, of human activities;

Whereas, in the European territory of the Member States, natural habitats are continuing to deteriorate and an increasing number of wild species are seriously threatened; whereas given that the threatened habitats and species form part of the Community's natural heritage and the threats to them are often of a transboundary nature, it is necessary to take measures at Community level in order to conserve them;

Whereas, in view of the threats to certain types of natural habitat and certain species, it is necessary to define them as having priority in order to favour the early implementation of measures to conserve them;

Whereas, in order to ensure the restoration or maintenance of natural habitats and species of Community interest at a favourable conservation status, it is necessary to designate special areas of conservation in order to create a coherent European ecological network according to a specified timetable;

Whereas all the areas designated, including those classified now or in the future as special protection areas pursuant to Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds ([5]), will have to be incorporated into the coherent European ecological network;

Whereas it is appropriate, in each area designated, to implement the necessary measures having regard to the conservation objectives pursued;

([1]) OJ No C 247, 21. 9. 1988, p. 3 and
OJ No C 195, 3. 8. 1990, p. 1.
([2]) OJ No C 75, 20. 3. 1991, p. 12.
([3]) OJ No C 31, 6. 2. 1991, p. 25.
([4]) OJ No C 328, 7. 12. 1987, p. 1.
([5]) OJ No L 103, 25. 4. 1979, p. 1. Directive as last amended by Directive 91/244/ECC (OJ No L 115, 8. 5. 1991, p. 41).

▼B

Whereas sites eligible for designation as special areas of conservation are proposed by the Member States but whereas a procedure must nevertheless be laid down to allow the designation in exceptional cases of a site which has not been proposed by a Member State but which the Community considers essential for either the maintenance or the survival of a priority natural habitat type or a priority species;

Whereas an appropriate assessment must be made of any plan or programme likely to have a significant effect on the conservation objectives of a site which has been designated or is designated in future;

Whereas it is recognized that the adoption of measures intended to promote the conservation of priority natural habitats and priority species of Community interest is a common responsibility of all Member States; whereas this may, however, impose an excessive financial burden on certain Member States given, on the one hand, the uneven distribution of such habitats and species throughout the Community and, on the other hand, the fact that the 'polluter pays' principle can have only limited application in the special case of nature conservation;

Whereas it is therefore agreed that, in this exceptional case, a contribution by means of Community co-financing should be provided for within the limits of the resources made available under the Community's decisions;

Whereas land-use planning and development policies should encourage the management of features of the landscape which are of major importance for wild fauna and flora;

Whereas a system should be set up for surveillance of the conservation status of the natural habitats and species covered by this Directive;

Whereas a general system of protection is required for certain species of flora and fauna to complement Directive 79/409/EEC; whereas provision should be made for management measures for certain species, if their conservation status so warrants, including the prohibition of certain means of capture or killing, whilst providing for the possibility of derogations on certain conditions;

Whereas, with the aim of ensuring that the implementation of this Directive is monitored, the Commission will periodically prepare a composite report based, *inter alia,* on the information sent to it by the Member States regarding the application of national provisions adopted under this Directive;

Whereas the improvement of scientific and technical knowledge is essential for the implementation of this Directive; whereas it is consequently appropriate to encourage the necessary research and scientific work;

Whereas technical and scientific progress mean that it must be possible to adapt the Annexes; whereas a procedure should be established whereby the Council can amend the Annexes;

Whereas a regulatory committee should be set up to assist the Commission in the implementation of this Directive and in particular when decisions on Community co-financing are taken;

Whereas provision should be made for supplementary measures governing the reintroduction of certain native species of fauna and flora and the possible introduction of non-native species;

Whereas education and general information relating to the objectives of this Directive are essential for ensuring its effective implementation,

▼B

HAS ADOPTED THIS DIRECTIVE:

Definitions

Article 1

For the purpose of this Directive:

(a) *conservation* means a series of measures required to maintain or restore the natural habitats and the populations of species of wild fauna and flora at a favourable status as defined in (e) and (i);

(b) *natural habitats* means terrestrial or aquatic areas distinguished by geographic, abiotic and biotic features, whether entirely natural or semi-natural;

(c) *natural habitat types of Community interest* means those which, within the territory referred to in Article 2:

(i) are in danger of disappearance in their natural range;

or

(ii) have a small natural range following their regression or by reason of their intrinsically restricted area;

or

▼M3

(iii) present outstanding examples of typical characteristics of one or more of the nine following biogeographical regions: Alpine, Atlantic, Black Sea, Boreal, Continental, Macaronesian, Mediterranean, Pannonian and Steppic.

▼B

Such habitat types are listed or may be listed in Annex I;

(d) *priority natural habitat types* means natural habitat types in danger of disappearence, which are present on the territory referred to in Article 2 and for the conservation of which the Community has particular responsibility in view of the proportion of their natural range which falls within the territory referred to in Article 2; these priority natural habitat types are indicated by an asterisk (*) in Annex I;

(e) *conservation status of a natural habitat* means the sum of the influences acting on a natural habitat and its typical species that may affect its long-term natural distribution, structure and functions as well as the long-term survival of its typical species within the territory referred to in Article 2.

►C1 The conservation status ◄ of a natural habitat will be taken as 'favourable' when:

— its natural range and areas it covers within that range are stable or increasing, and

— the specific structure and functions which are necessary for its long-term maintenance exist and are likely to continue to exist for the foreseeable future, and

— the conservation status of its typical species is favourable as defined in (i);

(f) *habitat of a species* means an environment defined by specific abiotic and biotic factors, in which the species lives at any stage of its biological cycle;

(g) *species of Community interest* means species which, within the territory referred to in Article 2, are:

▼B

(i) endangered, except those species whose natural range is marginal in that territory and which are not endangered or vulnerable in the western palearctic region; or

(ii) vulnerable, i.e. believed likely to move into the endangered category in the near future if the causal factors continue operating; or

(iii) rare, i.e. with small populations that are not at present endangered or vulnerable, but are at risk. The species are located within restricted geographical areas or are thinly scattered over a more extensive range; or

(iv) endemic and requiring particular attention by reason of the specific nature of their habitat and/or the potential impact of their exploitation on their habitat and/or the potential impact of their exploitation on their conservation status.

Such species are listed or may be listed in Annex II and/or Annex IV or V;

(h) *priority species* means species referred to in (g) (i) for the conservation of which the Community has particular responsibility in view of the proportion of their natural range which falls within the territory referred to in Article 2; these priority species are indicated by an asterisk (*) in Annex II;

(i) *conservation status of a species* means the sum of the influences acting on the species concerned that may affect the long-term distribution and abundance of its populations within the territory referred to in Article 2;

The *conservation status* will be taken as 'favourable' when:

— population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats, and

— the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future, and

— there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis;

(j) *site* means a geographically defined area whose extent is clearly delineated;

(k) *site of Community importance* means a site which, in the biogeographical region or regions to which ►C1 it belongs, ◄ contributes significantly to the maintenance or restoration at a favourable conservation status of a natural habitat type in Annex I or of a species in Annex II and may also contribute significantly to the coherence of Natura 2000 referred to in Article 3, and/or contributes significantly to the maintenance of biological diversity within the biogeographic region or regions concerned.

For animal species ranging over wide areas, sites of Community importance shall correspond to the places within the natural range of such species which present the physical or biological factors essential to their life and reproduction;

(l) *special area of conservation* means a site of Community importance designated by the Member States through a statutory, administrative and/or contractual act where the necessary conservation measures are applied for the maintenance or restoration, at a favourable conservation status, of the natural habitats and/or the populations of the species for which the site is designated;

(m) *specimen* means any animal or plant, whether alive or dead, of the species listed in Annex IV and Annex V, any part or derivative thereof, as well as any other goods which appear, from an accompanying document, the packaging or a mark or label, or from any

▼B

other circumstances, to be parts or derivatives of animals or plants of those species;

(n) *the committee* means the committee set up pursuant to Article 20.

Article 2

1. The aim of this Directive shall be to contribute towards ensuring bio-diversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the Treaty applies.

2. Measures taken pursuant to this Directive shall be designed to maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora of Community interest.

3. Measures taken pursuant to this Directive shall take account of economic, social and cultural requirements and regional and local characteristics.

Conservation of natural habitats and habitats of species

Article 3

1. A coherent European ecological network of special areas of conservation shall be set up under the title Natura 2000. This network, composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II, shall enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range.

The Natura 2000 network shall include the special protection areas classified by the Member States pursuant to Directive 79/409/EEC.

2. Each Member State shall contribute to the creation of Natura 2000 in proportion to the representation within its territory of the natural habitat types and the habitats of species referred to in paragraph 1. To that effect each Member State shall designate, in accordance with Article 4, sites as special areas of conservation taking account of the objectives set out in paragraph 1.

3. Where they consider it necessary, Member States shall endeavour to improve the ecological coherence of Natura 2000 by maintaining, and where appropriate developing, features of the landscape which are of major importance for wild fauna and flora, as referred to in Article 10.

Article 4

1. On the basis of the criteria set out in Annex III (Stage 1) and relevant scientific information, each Member State shall propose a list of sites indicating which natural habitat types in Annex I and which species in Annex II that are native to its territory the sites host. For animal species ranging over wide areas these sites shall correspond to the places within the natural range of such species which present the physical or biological factors essential to their life and reproduction. For aquatic species which range over wide areas, such sites will be proposed only where there is a clearly identifiable area representing the physical and biological factors essential to their life and reproduction. Where appropriate, Member States shall propose adaptation of the list in the light of the results of the surveillance referred to in Article 11.

The list shall be transmitted to the Commission, within three years of the notification of this Directive, together with information on each site. That information shall include a map of the site, its name, location,

▼B

extent and the data resulting from application of the criteria specified in Annex III (Stage 1) provided in a format established by the Commission in accordance with the procedure laid down in Article 21.

2. On the basis of the criteria set out in Annex III (Stage 2) and in the framework both of each of the ►M3 nine ◄ biogeographical regions referred to in Article 1 (c) (iii) and of the whole of the territory referred to in Article 2 (1), the Commission shall establish, in agreement with each Member State, a draft list of sites of Community importance drawn from the Member States' lists identifying ►C1 those which host one ◄ or more priority natural habitat types or priority species.

Member States whose sites hosting one or more priority natural habitat types and priority species represent more than 5 % of their national territory may, in agreement with the Commission, request that the criteria listed in Annex III (Stage 2) be applied more flexibly in selecting all the sites of Community importance in their territory.

The list of sites selected as sites of Community importance, identifying those which host one or more priority natural habitat types or priority species, shall be adopted by the Commission in accordance with the procedure laid down in Article 21.

3. The list referred to in paragraph 2 shall be established within six years of the notification of this Directive.

4. Once a site of Community importance has been adopted in accordance with the procedure laid down in paragraph 2, the Member State concerned shall designate that site as a special area of conservation as soon as possible and within six years at most, establishing priorities in the light of the importance of the sites for the maintenance or restoration, at a favourable conservation status, of a natural habitat type in Annex I or a species in Annex II and for the coherence of Natura 2000, and in the light of the threats of degradation or destruction to which those sites are exposed.

5. As soon as a site is placed on the list referred to in the third subparagraph of paragraph 2 it shall be subject to Article 6 (2), (3) and (4).

Article 5

1. In exceptional cases where the Commission finds that a national list as referred to in Article 4 (1) fails to mention a site hosting a priority natural habitat type or priority species which, on the basis of relevant and reliable scientific information, it considers to be essential for the maintenance of that priority natural habitat type or for the survival of that priority species, a bilateral consultation procedure shall be initiated between that Member State and the Commission for the purpose of comparing the scientific data used by each.

2. If, on expiry of a consultation period not exceeding six months, the dispute remains unresolved, the Commission shall forward to the Council a proposal relating to the selection of the site as a site of Community importance.

3. The Council, acting unanimously, shall take a decision within three months of the date of referral.

4. During the consultation period and pending a Council decision, the site concerned shall be subject to Article 6 (2).

Article 6

1. For special areas of conservation, Member States shall establish the necessary conservation measures involving, if need be, appropriate management plans specifically designed for the sites or integrated into

▼B

other development plans, and appropriate statutory, administrative or contractual measures which correspond to the ecological requirements of the natural habitat types in Annex I and the species in Annex II present on the sites.

2. Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.

3. Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.

4. If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.

Article 7

Obligations arising under Article 6 (2), (3) and (4) of this Directive shall replace any obligations arising under the first sentence of Article 4 (4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4 (1) or similarly recognized under Article 4 (2) thereof, as from the date of implementation of this Directive or the date of classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later.

Article 8

1. In parallel with their proposals for sites eligible for designation as special areas of conservation, hosting priority natural habitat types and/or priority species, the Member States shall send, as appropriate, to the Commission their estimates relating to the Community co-financing which they consider necessary to allow them to meet their obligations pursuant to Article 6 (1).

2. In agreement with each of the Member States concerned, the Commission shall identify, for sites of Community importance for which co-financing is sought, those measures essential for the maintenance or re-establishment at a favourable conservation status of the priority natural habitat types and priority species on the sites concerned, as well as the total costs arising from those measures.

3. The Commission, in agreement with the Member States concerned, shall assess the financing, including co-financing, required for the operation of the measures referred to in paragraph 2, taking into

▼B

account, amongst other things, the concentration on the Member State's territory of priority natural habitat types and/or priority species and the relative burdens which the required measures entail.

4. According to the assessment referred to in paragraphs 2 and 3, the Commission shall adopt, having regard to the available sources of funding under the relevant Community instruments and according to the procedure set out in Article 21, a prioritized action framework of measures involving co-financing to be taken when the site has been designated under Article 4 (4).

5. The measures which have not been retained in the action framework for lack of sufficient resources, as well as those included in the abovementioned action framework which have not received the necessary co-financing or have only been partially co-financed, shall be reconsidered in accordance with the procedure set out in Article 21, in the context of the two-yearly review of the action framework and may, in the maintime, be postponed by the Member States pending such review. This review shall take into account, as appropriate, the new situation of the site concerned.

6. In areas where the measures dependent on co-financing are postponed, Member States shall refrain from any new measures likely to result in deterioration of those areas.

Article 9

The Commission, acting in accordance with the procedure laid down in Article 21, shall periodically review the contribution of Natura 2000 towards achievement of the objectives set out in Article 2 and 3. In this context, a special area of conservation may be considered for declassification where this is warranted by natural developments noted as a result of the surveillance provided for in Article 11.

Article 10

Member States shall endeavour, where they consider it necessary, in their land-use planning and development policies and, in particular, with a view to improving the ecological ►C1 coherence of the Natura ◄ 2000 network, to encourage the management of features of the landscape which are of major importance for wild fauna and flora.

Such features are those which, by virtue of their linear and continuous structure (such as rivers with their banks or the traditional systems for marking field boundaries) or their function as stepping stones (such as ponds or small woods), are essential for the migration, dispersal and genetic exchange of wild species.

Article 11

Member States shall undertake surveillance of the conservation status of the natural habitats and species referred to in Article 2 with particular regard to priority natural habitat types and priority species.

Protection of species

Article 12

1. Member States shall take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV (a) in their natural range, prohibiting:

▼B

(a) all forms of deliberate capture or killing of specimens of these species in the wild;

(b) deliberate disturbance of these species, particularly during the period of breeding, rearing, hibernation and migration;

(c) deliberate destruction or taking of eggs from the wild;

(d) deterioration or destruction of breeding sites or resting places.

2. For these species, Member States shall prohibit the keeping, transport and sale or exchange, and offering for sale or exchange, of specimens taken from the wild, except for those taken legally before this Directive is implemented.

3. The prohibition referred to in paragraph 1 (a) and (b) and paragraph 2 shall apply to all stages of life of the animals to which this Article applies.

4. Member States shall establish a system to monitor the incidential capture and killing of the animal species listed in Annex IV (a). In the light of the information gathered, Member States shall take further research or conservation measures as required to ensure that incidental capture and killing does not have a significant negative impact on the species concerned.

Article 13

1. Member States shall take the requisite measures to establish a system of strict protection for the plant species listed in Annex IV (b), prohibiting:

(a) the deliberate picking, collecting, cutting, uprooting or destruction of such plants in their natural range in the wild;

(b) the keeping, transport and sale or exchange and offering for sale or exchange of specimens of such species taken in the wild, except for those taken legally before this Directive is implemented.

2. The prohibitions referred to in paragraph 1 (a) and (b) shall apply to all stages of the biological cycle of the plants to which this Article applies.

Article 14

1. If, in the light of the surveillance provided for in Article 11, Member States deem it necessary, they shall take measures to ensure that the taking in the wild of specimens of species of wild fauna and flora listed in Annex V as well as their exploitation is compatible with their being maintained at a favourable conservation status.

2. Where such measures are deemed necessary, they shall include continuation of the surveillance provided for in Article 11. Such measures may also include in particular:

— regulations regarding access to certain property,

— temporary or local prohibition of the taking of specimens in the wild and exploitation of certain populations,

— regulation of the periods and/or methods of taking specimens,

— application, when specimens are taken, of hunting and fishing rules which take account of the conservation of such populations,

— establishment of a system of licences for taking specimens or of quotas,

— regulation of the purchase, sale, offering for sale, keeping for sale or transport for sale of specimens,

▼B

— breeding in captivity of animal species as well as artificial propagation of plant species, under strictly controlled conditions, with a view to reducing the taking of specimens of the wild,

— assessment of the effect of the measures adopted.

Article 15

In respect of the capture or killing of species of wild fauna listed in Annex V (a) and in cases where, in accordance with Article 16, derogations are applied to the taking, capture or killing of species listed in Annex IV (a), Member States shall prohibit the use of all indiscriminate means capable of causing local disappearance of, or serious disturbance to, populations of such species, and in particular:

(a) use of the means of capture and killing listed in Annex VI (a);

(b) any form of capture and killing from the modes of transport referred to in Annex VI (b).

Article 16

1. Provided that there is no satisfactory alternative and the derogation is not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range, Member States may derogate from the provisions of Articles 12, 13, 14 and 15 (a) and (b):

(a) in the interest of protecting wild fauna and flora and conserving natural habitats;

(b) to prevent serious damage, in particular to crops, livestock, forests, fisheries and water and other types of property;

(c) in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment;

(d) for the purpose of research and education, of repopulating and reintroducing these species and for the breedings operations necessary for these purposes, including the artificial propagation of plants;

(e) to allow, under strictly supervised conditions, on a selective basis and to a limited extent, the taking or keeping of certain specimens of the species listed in Annex IV in limited numbers specified by the competent national authorities.

2. Member States shall forward to the Commission every two years a report in accordance with the format established by the Committee on the derogations applied under paragraph 1. The Commission shall give its opinion on these derogations within a maximum time limit of 12 months following receipt of the report and shall give an account to the Committee.

3. The reports shall specify:

(a) the species which are subject to the derogations and the reason for the derogation, including the nature of the risk, with, if appropriate, a reference to alternatives rejected and scientific data used;

(b) the means, devices or methods authorized for the capture or killing of animal species and the reasons for their use;

(c) the circumstances of when and where such derogations are granted;

(d) the authority empowered to declare and check that the required conditions obtain and to decide what means, devices or methods may be used, within what limits and by what agencies, and which persons ►C1 are to carry out the ◄ task;

▼B

(e) the supervisory measures used and the results obtained.

Information

Article 17

1. Every six years from the date of expiry of the period laid down in Article 23, Member States shall draw up a report on the implementation of the measures taken under this Directive. This report shall include in particular information concerning the conservation measures referred to in Article 6 (1) as well as evaluation of the impact of those measures on the conservation status of the natural habitat types of Annex I and the species in Annex II and the main results of the surveillance referred to in Article 11. The report, in accordance with the format established by the committee, shall be forwarded to the Commission and made accessible to the public.

2. The Commission shall prepare a composite report based on the reports referred to in paragraph 1. This report shall include an appropriate evaluation of the progress achieved and, in particular, of the contribution of Natura 2000 to the achievement of the objectives set out in Article 3. A draft of the part of the report covering the information supplied by a Member State shall be forwarded to the Member State in question for verification. After submission to the committee, the final version of the report shall be published by the Commission, not later than two years after receipt of the reports referred to in paragraph 1, and shall be forwarded to the Member States, the European Parliament, the Council and the Economic and Social Committee.

3. Member States may mark areas designated under this Directive by means of Community notices designed for that purpose by the committee.

Research

Article 18

1. Member States and the Commission shall encourage the necessary research and scientific work having regard to the objectives set out in Article 2 and the obligation referred to in Article 11. They shall exchange information for the purposes of proper coordination of research carried out at Member State and at Community level.

2. Particular attention shall be paid to scientific work necessary for the implementation of Articles 4 and 10, and transboundary cooperative research between Member States shall be encouraged.

Procedure for amending the Annexes

Article 19

Such amendments as are necessary for adapting Annexes I, II, III, V and VI to technical and scientific progress shall be adopted by the Council acting by qualified majority on a proposal from the Commission.

Such amendments as are necessary for adapting Annex IV to technical and scientific progress shall be adopted by the Council acting unanimously on a proposal from the Commission.

▼B

Committee

▼M2

Article 20

The Commission shall be assisted by a committee.

Article 21

1. Where reference is made to this Article, Articles 5 and 7 of Decision 1999/468/EC [1] shall apply, having regard to the provisions of Article 8 thereof.

The period laid down in Article 5(6) of Decision 1999/468/EC shall be set at three months.

2. The Committee shall adopt its rules of procedure.

▼B

Supplementary provisions

Article 22

In implementing the provisions of this Directive, Member States shall:

(a) study the desirability of re-introducing species in Annex IV that are native to their territory where this might contribute to their conservation, provided that an investigation, also taking into account experience in other Member States or elsewhere, has established that such re-introduction contributes effectively to re-establishing these species at a favourable conservation status and that it takes place only after proper consultation of the public concerned;

(b) ensure that the deliberate introduction into the wild of any species which is not native to their territory is regulated so as not to prejudice natural habitats within their natural range or the wild native fauna and flora and, if they consider it necessary, prohibit such introduction. The results of the assessment undertaken shall be forwarded to the committee for information;

(c) promote education and general information on the need to protect species of wild fauna and flora and to conserve their habitats and natural habitats.

Final provisions

Article 23

1. Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive within two years of its notification. They shall forthwith inform the Commission thereof.

2. When Member States adopt such measures, they shall contain a reference to this Directive or be accompanied by such reference on the occasion of their official publication. The methods of making such a reference shall be laid down by the Member States.

[1] Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission (OJ L 184, 17.7.1999, p. 23).

▼B

3. Member States shall communicate to the Commission the main provisions of national law which they adopt in the field covered by this Directive.

Article 24

This Directive is addressed to the Member States.

▼M3

ANNEX I

NATURAL HABITAT TYPES OF COMMUNITY INTEREST WHOSE CONSERVATION REQUIRES THE DESIGNATION OF SPECIAL AREAS OF CONSERVATION

Interpretation

Guidance on the interpretation of habitat types is given in the 'Interpretation Manual of European Union Habitats' as approved by the committee set up under Article 20 ('Habitats Committee') and published by the European Commission ([1]).

The code corresponds to the NATURA 2000 code.

The sign '*' indicates priority habitat types.

1. COASTAL AND HALOPHYTIC HABITATS

11. Open sea and tidal areas

1110 Sandbanks which are slightly covered by sea water all the time

1120 * *Posidonia* beds (*Posidonion oceanicae*)

1130 Estuaries

1140 Mudflats and sandflats not covered by seawater at low tide

1150 * Coastal lagoons

1160 Large shallow inlets and bays

1170 Reefs

1180 Submarine structures made by leaking gases

12. Sea cliffs and shingle or stony beaches

1210 Annual vegetation of drift lines

1220 Perennial vegetation of stony banks

1230 Vegetated sea cliffs of the Atlantic and Baltic Coasts

1240 Vegetated sea cliffs of the Mediterranean coasts with endemic *Limonium* spp.

1250 Vegetated sea cliffs with endemic flora of the Macaronesian coasts

13. Atlantic and continental salt marshes and salt meadows

1310 *Salicornia* and other annuals colonizing mud and sand

1320 *Spartina* swards (*Spartinion maritimae*)

1330 Atlantic salt meadows (*Glauco-Puccinellietalia maritimae*)

1340 * Inland salt meadows

14. Mediterranean and thermo-Atlantic salt marshes and salt meadows

1410 Mediterranean salt meadows (*Juncetalia maritimi*)

1420 Mediterranean and thermo-Atlantic halophilous scrubs (*Sarcocornetea fruticosi*)

1430 Halo-nitrophilous scrubs (*Pegano-Salsoletea*)

15. Salt and gypsum inland steppes

1510 * Mediterranean salt steppes (*Limonietalia*)

1520 * Iberian gypsum vegetation (*Gypsophiletalia*)

1530 * Pannonic salt steppes and salt marshes

([1]) 'Interpretation Manual of European Union Habitats', version EUR 15/2″ adopted by the Habitats Committee on 4 October 1999 and 'Amendments to the "Interpretation Manual of European Union Habitats" with a view to EU enlargement' (Hab. 01/11b-rev. 1) adopted by the Habitats Committee on 24 April 2002 after written consultation, European Commission, Directorate General for Environment.

▼M3

16. Boreal Baltic archipelago, coastal and landupheaval areas

1610 Baltic esker islands with sandy, rocky and shingle beach vegetation and sublittoral vegetation

1620 Boreal Baltic islets and small islands

1630 * Boreal Baltic coastal meadows

1640 Boreal Baltic sandy beaches with perennial vegetation

1650 Boreal Baltic narrow inlets

2. COASTAL SAND DUNES AND INLAND DUNES

21. Sea dunes of the Atlantic, North Sea and Baltic coasts

2110 Embryonic shifting dunes

2120 Shifting dunes along the shoreline with *Ammophila arenaria* (‘white dunes’)

2130 * Fixed coastal dunes with herbaceous vegetation (“grey dunes’)

2140 * Decalcified fixed dunes with *Empetrum nigrum*

2150 * Atlantic decalcified fixed dunes (*Calluno-Ulicetea*)

2160 Dunes with *Hippophaë rhamnoides*

2170 Dunes with *Salix repens* ssp. *argentea* (*Salicion arenariae*)

2180 Wooded dunes of the Atlantic, Continental and Boreal region

2190 Humid dune slacks

21A0 Machairs (* in Ireland)

22. Sea dunes of the Mediterranean coast

2210 *Crucianellion maritimae* fixed beach dunes

2220 Dunes with *Euphorbia terracina*

2230 *Malcolmietalia* dune grasslands

2240 *Brachypodietalia* dune grasslands with annuals

2250 * Coastal dunes with *Juniperus* spp.

2260 *Cisto-Lavenduletalia* dune sclerophyllous scrubs

2270 * Wooded dunes with *Pinus pinea* and/or *Pinus pinaster*

23. Inland dunes, old and decalcified

2310 Dry sand heaths with *Calluna* and *Genista*

2320 Dry sand heaths with *Calluna* and *Empetrum nigrum*

2330 Inland dunes with open *Corynephorus* and *Agrostis* grasslands

2340 * Pannonic inland dunes

3. FRESHWATER HABITATS

31. Standing water

3110 Oligotrophic waters containing very few minerals of sandy plains (*Littorelletalia uniflorae*)

3120 Oligotrophic waters containing very few minerals generally on sandy soils of the West Mediterranean, with *Isoetes* spp.

3130 Oligotrophic to mesotrophic standing waters with vegetation of the *Littorelletea uniflorae* and/or of the *Isoëto-Nanojuncetea*

3140 Hard oligo-mesotrophic waters with benthic vegetation of *Chara* spp.

3150 Natural eutrophic lakes with *Magnopotamion* or *Hydrocharition* — type vegetation

3160 Natural dystrophic lakes and ponds

3170 * Mediterranean temporary ponds

3180 * Turloughs

▼M3

3190 Lakes of gypsum karst

31A0 * Transylvanian hot-spring lotus beds

32. Running water — sections of water courses with natural or semi-natural dynamics (minor, average and major beds) where the water quality shows no significant deterioration

3210 Fennoscandian natural rivers

3220 Alpine rivers and the herbaceous vegetation along their banks

3230 Alpine rivers and their ligneous vegetation with *Myricaria germanica*

3240 Alpine rivers and their ligneous vegetation with *Salix elaeagnos*

3250 Constantly flowing Mediterranean rivers with *Glaucium flavum*

3260 Water courses of plain to montane levels with the *Ranunculion fluitantis* and *Callitricho-Batrachion* vegetation

3270 Rivers with muddy banks with *Chenopodion rubri* p.p. and *Bidention* p.p. vegetation

3280 Constantly flowing Mediterranean rivers with *Paspalo-Agrostidion* species and hanging curtains of *Salix* and *Populus alba*

3290 Intermittently flowing Mediterranean rivers of the *Paspalo-Agrostidion*

4. TEMPERATE HEATH AND SCRUB

4010 Northern Atlantic wet heaths with *Erica tetralix*

4020 * Temperate Atlantic wet heaths with *Erica ciliaris* and *Erica tetralix*

4030 European dry heaths

4040 * Dry Atlantic coastal heaths with *Erica vagans*

4050 * Endemic macaronesian heaths

4060 Alpine and Boreal heaths

4070 * Bushes with *Pinus mugo* and *Rhododendron hirsutum* (*Mugo-Rhododendretum hirsuti*)

4080 Sub-Arctic *Salix* spp. Scrub

4090 Endemic oro-Mediterranean heaths with gorse

40A0 * Subcontinental peri-Pannonic scrub

40B0 Rhodope *Potentilla fruticosa* thickets

40C0 * Ponto-Sarmatic deciduous thickets

5. SCLEROPHYLLOUS SCRUB (MATORRAL)

51. Sub-Mediterranean and temperate scrub

5110 Stable xerothermophilous formations with *Buxus sempervirens* on rock slopes (*Berberidion* p.p.)

5120 Mountain *Cytisus purgans* formations

5130 *Juniperus communis* formations on heaths or calcareous grasslands

5140 * *Cistus palhinhae* formations on maritime wet heaths

52. Mediterranean arborescent matorral

5210 Arborescent matorral with *Juniperus* spp.

5220 * Arborescent matorral with *Zyziphus*

5230 * Arborescent matorral with *Laurus nobilis*

53. Thermo-Mediterranean and pre-steppe brush

5310 *Laurus nobilis* thickets

5320 Low formations of Euphorbia close to cliffs

5330 Thermo-Mediterranean and pre-desert scrub

▼M3

54. Phrygana

5410 West Mediterranean clifftop phryganas (*Astragalo-Plantaginetum subulatae*)

5420 Sarcopoterium spinosum phryganas

5430 Endemic phryganas of the *Euphorbio-Verbascion*

6. NATURAL AND SEMI-NATURAL GRASSLAND FORMATIONS

61. Natural grasslands

6110 * Rupicolous calcareous or basophilic grasslands of the *Alysso-Sedion albi*

6120 * Xeric sand calcareous grasslands

6130 Calaminarian grasslands of the *Violetalia calaminariae*

6140 Siliceous Pyrenean *Festuca eskia* grasslands

6150 Siliceous alpine and boreal grasslands

6160 Oro-Iberian *Festuca indigesta* grasslands

6170 Alpine and subalpine calcareous grasslands

6180 Macaronesian mesophile grasslands

6190 Rupicolous pannonic grasslands (*Stipo-Festucetalia pallentis*)

62. Semi-natural dry grasslands and scrubland facies

6210 Semi-natural dry grasslands and scrubland facies on calcareous substrates (*Festuco-Brometalia*) (* important orchid sites)

6220 * Pseudo-steppe with grasses and annuals of the *Thero-Brachypodietea*

6230 * Species-rich *Nardus* grasslands, on silicious substrates in mountain areas (and submountain areas in Continental Europe)

6240 * Sub-Pannonic steppic grasslands

6250 * Pannonic loess steppic grasslands

6260 * Pannonic sand steppes

6270 * Fennoscandian lowland species-rich dry to mesic grasslands

6280 * Nordic alvar and precambrian calcareous flatrocks

62A0 Eastern sub-Mediterranean dry grasslands (*Scorzoneratalia villosae*)

62B0 * Serpentinophilous grassland of Cyprus

62C0 * Ponto-Sarmatic steppes

62D0 Oro-Moesian acidophilous grasslands

63. Sclerophillous grazed forests (dehesas)

6310 Dehesas with evergreen *Quercus* spp.

64. Semi-natural tall-herb humid meadows

6410 *Molinia* meadows on calcareous, peaty or clayey-silt-laden soils (*Molinion caeruleae*)

6420 Mediterranean tall humid grasslands of the *Molinio-Holoschoenion*

6430 Hydrophilous tall herb fringe communities of plains and of the montane to alpine levels

6440 Alluvial meadows of river valleys of the *Cnidion dubii*

6450 Northern boreal alluvial meadows

6460 Peat grasslands of Troodos

65. Mesophile grasslands

6510 Lowland hay meadows (*Alopecurus pratensis, Sanguisorba officinalis*)

6520 Mountain hay meadows

6530 * Fennoscandian wooded meadows

▼M3

7. RAISED BOGS AND MIRES AND FENS

71. Sphagnum acid bogs

7110 * Active raised bogs

7120 Degraded raised bogs still capable of natural regeneration

7130 Blanket bogs (* if active bog)

7140 Transition mires and quaking bogs

7150 Depressions on peat substrates of the *Rhynchosporion*

7160 Fennoscandian mineral-rich springs and springfens

72. Calcareous fens

7210 * Calcareous fens with *Cladium mariscus* and species of the *Caricion davallianae*

7220 * Petrifying springs with tufa formation (*Cratoneurion*)

7230 Alkaline fens

7240 * Alpine pioneer formations of the *Caricion bicoloris-atrofuscae*

73. Boreal mires

7310 * Aapa mires

7320 * Palsa mires

8. ROCKY HABITATS AND CAVES

81. Scree

8110 Siliceous scree of the montane to snow levels (*Androsacetalia alpinae and Galeopsietalia ladani*)

8120 Calcareous and calcshist screes of the montane to alpine levels (*Thlaspietea rotundifolii*)

8130 Western Mediterranean and thermophilous scree

8140 Eastern Mediterranean screes

8150 Medio-European upland siliceous screes

8160 * Medio-European calcareous scree of hill and montane levels

82. Rocky slopes with chasmophytic vegetation

8210 Calcareous rocky slopes with chasmophytic vegetation

8220 Siliceous rocky slopes with chasmophytic vegetation

8230 Siliceous rock with pioneer vegetation of the *Sedo-Scleranthion* or of the *Sedo albi-Veronicion dillenii*

8240 * Limestone pavements

83. Other rocky habitats

8310 Caves not open to the public

8320 Fields of lava and natural excavations

8330 Submerged or partially submerged sea caves

8340 Permanent glaciers

9. FORESTS

(Sub)natural woodland vegetation comprising native species forming forests of tall trees, with typical undergrowth, and meeting the following criteria: rare or residual, and/or hosting species of Community interest

90. Forests of Boreal Europe

9010 * Western Taïga

9020 * Fennoscandian hemiboreal natural old broad-leaved deciduous forests (*Quercus, Tilia, Acer, Fraxinus or Ulmus*) rich in epiphytes

▼M3

9030	* Natural forests of primary succession stages of landupheaval coast
9040	Nordic subalpine/subarctic forests with *Betula pubescens* ssp. *czerepanovii*
9050	Fennoscandian herb-rich forests with *Picea abies*
9060	Coniferous forests on, or connected to, glaciofluvial eskers
9070	Fennoscandian wooded pastures
9080	* Fennoscandian deciduous swamp woods
91.	**Forests of Temperate Europe**
9110	*Luzulo-Fagetum* beech forests
9120	Atlantic acidophilous beech forests with *Ilex* and sometimes also *Taxus* in the shrublayer (*Quercion robori-petraeae or Ilici-Fagenion*)
9130	*Asperulo-Fagetum* beech forests
9140	Medio-European subalpine beech woods with *Acer* and *Rumex arifolius*
9150	Medio-European limestone beech forests of the *Cephalanthero-Fagion*
9160	Sub-Atlantic and medio-European oak or oak-hornbeam forests of the *Carpinion betuli*
9170	*Galio-Carpinetum* oak-hornbeam forests
9180	* *Tilio-Acerion* forests of slopes, screes and ravines
9190	Old acidophilous oak woods with *Quercus robur* on sandy plains
91A0	Old sessile oak woods with *Ilex* and *Blechnum* in the British Isles
91B0	Thermophilous *Fraxinus angustifolia* woods
91C0	* Caledonian forest
91D0	* Bog woodland
91E0	* Alluvial forests with *Alnus glutinosa* and *Fraxinus excelsior* (*Alno-Padion, Alnion incanae, Salicion albae*)
91F0	Riparian mixed forests of *Quercus robur, Ulmus laevis* and *Ulmus minor*, *Fraxinus excelsior* or *Fraxinus angustifolia*, along the great rivers (*Ulmenion minoris*)
91G0	* Pannonic woods with *Quercus petraea* and *Carpinus betulus*
91H0	* Pannonian woods with *Quercus pubescens*
91I0	* Euro-Siberian steppic woods with *Quercus* spp.
91J0	* *Taxus baccata* woods of the British Isles

91Q0	Western Carpathian calcicolous *Pinus sylvestris* forests
91R0	Dinaric dolomite Scots pine forests (*Genisto januensis-Pinetum*)
91S0	* Western Pontic beech forests
91T0	Central European lichen Scots pine forests
91U0	Sarmatic steppe pine forest
91V0	Dacian Beech forests (*Symphyto-Fagion*)
91W0	Moesian beech forests
91X0	* Dobrogean beech forests
91Y0	Dacian oak & hornbeam forests
91Z0	Moesian silver lime woods

▼M3

91AA * Eastern white oak woods

91BA Moesian silver fir forests

91CA Rhodopide and Balkan Range Scots pine forests

92. Mediterranean deciduous forests

9210 * Apeninne beech forests with *Taxus* and *Ilex*

9220 * Apennine beech forests with *Abies alba* and beech forests with *Abies nebrodensis*

9230 Galicio-Portuguese oak woods with *Quercus robur* and *Quercus pyrenaica*

9240 *Quercus faginea* and *Quercus canariensis* Iberian woods

9250 *Quercus trojana* woods

9260 *Castanea sativa* woods

9270 Hellenic beech forests with *Abies borisii-regis*

9280 *Quercus frainetto* woods

9290 *Cupressus* forests (*Acero-Cupression*)

92A0 *Salix alba* and *Populus alba* galleries

92B0 Riparian formations on intermittent Mediterranean water courses with *Rhododendron ponticum, Salix* and others

92C0 *Platanus orientalis* and *Liquidambar orientalis* woods (*Platanion orientalis*)

92D0 Southern riparian galleries and thickets (*Nerio-Tamaricetea* and *Securinegion tinctoriae*)

93. Mediterranean sclerophyllous forests

9310 Aegean *Quercus brachyphylla* woods

9320 *Olea* and *Ceratonia* forests

9330 *Quercus suber* forests

9340 *Quercus ilex* and *Quercus rotundifolia* forests

9350 *Quercus macrolepis* forests

9360 * Macaronesian laurel forests (*Laurus, Ocotea*)

9370 * Palm groves of *Phoenix*

9380 Forests of *Ilex aquifolium*

9390 * Scrub and low forest vegetation with *Quercus alnifolia*

93A0 Woodlands with *Quercus infectoria* (*Anagyro foetidae-Quercetum infectoriae*)

94. Temperate mountainous coniferous forests

9410 Acidophilous *Picea* forests of the montane to alpine levels (*Vaccinio-Piceetea*)

9420 Alpine *Larix decidua* and/or *Pinus cembra* forests

9430 Subalpine and montane *Pinus uncinata* forests (* if on gypsum or limestone)

95. Mediterranean and Macaronesian mountainous coniferous forests

9510 * Southern Apennine *Abies alba* forests

9520 *Abies pinsapo* forests

9530 * (Sub-) Mediterranean pine forests with endemic black pines

9540 Mediterranean pine forests with endemic Mesogean pines

9550 Canarian endemic pine forests

9560 * Endemic forests with *Juniperus* spp.

▼**M3**

9570	* *Tetraclinis articulata* forests
9580	* Mediterranean *Taxus baccata* woods
9590	* *Cedrus brevifolia* forests (*Cedrosetum brevifoliae*)
95A0	High oro-Mediterranean pine forests

ANNEX II

ANIMAL AND PLANT SPECIES OF COMMUNITY INTEREST WHOSE CONSERVATION REQUIRES THE DESIGNATION OF SPECIAL AREAS OF CONSERVATION

Interpretation

(a) Annex II follows on from Annex I for the establishment of a consistent network of special areas of conservation.

(b) The species listed in this Annex are indicated:

— by the name of the species or subspecies, or

— by all the species belonging to a higher taxon or to a designated part of that taxon.

The abbreviation 'spp.' after the name of a family or genus designates all the species belonging to that family or genus.

(c) Symbols

An asterisk (*) before the name of a species indicates that it is a priority species.

Most species listed in this Annex are also listed in Annex IV. Where a species appears in this Annex but does not appear in either Annex IV or Annex V, the species name is followed by the symbol (o); where a species which appears in this Annex also appears in Annex V but does not appear in Annex IV, its name is followed by the symbol (V).

* *Centaurea balearica* J. D. Rodriguez

* *Centaurea borjae* Valdes-Berm. & Rivas Goday

* *Centaurea citricolor* Font Quer

Centaurea corymbosa Pourret

Centaurea gadorensis G. Blanca

* *Centaurea horrida* Badaro

Centaurea immanuelis-loewii Degen

Centaurea jankae Brandza

* *Centaurea kalambakensis* Freyn & Sint.

Centaurea kartschiana Scop.

* *Centaurea lactiflora* Halacsy

Centaurea micrantha Hoffmanns. & Link subsp. *herminii* (Rouy) Dostál

* *Centaurea niederi* Heldr.

* *Centaurea peucedanifolia* Boiss. & Orph.

* *Centaurea pinnata* Pau

Centaurea pontica Prodan & E. I. Nyárády

Centaurea pulvinata (G. Blanca) G. Blanca

Centaurea rothmalerana (Arènes) Dostál

Centaurea vicentina Mariz

Cirsium brachycephalum Juratzka

* *Crepis crocifolia* Boiss. & Heldr.

Crepis granatensis (Willk.) B. Blanca & M. Cueto

Crepis pusilla (Sommier) Merxmüller

Crepis tectorum L. subsp. *nigrescens*

Erigeron frigidus Boiss. ex DC.

* *Helichrysum melitense* (Pignatti) Brullo et al

▼M3

Hymenostemma pseudanthemis (Kunze) Willd.

Hyoseris frutescens Brullo et Pavone

* *Jurinea cyanoides* (L.) Reichenb.

* *Jurinea fontqueri* Cuatrec.

* *Lamyropsis microcephala* (Moris) Dittrich & Greuter

Leontodon microcephalus (Boiss. ex DC.) Boiss.

Leontodon boryi Boiss.

* *Leontodon siculus* (Guss.) Finch & Sell

Leuzea longifolia Hoffmanns. & Link

Ligularia sibirica (L.) Cass.

* *Palaeocyanus crassifolius* (Bertoloni) Dostal

Santolina impressa Hoffmanns. & Link

Santolina semidentata Hoffmanns. & Link

Saussurea alpina subsp. *esthonica* (Baer ex Rupr) Kupffer

* *Senecio elodes* Boiss. ex DC.

Senecio jacobea L. subsp. *gotlandicus* (Neuman) Sterner

Senecio nevadensis Boiss. & Reuter

* *Serratula lycopifolia* (Vill.) A.Kern

*Tephroseris longifolia (*Jacq.) Griseb et Schenk subsp. *moravica*

CONVOLVULACEAE

* *Convolvulus argyrothamnus* Greuter

* *Convolvulus fernandesii* Pinto da Silva & Teles

CRUCIFERAE

Alyssum pyrenaicum Lapeyr.

* *Arabis kennedyae* Meikle

Arabis sadina (Samp.) P. Cout.

Arabis scopoliana Boiss

* *Biscutella neustriaca* Bonnet

Biscutella vincentina (Samp.) Rothm.

Boleum asperum (Pers.) Desvaux

Brassica glabrescens Poldini

Brassica hilarionis Post

Brassica insularis Moris

* *Brassica macrocarpa* Guss.

Braya linearis Rouy

* *Cochlearia polonica* E. Fröhlich

* *Cochlearia tatrae* Borbas

* *Coincya rupestris* Rouy

* *Coronopus navasii* Pau

Crambe tataria Sebeok

Diplotaxis ibicensis (Pau) Gómez-Campo

* *Diplotaxis siettiana* Maire

Diplotaxis vicentina (P. Cout.) Rothm.

Draba cacuminum Elis Ekman

▼M3

Draba cinerea Adams

Draba dorneri Heuffel.

Erucastrum palustre (Pirona) Vis.

* *Erysimum pieninicum* (Zapal.) Pawl.

* *Iberis arbuscula* Runemark

Iberis procumbens Lange subsp. *microcarpa* Franco & Pinto da Silva

* *Jonopsidium acaule* (Desf.) Reichenb.

Jonopsidium savianum (Caruel) Ball ex Arcang.

Rhynchosinapis erucastrum (L.) Dandy ex Clapham subsp. *cintrana* (Coutinho) Franco & P. Silva *(Coincya cintrana* (P. Cout.) Pinto da Silva)

ANNEX III

CRITERIA FOR SELECTING SITES ELIGIBLE FOR IDENTIFICATION AS SITES OF COMMUNITY IMPORTANCE AND DESIGNATION AS SPECIAL AREAS OF CONSERVATION

STAGE 1: **Assessment at national level of the relative importance of sites for each natural habitat type in Annex I and each species in Annex II (including priority natural habitat types and priority species)**

A. *Site assessment criteria for a given natural habitat type in Annex I*

(a) Degree of representativity of the natural habitat ►C1 type on the site. ◄

(b) Area of the site covered by the natural habitat type in relation to the total area covered by that natural habitat type within national territory.

(c) Degree of conservation of the structure and functions of the natural habitat type concerned and restoration possibilities.

(d) Global assessment of the value of the site for conservation of the natural habitat type concerned.

B. *Site assessment criteria for a given species in Annex II*

(a) Size and density of the population of the species present on the site in relation to the populations present within national territory.

(b) Degree of conservation of the features of the habitat which are important for the species concerned and restoration possibilities.

(c) Degree of isolation of the population present on the site in relation to the natural range of the species.

(d) Global assessment of the value of the site for conservation of the species concerned.

C. On the basis of these criteria, Member States will classify the sites which they propose on the national list as sites eligible for identification as sites of Community importance according to their relative value for the conservation of each natural habitat type in Annex I or each species in Annex II.

D. That list will show the sites containing the priority natural habitat types and priority species selected by the Member States on the basis of the criteria in A and B above.

STAGE 2: **Assessment of the Community importance of the sites included on the national lists**

1. All the sites identified by the Member States in Stage 1 which contain priority natural habitat types and/or species will be considered as sites of Community importance.

2. The assessment of the Community importance of other sites on Member States' lists, i.e. their contribution to maintaining or re-establishing, at a favourable conservation status, a natural habitat in Annex I or a species in Annex II and/or to the coherence of Natura 2000 will take account of the following criteria:

(a) relative value of the site at national level;

(b) geographical situation of the site in relation to migration routes of species in Annex II and whether it belongs to a continuous ecosystem situated on both sides of one or more internal Community frontiers;

(c) total area of the site;

(d) number of natural habitat types in Annex I and species in Annex II present on the site;

(e) global ecological value of the site for the biogeographical regions concerned and/or for the whole of the territory referred to in Article 2, as regards both ►C1 the characteristic or unique ◄ aspect of its features and the way they are combined.

COUNCIL

COUNCIL DECISION

of 3 December 1981

concerning the conclusion of the Convention on the conservation of European wildlife and natural habitats

(82/72/EEC)

THE COUNCIL OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Economic Community, and in particular Article 235 thereof,

Having regard to the proposal from the Commission,

Having regard to the opinion of the European Parliament (1),

Having regard to the opinion of the Economic and Social Committee (2),

Whereas a programme of action of the European Communities on the environment was adopted by the declaration of 22 November 1973 (3), and supplemented by the resolution of 17 May 1977 (4); whereas the aim of an environment policy in the Community, as defined in these acts, is to improve the setting and quality of life and the surroundings and living conditions of the peoples of the Community; whereas to this end it is, in particular, necessary to ensure the sound management of resources and of the natural environment and avoid any exploitation of them which causes significant damage to the ecological balance; whereas, further, common solutions to environment problems with States outside the Community should be sought, particularly in international organizations;

Whereas, as part of the Community programme of action on the environment, the Council adopted Directive 79/409/EEC on the conservation of wild birds (5), which covers the protection, management and control of these species and lays down rules for their exploitation;

Whereas the Community has participated in negotiations within the Council of Europe for a Convention on the conservation of European wildlife and natural habitats; whereas that Convention was signed on 19 September 1979;

Whereas participation by the Community in the implementation of the said Convention is necessary in order to attain one of the objectives of the Community; whereas the powers necessary for this end are not provided for by the Treaty, other than Article 235 thereof;

Whereas the Community will take part in such implementation by exercising the powers resulting from existing common rules and those acquired by it by virtue of future acts adopted by the Council as well as by making use of the results of Community action (research — exchange of information) undertaken in the areas concerned;

Whereas it is necessary for the Community to approve the said Convention;

(1) OJ No C 175, 14. 7. 1980, p. 17.
(2) OJ No C 53, 3. 3. 1980, p. 50.
(3) OJ No C 112, 20. 12. 1973, p. 1.
(4) OJ No C 139, 13. 6. 1977, p. 1.
(5) OJ No L 103, 25. 4. 1979, p. 1.

Whereas the conditions of life for wild flora and fauna in Greenland are fundamentally different from those of wild flora and fauna in the other regions of the Community because of the general circumstances and in particular the climate, the low density of population and the exceptional size and geographical situation of the island; whereas, because of this fact, the Council has already had to exclude Greenland from the scope of the Directive on the conservation of wild birds; whereas therefore Greenland should also be excluded from the scope of the Convention,

HAS DECIDED AS FOLLOWS:

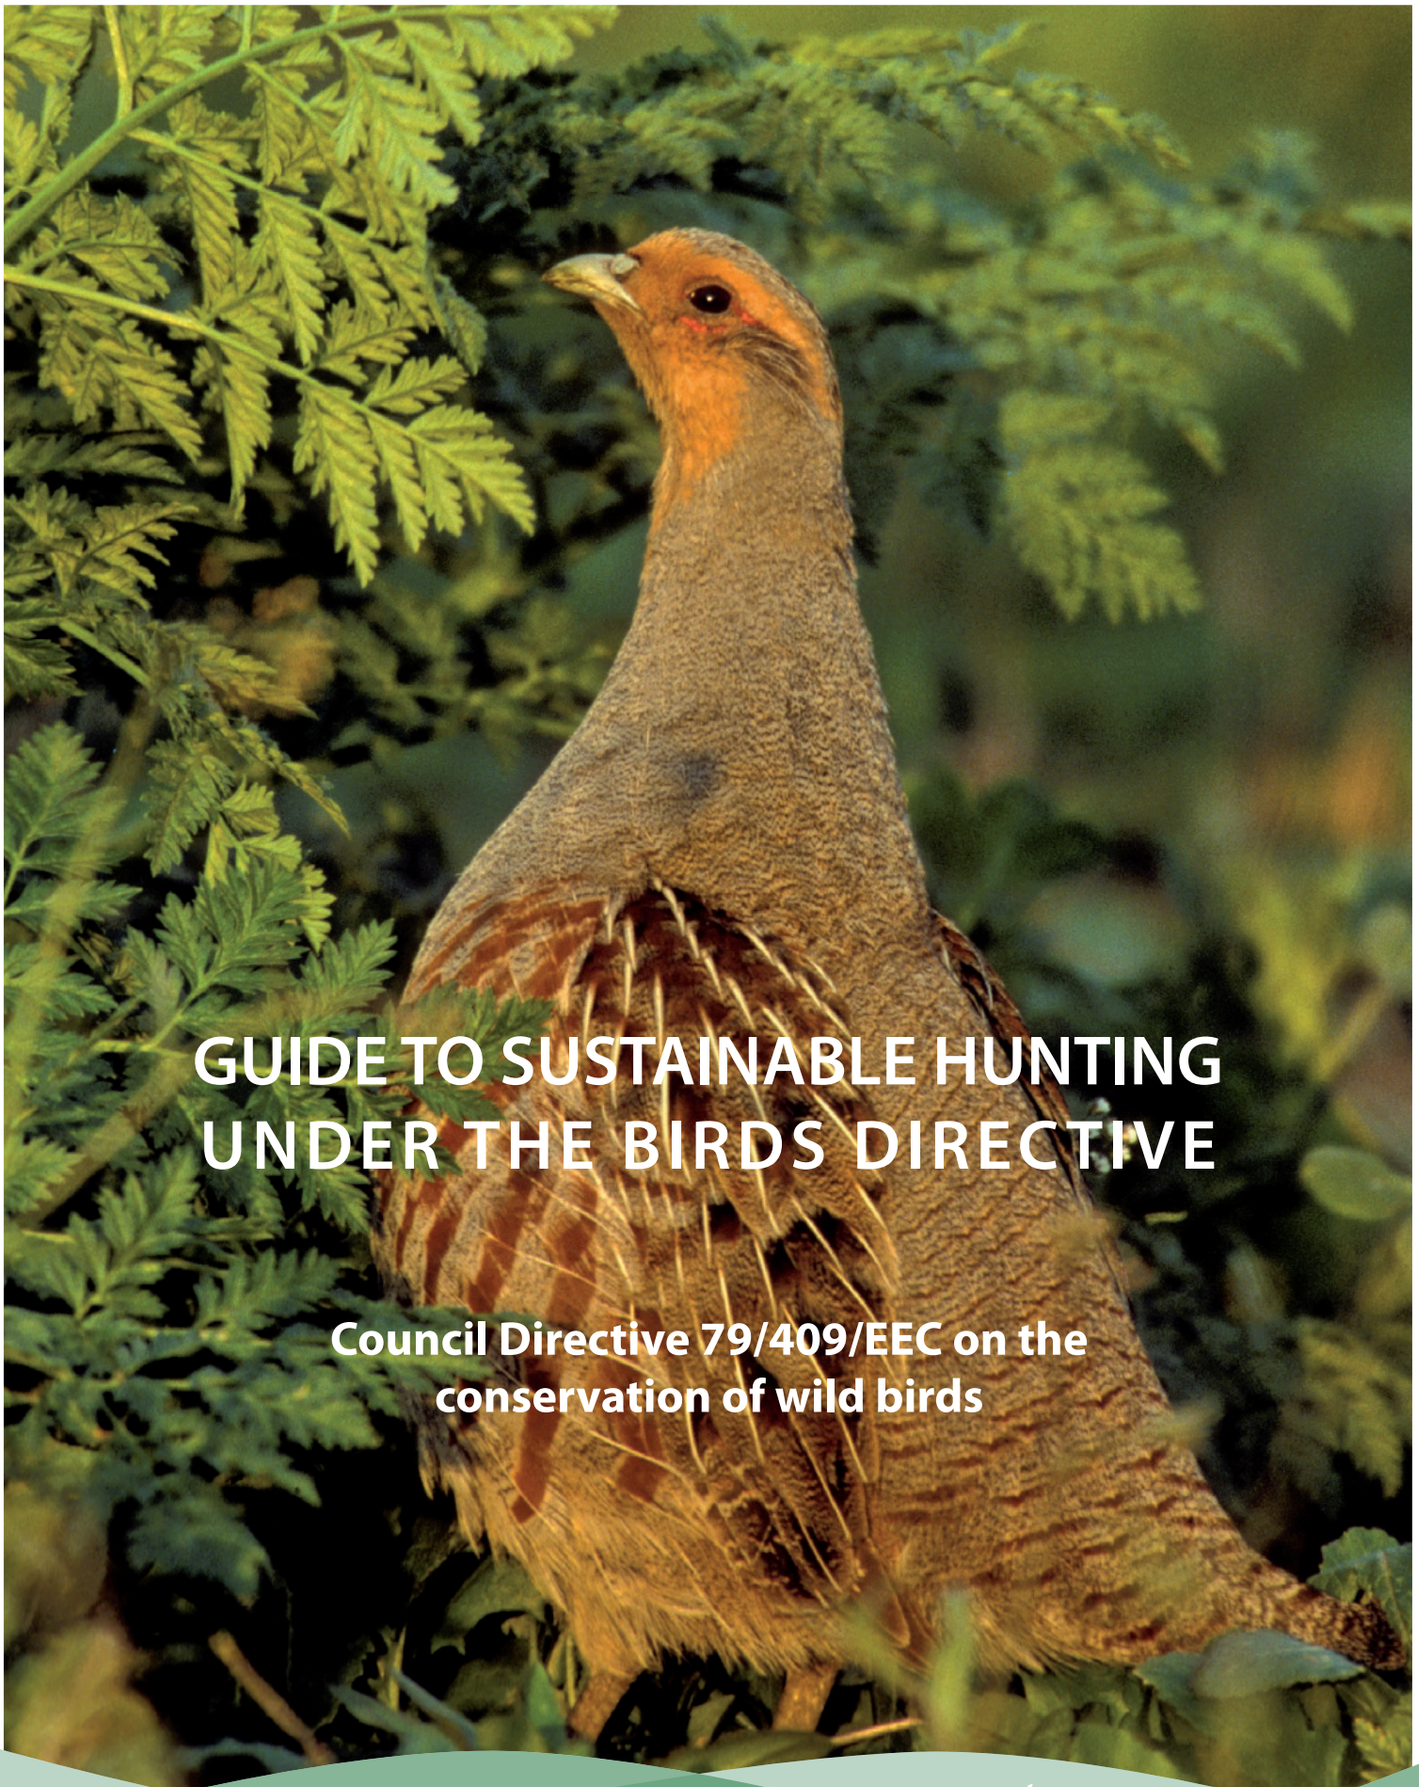
Article 1

The Convention on the conservation of European wildlife and natural habitats is hereby approved on behalf of the European Economic Community.

The text of the Convention is annexed to this Decision.

Article 2

The President of the Council shall deposit the instrument of approval as provided for in Article 19 of the Convention (1) for the territories in which the Treaty establishing the European Economic Community is applied under the conditions laid down in that Treaty, with the exception of Greenland.



Done at Brussels, 3 December 1981.

For the Council

The President

T. KING

(1) The date of entry into force of the Convention will be published in the *Official Journal of the European Communities* by the General Secretariat of the Council.

5 ANNEX 93

FOREWORD

Council Directive 79/409/EEC on the conservation of wild birds[1] (the so-called "Birds Directive") provides a common framework for the conservation of naturally occurring species of wild birds and their habitats throughout the European Union. The directive owes its origin to the fact that wild birds, which are mainly migratory, represent a shared heritage of the Member States and whose effective protection is typically a transfrontier problem entailing common responsibilities.

The Birds Directive fully recognises the legitimacy of hunting of wild birds as a form of sustainable use. Hunting is an activity that provides significant social, cultural, economic and environmental benefits in different regions of the European Union. It is limited to certain species, listed in the Directive, which also provides a series of ecological principles and legal requirements relating to this activity, to be implemented through Member States legislation. This provides the framework for the management of hunting.

There has been a lot of controversy and in recent years some confrontation, over the compatibility of hunting with certain requirements of the Directive. The controversy is often fed by differing interpretations of those requirements.

The Commission has therefore recognised the need to start a new dialogue with a view to developing co-operation between all governmental and non-governmental organisations concerned with the conservation and wise and sustainable use of our wild birds. With a view to this it launched a 'Sustainable Hunting Initiative' in 2001 aimed at improved understanding of the legal and technical aspects of the Directive's provisions on hunting as well as developing a programme of scientific, conservation and awareness raising measures to promote sustainable hunting under the directive.

This guidance document aims to fulfil one of the key objectives of the dialogue by providing better clarification of the requirements of the Directive relating to hunting, within the existing legal framework and strongly based on scientific principles and data and the overall conservation aim of the directive. This builds on the work that has already taken place on the key concepts of Article 7(4) of the Directive[2].

Why a guide on hunting?

There is clearly a demand for improved guidance on the hunting provisions of the Directive. This is evident from the extent of litigation on the subject. There have also been many questions to the Commission on this subject including those from the European Parliament. This must also be seen in the context of the increased polarisation as is evidenced by contrasting petitions to Parliament from hunting and bird conservation organisations, which have secured the signatures of millions of people.

[1] OJ No L 103, 25.4.1979, p.1

[2] Key concepts of Article 7(4) of Directive 79/409/EEC. Period of reproduction and prenuptial migration of Annex II bird species in the EU (September 2001).

Linked to this demand is a real need for improved clarity. Some Member States want to know what are the possibilities to fix hunting seasons outside the limits imposed by Article 7(4), which may be overly constraining, as appears to be the case for a small number of problematic species (such as the Mallard *Anas platyrhynchos* and the Wood Pigeon *Columba palumbus*) with early pre-nuptial migration and/or long reproduction periods, and wish to consider recourse to Article 9 derogations.

There is already positive experience from the development of guidance on Article 6 of Council Directive 92/43/EEC[3] on the conservation of natural habitats and of wild flora and fauna ("the Habitats Directive"). This is seen as a proactive rather than reactive approach that stimulates coherent reflection and avoids interpretation developing in an ad hoc and inconsistent way. However, it must be recognised that, unlike Article 6 of the Habitats Directive, the provisions of the Birds Directive are much older and have been subject to more extensive case-law, a factor which any interpretative guidance must take into account.

This document will also be of value to the Commission services in any contemplated action in this field and will provide principal stakeholders with some security in terms of what they can expect.

Limits of the guide

The guide is intended to be bound by and faithful to the text of the Directive and the wider principles underpinning Community environmental law. It is not legislative in character (not making new rules but providing guidance on the application of those that exist). As such this document reflects only the views of the Commission services and is not of a binding nature.

It should be stressed that **it rests with the EU Court of Justice to provide definitive interpretation of a Directive**. Therefore, the guidance provided will need to evolve in line with any emerging jurisprudence on this subject.

The guide intends to fully respect the existing case law of the Court, which is already quite extensive. This determines aspects of the guide, especially where clear positions have already been established by the Court.

The guide also aims to explain the ecological principles that underpin the management of hunting under the Directive and makes use of best available scientific data, although it is recognised that the lack of good quality scientific data creates a constraint in so far as trying to correctly and accurately manage populations.

It recognises that the management of hunting is the responsibility of the Member States, including their role in determine hunting seasons within their territory in accordance with the requirements of the Directive.

[3] OJ L206 of 22.07.1992, p.7

Scope of guide

The essential focus of the guide is on the timing of recreational hunting. However, other issues relevant to hunting are covered as appropriate. Its legal focus is primarily on huntable species listed in Annex II of the Directive as well as the relevant provisions of Articles 7 and 9 but all other Articles will be examined as relevant. Particular consideration is given to examining the basis for exercising derogations, especially under Article 9. 1 (c). The guide not only deals with legal provisions but also covers scientific and technical dimensions given in the directive which are relevant to the conservation of wild birds.

Structure of the guide

The guide is presented in three main chapters. The first chapter provides an overview of hunting within the framework of the Directive, including consideration of the relevant preambles and Articles.

The second chapter considers in more details the relevant legal and technical provisions of Article 7, including the specific conditions related to fixing hunting seasons under the Directive.

The third chapter then examines the possibilities for allowing for some hunting under the system of derogations that apply under Article 9 of the Directive. Different parts of the document are supplemented by Figures where additional information is considered useful to the guidance.

1 INTRODUCTION

1.1 Hunting within the Overall Scheme of the Directive

1.1.1 Council Directive 79/409/EEC is a wide-ranging instrument aimed at the general conservation of wild birds in the European Union. Addressing several aspects of conservation (including safeguards for habitats, controls on trade and hunting and promotion of research), it follows a standard layout for this type of legal instrument: a preamble with recitals, Articles containing substantive provisions, and a series of Annexes.

1.2 Preamble

1.2.1 The recitals in the preamble reflect the structure of the body of the Directive. The preamble is often used as an aid to interpreting the substantive provisions of secondary legislation, and has been cited by the Court in this regard in relation to the Directive[4].

1.2.2 As with any directive the interpretation needs to have regard to the different language versions, all of which are valid. In the context of the present guide it is to be noted that some phrases (e.g. 'judicious use', 'rearing season') in the different language versions merit careful attention. It is important when looking at the different language versions to elicit a meaning that best reflects the purpose and context of the terms under examination.

1.3 Species Covered by the Directive

1.3.1 Article 1 of the Directive states that it relates to the "*conservation of all species of naturally occurring birds in the wild state in the European territory of the Member States to which the Treaty applies. It covers the protection, management and control of these species and lays down rules for their exploitation.*" The case law of the Court confirms that, when implementing the Directive, the Member States have an obligation to protect species of wild birds occurring in the territory of the Community, and not merely those species occurring in their national territories[5].

---

[4] For example, see point 21 of case C-57/89, *Commission of the European Communities v Federal Republic of Germany*. In this case, which concerned the application of the habitat protection provisions of Directive 79/409/EEC, the Court observed : « *That interpretation of Article 4(4) of the Directive is borne out, moreover, by the ninth recital in the preamble, which underlines the special importance which the Directive attaches to special conservation measures concerning the habitats of the birds listed in Annex I in order to ensure their survival and reproduction in their area of distribution. It follows that the power of the Member States to reduce the extent of a special protection area can be justified only on exceptional grounds."*

[5] In its judgment of 8 July 1987, Commission/Belgium, case 247/85, ECR 1987, p.3029, the Court noted at paragraph 6 : *« The Directive is based on the consideration that effective bird protection is typically a transfrontier environment problem entailing common responsibilities for the Member States (third recital in the preamble). »*. In this context, the preamble to the Directive notes that *" effective bird protection is typically a trans-frontier environment problem entailing common responsibilities."*

1.3.2 Protection does not extend to specimens bred in captivity[6]. Nonetheless, in cases where captive bred individuals are released into or return to the wild, and are indistinguishable from wild individuals of the same species occurring in the same areas, it is reasonable to consider that the terms of the Directive are applicable[7].

1.3.3 The Commission has sought to list the wild bird species coming within the Directive's scope[8]. This list covers all bird species that naturally occur in the Member States, including accidental visitors. It does not extend to introduced species unless they are explicitly mentioned in one of the Annexes to the Directive (e.g. the Wild Turkey *Meleagris gallopavo*). However, introduced species are covered by the terms of the Directive in a Member State if they are native to another Member State.

1.4 General Orientation of Directive

1.4.1 Article 2 contains the general obligation on Member States to "*take the requisite measures to maintain the population of the species referred to in Article 1 at a level which corresponds in particular to ecological, scientific and cultural requirements, while taking account of economic and recreational requirements, or to adapt the population of these species to that level."* As this Article requires the protection of bird species to be balanced against other interests, a question has arisen as to whether this Article comprises a derogation independent from the general requirements of the Directive. The Court has confirmed that it does not, including with specific regard to hunting[9]. Nonetheless, the Court's pronouncements show that Article 2 is not

---

[6] Judgment of 8 February 1996, Criminal proceedings v Didier Vergy, case C-149/94, ECR 1996, p. 299.

[7] In areas where the only specimens of a huntable species in the wild are of released individuals from captive bred stock it would be reasonable to conclude that hunting seasons for this species must be fixed in a way that takes full regard for non permissible periods for similar species (e.g. release of Chukars *Alectoris chukar* in the Alps and possible confusion risk with Rock Partridge *Alectoris graeca*).

[8] A list of bird species covered by the Directive has been prepared by the Commission and presented to the Committee for the Adaptation to Technical and Scientific Progress (commonly referred to as the ORNIS Committee), established pursuant to Article 16 of the Directive. This is not a legal listing but is intended for guidance in application of the Directive. It is available on the web site of DG ENV at http://ec.europa.eu/environment/nature/conservation/wildbirds/eu_species/index_en.htm

[9] In its judgment of 8 July 1987, Commission/Belgium, case 247/85, ECR 1987, p.3029, the Court noted at paragraph 8 : « *In this context it is necessary to refer to Article 2 of the Directive, which requires Member States to take the requisite measures to maintain the population of all bird species at a level, or to adapt it to a level, which corresponds in particular to ecological, scientific and cultural requirements, while taking account of economic and recreational requirements, and from which it is therefore clear that the protection of birds must be balanced against other requirements, such as those of an economic nature. Therefore, although Article 2 does not constitute an autonomous derogation from the general system of protection, it none the less shows that the Directive takes into consideration, on the one hand, the necessity for effective protection of birds and, on the other hand, the requirements of public health and safety, the economy, ecology, science, farming and recreation.* » . In its Judgment of 8 July 1987, Commission/Italy, case 262/85, ECR 1987, p.3073, the Court rejected arguments by the Italian government that departures from the requirements of Article 7(4) could be based directly on Article 2. It noted at paragraph 37 : « *…it must be stressed that Article 2, as observed above, is not an independent derogation from the obligations and requirements of the Directive.* »

without relevance and weight when considering the interpretation of other provisions of the Directive. In this regard, its provisions have value as a general orientation guide as to what the Directive requires and allows.

1.5 Conservation of Habitats

1.5.1 Article 3 and 4 address the conservation of habitats. They include provisions related to prevention of significant disturbance within special protection areas (SPAs) classified pursuant to Article 4 (1) and (2). The Commission does not consider that socio-economic activities – of which hunting is an example - necessarily contravene these provisions. However, it is necessary that such activities within SPAs to be properly managed and monitored to avoid such significant disturbance[10].

1.5.2 The Commission has already prepared a guidance document covering the provisions of Article 6(2), (3) and (4) of Directive 92/43/EEC on the conservation of natural habitats and of wild flora and fauna ("the Habitats Directive"), which replace the provisions of Article 4(4), first sentence with regard to classified SPAs[11]. This existing document discusses disturbance. It is appropriate to have regard to the principle of proportionality in considering the matter of hunting under Article 6 of the Habitats Directive. The relevant section of the Article 6 guide is to be read in the sense that effects, which are not significant in terms of the conservation objectives for the NATURA 2000 site, are not to be considered as contravening Article 6(2) of the Habitats Directive.

1.5.3 Hunting is only one of the many potential uses of NATURA 2000 sites, alongside uses such as agriculture, fisheries and other forms of recreation. There is no general presumption against hunting in NATURA 2000 areas under the nature directives. However, it is clear that hunting and other human activities have potential to lead to a temporary reduction in use of habitats within a site. Such activities would be significant if they would lead to a pronounced reduction in the capacity of the site to support the species for which it was designated and would also result in reduced hunting potential.

1.5.4 There will be specific instances where hunting is incompatible with the conservation objectives of individual sites. Examples may be where there is the occurrence of rare species which is highly sensitive to disturbance alongside potential quarry species. Such instances can only be determined on a site by site basis.

---

[10] The report on a workshop on 'Hunting in and around NATURA 2000 areas' organised by the European Commission during Greenweek in April 2002 is to be found on the web site of DG Environment at :
http://ec.europa.eu/environment/nature/conservation/wildbirds/hunting/docs/report_green_week_en.pdf

[11] "Managing Natura 2000 sites: The provisions of Article 6 of the 'Habitats' Directive 92/43/EEC", European Commission, Office for Official Publications of the European Communities, Luxembourg

1.5.5 Sustainable hunting can provide beneficial consequences to habitat conservation in and around sites. This is considered further in section 2.4.20-2.4.23 of the guide.

1.5.6 Ensuring that hunting or other activities does not lead to significant disturbance will depend on a variety of factors such as the nature and extent of the site and of the activity as well as on the species present. There is a need to understand the reasons why the site is important for nature conservation leading to its inclusion in NATURA 2000, which provides the basis for determining its conservation objectives. Such an understanding provides an essential starting point for determining the specific management actions that are needed to conserve the site.

1.5.7 In order to reconcile human use with the conservation objectives the Commission advocates the development of management plans, which make provision for ensuring that activities in and around SPAs under the Birds Directive as well as sites designated under the Habitats Directive (which are collectively known as the NATURA 2000 network) are consistent with the ecological requirements of the species or habitats types of EU conservation interest for which these sites have been designated. It is reasonable to expect that those who exploit natural resources such as wild birds have also a responsibility to ensure that their activities are sustainable and not detrimental to the populations concerned. In conclusion, therefore the Commission believes that hunting activities on NATURA 2000 sites are essentially management issues to be determined predominantly at local level. This management would be best structured with a management plan which ensures that activities are compatible with the conservation objectives for which the sites have been designated.

1.5.8 Depending on the nature of the NATURA 2000 sites and hunting practices such management plans should give consideration to the provision of adequate no hunting refuge zones. A comprehensive research programme in Denmark has shown that the careful establishment of hunting free zones can increase at the same time site use by waterfowl and hunting opportunities in the vicinity of such areas[12]. The concept of hunting free zones is also well established in other Member States and is not restricted to NATURA 2000 areas (e.g. reserves de chasse in France).Basic Species Protection Prohibitions.

[12] Madsen, Pihl & Clausen (1998), Establishing a reserve network for waterfowl in Denmark: a biological evaluation of needs and consequences. Biological Conservation 85: 241-256.
Madsen & Fox (1997), The impact of hunting disturbance on waterfowl populations: The concept of flyway networks of disturbance-free areas. *Gibier faune sauvage* 14: 201-209. However, this particular model may not be applicable to Member States or areas where hunters' access and hunting pressure are regulated differently (e.g. private property owners).

1.6 Basic Species Protection Prohibitions

1.6.1 Article 5 of the Directive requires Member States to take the requisite measures to "*establish a general system of protection for all species referred to in Article 1".*
The basic prohibition on hunting is found in Article 5 (a) of the Directive, which requires Member States to prohibit in particular the *"deliberate killing or capture by any method*". [13]

1.6.2 Article 6(1) contains the basic prohibition on trading in birds that are protected under Article 1. Specifically " *Member States shall prohibit, for all the bird species referred to in Article 1, the sale, transport for sale, keeping for sale and the offering for sale of live or dead birds and of any readily recognisable parts or derivatives of such birds."*

1.7 Exceptions to Basic Prohibitions

1.7.1 The Directive provides for exceptions to the general prohibitions set out in Articles 5 and 6.

1.7.2 The trade in species listed in Annex III of the Directive is permitted, provided that the conditions and restrictions within Articles 6 (2) and 6 (3) are observed.

1.7.3 In relation to hunting, species listed in Annex II may be hunted under Article 7 of the Directive owing *"to their population level, geographical distribution level and reproductive rate throughout the Community ".* Where a species is not listed in Annex II, an exception to the prohibitions in Article 5 is only possible where the strict requirements of Article 9 are fulfilled.

1.7.4 The Article 7 hunting exception to the Article 5 prohibitions is subject to several conditions set out in Article 7. Member States are required to ensure "*that the practice of hunting, including falconry if practised, as carried on in accordance with the national measures in force, complies with the principles of wise use and ecologically balanced control of the species of birds concerned and that this practice is compatible as regards the population of these species, in particular migratory species, with the measures resulting from Article 2.*" They are also required to ensure that "*the species to which hunting laws apply are not hunted during the rearing season or during the various stages of reproduction. In the case of migratory species, they shall see in particular that the species to which hunting regulations apply are not hunted during their period of reproduction or during their return to their rearing grounds*." The Court of Justice has interpreted the last-mentioned

[13] Article 5 also requires Member States to prohibit the:
- deliberate destruction of, or damage to, their nests and eggs or removal of their nests (Art 5 (b))
- taking their eggs in the wild and keeping these eggs even if empty (Art 5 (c))
- deliberate disturbance of these birds particularly during the period of breeding and rearing, in so far as disturbance would be significant having regard to the objectives of this Directive (Art 5 (d))
- keeping birds of species the hunting and capture of which is prohibited (Art 5 (e))

provision as requiring that Member States set the hunting period so as to ensure that the period *"guarantees complete protection of the species concerned*."[14] The requirements of Article 7 are considered in detail in Chapter 2.

1.7.5 Further qualifications are set out in Article 8, which requires Member States to prohibit « *the use of all means, arrangements or methods used for the large-scale or non-selective capture or killing of birds or capable of causing the local disappearance of a species, in particular the use of those listed in Annex IV (a).* Hunting from the modes of transport and under the conditions mentioned in Annex IV(b) is also required to be prohibited.

1.7.6 In addition to the exceptions for trade and hunting set out in Articles 6(2),(3) and 7, Article 9 allows Member States to derogate (i.e. depart)from the basic prohibitions in Article 5, 6, 7 and 8 provided three conditions are fulfilled: there is no other satisfactory solution ; one of the reasons listed in 9(1)(a), 9(1)(b), or 9(1)(c) applies; and the technical requirements of Article 9(2) are fulfilled. These conditions are considered in detail in Chapter 3. Article 9 also provides for a system of annual derogation reports from the Member States to the Commission[15].

1.7.7 Derogations under Article 9 are also possible with regard to the prohibitions set out in Article 7 and 8.

1.8 Research

1.8.1 Article 10 requires Member States to encourage research and *« any work required as a basis for the protection, management and use of the population of all species of bird referred to in Article 1. »*. The Court of Justice confirmed that this provision creates an obligation for Member States and has to be transposed and implemented in national domestic legal orders[16]. Particular attention is required to be paid to research and work on subjects listed in Annex V. A number of categories of research listed in Annex V are relevant to hunting, especially items (c) "*listing of data on the population levels of migratory species as shown by ringing*" and (d) "*assessing the influence of taking wild birds on population levels"*. Item (e) "*Developing or refining ecological methods for preventing the type of damage caused by birds*" is also relevant to species which may cause damage. The case-law of the Court of Justice underscores the importance of using the best available scientific information as a basis for implementing the Directive[17].

---

[14] Judgment of 19 January 1994, Association pour la Protection des Animaux Sauvages and others v Préfet de Maine-et-Loire and Préfet de Loire-Atlantique, case C-435/92, ECR 1994, p.67 paragraph 13.
[15] On the basis of these annual reports the Commission provides a report on the use of derogations under the Birds Directive to the Convention on the Conservation of European Wildlife and Natural Habitats. This biannual report is provided in fulfilment of Article 9(2) of the Convention.
[16] Judgement of 13 December 2007, Commission/Ireland, C-418/04, paragraphs 266-275.
[17] In its judgment of 17 January 1991, Commission/Italy, Case C-157/89, ECR 1991, p.57, paragraph 15, the Court accepted that, in the absence of specific Italian reference material, the Commission was entitled to rely on a more general ornithological reference work in support of its contentions, especially as the Italian government had not adduced alternative scientific studies.

1.8.2 However, it must be acknowledged that, in relation to the categories of research relevant to huntable species, high quality information on a series of even basic features of the migratory system of many huntable species remains extremely limited. The proper hunting management of migratory birds implies an adequate knowledge of the functional system of staging, moulting, fattening and wintering areas representing a migratory route, or flyway. In order to better apply the Directive, there is a need for enhanced understanding of geographical distribution of flyways, seasonality of movements and ecological requirements of migratory birds across the EU. Relevant studies can best be performed on individually marked birds; recoveries of ringed birds provide exact locations of migrants in time and space, and represent the best source of information for such large-scale analyses. Migration studies can provide the necessary information both at the level of species and geographical population; they also offer the unique opportunity to describe migratory patterns for different sex- and age-classes, which is an important parameter for the proper management of wild populations.

1.9 Introduction of Non-naturally occurring Bird Species

1.9.1 Article 11 relates to the prevention of damage to local flora and fauna by the introduction of bird species which do not occur naturally in the wild state in the European territory of the Member States. One of the most documented cases is the threat posed by the North American Ruddy Duck *Oxyura jamaicensis* to the endangered native European White-headed Duck *Oxyura leucocephala* through hybridisation as well as competition and displacement. There is potential for introductions to not only pose a threat to rare species but also to more widespread species, including those at present subject to hunting.

1.10 Reporting

1.10.1 Article 12 concerns the general reporting obligations of the Member States and Commission. These three-yearly general Member State reports are to be distinguished from the annual Member State derogation reports referred to in Article 9. The Commission reports produced pursuant to Article 12 are a valuable reference for several hunting-related issues. For example, the second report on the implementation of the Directive[18] contained information on the status of Annex II species in the Member States, on special measures taken by the Member States for wise use of hunted species, as well as a record of earlier discussions in the Committee established under the Directive ("the ORNIS Committee") on several important concepts such as wise use and small numbers.

[18] COM(93) 572 final.

1.11 Stand-Still Clause

1.11.1 Article 13 states that «*application of the measures taken pursuant to this Directive may not lead to deterioration of the present situation as regards the conservation of species of birds referred to in Article 1.* » This is an example of a « *stand-still clause.* » Such clauses appear in a significant number of Community environmental Directives. They are aimed at ensuring that the implementation of the Directives concerned will not worsen the initial status of the environmental features sought to be conserved.

1.12 Possibility of Stricter National Measures

1.12.1 Article 14 provides that Member States may introduce stricter protective measures than those provided for under the Directive. This reflects a general approach to Community environmental legislation, which has since been enshrined in the Treaty, whereby Member States retain a freedom to exceed the level of protection agreed by the Community. With reference to hunting, some Member States have set national limitations going beyond what the Directive requires – for example, they have prohibited the hunting of certain species that are huntable under the Directive.

1.12.2 It is important to note that the faculty of adopting stricter measures is not unrestricted. Member States must respect rules in the EC Treaty concerning freedom of trade, as is confirmed by a decision of the Court in Case C-169/89, *Criminal proceedings against Gourmetterie Van den Burg*[19]. In addition, where it can be demonstrated that the huntability of a bird species is clearly linked to conservation benefits for that and/or for other wild bird species as a result of hunting-associated habitat conservation measures, it may be appropriate, where a hunting ban is contemplated, to consider any disbenefits that may arise for habitat conservation.

1.13 Adapting the Directive

1.13.1 Articles 15 to 17 contain provisions relating to the adaptation to technical and scientific progress of Annexes I and V, as well as to the adaptation of Annex III. These provisions give a role to a committee established under Article 16,

[19] Judgment of 23 May 1990, Criminal proceedings v Gourmetterie Van den Burg, case C-169/89, ECR 1990, p. 2143. This case involved a request from a Dutch Court to the Court of Justice for an interpretative ruling following the prosecution in the Netherlands of an individual for possession of a Red Grouse, *Lagopus lagopus,* lawfully shot and killed in the United Kingdom. The Court drew a distinction between migratory species and endangered species listed in Annex I, and other species, such as Red Grouse. Noting the special emphasis the Directive placed on protection of migratory and endangered species, it stated at paragraph 12 : « *It follows from those general objectives laid down by Directive 79/409 for the protection of birds that the Member States are authorized, pursuant to Article 14 of the directive, to introduce stricter measures to ensure that the aforesaid species are protected even more effectively.With regard to the other bird species covered by Directive 79/409, the Member States are required to bring into force the laws, regulations and administrative provisions necessary to comply with the directive, but are not authorized to adopt stricter protective measures than those rovided for under the directive, except as regards species occurring within their territory.*

consisting of representatives of the Member States and Commission. While formally the regulatory role of this committee is quite limited, in practice the representatives on the Committee – now known as the "ORNIS Committee" – have an important advisory role and regularly discuss all aspects of the implementation of the Directive, including hunting aspects. With reference to changes to the hunting provisions of the Directive, the Committee has no formal role. Any relevant amendments to either the body of the Directive or Annex II require adoption by the Council of Ministers and European Parliament[20] on the basis of a proposal from the Commission.

[20] To date Annex II has been amended by one secondary instrument, Council Directive 94/24/EEC. This modified Annex II of Directive 79/409/EEC to include five species of *Corvidae*, which can cause damage to crops, and for which control measures were formerly only possible under Article 9 derogations.

Birds_directive5framed.indd 2 9/12/2008 11:19:23

2 PROVISIONS OF ARTICLE 7

Mallards - Oil painting by Pieter Verstappen

2 PROVISIONS OF ARTICLE 7

Text of Article 7

"*1. Owing to their population level, geographical distribution and reproductive rate throughout the community, the species listed in Annex II may be hunted under national legislation. Member states shall ensure that the hunting of these species does not jeopardise conservation efforts in their distribution area.*

2. The species referred to in Annex II/1 may be hunted in the geographical sea and land area where this Directive applies.

3. The species referred to in Annex II/2 may be hunted only in the member states in respect of which they are indicated.

4. Member states shall ensure that the practice of hunting, including falconry if practised, as carried on in accordance with the national measures in force, complies with the principles of wise use and ecologically balanced control of the species of birds concerned and that this practice is compatible as regards the population of these species, in particular migratory species, with the measures resulting from Article 2. They shall see in particular that the species to which hunting laws apply are not hunted during the rearing season nor during the various stages of reproduction. In the case of migratory species, they shall see in particular that the species to which hunting regulations apply are not hunted during their period of reproduction or during their return to their rearing grounds. Member states shall send the commission all relevant information on the practical application of their hunting regulations."

2.1 Introduction

2.1.1 Article 7 provides an explicit basis for hunting under the Directive. By reference to Annex II it lists the species that may be hunted throughout the Community (listed in Annex II part 1) and those that may be hunted within specified Member States (listed in Annex II part 2). It also sets out the principles to be respected with regard to hunting, including with regard to the fixing of hunting seasons.

2.1.2 This chapter of the guide starts with a brief reference to the need for appropriate transposition. It then deals in turn with the species that are huntable, the general principles and criteria to be respected in hunting (non-jeopardisation of conservation efforts, wise use, and ecologically balanced control). It finally considers the specific conditions relating to fixing hunting seasons.

2.1.3 As regards hunting seasons the chapter ends with a discussion of overlaps between the hunting periods and prohibited periods under Article 7(4) of the Directive.

2.2 Formal considerations

2.2.1 The relevant provisions of Article 7 of the Directive need to be fully and clearly transposed by the Member States." In Case C-159/99, *Commission v Italy*[21], the Court observed that "*the provisions of Directives must be implemented with unquestionable binding force, and the specificity, precision and clarity necessary to satisfy the requirements of legal certainty".* In Case C-339/87, *Commission v the Netherlands,* the Court also noted that "*mere administrative practices, which by their nature may be changed at will by the authorities, cannot be regarded as constituting proper compliance with the obligation on Member States to which a Directive is addressed, pursuant to Article 189 of the Treaty."*[22]

2.3 Huntable species

RATIONALE FOR ALLOWING HUNTING

2.3.1 Article 7 allows for the hunting of certain species of bird. Due to their population level, geographical distribution and reproductive rate throughout the Community, hunting of these species is considered to constitute acceptable exploitation.

2.3.2 Whereas bird hunting in Europe is mainly a recreational activity and is generally not carried out to regulate bird populations, it may also be a tool to control damage-caused by certain bird species (see section 2.4.31 onwards on ecologically balanced control).

WHICH SPECIES CAN BE HUNTED?

2.3.3 The species that may be hunted are listed in Annex II of the Directive. This comprises two parts. Those species listed in Annex II part 1 may be hunted in all Member States. The species listed in Annex II part 2 may only be hunted in those countries for which they are indicated. The number of potentially huntable species present in each Member State is shown in Figure 1.

2.3.4 Apart from adaptations resulting from the accession of new Member States, there has been one amendment of Annex II part 2 to take account of the latest knowledge on the situation of birds. This resulted in the addition of five species of *Corvidae* to Annex II/2 and the removal of three species of waders from Annex II/2 for Italy (species which closely resemble the globally threatened species Slender-billed Curlew *Numenius tenuirostris).*

2.3.5 Hunting is carried out under national legislation. The listing of a species in Annex II does not oblige a Member State to allow for it to be hunted. It is

[21] Judgment of 17 May 2001, Commission/Italy, case C-159/99, ECR 2001, p.4007, paragraph 32.
[22] Judgment of 15 March 1990, Commission/Netherlands, case C-339/87, ECR 1990, p.851. This position reflects the Court's earlier decision in its judgment of 23 February 1988, Commission/Italy, case 429/85, ECR 1988, p.843.

merely an option of which the Member States may or may not avail themselves.

2.4 General principles and criteria to be respected in hunting

2.4.1 Article 7(1) and 7(4) of the Directive provide a number of general principles that must be applied in relation to the practice of hunting. Each of these is considered in turn.

NON JEOPARDISATION OF CONSERVATION EFFORTS IN AREA OF DISTRIBUTION

2.4.2 Member States must ensure that hunting is compatible with the maintenance of the populations of the species concerned at a satisfactory level and that the practice does not jeopardise conservation efforts in their area of distribution. This clearly implies that the practice of hunting must not represent a significant threat to efforts for the conservation of both huntable as well as non-huntable species. The national hunting regime should take into account this potential disturbing aspect of hunting. This provision needs to be assessed in the light of the nature and geographical scope of the 'conservation efforts' in question, as these may vary from a local to an international level (e.g. flyway management plan).

2.4.3 An example to illustrate this point is the Ferruginous Duck *Aythya nyroca,* a non-huntable bird species, which is globally threatened. This species has a late reproduction period, which can make it vulnerable to the opening of hunting seasons for other species in areas where it is still breeding.

2.4.4 As regards the area of distribution of species it is clear that for most species this is not restricted to the area of the Member State concerned with hunting but applies to the species range. This is particularly relevant to migratory species. If species are subject to excessive hunting along their migration route it may impinge on conservation efforts elsewhere, including those outside the European Union.

2.4.5 The area of application of the Directive is the European territory of the Member States to which the Treaty applies. However, for species whose range extends beyond the area covered by the Directive the international commitments entered into by the Community may also be relevant in this context.

WISE USE

2.4.6 Wise use is not defined in the Birds Directive. An explanation of the notion of wise use, developed in conjunction with the ORNIS Committee, is given in the second report on the application of the Directive[23]. This looked at potential impact of hunting on species both at the levels of their populations and their use of habitats. I

[23] Pp. 8-9 of Second Report on application of Directive 79/409/EEC (COM(93)572 final). This explanation has been used and further developed in the present guide.

2.4.7 In the context of hunting wise use clearly implies sustainable consumptive use with an emphasis on maintaining populations of species at a favourable conservation status. The concept appears to correspond well with the definition on sustainable utilisation given in Convention on Biological Diversity (CBD)[24]: "*the use of components of biological diversity in a way and at a rate that does not lead to the long-term decline of biological diversity, thereby maintaining its potential to meet the needs and aspirations of present and future generations*." The Birds Directive is one of the legal instruments of the European Union to implement this Convention.

2.4.8 Guidance on the issue of wise use has also been developed under the Ramsar Convention. The 3rd Meeting of the Conference of the Contracting Parties to the Convention (1987) have agreed a definition which states that '*the wise use of wetlands is their sustainable utilization*[25] *for the benefit of humankind in a way compatible with the maintenance of the natural properties of the ecosystem*'.

2.4.9 It can therefore be reasonably concluded that the concept of wise use is the same as the concept of 'sustainable utilisation' compatible with the conservation of natural resources, thus corresponding to the concept of sustainability laid down in the Community 5th Environmental Action Programme.

2.4.10 Hunting, which represents a consumptive use of wildlife, therefore must be seen in the broader context of sustainable use of resources. The concept of wise use needs not necessarily be limited to consumptive use. It must recognise that birdwatchers, nature lovers, scientists and society as a whole also have a legitimate right to enjoy or explore wildlife, as long as they exercise this right responsibly. It is generally accepted that the value of environmental resources includes both use values and existence values. The principle of wise use thus should cover the provision of access to and enjoyment of wildlife for non-hunter users in the countryside, which should be managed in a sustainable way and should also aim to provide benefits to local communities[26].

---

[24] The "sustainable use" objective is referred to in most of the substantive Articles of the Convention providing *inter alia* for the integration of sustainable use into national decision-making; the regulation and management of biological resources to ensure their conservation and sustainable use; the adoption of measures to avoid or minimize adverse impacts on biological diversity; the monitoring of ecosystems and habitats required by migratory species and species of economic value or cultural importance; the promotion of research which contributes to sustainable use.

[25] Sustainable utilization is defined as "human use of a wetland so that it may yield the greatest continuous benefit to present generations while maintaining its potential to meet the needs and aspirations of future generations". Natural properties of the ecosystem are defined as "those physical, biological or chemical components, such as soil, water, plants, animals and nutrients, and the interactions between them".

[26] Recently, IUCN's Policy Statement on Sustainable Use of Wild Living Resources (Annex to Resolution 2.29, Amman, 2000), also concluded that "Both consumptive and non-consumptive use of biological diversity are fundamental to the economies, cultures, and well-being of all nations and peoples."

2.4.11 In the following sections a number of aspects of wise, relevant to huntable bird species are examined. This includes population impact, habitat use, game management and the conservation status of species. These sections underline the challenge of applying the concept of wise use for both sedentary and migratory bird species. Finally, the important role of education, training and awareness raising in promoting wise use is highlighted.

- **Relevance to huntable species**

2.4.12 Most of the scientific work on the sustainability of hunting has been focused on water birds (excluding gulls), tetraonids and partridges (the latter two groups belonging to the Galliformes, often referred to as "gamebirds"). These birds differ very much in ecology and behaviour. Most water birds are typically long-distance migrants, which breed widely in Northern Europe and winter in patchily distributed wetlands in temperate to tropic regions. Because of their congregatory behaviour significant hunting disturbance[27] affects a many times more birds than the numbers actually killed by hunting. However, a recent scientific literature review on energetic physiology of birds has challenged the assumption that hunting always will give rise to disturbance which will significantly threaten the survival of wild birds (see section 2.6.17). Furthermore, a high hunting take restricted to a local level may not affect these local populations in the long term, given sufficient availability of food, where shot birds are able to be replaced by birds from elsewhere or through other biological compensatory mechanisms. However, this may not be the case where high hunting pressure is exercised over wider part of the range of a species.

2.4.13 On the contrary gamebirds that are sedentary species sometimes have complex social systems, of which local populations can benefit much from proper hunting management. A high hunting take may result in population reduction. Water birds and gamebirds are the main quarry species in the Europe, comprising 71% of all Annex II taxa. The remaining categories of Annex II species are gulls (7%), pigeons (6%), and passerines (15%).

- **Wise use and population impact**

2.4.14 Given that the overall objective of the Directive is the maintenance of bird population at a favourable conservation status[28] this should be reflected in the principle of wise use. From a general understanding of population dynamics and the theory of the taking of migratory birds it can be concluded that low

[27] Significant disturbance of birds in wetlands from hunting can cause considerable under-use of the resource, also putting pressure on non-quarry species. Local displacements and reduced stopover times may even have impacts on populations at the flyway level, because of over-winter density-dependence. However, the impact of disturbance at the level of flyway populations is at present poorly understood and therefore meriting investigation.

[28] Whereas the term 'favourable conservation status' is not mentioned explicitly in the Directive (was introduced in 1992 in the Habitats Directive) it is implicit from the requirements of Article 2 of the Directive.

levels of taking are likely to have little effect on spring populations' size[29]. Moderate levels are unlikely to cause populations of huntable species to decline but will reduce the size of the spring population. Very high levels of taking are likely to lead to a decline in populations. For most species this level of taking is unknown[30].

2.4.15 So that hunting does not lead to the decline of huntable species the general approach in wildlife management is to ensure that hunting of species does not exceed the range between 'maximum' and 'optimum' sustainable yield[31]. This concept would appear to be easier to apply to sedentary than to migratory species. In the absence of good information on population dynamics and hunting take of sedentary and migratory species high levels of exploitation should generally be avoided.

2.4.16 Furthermore, there is a need for sound, scientifically based monitoring mechanisms to ensure that any use is maintained at levels which can be sustained by the wild populations without adversely affecting the species' role in the ecosystem or the ecosystem itself. This should include information on bag statistics, which is at present lacking or poorly developed for most species throughout the European Union[32].

- **Wise use and habitat use**

2.4.17 Significant disturbance from hunting or other human activities is likely to restrict the use of habitats where it is taking place. This may result in birds subjected to hunting having to cover greater distances or to adapt their behaviour to escape hunting. It may even result in a failure to utilise habitats with a relatively high human presence. It is therefore important to ensure that the management of such activities is carried out in a way that avoids disturbance which would significantly effect the conservation values of the sites in question (see also section 1.5 of the guide).

---

[29] This depends on the timing of taking. A small take in Spring when the population is usually at its lowest annual level, can have disproportionate effects on population structure, if the species is subject to differential migration

[30] Working Document no. XI/189/91 of the Ornis Committee, as reproduced in the Second report on the application of Directive No 79/409/EEC on the conservation of wild birds (COM (93) 572, 24.11.1993, page 11)

[31] Sustainable yield may be defined as the removal of resources from the environment at a rate that allows balanced replacement by natural processes. Under normal conditions density dependent processes maintain bird populations at a stable level. The yield of a species is directly linked to its reproduction rate and its survival rate. Though annual harvesting can remove a sizeable proportion of a population, this is offset by a lower natural mortality and/or better reproduction rate. The maximum number of birds that can be hunted each year will be achieved when the largest number of birds is breeding at the fastest possible rate. This is achieved when breeding stock is reduced considerably below habitat capacity (Newton, I. 1998. Population limitation in Birds). Hunting usually reduces breeding populations of birds with low natural mortality (K-strategists, i.e geese) but their reproductive rates are higher than in non-hunted populations. This is termed the *maximum sustainable yield*. Because of the vagaries in ecological systems harvesting rates are usually set at a somewhat lower rate, which is defined as the *optimal sustainable yield*. Good management of populations can increase this yield.

[32] Other information may be relevant for certain species such as studies on crippling rates and impact of shotgun pellets in birds on their survival (eg see Madsen, J. and H. Noer 1996. Decreased survival of pink-footed geese *Anser brachyrhynchus* carrying shotgun pellet. Wildlife Biology 2 : 75-82.

2.4.18 This is particularly relevant in wetlands where large concentrations of wild birds, including huntable species, occur. In the Commission's Communication on the wise use and conservation of wetlands[33] sustainable wetland resource use is identified as one of the key wetland issues. Specific reference is made to bird exploitation: *"Waterfowl hunting in European wetlands is a popular leisure activity and can be an important source of income for wetland owners. Rightly, hunting associations are becoming an important driving force for wetland conservation. The principle of using the waterfowl resource in a sustainable way can substantially contribute to wetland conservation, providing it includes the use of non-toxic shot, the setting of bag limits, the creation of an adequate network of game refuges, and the adaptation of the hunting seasons to the ecological requirements of the species. These are also aspects covered by Council Directive […] on the conservation of wild birds"*.

2.4.19 The issue of the environmental pollution from lead shot arising from ammunition also needs to be considered in the context of wise use. It is increasingly recognised that the use of lead shot poses a significant threat to wild birds and their habitats, especially wetlands[34]. Whereas there is no explicit mention of lead shot in the Birds Directive any use of it in Special Protection Areas that leads to deterioration of habitats or significant disturbance to birds is incompatible with the protection requirements of these sites. The need to phase out the use of lead shot in wetlands has already been recognised in international forums such as the Ramsar Convention and the African Eurasian Waterbird Agreement.

- **Hunting and game management**

2.4.20 The notion of wise use should also incorporate the positive role that can derive from game management. This implies a set of measures such as the provision of better habitat, better nutrition, less predation, less disease or less poaching which improve the living conditions of huntable and other species. Therefore, whereas annual harvesting can remove a sizeable proportion of the population this is offset by gains due to a lower natural mortality and/or better reproduction rate. Sound management practices, in accordance with the wise use principle, should also take into account the needs of non-huntable species and the ecosystem. This can result in populations of game and other species on managed land being significantly higher than on unmanaged areas. This principle contrasts markedly with harvesting a wildlife resource in a situation where no management is undertaken. A harvested population, even when stable and being hunted sustainably, will inevitably be maintained at a lower level than an unharvested one under similar conditions. The beneficial consequences of game management are most evident with sedentary species[35].

[33] Wise use and conservation of wetlands (COM (95) 189, 29.05.1995).

[34] See for example Newsletter of the African Eurasian Waterbird Agreement, Special edition: Lead Poisoning in Waterbirds through the ingestion of spent lead shot. Special Issue 1, September 2002.

[35] However, it must be recognised that certain wetlands have been actively managed for migratory waterfowl (e.g. *Camargue* in France). There is also management of bogs directly linked to the hunting of Snipe *Gallinago gallinago.*

2.4.21 Some of the most important wildlife sites in Europe have survived the pressures of development and destruction due to the interests of game management. For example the United Kingdom has the largest areas of heather moorland anywhere in Europe largely due to its value for grouse hunting, which provided a strong basis from preventing the loss of this habitat from commercial afforestation and other threats. In Spain the remaining populations of Spanish Imperial Eagle *Aquila adalberti* mainly survived on large private game estates, where the hunting was formerly almost exclusively focussed on big game. In France, wild populations of Grey Partridge *Perdix perdix* are high in certain regions with intensive farming (e.g. *Beauce, Picardie*) as a result of management efforts, in particular the creation of thousands of hectares of 'wildlife set aside' with financial support of hunters.

2.4.22 Hunting can therefore support conservation through wise use. Steps taken to improve the condition for target species can not only enhance the sustainable yield but also benefit a range of other animals and plants that have similar requirements. Woodland managed for Pheasants *Phasianus colchicus* is more diverse than woodland managed exclusively for forestry. Field margins managed to help Partridges *Perdix perdix* also benefit wild flowers, butterflies and other invertebrates.

2.4.23 However, game management focused at artificially raising population levels of single species may be detrimental to some other species, particularly if it is linked to illegal persecution of birds of prey.

- **Wise use and conservation status of huntable species**

2.4.24 Bird species may be considered as having an unfavourable conservation status[36] when the sum of influences acting on the species concerned negatively affect the long-term distribution and abundance of its populations. This would include a situation where population dynamics data shows that the species is not maintaining itself on a long-term basis as a viable component of its natural habitats[37]. It is, of course, generally not advisable to subject such species or populations to hunting, even if hunting is not the cause of or contributing to their unfavourable conservation status. However, allowing hunting of a

[36] The term conservation status of a species is defined in Article 1 i) of Council Directive 92/43/EEC as "the sum of influences acting on the species concerned that may affect the long-term distribution and abundance of its populations …." It is considered to be favourable when "population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitat, and the natural range of the species is neither being reduced nor is likely to be reduced in the foreseeable future, and there is, and will continue to be, a sufficiently large habitat to maintain its population on a long-term basis.". Although the term is not explicitly mentioned in Directive 79/409/EEC the principles underpinning it are equally applicable in relation to the objectives of this Directive.

[37] Favourable conservation status assumes population viability: the concept of a "viable" population number that represents a threshold for survival versus extinction (Fiedler & Jain 1992, Conservation Biology). Viability of populations lies at the heart of the requirement laid down in Article 2 of the Directive, which contains the general obligation of population maintenance. Viable populations are integral to demonstrating a secure conservation status, but it encompasses more than just a stable population. Extrinsic forces, such as habitat loss, over-harvesting, and competition by introduced species, often lead to population decline. Random fluctuations that increase as populations become smaller can lead to extinction even of populations that have, on average, positive population growth when below carrying capacity.

species can provide a strong incentive to manage habitats and address other factors contributing to population decline, therefore contributing to the objective of restoring populations to favourable conservation status.

2.4.25 The issue of allowing the continuation of hunting of species with an unfavourable status was raised during the discussion on the last proposed amendment of Annex II of the Directive. In section 2.7 of the report[38] of the European Parliament's Committee on the Environment, Public Health and Consumer Protection on the Commission's 1991 proposal[39] to modify the Birds Directive, it was stated that 'Where a species is declining, hunting cannot by definition be sustainable unless it forms part of a properly running management plan that also involves habitat conservation and other measures that will slow and ultimately reverse the decline.'

2.4.26 Where such management plans are prepared, aiming at restoring the species' population levels they should apply to all populations, peripheral as well as central. Indeed, peripheral populations may play a particularly important role in the process through which species adapt to changes in the environment. In the European context, this process is fundamental. Furthermore, such plans can exist at different territorial levels (e.g. at EU, national or local levels).

2.4.27 Community management plans are being developed for Annex II species that have been identified as having an unfavourable conservation status. Those plans that have already been approved by the Member States, within the framework of the ORNIS Committee, are available on the web site of DG Environment. These framework plans do not have any separate legal status under the Directive. However, the success in their implementation and the extent to which the declines in huntable species are halted and reversed, as evidenced by appropriate monitoring, may ultimately determine if the continued hunting of these species is justified under the Directive or if other measures are required.

2.4.28 Management plans aimed at the recovery of species need to be underpinned with monitoring programmes that are able to detect changes in conservation status of the species concerned. This monitoring should include assessments of the hunting harvest and the role that this is playing in the dynamics of the population.

2.4.29 Finally, it should be noted that temporary moratoria on hunting certain species with an unfavourable conservation status, not necessarily as a result of hunting, introduced by Member States in agreement with hunter organisations represents a potentially important approach. Such an approach, if combined with a programme of conservation action for the species, can provide a strong incentive to different interests, including hunters, to work together to restore the species to a favourable conservation status. An important consideration for hunters is that such moratoria need to be seen and perceived as 'temporary' and not leading more or less automatically to a permanent hunting ban.

[38] PE 154. 220/fin
[39] COM (91) 0042 – C3 – 0180/91

- **Wise use and education, training and awareness**

2.4.30 The notion of wise use of natural resources implies also proper knowledge and skills. Hunters should be well informed about the need for correct species identification, good practices, hunting and the law, need for reporting etc. Illegal activities (shooting protected species, use of illegal trapping devices, shooting out of season or in prohibited areas, illegal use of poisons) are contrary to the 'principle of wise use' and are not in accordance with the principle of conservation through sustainable use. Furthermore, the illegal actions of a small number of hunters can also bring the entire activity of hunting into serious disrepute. As hunters are the most effective custodians of the hunted areas it is in their long-term interests to increasingly oppose such activities and to be seen to do so. There is also a need to inform people about the principle of conservation through sustainable use.

ECOLOGICALLY BALANCED CONTROL

2.4.31 This principle is not defined in the Directive. However, the 8th recital of the preamble of the Birds Directive suggests that it may not refer primarily to recreational utilisation but to population management aimed at species conservation: '*Whereas conservation is aimed at the long-term protection and management of natural resources as an integral part of the heritage of the peoples of Europe; whereas it makes it possible to control natural resources and governs their use on the basis of the measures necessary for the maintenance and adjustment of the natural balances between species as far as is reasonably possible'.*

2.4.32 Furthermore, Article 1 refers to "protection, management and control", while pursuant to Article 2 measures shall be taken to maintain populations or to adapt populations to a level "which corresponds in particular to ecological, scientific and cultural requirements, while taking account of economic and recreational requirements". The latter may mean that the control is not only focused on "balances between species" but could also be aimed at the protection of economic interests (e.g. damage prevention).

2.4.33 "Ecologically balanced control" implies that the measures taken should be ecologically sound and in proportion to the problem to be solved taking into account the conservation status of the species involved. Control measures may be considered necessary only for few Annex II species (e.g. crows, pigeons, gulls). This appears to be the main incentive for the listing of five species of *Corvidae* in Annex II/2 with the 1994 adaptation of the Directive.

2.4.34 On the contrary, for most other quarry species management measures are aimed at the increase or the restoration of population numbers in view of both conservation and hunting interests.

2.4.35 Application of this principle in the framework of Article 7(4) offers enhanced possibilities to the control measures for the protection of flora and fauna, that

may be taken under the derogation regime of 9 (1a). However, the extent to which populations of damage causing species can be effectively regulated during the regular hunting season alone is unclear. Other methods need to be explored such as scaring of birds, which can at least temporarily and locally solve the problem of damage.

2.4.36 Other dimensions to ecologically balanced control need consideration. These include the extent to which it should relate to ensuring demographically balanced exploitation of a species (e.g. not removing a surplus of any sex or age cohort). Also it needs to ensure that impacts on populations harvested do not result in imbalances in the ecosystem (favouring the development of another species through lack of competition).

2.5 Specific conditions related to fixing hunting seasons

2.5.1 Article 7(4) of the Directive lays down a number of key principles relating to the fixing of hunting seasons, the objective of which is to ensure that hunting does not take place during the most vulnerable periods of the annual cycle of huntable species.

2.5.2 For sedentary species it requires that they are not hunted during their rearing season or during the various stages of reproduction. In the case of migratory species it requires that they be not hunted during their period of reproduction or during their return to their rearing grounds.

2.5.3 The Court has stated that 'the second and third sentences of Article 7(4) of the Directive are designed to secure a **complete system of protection** in the periods during which the survival of wild birds is particularly under threat. Consequently, protection against hunting activities cannot be confined to the majority of birds of a given species, as determined by average reproductive cycles and migratory movements."[40]

THE KEY CONCEPTS WORK: REPRODUCTION AND PRE-NUPTIAL MIGRATION PERIODS

2.5.4 The Commission and the ORNIS Committee have recognised the need to have a clear interpretation of these concepts of Article 7(4) in the light of the 1994 Court of Justice's ruling, and how to apply them to the bird species of Annex II and have already carried out a review of information on the period of prenuptial migration and reproduction of each Annex II species for each Member State where that species occurs[41]. The ORNIS Committee has approved this review, which provides definitions for both the 'period of reproduction' and 'return to the breeding areas', which are outlined below.

[40] Judgment of 17 January 1991, Commission/Italy, Case C-157/89, ECR 1991, p.57, paragraph 14. There are also references to the concept of complete protection in the following judgements: 19 January 1994, Association pour la Protection des Animaux Sauvages and others v Préfet de Maine-et-Loire and Préfet de Loire-Atlantique, case C-435/92, ECR 1994, p.67 and judgment of 7 December 2000, Commission/France, case C-38/99, ECR 2000, p.10941.

[41] Key concepts of Article 7(4) of Directive 79/409/EEC. Period of Reproduction and Prenuptial migration of Annex II Bird Species in the EU. September 2001 (document available at http://ec.europa.eu/environment/nature/conservation/wildbirds/hunting/key_concepts_en.htm).

- **Period of reproduction**[42]

2.5.5 '**Breeding season'**[43] was defined using the definition of Cramp & Simmons (1997)[44]: "*the breeding season is the period during which a species lays and incubates its eggs and rears its young to the flying stage.*" However, the '**reproduction period**' not only covers the breeding season but also includes the occupation of the breeding areas as well as the period of dependence of young birds after leaving the nest (previously recognised in the 1993 Commission report on the application of the Birds Directive[45]). A scheme, which deals with the different stages of reproduction, was agreed by the 'ORNIS committee' as an appropriate general scheme for the period of reproduction (see Figure 2). The sequence and importance of the elements of this general scheme may vary by species according to differences in breeding biology.

- **Return to the breeding areas**[46]

2.5.6 Return to the breeding areas is an annual displacement, in one of more stages, of birds from their wintering areas back to nesting grounds. The wintering period ends with departure from the wintering areas where migrant birds have been more or less stationary since the end of the post-nuptial (autumn) migration. The return to the breeding areas is commonly called 'pre-nuptial migration' or 'spring migration'.

2.5.7 In Europe, return migration movements are mostly directed North, Northeast or Northwest. This means that migrants from African winter quarters first cross the Mediterranean, then pass through central Europe on their way to their Northern European breeding areas. This migration normally takes several weeks (including breaks at resting places on the way) but individual birds can complete the journey in one or a few days. The start, end and length of the migration season in a particular country are determined by a number of biological, geographical and methodological factors.

2.5.8 Regarding the beginning of the pre-nuptial migration, all individuals of a species within a same region do not end their wintering period at the same time. Not only are there individual differences, but also within a single wintering area, birds of different populations having different annual cycles come together. Birds belonging to northern populations, for example, often start their return flight much later than birds breeding more to the south. An extreme case is the so-called 'leapfrog' migration (e.g. in the Redshank *Tringa*

---

[42] Note that Article 7(4) refers both to 'rearing season' and 'the various stages of reproduction' (cf. French version *'les différents stades de reproduction et de dépendance'*; German version *'Einzelnen Phasen der Brut - und Aufzuchtzeit'*); Dutch version '*zolang de jonge vogels het nest nog niet hebben verlaten*').

[43] This term is considered equal and better English than the term 'rearing season' used in Article 7(4).

[44] Cramp, S. & Simmons, K.E.L. (eds.). 1977. *Birds of the Western Palearctic,* Volume 1. Oxford, Oxford University Press. 722 pp.

[45] COM (93) 572 final. *Second report on the application of Council Directive 79/409/EEC on the conservation of wild birds.* Brussels, 24 November 1993.

[46] "return to breeding areas" is taken as a synonym of "return to the rearing grounds"

totanus): birds breeding in more northern latitudes travel greater distances and move to more southerly wintering areas than those that nest farther south.

2.5.9 The fact that birds leave a wintering area does not necessarily mean that they start their return migration. They can move to other wintering quarters because of changes in the local ecological conditions, exhaustion of food resources, disturbance or changes in climatic conditions. When migratory and sedentary birds of the same species coexist on the same wintering grounds, the situation can be even more complex. Thus, apparent discrepancies may arise among the data for large countries. Major differences between neighbouring regions can reflect ecological differences more than actual differences in migration timing. For example, although the southern parts of Spain (*Andalucía*) and Italy (*Sicilia*) are situated on the same latitude (37th) this does not necessarily imply similar arrival dates of migrants because different populations might be involved.

2.5.10 The length of the migration period does not only depend on the North-south extension of the country concerned but also on the availability and the use of resting-places. A typical example concerns the Bar-tailed Godwits *Limosa lapponica* which migrate from the African winter quarters to Siberian breeding areas. After a continuous flight from the *Banc d'Arguin* in Western Africa, they stay several weeks in the Wadden Sea. The migration period length is also determined by the quantity and the geographical range of the birds involved: a small population can pass in a few days while a numerous species with an extensive breeding range can have a prolonged migratory season encompassing several months. Moreover, the migration period can also be extended if a country is passed over by several populations with different time schedules.

- **Applying the 'key concepts' definitions to different Annex II species**

2.5.11 In general, for migratory species, the stage of reproduction identifying the start of the period of reproduction is the 'occupation of the breeding sites'. However, the occupation of the breeding sites is generally difficult to use where the species is mainly locally resident or where there is a mixing of locally resident and migratory birds. In these cases, the stage identifying the start of the period of reproduction is the 'construction of the nest'. In those situations where the stage retained is difficult to recognise in the field, a mention is made to the corresponding number of decades counted from the start of egg laying (generally well known for most species).

2.5.12 In general, the stage retained to identify the end of the period of reproduction is the 'full flight of young birds', i.e. fledging of all broods including second or third broods for some species (e.g. rails/*Rallidae*, pigeons/*Columbidae*, thrushes/*Turdidae*). Full flight means that young birds are capable of sustained, continuous flight to a similar capacity as adult birds and corresponds to the 'independence of young birds. Nonetheless, for certain species (e.g. crows/*Corvidae*) the full flight occurs before 'independence of young birds'. Young birds are independent when the loss of parental care

and/or feeding does not significantly lower survival prospects of young. In those situations where the 'full flight/independence of young' is difficult to establish in the field, a mention is made to the corresponding number of decades counted from the end of hatching.

2.5.13 The stage that is used to identify the start and end of the period of reproduction for each Annex II species has been determined in relation to their biology. On the basis of this and the available information from different Member States the pre-nuptial and reproduction periods have been determined for each species[47]. It is recognised that there are likely to be differences in quality of the data for species across the EU and that there will be a need to regularly update this review, taking into account new and better data as it becomes available. Apart from this regular review it will also be necessary to account for any changes in migration or timing of breeding that may result from climate change effects, and to account for changes in timing as a result of other environmental pressures.

2.6 Assuring a system of complete protection where staggered opening and closing dates are considered

2.6.1 According to the consistent case-law of the Court *" national authorities are not empowered by the Directive to fix closing dates for the hunting season which vary according to the species of bird, unless the Member State concerned can adduce evidence, based on scientific and technical data relevant to each individual case, that staggering the closing dates for hunting does not impede the complete protection of the species of bird liable to be affected by such staggering*" [48] On condition that "complete protection of the species" is guaranteed, the Court has also held that "the fixing of closing dates, which vary between the different parts of the territory of a Member State, is compatible with the Directive" [49].

2.6.2 In cases C-435/92 and C-38/99, the Court recognised two difficulties with the staggering of closing dates, which are also relevant to opening dates: disturbance of other species and the risk of confusion. These are examined below and a proposed approach to addressing them is given.

[47] As regards presentation of the data for each species a number of general principles were applied (see p.7 of key concepts report). Where there is a range of dates in timing of pre-nuptial migration or reproduction the earliest date has been chosen. Likewise, where significant between year variation occurs on a regular basis, data from the earliest periods have been taken. Where different populations migrate through a country the earliest migrating population has been used. However, extreme, outlining and erratic data were excluded due to their unpredictable nature.

[48] Judgment of 19 January 1994, Association pour la Protection des Animaux Sauvages and others v Préfet de Maine-et-Loire and Préfet de Loire-Atlantique, case C-435/92, ECR 1994, p.67, paragraph 22 ; judgment of 7 December 2000, Commission/France, case C-38/99, ECR 2000, p.10941, paragraph 43.

[49] Judgment of 19 January 1994, Association pour la Protection des Animaux Sauvages and others v Préfet de Maine-et-Loire and Préfet de Loire-Atlantique, case C-435/92, ECR 1994, p.67, paragraph 27.

2.6.3 This phenomenon depends on a series of factors, including in particular the similarity between huntable species for which there is an open hunting season, and those for which the hunting season has ended or has still to commence, the conditions under which hunting is taking place and hunter proficiency.

2.6.4 In case C-435/92[50] the Court noted that, with regard to the risk that certain species for which hunting has already been closed will be subject to indirect depletion owing to confusion with the species for which hunting is still open, it must be emphasised that the third sentence of Article 7(4) of the directive is specifically intended to prevent those species from being exposed to the risk of depletion due to hunting during the period of pre-mating migration, requiring the Member States to take all necessary measures to prevent any hunting during that period.

2.6.5 The risk of confusion between different bird species is well recognised and has already been the subject of a number of specialist identification guides[51]. On the basis of criteria such as similarity in appearance and plumage, habitat use and behaviour (including calls) it is possible to categorise huntable species into groups of 'look-alike' species for the purpose of minimising the risk of confusion. This should be under the responsibility of the competent authorities that are responsible for authorising hunting seasons. Figure 3 is presenting one possible scheme for such a categorisation.

2.6.6 If staggering of hunting dates is to be allowed the opening and closing dates must be fixed for each group of 'look-alike' species in a way that ensures that there are not overlaps with non-permissible periods under the directive.

2.6.7 Any grouping of look-alike species needs to be adapted to the circumstances of time and place in which hunting is carried out. Firstly, for a risk to be real the huntable species (or group of species) must be present and huntable in the area during the timeframe in question. Secondly, other 'confusable' huntable species, for which the hunting season is closed, should also have a predictable and significant presence.

2.6.8 Furthermore, as regards hunting in early autumn it should be noted that surface duck species are mainly in eclipse plumage at this stage (males assume plumage similar to females during moult) which makes distinguishing them at this time significantly more difficult.

2.6.9 In addition, the problem of confusion is compounded by the fact that different bird species frequently co-exist. For example ducks, waders and thrushes

[50] Judgment of 19 January 1994, Association pour la Protection des Animaux Sauvages and others v Préfet de Maine-et-Loire and Préfet de Loire-Atlantique, case C-435/92, ECR 1994, p.67, paragraph 18.

[51] A good example of guides that focus on the identification of difficult groups of bird species are 'The Macmillan Guide to Bird Identification' by Alan Harris, Laurel Tucker and Keith Vinicombe. 1989. ISBN 1-85627-641-4 and the companion volume 'The Macmillan Birder's Guide to European and Middle Eastern Birds", by Alan Harris, Hadoram Shirihai and David Christie, 1996.

frequently move in flocks of mixed species. A group of ducks may be comprised of four or even five different species. Therefore, in such circumstances 'selective' shooting can become very difficult.

2.6.10 The categories of confusable species focus on different groups of the huntable species listed in Annex II of the directive. However, it should also be noted that the risk of confusion is not limited to huntable species and may represent a conservation threat to certain vulnerable or endangered species (e.g. Ferruginous Duck *Aythya nyroca*, Marbled Teal *Marmaronetta angustirostris*, Lesser White-fronted Goose *Anser erythropus* Crested Coot *Fulica cristata*) in particular areas where hunting takes place. This problem would need to be addressed in the overall context of the management of these sites.

2.6.11 The second factor that needs to be considered is the conditions under which hunting is taking place. This will depend upon factors such as the observation distance. The further a bird is from the hunter the greater is the difficulty in determining its specific characteristics (size, plumage etc.) Identification of flying birds will depend on the time that the bird is visible, which can be quite short. Therefore, the type of hunting is likely to influence the level of risk of confusion.

2.6.12 Likewise, the lighting conditions can also play an important role. Poor visibility at sunrise and sunset or at night can significantly reduce the capacity to distinguish bird species[52]. Particular weather conditions such as fog and rain can also reduce the possibility to correctly identify birds in the wild.

2.6.13 Finally, the issue of hunter proficiency also has an important influence. This will depend on the training and experience of the hunter. This applies at all times of the hunting season and is also relevant to distinguishing huntable from non-huntable species (e.g. Knots *Calidris canutus* from other small waders; Skylarks *Alauda arvensis* from other larks). Training and awareness schemes to assist hunters with species identification should be encouraged or enhanced where they already exist, as appropriate. Hunters should not shoot at a bird unless they are confident of its identity. However, many hunters specialise in particular groups of birds and rarely hunt species about which they do not have earlier experience. In this way hunters become specialists in the identification of their favourite target species.

RISK OF DISTURBANCE

2.6.14 This phenomenon will depend, *inter alia*, on the type of hunting, its intensity, frequency and duration, the species concerned and the habitats used, as well as on the availability of alternative refuge areas.

[52] Identification guidance has been produced by hunters on this subject (e.g. *'Reconnaître les oiseaux la nuit'* by Philippe du Cheyron for the *Association Picarde des chasseurs de gibier d'eau*).

2.6.15 In case C-435/92[53] the Court noted that hunting activity can lead to disturbance of wildlife and that it may affect the conservation status of the species concerned, independently of the extent to which it depletes numbers. The Court stated that the consequences of such activity are 'particularly serious for groups of birds, which, during the season of migration and wintering, tend to gather together in flocks and rest in areas which are often very confined or even enclosed. Disturbances caused by hunting force these animals to devote most of their energy to moving to other spots and to fleeing, to the detriment of time spent feeding and resting for the purpose of migration. These disturbances are reported to have an adverse impact on the level of energy of each individual and the mortality rate of all the populations concerned. The effects of disruption caused by hunting birds of other species are particularly significant for those species whose return migration takes place earlier'.

2.6.16 Disturbance is considered to most likely have an impact on bird populations during periods of the annual cycle when food is scarce or unavailable and birds have difficulty in meeting their energy and nutrient requirements[54]. This is most acute when birds need to build up their reserves prior to periods of high energy demand such as prior to migration or during periods, during severe adverse weather conditions or before commencing breeding[55].With regard to the severe weather conditions there are provisions in different Member States to introduce' cold weather hunting bans'.

2.6.17 A recent review of the scientific literature on energetic physiology of birds has challenged the assumption that hunting always will give rise to disturbance that will pose a significant threat to the survival of bird populations[56]. The energy balance of birds is a key factor in determining the reproductive success and survival potential of birds. This review demonstrates that under certain conditions birds can show high physiological and behavioural adaptability, through increase of food-intake rate and shift from a night-time to a day-time feeding or vice-versa, to offset the significant energetic and nutritional stresses that can result from disturbance, including hunting disturbance. As long as birds have access, even intermittently, to sufficient food resources (i.e. within acceptable levels of disturbance and food availability) then they are able to compensate to changes in their energy balance in response to disturbance

[53] Judgment of 19 January 1994, Association pour la Protection des Animaux Sauvages and others v Préfet de Maine-et-Loire and Préfet de Loire-Atlantique, case C-435/92, ECR 1994, p.67, paragraph 17.

[54] Madsen, J. 1995. Impacts of disturbance on migratory waterfowl. Ibis 137, Suppl 1 : 67-74.

[55] Mainguy, J., Bety, J., Gauthier, G. and Giroux, J.-F. (2002) Are body condition and reproductive effort of laying greater snow geese affected by the spring hunt? The Condor 104: 156-161

[56] Boos, M., J-P. Arnauduc, J-P. Robin. 2002 '*Effets du dérangement sur l'énergétique chez les oiseaux et les possibilités de compensation nutritionelles'* Rapport final de convention de recherche CNRS/FNC. Centre d'Ecologie et Physiologie Energétiques, France. The assumptions underpinning the conclusions of this study included the following: that the mean disturbance frequency to which birds actively react by flying was from 1 to 2.5 disturbances an hour; that the mean flight time was between 1 to 2 minutes per disturbance; that the period of disturbance extended over 10 hours per day; that food supply was not a limiting factor; that the birds were not in an advanced stage of preparation for reproduction, especially for egg production.

sources (see example of study of diving ducks on large shallow lake)[57]. Even if there are significant behavioural changes from this disturbance the impact on the energy equilibrium is small.

2.6.18 However, behavioural responses to disturbance are complex and may be underestimated especially where hunting is intense. For example the time lost after landing before birds resume feeding may take up to one hour (and if repeated disturbance up to 2 hours). This may affect other behavioural activities (social, preening, resting, mating). Disturbance is also likely to lead to increased vigilance to the detriment of feeding. Also there are currently few studies to support the assumption that birds have free and ample access to food resources to compensate. Birds will seek alternative undisturbed sites, which may not be nearby or where there may not be an adequate food supply. Furthermore, different categories of birds vary in their level of sensitivity to disturbance in relation to their biology and behaviour and dependency on different habitats. Notwithstanding, even though feeding behaviour can be disturbed there is a general lack of studies to determine if birds over a short or long-time scale cannot efficiently feed, particularly as energy income via food intake has to be considered in both the short and the long-term.

2.6.19 In the absence of empirical studies the consequences of a lack of energy balance on the reproductive success and survival of species is still not fully understood. According to the conclusions of the above mentioned review birds are unable to compensate if, in addition to the energy loss from disturbance there is no access to food resources during consecutive days (e.g. during adverse weather conditions) or during the active period prior to and during reproduction. This latter view is supported by studies of geese (which are capital breeders – i.e. dependant on energy reserves laid down before arrival on the breeding grounds) which have shown that disturbance can significantly reduce the reproductive success[58].

2.6.20 Allowing for staggered hunting dates during prenuptial migration is likely to present a greater risk to birds than at the end of the period of reproduction possibly due to the higher energetic demands of birds at this time. Other factors may play a role (e.g. shorter day length in February than in August with less potential daylight feeding time). The energy strategy over the annual cycle is an important fact. It has been shown for different waterfowl that February corresponds to a spontaneously and endogenously programmed build down of body fuels even when food is available *ad libitum.* This regulation of body reserves is associated with the voluntary decrease of food intake[59].

[57] Evans, D.M. and K.R. Day (2001) Does shooting disturbance affect diving ducks wintering on shallow lakes? A case study on Lough Neagh, Northern Ireland. Biological Conservation 98 : 315-323. Evans, D.M. and K.R. Day (2002). Hunting disturbance on a large shallow lake: the effectiveness of waterfowl refuges. Ibis 144 : 2-8. It should be noted in this study that birds used a large offshore area of the lake as refuge area during hunting and that most species fed at night when hunting did not take place.

[58] Madsen. J. 1995. Impacts of disturbance on migratory waterfowl. Ibis. 139 : S67-S74. Mainguy, J. , J. Bêty, G. Gauthier, J-F Giroux. 2002. Are body condition and reproductive effort of laying Greater Snow Geese affected by the Spring hunt? The Condor. 104 : 156-161. It should be noted that these studies relate to high levels of disturbance in Spring.

[59] M. Boos, pers. comm.

Furthermore, the demography of the population normally differs significantly between these two periods, with a relatively high adult cohort in the population in spring, which represent potential breeders, supplemented by a large proportion of immature birds in autumn.

2.6.21 There is a lack of consistent information and research on birds at flyway level to better evaluate the effect of disturbances, such as hunting, on bird populations and their conservation status[60]. Various studies have shown that poorly managed hunting can seriously reduce the carrying capacity of wetlands to support water birds. The location of hunting in relation to feeding areas may also be relevant.

2.6.22 As regards minimising the potential impact of human disturbance on bird populations during periods of staggering of hunting dates full account must therefore be taken of the need for supplementary undisturbed refuge areas that provide for both the resting and feeding requirements of affected birds. The design of such areas needs to ensure that there are sufficient opportunities for good quality feeding and other activities within them. This needs to be determined on an area by area basis in relation to the ecological, behavioural, nutrient and energy requirements of the different huntable species affected by staggered hunting dates. In this regard there has recently been increased research and development of appropriate and more effective methods to manage existing refuge and buffer areas, especially in wetland areas[61].

WHAT CONDITIONS NEED TO BE MET IF A MEMBER STATES WANTS TO AVAIL OF STAGGERED OPENING AND/OR CLOSING DATES FOR HUNTING UNDER ARTICLE 7(4) OF THE DIRECTIVE?

2.6.23 To ensure that this is consistent with the principle of complete protection, as interpreted by the Court of Justice, Member States must be able to demonstrate at the relevant geographic level at which staggering is intended to be applied that there are non-significant risks of confusion and disturbance.

2.6.24 As regards the risk of confusion this would require the categorisation of groups of 'look-alike' huntable species using the same habitat types at the same time and the fixing of the same opening and closing dates for hunting of these groups in a way to avoid overlapping with non-permissible periods. It also requires a determination that the conditions under which hunting takes

[60] See for example Hill, D., D. Hockin, D. Price, G. Tucker, R.Morris, J. Treeweek. 1997. Bird disturbance : improving the quality and utility of disturbance research. J. Appl.Ecol. 34, 275-288.

[61] for example the following studies: Fox, A.D. and J. Madsen (1997). Behavioural and distributional effects of hunting disturbance on waterbirds in Europe: implications for refuge design. J. Appl. Ecol. 35: 386-397. Madsen, J. 1998a. Experimental refuges for migratory waterfowl in Danish wetlands. I. Baseline of the disturbance effects of recreational activities. J. Appl. Ecol. 35 : 386-397. Madsen, J. 1998b. Experimental refuges for migratory waterfowl in Danish wetlands. II. Tests of hunting disturbance effects. J. Appl. Ecol. 35 : 398-417. Rogers, J.A. Jr, et H.T. Smith. 1997. Buffer zone distances to protect foraging and loafing waterbirds from human disturbance in Florida. Wildl. Soc. Bull. 25 : 139-145.

place do not give rise to a significant risk of confusion between different huntable species.

2.6.25 As regards the risk of disturbance there is a need to demonstrate a balance between the intensity, frequency and duration of hunting, and the availability and proximity of sufficient undisturbed areas offering adequate feeding and roosting areas.

2.6.26 There needs to be adequate enforcement measures to ensure that the above provisions are respected.

2.6.27 Finally, in areas which may be subject to staggered hunting seasons [62], integrated planning that takes full account of hunting and other potential disturbances on the birds and their use of the natural resources would appear to be a valuable management tool. Such planning should incorporate scientific monitoring to evaluate the potential impacts on the bird species concerned.

2.6.28 A suggested schema for considering the conditions that need to be fulfilled to ensure compatibility of staggered opening and closing dates is proposed (Figure 4).

2.7 Overlaps analysis

2.7.1 A preliminary comparison between existing hunting season periods and the agreed pre-nuptial and reproduction periods for huntable species in each Member States reveals that there are a wide range of potential or actual overlaps[63], which vary in extent between the different species. All Member States are concerned although the majority of them only have problems for a relatively small number of species. The problem of overlaps appears to be more complex in those Member States where hunting dates are fixed at regional levels. However, it should be noted that for the majority of species in the different Member States there is no overlap.

2.7.2 Data on reproduction and pre-nuptial migration periods in the 'Key concepts' analysis report is presented in 10 day periods (decades). Consequently the degree of accuracy is 10 days. Therefore, an overlap of one decade between hunting date and the period of prenuptial migration or reproduction is categorised as 'a theoretical overlap' as during this period it is possible that there may not actually be an overlap. For periods of greater than 1 decade of overlap there is no such uncertainty as this is therefore a 'real overlap'.

2.7.3 Furthermore, as the overlap analysis at the level of the Member State there may be situations where hunting in particular regions of larger Member State is actually in conformity with the requirements of Article 7(4), because the breeding season may end or return migration may start later than in the country as a whole.

[62] The scale of such planning would need to be determined in relation to the geographic scope of application of the area subject to staggering.
[63] Overlap analysis – DG Environment, 2002.

2.7.4 This analysis reveals that there are problems of overlaps in both the reproduction and pre-nuptial migration periods. Some current hunting regulations allow hunting:
- extending into period of pre-nuptial migration (and sometimes the reproduction period at the same time)
- starting before end of reproduction period
- at other times of the reproduction period

2.7.5 The most problematic species is the Wood Pigeon *Columba palumbus* (overlap for 13 Member States with up to 15 decades in Ireland). The Mallard *Anas platyrhynchos* also appears to be a problem in eight Member States (with up to 5 decades overlap). Overlaps (or theoretical overlaps) for several Crow species *Corvidae* (up to 9 decades) occur in several of the Member States.

2.7.6 Several of these overlaps appear to be linked to species with long reproduction periods (or late reproduction) and/or early migration periods. Other possible explanations for the overlaps may be linked to the inappropriateness of hunting during the normal period or due to the unavailability of the huntable species at this time. A more detailed examination of different categories of overlap is given in Chapter 3.

2.7.7 It would also appear that there are cases of hunting of species under Article 7(4), which may be justified in the context of controlling damage-causing species under Article 9.1 of the Directive.

- **Possible solutions to overlap problem**

2.7.8 For each case of overlap there is a need for full compliance with the requirements of Article 7(4). Therefore, in all cases there will be a need to bring the national and/or regional legislation that fixes hunting dates under Article 7(4) of the Directive into conformity.

2.7.9 However, it is recognised that some limited flexibility can be exercised in interpreting data with a view to determining opening and closing dates for hunting seasons in accordance with Article 7(4) of the Directive. The 'Key concepts' document has allowed for the exclusion of erratic, outlier and extreme data in determining the pre-nuptial and migration periods for different huntable bird species. Furthermore, it is possible to exclude overlaps of one 10 day period as, based on the level of precision of the data, these can be considered as theoretical overlaps (see section 2.7.2).

2.7.10 If hunting seasons are set for the country as a whole, they should not overlap with the breeding and return migration periods as identified in the "Key concepts" document. If regional hunting seasons overlap with national reproduction or return migration periods scientific and technical data could provide evidence that such overlap does in fact not occur because breeding ends earlier or return migration starts later in the region concerned. This may be the case particularly in countries with profound climatic differences

between the southern and northern parts[64] and or with similar climatic differences between regions situated at different altitudes. In each case there would be a need to demonstrate clearly distinguishable regions, where on the basis of clear scientific evidence on pre-nuptial migration and/or reproduction periods, such differential opening and closing dates could be justified. In the absence of regional data the overlap analysis has to be based on national data (or if not available reference should be made to data from neighbouring parts of Europe, cf. Conclusion C-157/89, para. 16). It should be noted however, that large distance within a country is not in itself evidence for regional variation in migration patterns because migratory birds can easily cover hundreds of kilometres in one day.

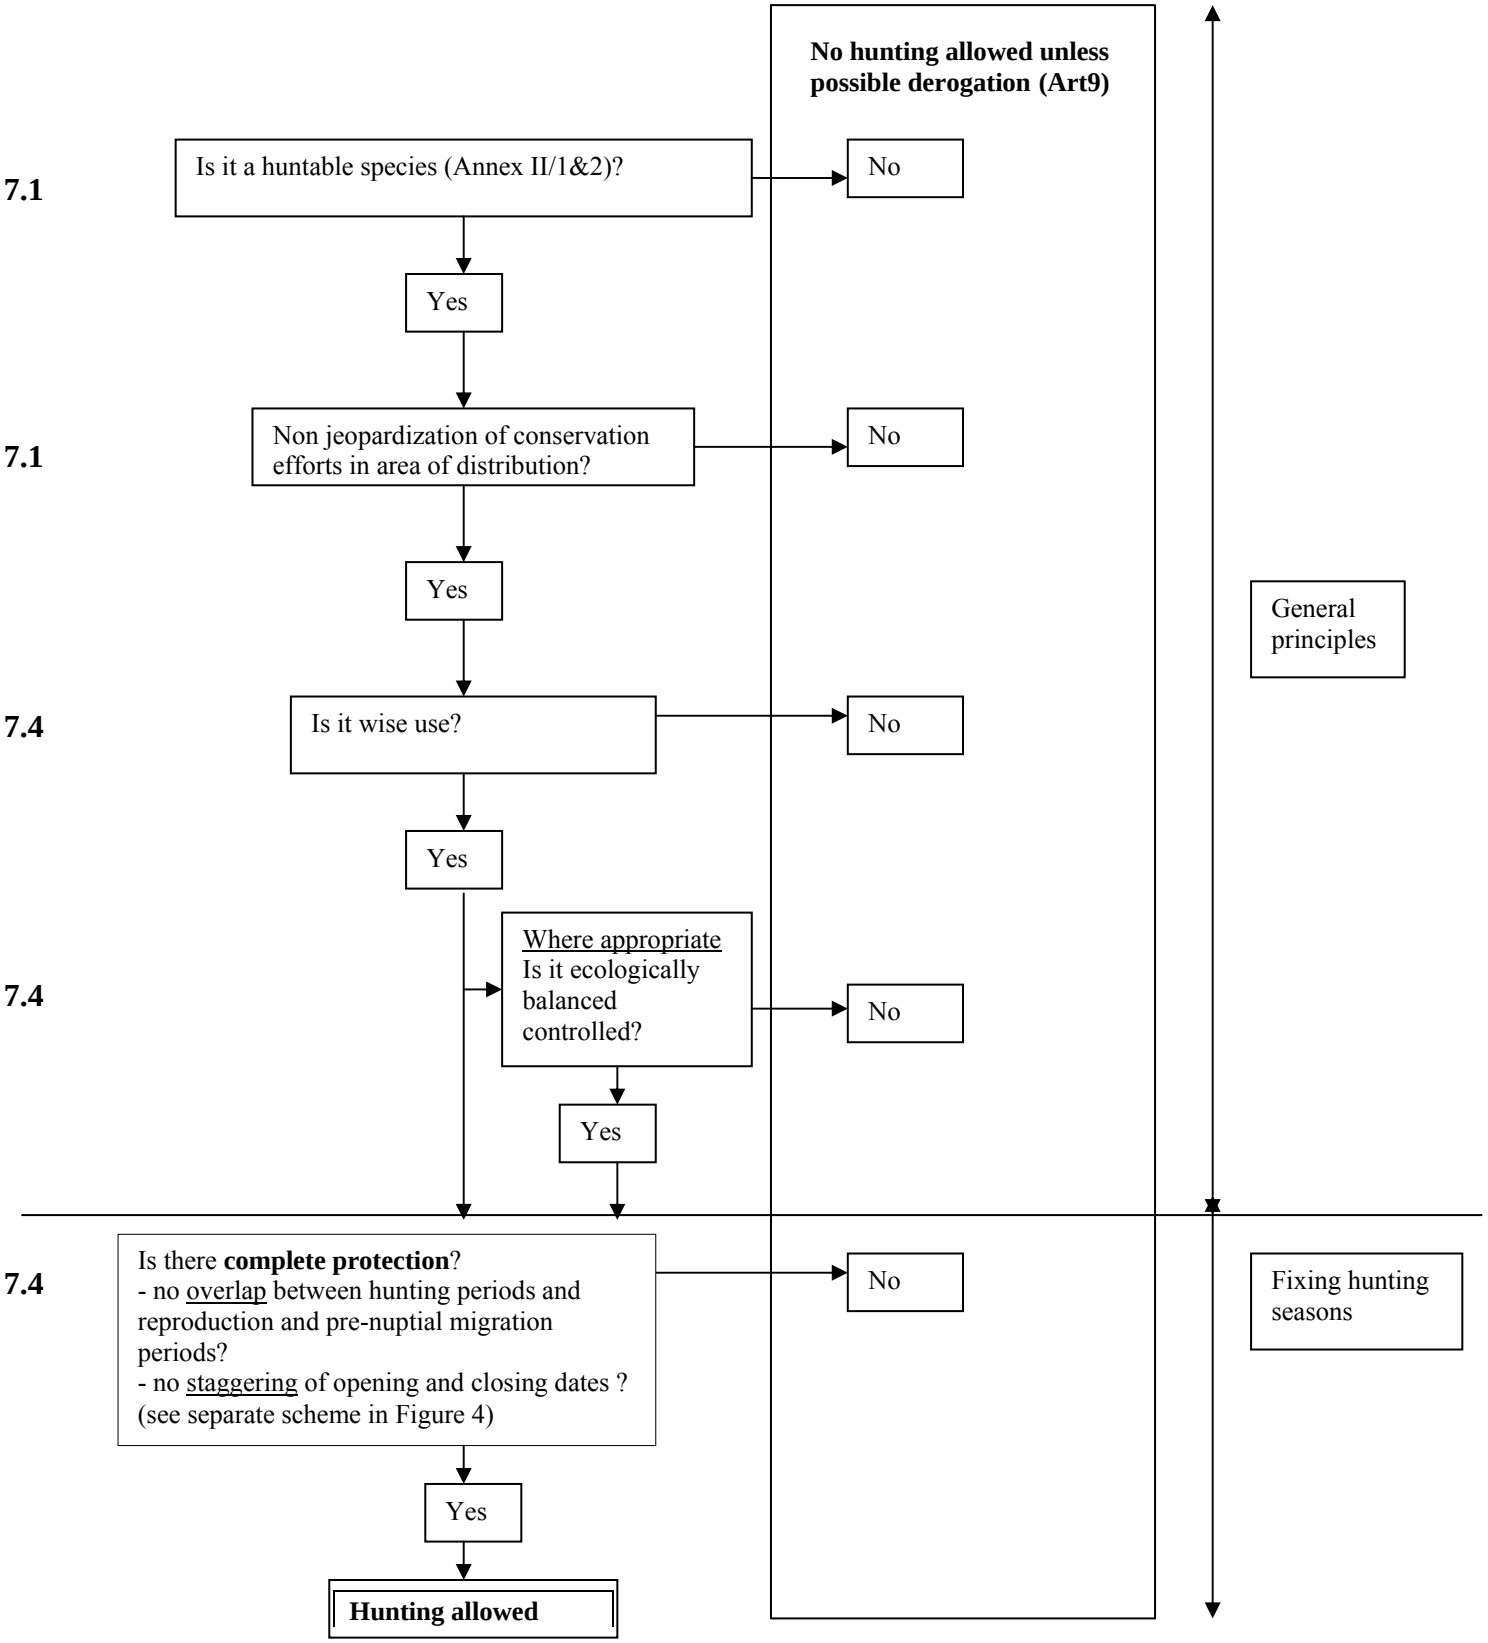
2.7.11 Likewise, where the breeding range of a species with a prolonged reproduction period is clearly geographically restricted in a Member State, with late localised breeding of this species, it may be permissible to allow for earlier opening dates for hunting seasons of the species outside of these areas. In such circumstances there would be a need for the geographic areas to be at the appropriate scale to ensure that territories with late breeders are not subject to hunting seasons until the reproduction period has ended.

2.7.12 The situation regarding the Mallard *Anas platyrhynchos*, which has a prolonged combined pre-nuptial and reproduction period in some Member States deserves particular mention (see also section 3.4.33 and figure 7). In some countries a large proportion of the population is comprised of captive bred specimens[65]. Captive bred specimens as such are not covered by the terms of the directive (as confirmed by the decision of the Court of Justice in Case C-149/94[66]). In application of the directive account needs to be taken of the mixing of captive bred and wild stocks. Introducing a high level of captive bred birds into the population may result in abnormal population behaviour, including that relating to pre-nuptial migration and reproduction periods. This would appear to be particularly the case in relation to the prolonged breeding seasons of this species[67]. In light of the fact that highly artificial human-derived factors are superimposed on the biological pattern, it would seem to be appropriate in those countries containing a high percentage of an artificial population to make allowance for any distortion in the pre-nuptial migration and breeding data when fixing the hunting season of this species under Article 7 to bring it into alignment with that for other similar surface duck species. This would also have the added value of reducing hunting pressure during this period on these other species which are less plentiful than the Mallard.

2.7.13 One other most obvious solution to avoid overlap under Article 7(4) is shortening or shifting the hunting season, which, if necessary, could be

[64] For example in Sweden the time of breaking up of the ice on lakes varies from 15 March in the south to 15 June in the mountainous parts in the north. This difference corresponds to up to 9 decades and has profound phenological consequences.

[65] For example, whereas the French breeding population of the Mallard is estimated at 30000-60000 pairs, game breeders produce 1.4 million Mallard each year (source: Y.Ferrand, Office National de la Chasse et de la Faune Sauvage).



[66] Judgment of 8 February 1996, Criminal proceedings v Didier Vergy, case C-149/94, ECR 1996, p.299.

[67] Cramp and Simmons KEL, Birds of the Western Palearctic, 1977, p.516 Oxford University Press).

combined with a proportional increase in hunting days (if hunting is restricted to certain days in the week).

2.7.14 In any case such solutions have to be examined if an Article 9 derogation is considered necessary. The next chapter of this guide examines the possibility for allowing for some hunting under the derogation system of Article 9 of the Directive. Several damage-causing species for which overlapping hunting dates exist at present may be more appropriately treated under Article 9(1)(a) of the Directive. The possibility for limited hunting of certain species outside the normal hunting period, as a form of 'judicious use' under Article 9(1)(c), is also explored in the next chapter of the guide.

Summary issues to consider to allow for hunting and fixing hunting seasons under Article 7

3 PROVISIONS OF ARTICLE 9

Grey Lag Geese - Acrylic painting by Pieter Verstappen

Photos_chapitres_FR.indd 9 6/01/2009 17:06:26

3 PROVISIONS OF ARTICLE 9

Text of Article 9

"1. Member states may derogate from the provisions of Articles 5, 6, 7 and 8, where there is no other satisfactory solution , for the following reasons :

(a) - in the interests of public health and safety,
- in the interests of air safety,
- to prevent serious damage to crops , livestock , forests , fisheries and water,
- for the protection of flora and fauna;

(b) for the purposes of research and teaching , of re-population , of re-introduction and for the breeding necessary for these purposes;

(c) to permit, under strictly supervised conditions and on a selective basis , the capture , keeping or other judicious use of certain birds in small numbers.

2. The derogations must specify:
- the species which are subject to the derogations,
- the means, arrangements or methods authorized for capture or killing,
- the conditions of risk and the circumstances of time and place under which such derogations may be granted,
- the authority empowered to declare that the required conditions obtain and to decide what means, arrangements or methods may be used, within what limits and by whom,
- the controls which will be carried out.

3. Each year the member states shall send a report to the Commission on the implementation of this Article.

4. On the basis of the information available to it, and in particular the information communicated to it pursuant to paragraph 3, the Commission shall at all times ensure that the consequences of these derogations are not incompatible with this Directive. It shall take appropriate steps to this end."

3.1 Introduction

3.1.1 Derogations are 'exceptions' which allow for some flexibility in the application of a law. A limited number of activities normally prohibited under the Birds Directive (Articles 5-8) are permissible by way of such derogations, where particular problems or situations exist or may arise. The possibilities for use of these derogations are constrained. They must be justified in relation to the overall objectives of the Directive and comply with the specific conditions for derogations described in Article 9. Member States do not need to consult the Commission before applying derogations but are obliged to report all derogations to the European Commission in annual derogation reports.

3.1.2 In this chapter major considerations relating to the use of derogations, particularly with regard to hunting, are reviewed. Firstly, formal legal considerations are examined. Secondly, the need to ensure that conditions for derogations are satisfied is explained. Then the three major conditions for use of derogations are explored. These are the issue of 'no other satisfactory solutions', the need to demonstrate one of the reasons allowed under Article 9(1)(a) to (c), which is followed by a section dealing with the need to satisfy the formal conditions set out in Article 9.2. Finally, reference is made to the reporting of derogations by Member States under Article 9.3 and the role of the Commission under Article 9.4 in ensuring that these are compatible with the requirements of the directive.

3.2 Formal legal considerations

3.2.1 Certain basic formal considerations must be taken into account in any use of derogations.

3.2.2 The national legislation on which derogations are based needs to fully and accurately mirror the provisions of Article 9. According to the established case-law[68] related to transposition of the Directive, the Court of Justice stated that *"the criteria which the Member States must meet in order to derogate from the prohibitions laid down in the Directive must be reproduced in specific national provisions, since a faithful transposition becomes particularly important in a case where the management of the common heritage is entrusted to the Member States in their respective territories."* In Case C-159/99, *Commission v Italy,* which also related to the Directive's transposition, the Court observed that "*the provisions of Directives must be implemented with unquestionable binding force, and the specificity, precision and clarity necessary to satisfy the requirements of legal certainty"*[69].

3.2.3 In Case C-339/87, the Court also confirmed that observance of the requirements of Article 9 in practice was not a substitute for proper formal transposition. It noted that "*mere administrative practices, which by their nature may be changed at will by the authorities, cannot be regarded as constituting proper compliance with the obligation on Member States to which a Directive is addressed, pursuant to Article 189 of the Treaty."*[70]

3.2.4 Derogations should not be compromised by non-compliance with the provisions from which they derogate. In particular, the prohibitions and other requirements from which derogations are made should be properly transposed into national law. Furthermore, in accordance with general legal principles, the

[68] For instance: Judgment of 15 March 1990, Commission/Netherlands, case C-339/87, ECR 1990, p.851, paragraph 28; judgment of 8 June 2006, WWF Italia and others, case C-60/05, ECR 2006, p.5083, paragraph 24.
[69] Judgment of 17 May 2001, Commission/Italy, case C-159/99, ECR 2001, p.4007, paragraph 32.
[70] Judgment of 15 March 1990, Commission/Netherlands, case C-339/87, ECR 1990, p.851. This position reflects the Court's earlier decision in its judgment of 23 February 1988, Commission/Italy, case 429/85, ECR 1988, p.843.

grounds justifying derogations need to be strictly interpreted to avoid undermining the main provisions of the Directive.

3.2.5 The Court confirmed[71] that Article 9 is to be interpreted as meaning that it authorizes the Member States to derogate from the general prohibition on hunting protected species laid down by Articles 5 and 7 of the directive only by measures which refer in sufficient detail to the factors mentioned in Article 9(1) and (2). In exercising their powers concerning the granting of derogations, in accordance with Article 9 of the Directive the authorities of the Member States must take account of various criteria relating to geographic, climatic, environmental and biological factors and, in particular, to the situation regarding the species' reproduction and total annual mortality rate owing to natural causes[72]. A licence or other instrument embodying a derogation should therefore be complete and explicit in referring to the conditions that a derogation must satisfy.

3.2.6 This enables the Commission, the Court[73] and, mainly, the national authorities to supervise the derogations granted. It should be recalled that, according to Articles 242 and 243 of the EC Treaty, the Court may, if it considers that circumstances so require, order that application of the contested act be suspended and may in any cases before it prescribe any necessary interim measures. In a recent case[74], the Court ordered Italy to suspend the application of a regional law granting hunting derogations.

3.2.7 When granting derogations, the national authorities bear the burden of proof[75] and must motivate their decisions in a clear and sufficient manner. According to the Court, "*the relevant national legislation applicable must specify the criteria for the derogation in a clear and precise manner and require the authorities responsible for applying them to take account of those criteria. In respect of exceptional arrangements, which must be interpreted strictly and impose on the authority taking the decision the burden of proving that those conditions are present for each derogation, the Member States are required to ensure that all action affecting the protected species is authorised only on the basis of decisions containing a clear and sufficient statement of reasons which refers to the reasons, conditions and requirements laid down in Article 9(1) and (2) of the Directive*"[76].

[71] Judgment of 7 March 1996, Associazione Italiana per il WWF and others v Regione Veneto, case C-118/94, ECR 1996, p.1223, paragraph 21 and judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02, paragraph 10.

[72] Judgment of 8 June 2006, WWF Italia and others, case C-60/05, ECR 2006, p.5083, paragraph 25.

[73] For instance, in the case of the hunting using limed twigs in the Community of Valencia (Spain) (method known as 'parany'), the Court refers to the preamble of the contested decree granting the derogation (judgment of 9 December 2004, Commission/Spain, case C-79/03, ECR 2004, p.11619).

[74] Order of 19 décembre 2006, Commission/Italy, case C-503/06R, ECR 2006, p.141.

[75] See for instance the case of spring hunting in Finland (judgment of 15 December 2005, Commission/Finland, ECR 2005, p.11033), where the Finnish Government has not provided evidence to support its assertions (e.g. paragraphs 35, 39 and 41).

[76] Judgment of 8 June 2006, WWF Italia and others, case C-60/05, ECR 2006, p.5083, paragraph 34.

3.2.8 In addition, the Court has provided useful clarification with regard to the effectiveness of the national control mechanisms of the decisions granting derogations. In Case C-60/05[77], the Court stressed that "*the relevant national procedural framework applicable must guarantee not only that the lawfulness of decisions granting authorisations derogating from the system of protection laid down by the Directive may be verified in a timely manner but also that the conditions attached to those decisions are complied with"*. Based on the need to ensure the power of the competent national authorities to intervene in a timely and effective manner, the Court ruled that *"the administrative procedures provided for are organised in such a way that both the decisions of the competent authorities authorising hunting derogations and the manner in which those decisions are applied are subject to effective control exercised in a timely manner"*.

3.3 Ensuring that Overall Conditions for Derogations are Satisfied

3.3.1 Before a valid derogation can be given under Article 9, the competent national authority needs to consider and properly address several conditions concerning the derogation's prior justification and subsequent application.

3.3.2 In Case C-118/94, *Associazione Italiana per il World Wildlife Fund and Others v. Regione Veneto*, the Court noted[78] that the use of Article 9 is subject to three conditions: *"It is important also to bear in mind that the Court has stated that the possibility provided for in Article 9 of derogating from the restrictions on hunting, as well as from the other restrictions and prohibitions contained in Articles 5, 6 and 8 of the Directive, is subject to three conditions. First, the Member State must restrict the derogation to cases in which there is no other satisfactory solution. Secondly, the derogation must be based on at least one of the reasons listed exhaustively in Article 9(1)(a), (b) and (c). Thirdly, the derogation must comply with the precise formal conditions set out in Article 9.2, which are intended to limit derogations to what is strictly necessary and to enable the Commission to supervise them. Although Article 9 therefore authorizes wide derogations from the general system of protection, it must be applied appropriately in order to deal with precise requirements and specific situations (judgements in Case 247/85 Commission v Belgium [1987] ECR 3029, paragraph 7, and Case 262/85 Commission v Italy [1987] ECR 3073, paragraph 7)."*

3.3.3 Non-respect of any one of these conditions may render a derogation invalid. It is therefore necessary for the Member State authorities to carefully examine the applicability of all three conditions, irrespective of the number and identity of the authorities within their territory responsible for applying that provision[79]. As noted in paragraph 3.2.5 above, any derogation should also be

[77] Judgment of 8 June 2006, WWF Italia and others, case C-60/05, ECR 2006, p.5083, mainly paragraphs 42-47.
[78] See paragraph 21 of the judgment.
[79] See in particular the judgment of 8 June 2006, WWF Italia and others, case C-60/05, ECR 2006, p.5083, paragraphs 41.

explicit in its references to these conditions. In terms of the structure of the present guide, Sections 3.4, 3.5 and 3.6 deal with each of the three conditions in turn.

3.4 First Condition for Derogations: Showing there is 'No other Satisfactory Solution'

3.4.1 As has been noted at paragraph 3.3.2 above, derogations are only possible in cases where there is no other satisfactory solution. This is an overarching condition that all derogations must satisfy.

GENERAL CONSIDERATIONS

3.4.2 An analysis of whether there is "no other satisfactory solution" can be considered as having three parts: What is the problem or specific situation[80] that needs to be addressed? Are there other solutions? If so, will these resolve the problem or specific situation for which the derogation is sought? Before answers are sought to the second and third parts, it should be clear that the problem or specific situation is capable of being covered by Article 9(1)(a) to (c).

3.4.3 This approach is illustrated by Case C-10/96, *Ligue Royale Belge pour la Protection des Oiseaux ASBL, Société d'Etudes Ornithologiques AVES ASBL v. Région Wallonne*[81] - the most extensive decision of the Court of Justice to date on "no other satisfactory solution". Although this case involved very specific circumstances, it is of considerable assistance in any general analysis of how this condition should be addressed. It is therefore worth looking at in some detail.

3.4.4 The background was a challenge made in the Belgian Court against two orders of the Walloon Region, which, *inter alia*, authorised the capture, under specified conditions, of certain species of birds protected by the Directive. The aim of the purported derogation was to supply bird fanciers with wild specimens to enable more successful captive-breeding to be carried out. Contesting the validity of the orders, the *Ligue Royale* and AVES argued that the capture of wild birds was in principle prohibited by the Directive and that derogations from that prohibition could, according to Article 9, be permitted only if there was no other satisfactory solution, such as breeding in captivity. They contended that there were extensive and adequate opportunities for breeding the species whose capture was authorised by the contested orders.

3.4.5 Two lines of argument were advanced by the Belgian authorities as to why there was no satisfactory alternative to allowing the capture of wild birds. The first related to the difficulties of immediately obliging bird fanciers to make the changes necessary to ensure more successful breeding using only captive-bred birds. The second related to the risk to successful captive breeding posed

[80] The recitals to the Directive relate the possibility of derogations to " certain specific situations".
[81] Judgment of 12 December 1996, Ligue royale belge pour la protection des oiseaux ASBL and Société d'études ornithologiques AVES ASBL v Région Wallonne, case C-10/96, ECR 1996, p.6775.

by a lack of genetic diversity in captive breeding stocks. These two rationales are reflected in the questions referred by the Belgian *Conseil d'État* to the Court of Justice for interpretation[82].

3.4.6 In essence, the Court rejected the first line of argument, but, with several qualifications, accepted the possibility of derogations to deal with problems of consanguinity[83].

3.4.7 In analysing the issue of other solutions, the Court noted that the actions to be permitted under the derogation (in this case capture of wild birds for recreational purposes) were an example of "judicious use" and thus came within the exhaustive reasons that constitute the second condition referred to in Case C-118/94, (see paragraph 3.3.2 above), i.e. a derogation must be based on at least one of the reasons listed exhaustively in Article 9(1)(a), (b) and (c)[84]. This underlines the inter-relationship between the issue of other satisfactory solutions and the reasons for the derogation. In practical terms, there is little point in examining the issue of other solutions if the actions concerned by the derogation do not come within the scope of Article 9(1)(a) to (c).

3.4.8 The Court observed that, in the specific circumstances of the case, there was another solution to capturing wild birds under the derogation, namely breeding exclusively using captive specimens.

---

[82] The questions referred to the Court were the following:
"1. Do Articles 5, 9 and 18 of Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds allow a Member State to take account, on a decreasing basis and over a specified period, of the fact that the prohibition of capturing birds for recreational purposes would compel numerous fanciers to alter their installations and to abandon certain habits where that State recognizes that breeding is possible but is not yet feasible on a large scale for that reason?
2. Do Articles 5, 9 and 18 of Directive 79/409/EEC allow Member States, and if so to what extent, to authorize the capture of birds living naturally in the wild state within European territory with a view to obviating, in bird breeding for recreational purposes, the problems of consanguinity which would result from too many endogenous crossings?'

[83] The Court responded to the questions posed as follows:
"1. Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds, and in particular Article 9(1)(c) thereof, must be interpreted as meaning that a Member State may not, on a decreasing basis and for a limited period, authorize the capture of certain protected species in order to enable bird fanciers to stock their aviaries, where breeding and reproduction of those species in captivity are possible but are not yet practicable on a large scale by reason of the fact that many fanciers would be compelled to alter their installations and change their habits.
2. National authorities are authorized under Directive 79/409, and in particular under Article 9(1)(c) thereof, to permit the capture of protected species with a view to obviating, in bird breeding for recreational purposes, the problems of consanguinity which would result from too many endogenous crossings, on condition that there is no other satisfactory solution, it being understood that the number of specimens which may be captured must be fixed at the level of what proves to be objectively necessary to provide a solution for those problems, subject always to observance of the maximum limit of `small numbers' referred to in that provision.".

[84] The Court's reasoning includes the following: "*15 It should first be pointed out that the Court has held, at paragraph 38 of its judgment in Case 262/85 Commission v Italy [1987] ECR 3073, that the capture and sale of wild birds with a view to keeping them for use as live decoys or for recreational purposes in fairs and markets may constitute judicious use authorized bArticle 9(1)(c) of the Directive. 16 It cannot therefore be ruled out that the capture of certain protected species for recreational purposes, such as that intended to enable fanciers to stock their aviaries, may also constitute judicious use within the meaning of Article 9(1)(c)."*

3.4.9 The Court then examined whether this other solution could be considered satisfactory, noting:
"*20 In those circumstances, breeding and reproduction in captivity could be regarded as not constituting an `other satisfactory solution' only if it were established that, were it not for the capture of birds in the wild, those activities could not prosper.*
21 Consequently, the fact that the breeding and reproduction in captivity of the species concerned are not yet feasible on a large scale by reason of the installations and the inveterate habits of bird fanciers, habits which, moreover, have been encouraged by domestic rules derogating from the general scheme of the Directive, is not in itself such as to cast doubt on the satisfactory nature of the alternative solution to capturing birds in the wild."

3.4.10 It is evident from this passage as well as remarks of the Advocate General that, where another solution exists, any arguments that it is not "satisfactory" will need to be strong and robust. As the Advocate General observes: *"The essential unifying characteristic of paragraphs (a), (b) and (c) of Article 9.1 is that a prohibition laid down in the Directive in the interests of bird protection may have to yield to other requirements; a derogation under this provision can therefore only be a last resort. In this context the term `satisfactory' may be interpreted as meaning a solution which resolves the particular problem facing the national authorities, and which at the same time respects as far as possible the prohibitions laid down in the Directive; a derogation may only be allowed where no other solution which does not involve setting aside these prohibitions can be adopted."*

3.4.11 It is therefore clear that another solution cannot be deemed unsatisfactory merely because it would cause greater inconvenience to or compel a change in behaviour by the beneficiaries of the derogation. The Advocate General remarks: *" It is in the nature of environmental protection that certain categories of persons may be required to amend their behaviour in pursuit of a general good; in this case, the abolition, as a consequence of the Directive, of `tenderie' or `the capture of birds for recreational purposes', which Belgium sought so stoutly to defend in ratifying the Bern Convention, is one example. That such activities may be `ancestral' or partake of an `historical and cultural tradition' does not suffice to justify a derogation from the Directive."*

3.4.12 On the other hand, the cautious[85] admission by the Court of the possibility of a derogation based on the risk of consanguinity demonstrates that, under certain circumstances, the condition as to no other satisfactory alternative may be satisfied. The Advocate General observes[86]: *"The determination of whether*

[85] The caution of the Court is evident in the following passage: *"25 It must next be borne in mind that, as already indicated in paragraph 17 of this judgment, a derogation from Article 5(a) of the Directive may be accorded only if there is no other satisfactory solution. In particular, that condition would not be met if it were possible to obviate the problems of consanguinity by cooperation and exchanges of specimens between breeding establishments."*

[86] Opinion of Mr Advocate General Fennelly delivered on 7 November 1996, Ligue royale belge pour la protection des oiseaux ASBL and Société d'études ornithologiques AVES ASBL v Région Wallonne, Case C-10/96, paragraph 39.

another satisfactory solution exists in a given factual situation is, of course, a matter for the national court. Such a determination must, in my view, be founded on objectively verifiable factors, such as the scientific and technical considerations suggested by the Commission." Against this background, it seems reasonable to state as a general proposition that any determination that another solution is unsatisfactory should be based on objectively verifiable factors, and that close attention needs to be paid to the scientific and technical evaluation of these. In Case C-79/03[87], the Court focused on those factors in order to assess the compatibility of the derogations granted hunting using limed twigs in the Spanish Community of Valencia. It seems that the arguments based on the *"deeply rooted tradition"* of hunting practices are not sufficient in order to justify the need for derogations[88]. In addition, in its judgement of 16 October 2003, the Court took a rigorous view with regard to the "need" and the "purpose" of a derogation[89]. A final point is worth noting from the decision in Case C-10/96[90] - the need to limit a derogation to the extent necessary to resolve the problem addressed. Thus, while there might be no other satisfactory solution to the risk of consanguinity than capture of a supplementary stock of wild birds, the number of specimens involved must be "*fixed at the level of what proves to be objectively necessary to provide a solution for those problems".* This limitation is distinct from the limitation of "small numbers" in Article 9(1)(c), although the limitation for small numbers must be observed as an overall "cap".

"NO OTHER SATISFACTORY SOLUTION" IN RELATION TO HUNTING

3.4.13 A basic question arises as to whether, as a matter of law and fact, this condition can ever be satisfied in relation to hunting, especially proposed extensions of hunting seasons. In the case of recreational hunting, this question is inextricably linked to the question of whether such hunting can be considered a "judicious use" for purposes of Article 9(1)(c). Clarification has been provided by the Court of Justice in its judgment in Case C-182/02 *Ligue pour la protection des oiseaux and others*[91], which arose out of a preliminary reference from the French *Conseil d'État* Having confirmed that recreational hunting may constitute a "judicious use" (see section 3.5 below), the Court declared that a derogation under Article 9(1)(c) could only be given where there is no other satisfactory solution.

3.4.14 The Court did not describe at length under what circumstances recreational hunting would meet the condition as to "no other satisfactory solution".

[87] Judgment of 9 December 2004, Commission/Spain, case C-79/03, ECR 2004, p.11619.
[88] Judgment of 9 December 2004, Commission/Spain, case C-79/03, ECR 2004, p.11619, paragraph 27.
[89] Judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02, paragraph 16. The Court confirmed this approach in the following rulings: judgment of 9 June 2005, Commission/Spain, case C-135/04, ECR 2005, p.5261, paragraph 19 and judgment of 15 December 2005, Commission/Finland, case C-344/03, ECR 2005, p.11033, paragraph 33.
[90] Judgment of 12 December 1996, Ligue royale belge pour la protection des oiseaux ASBL and Société d'études ornithologiques AVES ASBL v Région Wallonne, case C-10/96, ECR 1996, p.6775.
[91] Judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02.

However, in paragraph 16 of the judgement, the Court provides important clarification, noting that this condition

"cannot be considered to have been satisfied when the hunting period under a derogation coincides, without need, with periods in which the Directive aims to provide particular protection (see, to that effect, Commission v Italy, paragraph 39). There would be no such need if the sole purpose of the derogation authorising hunting were to extend the hunting periods for certain species of birds in territories which they already frequent during the hunting periods fixed in accordance with Article 7 of the Directive."

3.4.15 The reference to "need" and "purpose" of a derogation underlines, as does the judgement in Case C-10/96[92], the importance of demonstrating that there are compelling reasons to justify a derogation. This approach has been confirmed by the following rulings of the Court with regard to the hunting of woodpigeons in the Spanish province of Guipúzco[93] and the spring hunting in Finland[94].

3.4.16 Furthermore, the second sentence quoted explicitly rules out the possibility of a derogation where the sole purpose is to extend a hunting season for wild birds that are available to be hunted during a normal open season. The Court has shown itself ready to carry out an "opportunity" check (*contrôle d'opportunité*)[95] for granting derogations.

3.4.17 In Case C-344/03, the Court also ruled that hunting in the autumn, or in the spring, of other species birds present "*by way of replacement"* cannot be regarded as another satisfactory solution within the meaning of Article 9(1)(c) of the Directive. According to the Court, *"such a solution would risk rendering that provision nugatory, at least partially, because it would allow in certain territories for prohibitions on hunting certain species of birds, even though hunting in small numbers might, in theory, not jeopardise the maintenance of their populations at a satisfactory level and, therefore, constitute judicious use of those species (see, to that effect, Ligue pour la protection des oiseaux and Others, paragraph 17). Moreover, unless all bird species are considered to be equivalent for the purposes of hunting, that solution would, in any event, be a source of legal uncertainty, because the basis on which it may be considered that the hunting of a given species can replace the hunting of another species is not clear from the applicable legislation"*[96].

[92] Judgment of 12 December 1996, Ligue royale belge pour la protection des oiseaux ASBL and Société d'études ornithologiques AVES ASBL v Région Wallonne, case C-10/96, ECR 1996, p.6775.

[95] An examination of whether, in a specific set of circumstances, a derogation is justified.
[96] Judgment of 15 December 2005, Commission/Finland, case C-344/03, ECR 2005, p.11033, paragraph 44.

POSSIBLE OBJECTIVELY VERIFIABLE FACTORS AND SCIENTIFIC AND TECHNICAL CONSIDERATIONS

3.4.18 In the light of the decision of the Court in Case C-182/02[97], it requires to be examined whether there are needs - or, to use expressions found in the Advocate General's Opinion in Case C-10/96, objectively verifiable factors and scientific and technical considerations[98] - that would justify derogations for hunting on the basis that there is no other satisfactory solution to a specific situation.

- **Hunting with a non-recreational justification**

3.4.19 It is generally accepted that some huntable bird species can jeopardise the interests referred to in Article 9(1)(a) outside of the hunting season allowed under Article 7. It is also generally accepted that, in order to safeguard these interests, there may sometimes be no satisfactory solution other than destruction of birds. In this context, it would seem reasonable that the use of hunting is a legitimate means of safeguarding the interests mentioned in Article 9(1)(a). Of course, in this instance, hunting serves a non-recreational objective (i.e. damage prevention).

3.4.20 The species for which Article 9(1)(a) are invoked are sometimes referred to as 'pest species'. The justifications for their control include 'to prevent serious damage to crops, livestock, forests, fisheries and water' as well as 'for the protection of flora and fauna'. The first justification in particular relates to a wide range of species, including members of the *Corvidae*, *Columbidae*, *Sturnidae*, *Laridae* and *Anseridae*[99]. Several of the species concerned are widespread and relatively abundant and are considered to have a favourable conservation status (see Figure 5 for consideration).

- **Hunting for recreational purposes**

3.4.21 As regards hunting for recreation, it would seem reasonable to consider that, in terms of objectively verifiable factors and scientific and technical considerations, the findings of the Overlap Analysis (see Chapter 2) are pertinent.

3.4.22 It has already been noted from the Overlap Analysis that, to a significant extent, hunting is permitted in some Member States during periods precluded under Article 7(4), thus requiring steps to ensure alignment of hunting seasons with the requirements of the Directive.

---

[97] Judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02.

[98] Opinion of Mr Advocate General Fennelly delivered on 7 November 1996, Ligue royale belge pour la protection des oiseaux ASBL and Société d'études ornithologiques AVES ASBL v Région Wallonne, Case C-10/96, paragraph 39.

[99] This category also applies to species not listed in Annex II such as the Cormorant *Phalacrocorax carbo*

3.4.23 The first and primary reaction should, of course, be to ensure compliance with Article 7(4). This would be consistent with the second sentence of paragraph 16 of the judgement in Case C-182/02[100].

3.4.24 The question that then arises is whether there are factors which merit consideration of the scope for derogations in relation to the overlaps. It would appear that, in some cases, the overlaps may be correlated to a number of biological and conservation factors and there may be arguments as to why these may merit being looked at as possible objectively verifiable factors. Whereas these factors need to be examined on a species by species basis, several broad categories of overlap emerge, which need to be considered. For individual species or populations several of the different categories may simultaneously apply.

3.4.25 It should be stressed that in considering these factors for the purpose of derogation possibilities of Article 9(1) it will always be necessary to carry out an in-depth examination of the populations of the species and to have particular regard to the circumstances. Furthermore, it again needs to be emphasised that derogations are intended to address exceptional situations and that the factors mentioned should not be seen as justifying a general, systematic extension of hunting periods for general convenience. Before any derogations is granted, an assessment on a case by case basis and based on clear scientific evidence should take place. This approach is in line with the relevant case-law of the Court[101].

To assist reflection on the matter, a number of possible situations are outlined below. It should be stressed that the presentation of these situations does not imply that the Commission accepts that they constitute grounds for derogation.

- *Species for which hunting may be impractical or inappropriate during significant parts of normal period*

3.4.26 For example, for some species, which exist in cold climates, it may not be practical or appropriate to allow for hunting during cold periods of prolonged physiological stress. Examples may include species of the Grouse family *Tetraonidae* in mountainous environments. From a conservation point of view it may be less damaging to these species to allow some limited hunting during

[100] Judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02. In order to assess if France had restricted the derogation to cases in which there was no other satisfactory solution, the Court examined whether it was necessary that the hunting period under a derogation coincides, without need, with periods in which the Birds Directive aims to provide particular protection. According to the Court, "there would be no such need if the sole purpose of the derogation authorising hunting were to extend the hunting periods for certain species of birds in territories which they already frequent during the hunting periods fixed in accordance with Article 7 of the Directive."

[101] See in particular the following judgments of: Judgment of 7 March 1996, Associazione Italiana per il WWF and others v Regione Veneto, case C-118/94, ECR 1996, p.1223, paragraph 21; judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02, paragraphs 13-19.

closed periods than during the normal hunting season[102]. However, any consideration given to this matter should take full account of the needs of species during the short summer to ensure successful reproduction, moulting and preparations for winter and be based on clear scientific evidence. Furthermore, the judgement in Case C-182/02 makes it clear that an extension for the sole purpose of extending the hunting season would be unlawful.

- *Species which may be unavailable in parts of range during most of normal hunting period*

3.4.27 The absence of species in particular regions during normal hunting periods due to migration patterns may also be a factor for consideration. In its judgement in Case C-182/02[103] the Court has not excluded the possibility of hunting under derogation outside normal periods fixed in accordance with Article 7. Such hunting would be permissible in "territories" not used by birds during the normal hunting period.

3.4.28 The identification of territories to which such derogations may be applied should be done on a scale which is related to the movement and distribution of the species concerned. It should also include consideration of the opportunities for hunting the particular species within a given region. The granting of derogations on the basis of the absence of the species from 'local' territories within a region where such species are present during the normal hunting period would not be appropriate. This line has also been confirmed by the Court in Case C-135/04, related to the hunting of woodpigeons in the Spanish province of Guipúzcoa[104].

3.4.29 Any such derogation would need to be assessed on a case by case basis. For some migratory species that do not spend the winter in a Member State there may be consistently good opportunities for a hunting season in such territories, while the species is on post reproduction migration. This is an important factor in any consideration of allowing hunting seasons outside normal permissible periods.

3.4.30 In Case C-344/03, the Court ruled on the issue of the permissibility of hunting birds on pre-nuptial migration and conditions that should apply[105]. The case concerned the following species: eider *(Somateria mollissima)*, golden-eye *(Bucephala clangula)*, red-breasted merganser *(Mergus serrator)*, goosander *(Mergus merganser)*, velvet scoter *(Melanitta fusca)* and tufted duck *(Aythya fuligula)*. The Court assessed the situation species by species with a view to verifying whether the sole purpose of the derogation was to extend the hunting seasons for those species in territories which they already frequent during the hunting seasons fixed in accordance with Article 7 of the Directive. On the

[102] In some Member States hunting there is a statutory suspension of hunting during periods of prolonged cold weather.
[103] Judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02, paragraph 16.
[104] Judgment of 9 June 2005, Commission/Spain, case C-135/04, ECR 2005, p.5261, paragraphs 20-22.
[105] Judgement of 15 December 2005, Commission/Finland, case C-344/03, ECR 2005, p.11033, paragraphs 29-46.

basis of the scientific evidence available, the Court concluded that those species could also be hunted in autumn and ruled that the derogation had not complied with the condition that there be no other satisfactory solution.

- *Species with prolonged (pre-nuptial and) reproduction periods*

3.4.31 This category refers to a relatively small number of species with prolonged breeding periods during which several clutches are produced. This may also be combined with a pre-nuptial migration period although the duration of the breeding period is the most significant factor. Examples include *Anas platyrhynchos, Aythya fuligula*, *Columba palumbus*, *Streptopelia decaocto*. This category applies in particular to the latter two species. Despite the fact that the Wood Pigeon *Columba palumbus* and Collared Dove *Streptopelia decaocto* have breeding seasons spread over 6-8 months the peak of breeding activity is over two months[106]. Several of these species are very plentiful and have a favourable conservation status (see Figure 5 for consideration).

3.4.32 For the majority of these species, the very late clutches are second or even third ones, or even replacement clutches. In general, the viability of late born chicks is probably very low because of climatic conditions in autumn and a lack of time to develop properly and accumulate enough food before winter. In such circumstances, they may provide a low contribution to the overall recruitment of the population. However, the production of late clutches may also be linked to availability of abundant food supply at this time and therefore represent a significant contribution to the population. For example, the breeding success of Collared Doves in eastern Germany increased throughout the season from 32% in March to 70% in August-October. It would therefore appear necessary to determine the significance of early and late breeding to overall population success.

3.4.33 Some prolonged breeding periods can also be linked to human influences (e.g. availability of cereals as late food for *Columbus palumbus* in the UK and Netherlands[107]). The prolonged breeding season of the Mallard, *Anas platyrhynchos,* in some areas may be related to the presence of domestic strains selected for long breeding seasons[108]. This illustrates the fact that human-derived, artificial factors may superimpose on the biological pattern and distort it through prolongation of reproduction periods.

[106] According to a study by R.K. Murton (Bird Study, 5, 157-183. 1958) breeding peaked from late July till the end of September. A Dutch study showed a clear peak of nests with eggs at the turn of August to September (Bijlsma 1980). Birds of the Western Palearctic (1985, 325): "Considerable variation even within countries, with urban birds in Britain nesting significantly earlier (starting second half of February) than rural (starting second half of March to second half of April); peak laying period for urban birds second half of April and first half of May, and for rural first half of July to first half of September; differences dictated by food availability (Murton 1958, Cramp, S 1972. Ibis 114, 163-171)." For Collared Dove BWP (1985, 350) states merely "Prolonged throughout range."

[107] Murton (1958), Bijlsma (1980).

[108] (Cramp, S and Simmons K.E.L, Birds of the Western Palearctic 1977, 516).

3.4.34 The situation for *Anas platyrhynchos*[109] and *Columba palumbus*, which are the most problematic species in many Member States, is indicated in Figures 6 and 7. This shows that restricting the hunting season to normal periods under Article 7(4) would result in it being excluded for up to 25 of the 35 decades (i.e. periods of ten days) in the annual cycle of these species. The biological factors result in a hunting season that is 5 decades shorter than is the case for many other quarry species. There would not appear to be conservation needs requiring such a constraint, given their prolific numbers and conservation status. These species are key quarry species in many parts of the EU and central to the whole recreational hunting activity there. Furthermore, the presence of domestic strains of Mallard *Anas platyrhynchos* in different parts of its wintering range may contribute to this different behaviour as regards both pre-nuptial migration and reproduction periods, although this factor merits further scientific study and it is therefore proposed that where this highly artificial situation exists it may be partly accommodated within the framework of Article 7 of the directive (see section 2.7.11-2.7.12).

- *Species with reproduction period with prolonged parental care*

3.4.35 For several groups of birds (e.g. *Tetraonidae*, *Phasianidae*, *Laridae*, *Anseridae*) the period of dependence of the young from hatching to full fledging can be very prolonged. In fact, for young of the *Anseridae,* the period of offspring parental care can continue through to spring migration (for these species the fledging of young is considered to be the end of dependency for the purposes of Article 7(4)). For the *Tetraonidae,* an extremely precautionary approach has been taken in defining the period of dependence of the young birds, which may last for 6-9 decades after hatching. This phenomenon of a prolonged period of dependency when combined with late (replacement) clutches can result in the reproduction period extending up to the end of September for several species. Because of this late date, the viability of chicks born of these late clutches of *Tetraonidae* is uncertain owing to meteorological conditions in the mountains in autumn.

3.4.36 In considering whether objectively verifiable factors exist it may also be appropriate for the scientific and technical considerations to take some account of the beneficial consequences for the conservation of bird species that may accrue from game management linked to a contemplated exercise of the derogation. For example, hunters may take care of game habitats on a voluntary basis, nest boxes may be offered in large quantities, and supplementary food offered at proper occasions. Upland heather management and lawful predator control as a consequence of game management not only benefits Red Grouse *Lagopus lagopus* but also has wider environmental benefits[110].

[109] The prolonged breeding season of the Mallard in some areas may be related to the presence of domestic strains selected for long breeding seasons (Cramp, S and Simmons K.E.L. 1977. Birds of the Western Palearctic p. 516. Oxford University Press).

3.5 Second Condition for Derogations: Demonstrating One of the Reasons Allowed Under Article 9(1)(a) (b) and (c)

3.5.1 As has been noted at paragraph 3.3.2, a derogation must be based on at least one of the reasons listed exhaustively in Article 9(1)(a), (b) and (c).

ARTICLE 9(1)(A) DEROGATIONS

3.5.2 Article 9(1)(a) of the Directive lists a number of reasons, which may justify the use of derogations. They are:

- In the interests of public health and safety
- In the interests of air safety
- To prevent serious damage to crops, livestock, forests, fisheries and water
- For the protection of flora and fauna

3.5.3 These provisions are not restricted to huntable bird species (listed in Annex II of the Directive) but apply to all bird species for which there is justification for use of the derogation. However, many of the species that are considered to pose problems under Article 9(1)(a) (so-called pest species) are listed in Annex II of the Directive and therefore can be controlled during the normal hunting period in accordance with the provisions of Article 7 of the Directive[111].

3.5.4 Therefore, Article 9(1)(a) would mainly apply for huntable species in situations where control measures are to be exercised during the pre-nuptial and reproduction periods. The possibilities for its use are considered below.

"In the interests of public health and safety and in the interests of air safety"

3.5.5 The first and second reason under subsection (a) concern "interests of public health and safety" and "interests of air safety" respectively. Public health and safety may be locally affected where the presence or the feeding of birds causes a demonstrable risk to human health or increases risk of accidents. In many cases habitat alterations or exclusion of birds will be appropriate solutions. For example, at many airports, management measures are taken to prevent bird strikes with aeroplanes.

3.5.6 Such solutions involve in particular habitat management (to reduce the attractiveness to birds and in particular flocks of birds) and various scaring techniques including sometimes shooting. In most cases other satisfactory solutions are available which are more effective and durable than hunting, with the exception of falconry. Therefore under Article 9 these must be used instead.

[111] Council Directive 94/24/EC amended Annex II of Directive 79/409/EEC to include five species of *Corvidae*, which can cause damage to crops, livestock and fauna and for which control measures were formerly only possible under Article 9 derogation. Their listing in Annex II facilitated balanced regulation of their populations.

'To prevent serious damage to crops, livestock, forests, fisheries and water'

3.5.7 The third reason for derogation under subsection (a) concerns the prevention of serious damage to crops, livestock, forests, fisheries and water. This derogation, which is intended to regulate 'damage-causing birds', has a number of dimensions. Firstly, it clearly relates to economic interest. Secondly, it is intended to prevent damage; therefore it is not a response to already proven damage but of the strong likelihood that this will take place in the absence of action. Thirdly, there must be a basis for concluding that damage will be serious in the absence of action.

3.5.8 Bird damage is usually caused by feeding (crops, livestock, fisheries), destruction (crops, forests), and pollution (water).

3.5.9 Such bird damage concerns a wide spectrum of species, including the *Corvidae*, *Columbidae*, *Sturnus vulgaris*, *Laridae* and *Anseridae*. Of those Annex II species many are also the subject of long overlaps (over 40 days) between hunting seasons and the periods of breeding and return migration.

3.5.10 Damage to interests other than those mentioned, e.g. other forms of property or other damaging situations, is not covered.

3.5.11 The damage concerned must be serious. In this regard the European Court has noted that "*the aim of this provision of the Directive is not to prevent the threat of minor damage*."[112] Two aspects may be noted: the likelihood and extent of damage. The chance of the occurrence of damage does not suffice. If damage is not yet apparent, past experience should demonstrate a high probability of the occurrence of damage. Furthermore, it should concern serious damage to an economic interest, indicating that this does not cover mere nuisance and normal business risk.

3.5.12 As always with derogations, it is necessary to consider the available solutions. Hunting will not always be an effective solution. Any control method is vulnerable to the removed birds being replaced from elsewhere and shot birds will, after some time, be replaced by other birds.

3.5.13 In Case C-79/03, which related to the hunting by means of limed twigs aiming to avoid serious damages to crops in the Spanish Community of Valencia, the Court ruled on the existence of alternatives and on the relevance of this type of hunting to avoid damages[113]. According to the Commission, there were other satisfactory solutions for preventing the alleged serious damage caused by the thrushes to vineyards and olive groves (e.g. hunting with guns and the use of bird scarers which were successfully carried out in other autonomous communities in Spain). The Spanish authorities claimed that the hunting by means of limed twigs provided a satisfactory solution for preventing damages, as the use of bird scarers was too expensive in relation to the cost of the

[112] "*The fact that a certain degree of damage is required for this derogation from the general system of protection accords with the degree of protection sought by the Directive.*" (judgment of 8 July 1987, Commission/Belgium, case 247/85, ECR 1987, p.3029paragraph 56).
[113] Judgment of 9 December 2004, Commission/Spain, case C-79/03, ECR 2004, p.11619.

damage caused and their use can cause fires, while the use of guns would have entailed an increase in the number of hunting permits and an extension of the hunting season.

3.5.14 The Court observed that in other regions of Spain facing the same problems (where there was large-scale cultivation of olives and grapes and where there was also large populations of thrushes), hunting using limed twigs was not permitted, but thrushes could be shot, as a selective method of culling. The Court also noted that 80% of the limed twigs were to be found in one province for which 69.5% were in areas without olive groves or vineyards; thus, the justification based on prevention of serious damage to those crops did not appear to be consistent with such a situation. Consequently, the Court considered that hunting by means of the limed twigs was not justified under Article 9(1)(a) of the Directive[114].

3.5.15 However, there will be cases where hunting of birds to control damage is justified. In order to maximise damage prevention, control measures for a species that causes damage are most likely to be effective when the population is at its seasonal minimum and when there is the least availability of replacement birds – typically this is the breeding or pre-breeding period. When devising pest control strategies, logic suggests that the first approach should be to make the control local in time and place to where the damage is occurring. However, widespread species that can cause damage over large areas, such as the Wood Pigeon *Columba palumbus*, may justify derogations that are more generalised in their territorial scope[115].

"for the protection of flora and fauna"

3.5.16 The fourth reason for derogation under subsection (a) concerns the protection of flora and fauna. The types of fauna or flora are not specified but would appear to be different from the flora and fauna of economic interest covered by other provisions of Article 9(1)(a). The case for using the derogation is likely to be strongest where it is linked to the maintenance of populations of species that are rare or threatened but is not limited to such species. Furthermore, there appears not to be a need in this case to demonstrate a likelihood of serious effect before applying the derogation.

3.5.17 Birds may affect flora and fauna by predation, grazing, demolition, trampling, accumulation of droppings etc. A relatively small number of species is allegedly blamed for this: e.g. Herring Gull *Larus argentatus*, Crow *Corvus corone*, Magpie *Pica pica*[116]. A long-term impact on other populations of flora and fauna is only likely when localised occurrences are involved. Each case should be considered thoroughly and decided on advice from the conservation

[114] Judgment of 9 December 2004, Commission/Spain, case C-79/03, ECR 2004, p.11619, paragraphs 25 and 28.
[115] As regards the use of general authorisations to deal with such situations, this is discussed in more detail sections 3.6.10 to 12 in relation to Article 9(2).
[116] Certain species not listed in Annex II of the directive are also involved (e.g. Cormorant *Phalacrocorax carbo).*

authorities. Decisions should be made on best available scientific information available. The following questions might be answered:

- Does it concern threatened, rare or other populations of naturally occurring species with an unfavourable conservation status?
- Are the 'flora and fauna' in question in a poorer conservation status than the species for which the derogation is sought?
- Does it concern other important biodiversity considerations?
- Is good scientific evidence available on the long-term impact on the affected population(s)?
- Are "other satisfactory solutions" not available, thus is population control necessary to effectively reduce or prevent the "ecological damage"?

3.5.18 With regard to "other satisfactory solutions", the extent to which predation is directly related to habitat loss, habitat deterioration or modification (e.g. loss of vegetation cover) or other environmental factors should be considered. Where such a direct relationship exists, it may be appropriate to consider predator control in combination with habitat restoration or better management of human activities. For example, predation of colonies of tern (*Sterna)* species by gull (*Larus)* species may be related to an overall increase in gull populations linked to increased food provided by poorly managed waste disposal sites.

3.5.19 Where the case for protection is supported by compelling elements, control (which may include hunting) could be considered. It would therefore appear that only in specific situations, to be determined by the conservation authorities or their agencies, could control of birds be an appropriate management measure, at the relevant geographical level, to effectively reduce the negative impact of certain bird species on vulnerable flora and fauna.

ARTICLE 9(1)(B) DEROGATIONS

3.5.20 Article 9(1)(b) allows the possibility for use of derogations for the purposes of research and teaching, of re-population, of re-introduction and for the breeding necessary for these populations. The links between these possibilities and hunting are likely to be very limited, although it may be relevant in cases where there are breeding programmes for game species with a view to their re-population or re-introduction. There may also be cases where other hunting research projects may justify the use of this type of derogation.

ARTICLE 9(1)(C) DEROGATIONS

3.5.21 Article 9(1)(c) allows for the use of derogations for the capture, keeping or other judicious use of certain birds. Apart from general conditions, there are four specific conditions, which must be respected in order to apply a derogation under Article 9(1)(c). It must represent 'judicious use'. It must relate to 'small numbers'. It is only permissible if carried out under 'supervised conditions'. Finally it must be on a 'selective basis'. The Court ruling in Case C-60/05 clarifies several issues with regard to the conditions of

Article 9(1)(c) and the type of national administrative framework required for the effective implementation of this provision[117].

- **"Certain Birds"**

3.5.22 Whereas it is mentioned that this derogation can apply to "certain birds", these are not specified in the Directive. In negotiations leading to the adoption of the Directive, there was reference to the need to provide for a derogation to allow the taking of birds of prey for falconry[118]. However, it may be concluded that this derogation can also apply to other bird species for which judicious use is justified. In Case C-182/02, the Court stated[119] that the condition as to "certain birds in small numbers"*"cannot be satisfied if a hunting derogation does not ensure the maintenance of the population of the species concerned at a satisfactory level."* It is therefore difficult to conceive of circumstances where an Article 9(1)(c) derogation would be justified for a species that has an unfavourable conservation status,

- **Judicious Use**

3.5.23 9(1)(c)A fundamental question arises as to whether hunting can constitute a "judicious use" for the purposes of Article 9(1)(c). This question has now been answered by the Court in Case C-182/02 *Ligue pour la protection des oiseaux and others.* Based on previous case-law[120], the Court stated that:

"It is clear from the foregoing that the hunting of wild birds for recreational purposes during the periods mentioned in Article 7(4) of the Directive may constitute a judicious use authorised by Article 9(1)(c) of that directive, as do the capture and sale of wild birds even outside the hunting season with a view to keeping them for use as live decoys or to using them for recreational purposes in fairs and markets" [121].

3.5.24 It is evident from the same judgment that recreational hunting does not automatically constitute a judicious use. Having noted the need for a hunting derogation to ensure the maintenance of the population concerned at a satisfactory level, the Court observed that:

---

[117] Judgment of 8 June 2006, WWF Italia and others, case C-60/05, ECR 2006, p.5083.

[118] The Economic and Social Committee in its opinion on the proposal for a Council Directive on bird conservation of 25 May 1977 (O.J. N° C 152/3 of 29.6.77) stated *"2.8.1. The absence of a possibility of derogating in order to take birds of prey for falconry was noted. It was pointed out to the Commission that this was a legitimate and ancient sport, which if properly controlled, harmed neither birds of prey populations nor the populations of birds pursued in the course of falconry. Some provisions should be made therefore to allow the continuation of this on a controlled basis"*

[119] Judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02, paragraph 17.

[120] See in particular judgment of 8 July 1987, Commission/Italy, case 262/85, ECR 1987, p.3073, paragraph 38, but also judgment of 8 July 1987, Commission/Belgium, case 247/85, ECR 1987, p.3029, paragraph 7 and judgment of 7 March 1996, Associazione Italiana per il WWF and others v Regione Veneto, case C-118/94, ECR 1996, p.1223, paragraph 21.

[121] See paragraph 11 of the judgment. This has been recently confirmed in the judgment of 8 June 2006, WWF Italia and others, case C-60/05, ECR 2006, p.5083, paragraph 32.

"If that condition is not fulfilled, the use of birds for recreational hunting cannot, in any event, be considered judicious and, accordingly, acceptable for the purposes of the 11th recital in the preamble to the Directive." 32 60/05

3.5.25 Judicious use is not defined in the Directive, although it is clear from Article 9(1)(c) that it can include the capture and keeping of certain birds. It is also worth noting that, while, in the English version of the Directive, the word "use" is repeated in the phrase "wise use" in Article 7 and the phrase "judicious use" in Article 9.1(c), other language versions employ different terms in these two phrases. In many of these versions, the equivalent word for "use" in the phrase "judicious use" has an exploitative connotation[122]. The Commission has previously stated: '*This concept is to include activities which make a vital contribution to improving the efficiency of the general system for the protection of wild birds established by the Directive. It may also include other use provided that this does not jeopardise the general objectives of the Directive and it may include hunting using birds of prey in the context of falconry'*[123]. However, any exploitative connotation carried by the term "use" needs to be balanced by the connotations of responsibility, restraint and good judgement imparted by "judicious". This is confirmed by the observation of the Court in Case C-182/02 referred to in paragraph 3.5.22 above.

3.5.26 Falconry provides an illustration of circumstances which amount to a non-respect of Articles 5 (prohibition on killing or capture of wild birds) and 7 (huntable species) but which, in the Commission's view, nonetheless represent a "judicious use". Although falconry is explicitly mentioned in Article 7(4) of the Directive, the practice is limited to huntable species listed in Annex II/1 and Annex II/2 of the Directive for the Member States concerned. In the United Kingdom, the skylark *Alauda arvensis* constitutes one of the main quarry species for the Merlin *Falco columbarius.* Falconry using merlins is practised, but the skylark is not amongst the species listed in Annex II/2 for this Member State. For this reason, the United Kingdom authorises, by way of derogation, the hunting of small numbers of skylarks by merlin. The Commission considers that this is justifiable as a "judicious use" under Article 9(1)(c) by reason of the fact that the merlin has a natural propensity to hunt skylarks. It should be noted that this is not the only instance in which hunting might be the subject of a derogation pursuant to Article 9(1)(c).

- **Small Numbers**

3.5.27 In order to meet the requirements of Article 9(1)(c) the derogations must only relate to "small numbers". Therefore it would be appropriate to be able to determine a quantity to fix a threshold below which the derogation is automatically considered as meeting the requirements of the notion of "small numbers".

[122] Other languages: "utilisation raisonnée " as against "exploitation judicieuse" (FR); "fornuftig udnyttelse" ,fornuftig anvendelse (DK); "saggia utilizzazione" , impieghi misurati (IT); "utilización razonable" , "explotación prudente" (ES); "förnuftigt utnyttjande",. förnuftig användning (SE); "ορθολογική χρησιμοποίηση", "ορθολογική εκμετάλευση" (GR).

[123] From Second Report on Birds Directive (pp 9-10)

3.5.28 In Case 252/85, *Commission v France*[124], the Court considered the issue of small numbers in the following passage: "*In this respect, it is apparent from Article 2, in conjunction with the 11th recital of the preamble to the Directive, that the criterion of small quantities is not an absolute criterion but rather refers to the maintenance of the level of the total population and to the reproductive situation of the species concerned."* As noted earlier, in Case C-182/02, the Court stated[125] that the condition as to "certain birds in small numbers"*"cannot be satisfied if a hunting derogation does not ensure the maintenance of the population of the species concerned at a satisfactory level."*

3.5.29 The Commission considers that the notion of "small numbers" is therefore necessarily relative. A size cannot be small or large except in relation to another size. It must also not be detrimental to maintenance of the population level and take full account of the conservation status of the species concerned.

In its recent judgements the Court has confirmed the Commission's approach and provided further legal clarification on the issue of small numbers[126].

Determining the size

3.5.30 The question arises as to the size to which "small numbers" are to be compared. Since all the cases of derogations concern the taking of birds i.e. an annual loss for the population affected, the most appropriate solution is to compare the numbers involved in this taking to the overall annual mortality, defined as the sum of deaths due to natural causes and to the taking of birds under Article 7 if applicable.

3.5.31 It is therefore proposed that the threshold of "small quantities" should be fixed as a given percentage of the total annual mortality of the population(s) concerned by the derogation.

3.5.32 For sedentary species, "population concerned" means the population of the geographical region in which the derogation is sought to be applied. For species on migration, it means the population of the regions from which the largest numbers of migratory birds come before passing through the region where the derogation is sought be applied during the period the latter is in force. During the winter period, it means the minimum wintering population present in the region where the derogation is sought to be applied. In cases where the population is shared by different Member States, there may be use of derogations on migratory birds of the same population in the different countries. In such circumstances it would be necessary to restrict the

[124] Judgment of 27 April 1988, Commission/France, case 252/85, ECR 1988, p.2243.
[125] Judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02, paragraph 17.
[126] See the following judgements: judgment of 9 December 2004, Commission/Spain, case C-79/03, ECR 2004, p.11619, paragraphs 36 and 41; judgment of 15 December 2005, Commission/Finland, case C-344/03, ECR 2005, p.11033, paragraphs 53-54; judgment of 8 June 2006, WWF Italia and others, case C-60/05, ECR 2006, p.5083, paragraphs 25-27.

population concerned to that occurring in the territory to which the derogation applies at the time when the taking takes place, so as to minimise cumulative effects.

3.5.33 There is also a temporal dimension to determining the reference population at the time of application of the derogation. For example, the taking of Wood Pigeons *Columba palumbus* in autumn, when there is a surplus of young birds will be very different from the taking of sea ducks on spring migration, when the impacts will proportionately be higher on the adult population of pre-breeders. There may also be cases where a species undergoes differential migration (e.g. Ruff *Philomachus pugnax*) and this needs to be taken into consideration in determining the reference population.

3.5.34 In order to determine an exact figure for the threshold, two approaches are possible:
- the figure must be much lower, by at least an order of size, than those figures characteristic of the taking of birds under Article 7. A figure of 1% meets this condition.
- the taking must have a negligible effect on the population dynamics of the species concerned. A figure of 1% or less meets this condition as the parameters of population dynamics are seldom known to within less than one percentage point and bird taking amounting to less than 1% can be ignored from a mathematical point of view in model studies.

3.5.35 Hunting bag statistics exist for only a few Member States and species and the data is of variable quality. Whereas hunting bags may generally be proportional to population size, hunting pressures do not necessarily provide an appropriate approach as they focus on determining a threshold for derogation on the basis of hunting take and not in terms of population size. The implication that the greater the hunting take in a region the more birds that could be hunted under derogation may also not be considered as good conservation practice. Such an approach would also discriminate against regions that may have limited hunting possibilities under normal hunting seasons.

3.5.36 The overall annual mortality is an appropriate parameter to quantify small numbers because it takes population size, status and population dynamics into account. Within this framework "small numbers" should be considered as being any taking of around 1% of the annual mortality for species which may be hunted, it being understood that conformity with Article 9 of the Directive depends in any event on compliance with the other provisions of the Article.

The Court follows the same approach as regards the application of Article 9, which is summarized in the paragraphs 25-27 of Case C-60/05[127]:

25 *"It is also important to note that, in exercising their powers concerning the grant of derogations, in accordance with Article 9 of the Directive the authorities of the Member States must take account of various criteria which*

[127] Judgment of 8 June 2006, WWF Italia and others, case C-60/05, ECR 2006, p.5083.

relate to geographic, climatic, environmental and biological factors and, in particular, to the situation regarding the species' reproduction and total annual mortality rate owing to natural causes.

26 As to those criteria, the Court pointed out in Case C-79/03 Commission v Spain [2004] ECR I-11619, paragraph 36, and Case C-344/03 Commission v Finland [2005] ECR I-0000, paragraph 53, that, according to the document entitled 'Second report [of the Commission] on the application of Directive 79/409/EEC on the conservation of wild birds' of 24 November 1993 (COM(93) 572 final), 'small numbers' are any sample of less than 1% of the total annual mortality rate of the population in question (average value) for those species which are not to be hunted and a sample in the order of 1% for those species which may be hunted. The Court stated in that regard that those quantities are based on the work of the ORNIS Committee for the Adaptation to Technical and Scientific Progress under the Directive, instituted under Article 16 of the latter and consisting of representatives of the Member States.

27 It is also clear from the judgments cited above in Commission v Spain, paragraph 41, and Commission v Finland, paragraph 54, that although the percentages referred to above are not legally binding, they can none the less constitute, by reason of the scientific value of the work of the ORNIS Committee and the absence before the Court of any element of scientific proof to the contrary, a basis of reference for assessing whether a derogation granted under Article 9(1)(c) of the Directive complies with that provision (see by analogy, in respect of the relevance of scientific data in the field of ornithology, Case C-3/96 Commission v Netherlands [1998] ECR I-3031, paragraphs 69 and 70, and Case C-374/98 Commission v France [2000] ECR I-10799, paragraph 25)."

<u>Calculating annual mortality rates</u>

3.5.37 One of the perceived difficulties in applying the annual mortality for estimating small numbers is the fact that mortality rates are described for a limited number of species and usually for only part of their populations. Whereas estimates of annual mortality vary in availability and quality, they do exist for most huntable species (see Figure 8) which summarises published mortality rates for these species in two key scientific reference sources; 'Birds of the Western Palaearctic' and the'Kompendium der Vögel Mitteleuropas').

3.5.38 Furthermore, it is possible to calculate, on the basis of the available scientific literature for biologically similar species estimates for species for which no data is available at present (see worked example for *Rallus aquaticus* in Figure 9).

3.5.39 There will be a need to refine and improve the data on annual mortality of different species and populations, including developing the use of ringing

data[128]. The availability of good quality scientific information on population size and natural mortality is a prerequisite of reliable calculations. In cases where such data is lacking or incomplete there would be a need to use minimum estimates of population size and mortality rates, based on best available data. Furthermore, any application of derogations for a species must be underpinned by robust monitoring systems for the populations concerned to ensure that the taking is not detrimental to their conservation status.

Small numbers and conservation status of species

3.5.40 Derogations should not be granted for species or populations with an unfavourable conservation status, which are declining within the European Union (or in a Member State considering exercising such derogations), whose area of distribution (breeding or wintering) is contracting, or with very low population levels, unless it can be clearly demonstrated that use of such derogations are beneficial to the conservation status of the species/population concerned. Any consideration of use of derogations for such species should only be in the framework of a conservation management plan for them, aimed at their recovery to favourable conservation status. The Commission is of the view that this conclusion is consistent with the Court judgement in case C-182/02 (paragraph 17). In that case, the Court confirmed in paragraph 17 of its judgement that a hunting derogation will not be justified if it does not ensure the maintenance of the population of the species at a satisfactory level. The need to ensure the maintenance of the species population at a satisfactory level is not explicitly mentioned in Article 9. It seems that the Court took into account the general orientation of the Birds Directive set out in Article 2 and the 11th recital. Moreover, there is an obvious analogy with Article 16 of Directive 92/43/EEC, which states that the derogation must not be "detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range". Therefore, the need to ensure the maintenance of the population of the species at a satisfactory level becomes a pre-condition for granting derogations. It should also be noted that Article 9(4) of directive 79/409/EEC also implies that the use of derogations must not be incompatible with the objectives of the directive.

3.5.41 A list of huntable migratory species that are considered at present to have an unfavourable conservation status at the European Union level is given in Figure 10.
Member States should also take into consideration the conservation status of sedentary species within their territory. Figure 11 provides an overview for different grouse and pheasant species.

3.5.42 For abundant species with a favourable conservation status, taking in excess of the 1% threshold (up to 5% of annual mortality) may be considered following an in-depth scientific analysis by the competent authority which authorises the derogation. This would be in order to verify that the derogation is not incompatible with the objectives of the Directive.

[128] Annex V of the directive, which lists areas of research that require particular attention, includes 'listing of data on the population levels of migratory species as shown by ringing'.

Need to ensure a consistent application of derogations in small numbers

3.5.43 In the framework of a reference for a preliminary ruling from the *Tribunale amministrativo regionale per la Lombardia*[129], the Court provided clarification as regards the interpretation of Article 9(1)(c) of the Directive concerning the conditions for the exercise by the Member States of the derogations. The Court replied to the four questions as follows:

3.5.44 As regards the transposition requirements and the need to govern all the situations subject to the derogation system, the Court ruled that Article 9(1)(c) of Directive 79/409/EEC *"requires the Member States, irrespective of the internal allocation of powers prescribed by the national legal system, upon adoption of measures implementing that provision to ensure that, in all cases of application of the derogation provided for therein and for all the protected species, authorised hunting does not exceed a ceiling consistent with the restriction on that hunting to small numbers imposed by that provision, and that ceiling must be determined on the basis of strict scientific data".*

3.5.45 With regard to the level of precision which must characterise national implementing provisions in respect of the technical criteria on the basis of which a quota corresponding to 'small numbers' of birds may be fixed, the Court considered that *"national implementing provisions concerning the 'small numbers' referred to in Article 9(1)(c) of Directive 79/409 must enable the authorities responsible for authorising hunting derogations in respect of birds of a given species to rely on criteria which are sufficiently precise as to the quantitative ceilings to be complied with".*

3.5.46 The third question related to how the competent national authorities are to ensure that the maximum number of birds of a given species which may be hunted is not exceeded in the entire national territory. The Court replied that *"upon implementation of Article 9(1)(c) of Directive 79/409, the Member States are required to ensure that, irrespective of the number and identity of the authorities within their territory responsible for applying that provision, the amount of authorised hunting derogations in respect of each protected species by each of those authorities does not exceed the ceiling compatible with the restriction on that hunting to 'small numbers', fixed for that species for the entire national territory".*

3.5.47 Finally, as regards the control of hunting derogations, the Court ruled that *"the obligation on the Member States to ensure that hunting of birds is carried out only in 'small numbers', in accordance with Article 9(1)(c) of Directive 79/409, requires that the administrative procedures provided for are organised in such a way that both the decisions of the competent authorities authorising hunting derogations and the manner in which those decisions are applied are subject to effective control exercised in a timely manner".*

[129] Judgement of 8 June 2006, Commission/Italy, case C-60/05, ECR 2006, p.5083.

- **Strictly Supervised and Selective Basis**

3.5.48 Having regard to the fact that all derogations must in any case comply with the precise formal conditions of Article 9.2, the express reference in Article 9(1)(c) to "*under strictly supervised conditions and on a selective basis"* might be argued to be redundant. However, the context suggests that, by this express reference, the legislator intended a greater level of constraint than might otherwise arise.

3.5.49 The principle of strictly supervised conditions implies that any use of this type of derogation must involve clear authorisations that must be related to particular individuals, places, times and quantities. It also implies the need for a strong element of enforcement of such derogations to ensure compliance.

3.5.50 The principle of 'selectivity' is also essential. It means that the activity in question must be highly specific in its effect, targeting one species (or group of closely related species), or even one gender or age class of that species (e.g. mature males only), with the exception of all others.

3.5.51 It also implies that certain technical aspects of the method used can verifiably demonstrate selectivity. There is a need to come to a view on methods which of themselves are not entirely selective (e.g. use of certain nets) unless combined with the skills and experience of the operator, or by a combination of both. In case the method of taking results in specimens being killed, the selectivity method should be at a very high level. When birds are taken alive and may then be released unharmed, there is a need to ensure that fully verifiable safeguards apply. Furthermore, this type of derogation would also relate to Article 8 of the Directive, which refers to the need to avoid large-scale and non-selective capture and killing of bird species, particularly those involving the proscribed methods in Annex IV of the Birds Directive. In this regard Case C-79/03 is a good example[130].

3.5.52 The issue of selectivity also implies that full regard is given to minimising the risk of confusion and risk of disturbance to species that are not the subject of the derogation[131]. Taking these considerations into account is consistent with the requirement to strictly interpret the grounds invoked to justify derogations. It can be argued that such an approach has already been endorsed by the Court. On several occasions[132], the Court has stated that Article 9 derogations from the general system of protection must be applied appropriately in order to deal with precise requirements and specific situations. In addition, with regard to derogations aiming at the prevention of serious damage, which constitutes the third reason for derogation under 9(1)(a), the Court stated that "t*he fact that a*

[130] See in particular paragraphs 25-26 of the judgment of 9 December 2004 (Commission/Spain, case C-79/03, ECR 2004, p.11619). The Court compares the hunting by means of limed twigs to the hunting with guns.
[131] See section 2.6 of the guide.
[132] See judgments of: 8 July 1987, Commission/Belgium, case 247/85, ECR 1987, p.3029, paragraph 7; 8 July 1987, Commission/Italy, case 262/85, ECR 1987, p.3073, paragraph 7; judgment of 7 March 1996, Associazione Italiana per il WWF and others v Regione Veneto, case C-118/94, ECR 1996, p.1223, paragraph 21.

certain degree of damage is required for this derogation from the general system of protection accords with the degree of protection sought by the Directive"[133].

3.5.53 Case 252/85[134] is of assistance in examining the scope of the requirement concerning strictly supervised conditions and selectivity. The Court satisfied itself that the requirements had been met by France, which had stressed that the use of the limes and nets in question involved individual authorisations[135] and that there were strict territorial, temporal and personal controls in order to guarantee the selective nature of the capture.

3.5.54 Against this background, it would seem reasonable to propose that the phrases *"under strictly supervised conditions and on a selective basis"* should be understood to imply a system of individual authorisations (or narrow-category authorisations involving a high degree of accountability), and should imply strict territorial, temporal and personal controls.

3.6 Third Condition for Derogations: Satisfying Precise Formal Conditions Set Out in Article 9(2)

3.6.1 As has been noted at paragraph 3.3.2 above, the third condition that derogations must satisfy relates to compliance with the precise formal conditions set out in Article 9(2). In the words of the Court in Case C-118/94[136], these formal conditions "*are intended to limit derogations to what is strictly necessary and to enable the Commission to supervise them."*

TAKING ACCOUNT OF EACH OF THE FORMAL CONDITIONS

3.6.2 The case-law confirms the importance of taking account of each of the formal conditions in Article 9(2). This is illustrated by Case C-247/85, *Commission v Belgium*[137]. In that case, the Commission, in its fourth ground of complaint, had objected to Belgian legislation authorising certain persons to capture, kill, destroy or drive away house sparrows, tree sparrows and starlings and to destroy their eggs, nests and broods. The Court rejected a Belgian defence that the legislation complied with Article 9 *inter alia* noting: *"Furthermore, the derogations do not comply with the criteria and conditions of Article 9(2) in so far as they mention neither the circumstances of time and place in which they may be granted nor the controls which will be carried out."*

3.6.3 In relation to the derogations the following formal conditions need to be respected and specified in any licence granting derogations

[133] Judgment of 8 July 1987, Commission/Belgium, case 247/85, ECR 1987, p.3029, paragraph 56.
[134] Judgment of 27 April 1988, Commission/France, case 252/85, ECR 1988, p.2243.
[135] See judgment of 27 April 1988, Commission/France, case 252/85, ECR 1988, p.2243, paragraph 26.
[136] Judgment of 7 March 1996, Associazione Italiana per il WWF and others v Regione Veneto, case C-118/94, ECR 1996, p.1223.
[137] Judgment of 8 July 1987, Commission/Belgium, case 247/85, ECR 1987, p.3029.

The species, which are the subject to the derogations

3.6.4 The species concerned need to be clearly indicated. This generally implies identification at individual species level. However, there may be circumstances, which might provide for several similar species being covered by the same derogation.

The means, arrangements or methods authorised for capture or killing

3.6.5 These must clearly be specified and applications of the derogation restricted to them.

The conditions of risk and the circumstances of time and place under which such derogations may be granted

3.6.6 This should include details of the level of risk attached to the use of the method, (including how often it will be inspected etc.) as well as precise details on the timing and location of the derogation. Precautions to restrict the risk for other species may also be appropriate.

The authority empowered to declare that the required conditions obtain and to decide what means, arrangements or methods may be used, within the limits and by whom

3.6.7 Within each Member State certain designated authorities are responsible for issuing derogations. The exact terms should be set out in the relevant legislation for each country (or region thereof). For example, in the absence of alternative solutions, an airport authority may apply for a derogation to take several species of bird that are attempting to nest on the airfield because they are in danger of interfering with aircraft safety. The application is made to a derogation authority which then issues a derogation to the airport authority permitting specific activities and specifying the methods by which they can be carried out and the species involved.

3.6.8 Where the authority to grant derogations is given at sub-national levels (e.g. by regional administration) there is a need for a co-ordinating overview of the granting of derogations at Member State level to avoid the risk that the sum of the derogations may exceed permissible levels.

The controls which will be carried out

3.6.9 A derogation authorises acts that would otherwise be an offence under the legislation transposing the Birds Directive. Therefore, there needs to be compliance with certain specified conditions that are set out in the derogation. This must be underpinned by appropriate enforcement.

AUTHORISATIONS TO A GENERAL CATEGORY OF PERSON

3.6.10 A question which arises is whether, in relation to pest control derogations under Article 9(1)(a), it is possible to satisfy the formal conditions of Article

9(2) by way of general authorisations, i.e. authorisations not given to specific individuals but rather to a general category of authorised person such as landowners and their agents. While the reference to "strictly supervised conditions" in Article 9(1)(c) suggests that this is not possible for derogations based on that provision, the wording of Article 9(2) does not appear to preclude such general authorisations for derogations based on Article 9(1)(a).

3.6.11 Case 247/85, *Commission v Belgium*[138] is pertinent, again in relation to the Commission's fourth ground of complaint. The Court recalled that the wording of the Belgian legislation provided that: "*Occupants and hunting-right owners, their attorneys or sworn wardens and officials and servants of the water and forestry authorities shall be permitted to at any time to capture, kill, destroy or drive away the birds, as well as their eggs and broods, mentioned in Annex I to this decree."* In rejecting the Belgian defence that the legislation complied with Article 9, the Court was critical of the lack of justification for a general authorisation. The Court commented:
"If the three species specified in Annex I to the royal decrees cause serious damage to crops and orchards or are responsible for pollution and noise in towns or certain regions, Belgium is in principle authorised to provide for a derogation from the general system of protection provided for in Articles 5, 6 and 7.34. However, as was stated above, a derogation under Article 9 must, according to Article 9 (1), cover specific situations and, according to Article 9(2), comply with the requirements stated therein. The general derogations provided for in Articles 4 and 6 of the royal decrees do not comply with those criteria and conditions. The Belgian rules do not indicate the reasons regarding the protection of public health or the prevention of serious damage to crops or other fields mentioned in Article 9 (1) (a) of the Directive which might necessitate the granting to such a wide category of persons of a permanent derogation, applying throughout Belgium, from the protection provided for by the Directive ".

3.6.12 Assuming of course that the derogation covers all the aspects referred to in Article 9(2), the above passage from the judgement in Case 247/85 suggests that the reasons justifying the grant of a derogation to a wide category of person should be compelling and clearly specified in the derogation. With regard to derogations under Article 9(1) c it is also important to note the specific conditions that are mentioned in it.

3.7 Article 9.3 and 4

3.7.1 The reporting obligations on the use of derogations are laid down in Article 9.3 of the directive. This requires Member States to provide an annual report to the Commission on the implementation of Article 9. The Commission and the Member States, within the framework of the ORNIS Committee, have agreed a reporting period that covers the period from January to December. In order to allow a reasonable time for compiling national reports and it has also

[138] Judgment of 8 July 1987, Commission/Belgium, case 247/85, ECR 1987, p.3029.

been agreed with Member States that reports are forwarded to the Commission by September of the following year at the latest[139].

3.7.2 Article 9.3 does not define the precise content of the national reports. It is clear that the information must be factual and relate to cover the details of Article 9(1) and (2). A scheme has been agreed between the Commission and the Member States to provide information under the following headings:

- the reasons (9.1 a to c),
- the species concerned,
- in case of 9.1.c, the numbers of individuals concerned
- the means, arrangements or method authorised for capture or killing
- the conditions of risk and the circumstances of time and place under which such derogations may be granted
- the authority empowered and number of authorisations delivered
- the controls carried out.

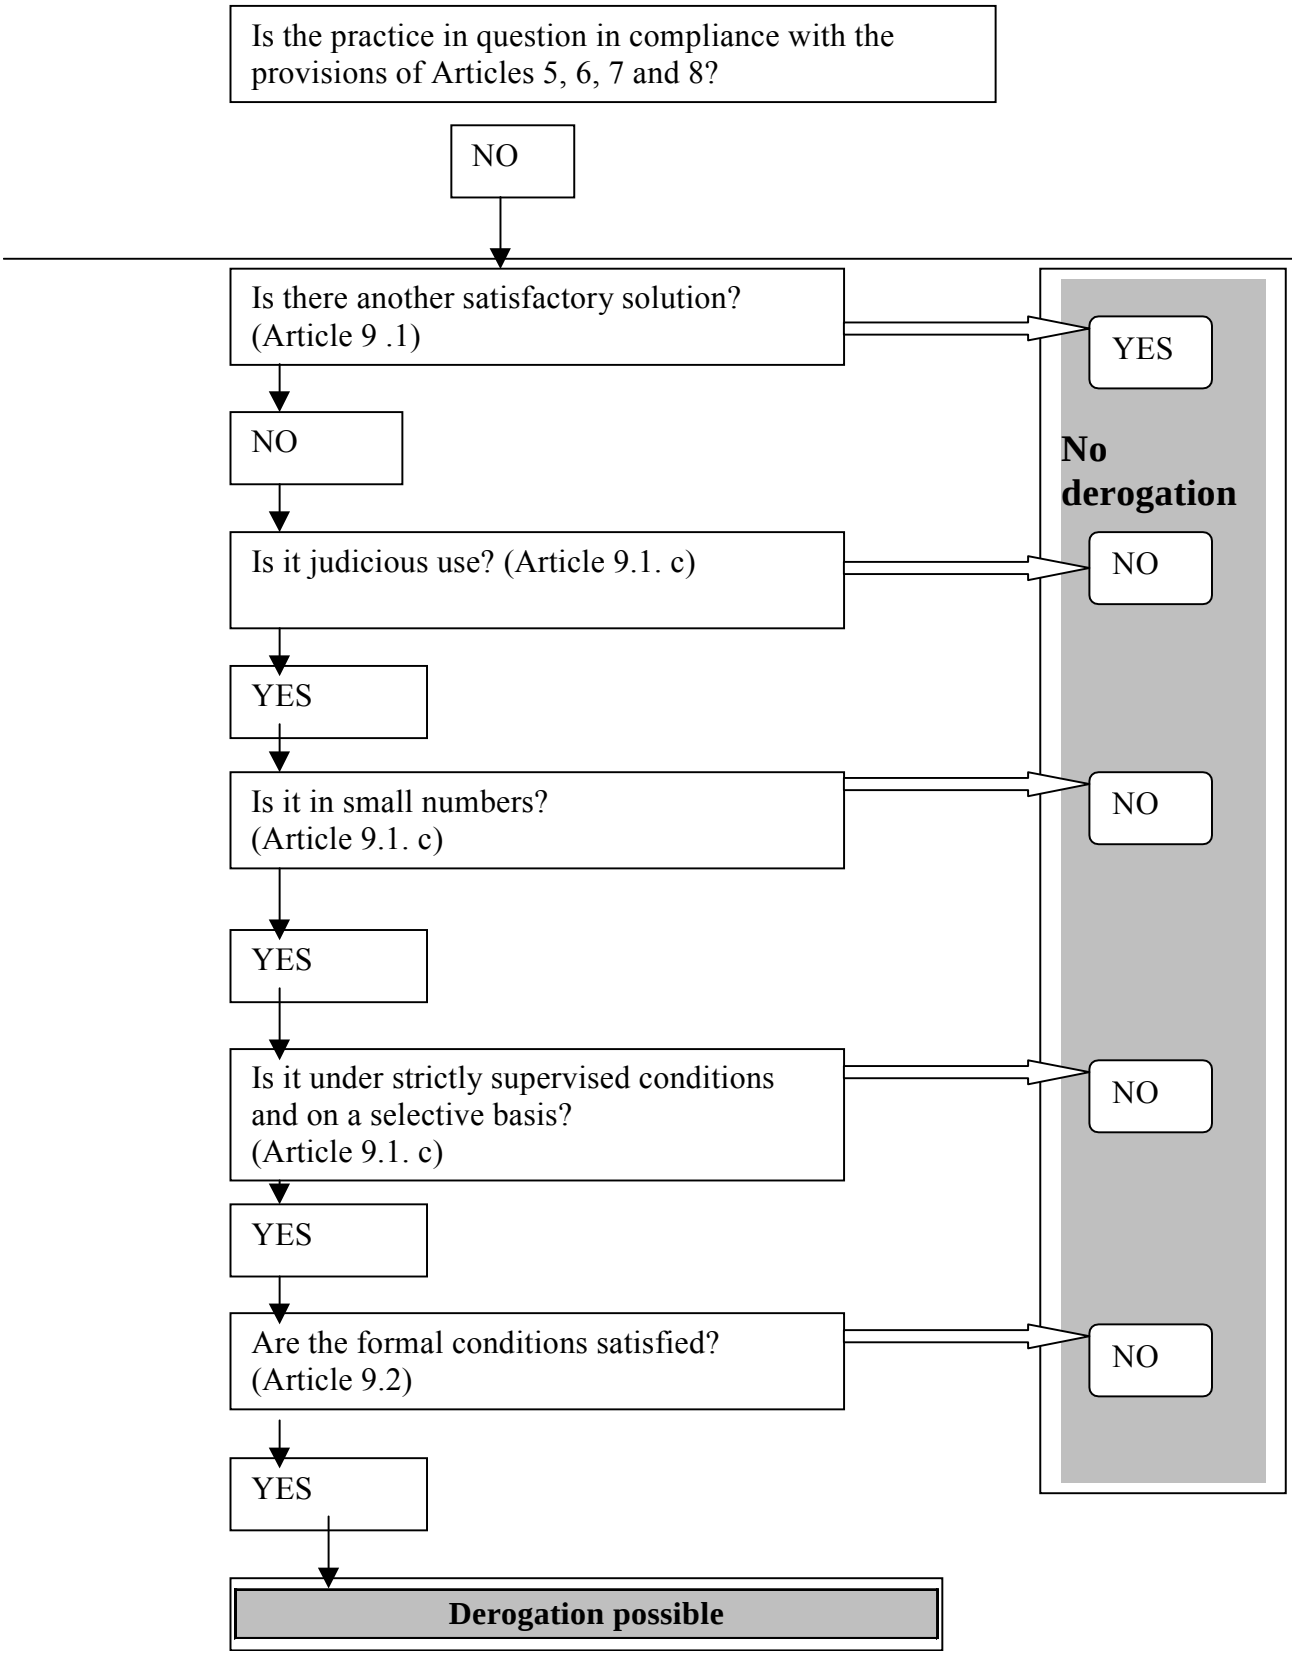
3.7.3 Also relevant is information on the region(s) concerned, as well as the period for which the licence is granted[140]. Where pertinent it should also indicate the number of individuals taken under a derogation. This is especially important in the context of derogations granted in the context of Article 9(1)c.

3.7.4 A derogation information system has been developed by the Joint Nature Conservation Committee in the United Kingdom to facilitate data entry for derogations in a standard format by different Member States.

3.7.5 On the basis of the information provided in the derogation reports, especially that relating to Article 9(3), the Commission is required under Article 9(4) to ensure that the use of derogations does not result in consequences that are incompatible with the Directive

3.7.6 The Commission evaluates the derogations reported in order to verify their compatibility with the directive. This involves an examination of the reported use of derogations under each of the different categories of derogations. This includes a determination for derogations granted under Article 9.1.c if the threshold of 'small numbers' is being exceeded, in cases where there may be concerns that this requirement is not being met.

3.7.7 In cases where the Commission concludes that the use of derogations is not in conformity with the requirements of the directive it retains the right to take legal action against the Member State concerned.



3.7.8 In accordance with its obligations under Article 9.2 of the Convention on the Conservation of European Wildlife and natural Habitats (Berne Convention) the Commission compiles a bi-annual report on the application of derogations

[139] In cases where there are serious delays of Member States in providing these annual reports the Commission can take legal action against the countries concerned under Article 226 of the Treaty.

[140] A derogation information system has been developed for the Commission by the Joint Nature Conservation Committee in the United Kingdom to facilitate data entry for derogations in a standard format by different Member States. This system is presently under revision/adaptation.

by Member States, on the basis of the national reports, which it sends to the Standing Committee of the Convention.

Summary of conditions to be fulfilled for a derogation to be granted under Article 9§1 under c) of the "Birds Directive"

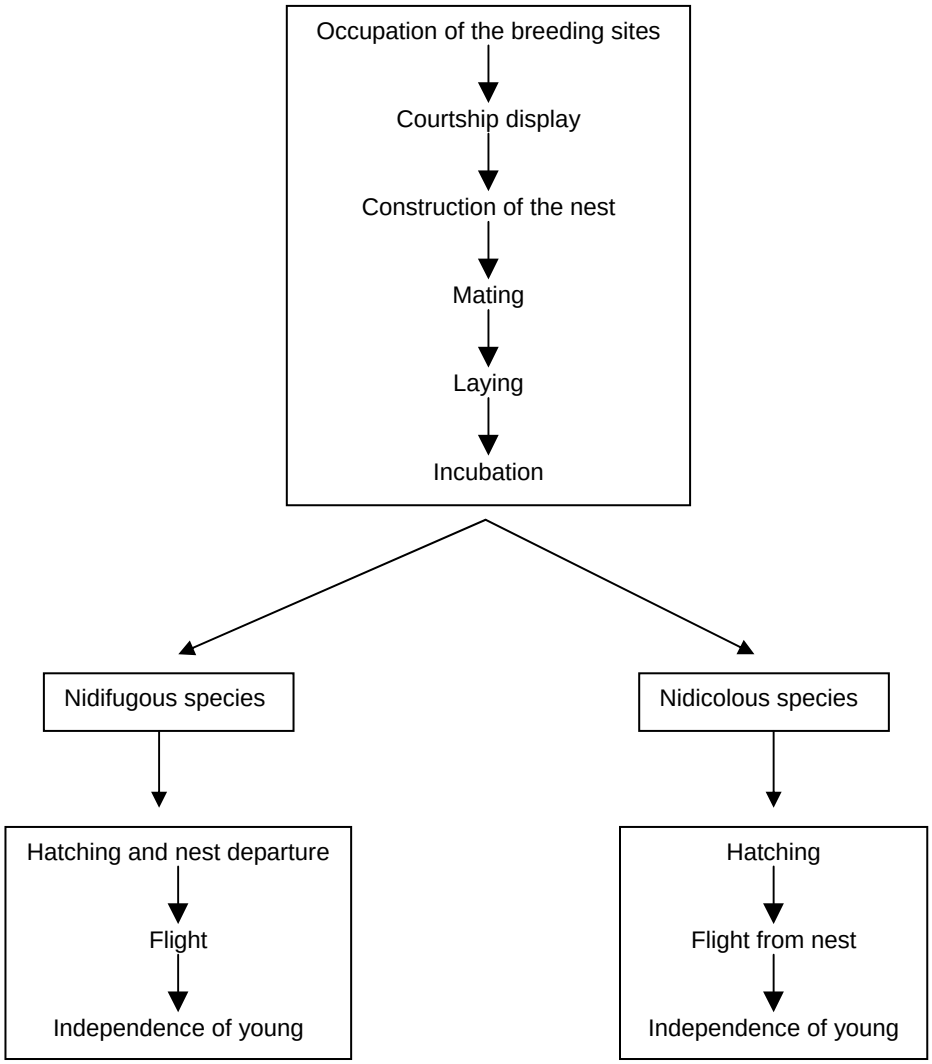

Figure 3: One possible scheme for categorisation of 'look-alike' huntable species

Groups of "look-alikes"	Confusable species in groups	Habitats types and others criteria to be considered	Countries for which species are listed in annex II	When problems most likely to occur if staggered opening or closing dates are used to extend hunting seasons
Grey geese	*Anser anser* *Anser fabalis* *Anser brachyrhynchus* *Anser albifrons*	In winter grasslands and arable lands Calls distinctive	All Member States except Greece, Ireland, Luxembourg, Netherlands and Portugal	End of the hunting period
Eclipse male Female and immature dabbling ducks	*Anas penelope* *Anas strepera* *Anas crecca* *Anas platyrhynchos* *Anas acuta* *Anas querquedula* *Anas clypeata*	Wetlands Calls often distinctive	All Member States	Beginning of the hunting period Mostly between July and September, when the males are in eclipse and immatures have not moulted yet
Eclipse male Female and immature diving ducks	*Aythya ferina* *Aythya fuligula* *Aythya marila* *(Netta rufina)* *(Bucephala clangula)*	Wetlands including Marine	All Member States At Sea, mostly Baltic Sea (Dk, SW, SF)	Beginning of the hunting period Mostly between July and September, when the males are in eclipse and immatures have not moulted yet End of the hunting period
Scoters (females and immatures)	*Melanitta nigra* *Melanitta fusca* *(Imature Somateria)* *(Immature Aythya marila)*	mainly marine	At Sea, mostly Baltic Sea (Dk, SW, SF)	Beginning and end of the hunting period
Female and imm. Mergus ducks	*Mergus merganser* *Mergus serrator*	Wetlands, including coastal areas	Fennoscandia (DK, SW, SF)	End of the hunting period
Female and immature *Lagopus* Grouse	*Lagopus lagopus scoticus* *Lagopus mutus*	Heathlands, uplands Species normally segregated altitudinally	United-Kingdom	Beginning and end of the hunting period
Female and immature *Tetrao* Grouse	*Tetrao urogallus* *Tetrao tetrix*	Woods, clearings, heathlands Pronounced size difference should normally facilitate identification	Tetrao in the Alps (AT, It) and Fennoscandia (SW, SF)	Beginning and end of the hunting period
Alectoris partridges	*Alectoris rufa* *Alectoris graeca* *Alectoris chuckar* *Alectoris barbara*	For A. graeca, A. barbara and A. cchukar dry rocky slopes For A. rufa and A. chukar (where introduced) arable lands, heaths, other farmlands and open lowland. .	Where overlaps in the distribution occur (South eastern France for rufa and graeca; Thraki for graeca and chuckar, southern Andalucia for barbara and rufa)	Beginning and end of the hunting period
Quail and young gamebirds	*Coturnix coturnix* Young *Perdix* or *Alectoris* (Young *Phasianus colchicus)*	Arable lands, farmlands.	Gr, Es, Fr, It, Pt	Beginning of the hunting period
Large plovers and Ruff	*Pluvialis squatarola* *Pluvialis apricaria* *Philomachus pugnax*	In autumn and winter P. squatarola mostly on mudflats or sea shores; P. apricaria mostly on arable land or meadows Calls and underwings are distinctive	Fr, Ie, UK, Pt	End of the hunting period for Pluvialis Beginning of the hunting period, August
Snipes	*Gallinago gallinago* *Lymnocryptes minimus*	Marshes and wet meadows	All Member States except Be, De, Lu, Nl, SF	Beginning and end of the hunting period
Godwits Curlews and Whimbrel	*Limosa limosa* *Limosa lapponica* *Numenius arquata* *Numenius phaeopus*	In autumn and winter on mudflats and seashores Heaths, open lowlands, wet meadows, mudflats Calls are distinctive	FR, UK, IE	Beginning and end of the hunting period
Large *Tringa* sandpipers	*Tringa erythropus* *Tringa totanus* *Tringa nebularia*	Seashores, mudflats Calls are distinctive	Fr	Beginning and end of the hunting period
Small gulls in immature and winter plumage	*Larus ridibundus* *Larus canus*		AT, FR, ES, SW, FI	Beginning and end of the hunting period
Large gulls immature plumages	*Larus fuscus* *Larus argentatus* *Larus cachinnans* *Larus marinus*	Nearly everywhere, except high mountains and wooded areas	Dk, De, Es, Sw, SF	Beginning and end of the hunting period
Columba pigeons and doves	*Columba livia* *Columba palumbus* *Columba oenas*	Wild C. livia in rocky habitats, domesticated form near human habitations	Where wild and feral C. livia occur together (Sp, Corsica, Pt,…)	Beginning and end of the hunting period

Groups of "look-alikes"	**Confusable species in groups**	**Habitats types and others criteria to be considered**	**Countries for which species are listed in annex II**	**When problems most likely to occur if staggered opening or closing dates are used to extend hunting seasons**
Streptopelia doves	*Streptopelia turtur* *Streptopelia decaocto*	Collared Dove is more prone to live in town and villages	At, De, Fr, It, Gr, Pt…	Beginning of the hunting period
Thrushes	*Turdus merula, female* *Turdus philomelos* *Turdus iliacus* *Turdus viscivorus* *Turdus pilaris*	Wide range of habitats Calls distinctive	Gr, Es, Fr, It, Pt Opening and closing dates are usually the same for all the species in the group, exept in Italy where T. viscivorus is protected	Beginning and end of the hunting period
Crows	*Corvus corone* *Corvus frugilegus* *(Corvus monedula)*	Wide range of habitats Calls often distinctive	DK, De, Gr, Es, Fr, Lu, Pt	Beginning and end of the hunting period

Figure 4: Questionnaire For Assessing Compatibility Of Staggered Hunting Seasons For Annex II Bird Species With Article 7§4 Of Directive 79/409/EEC

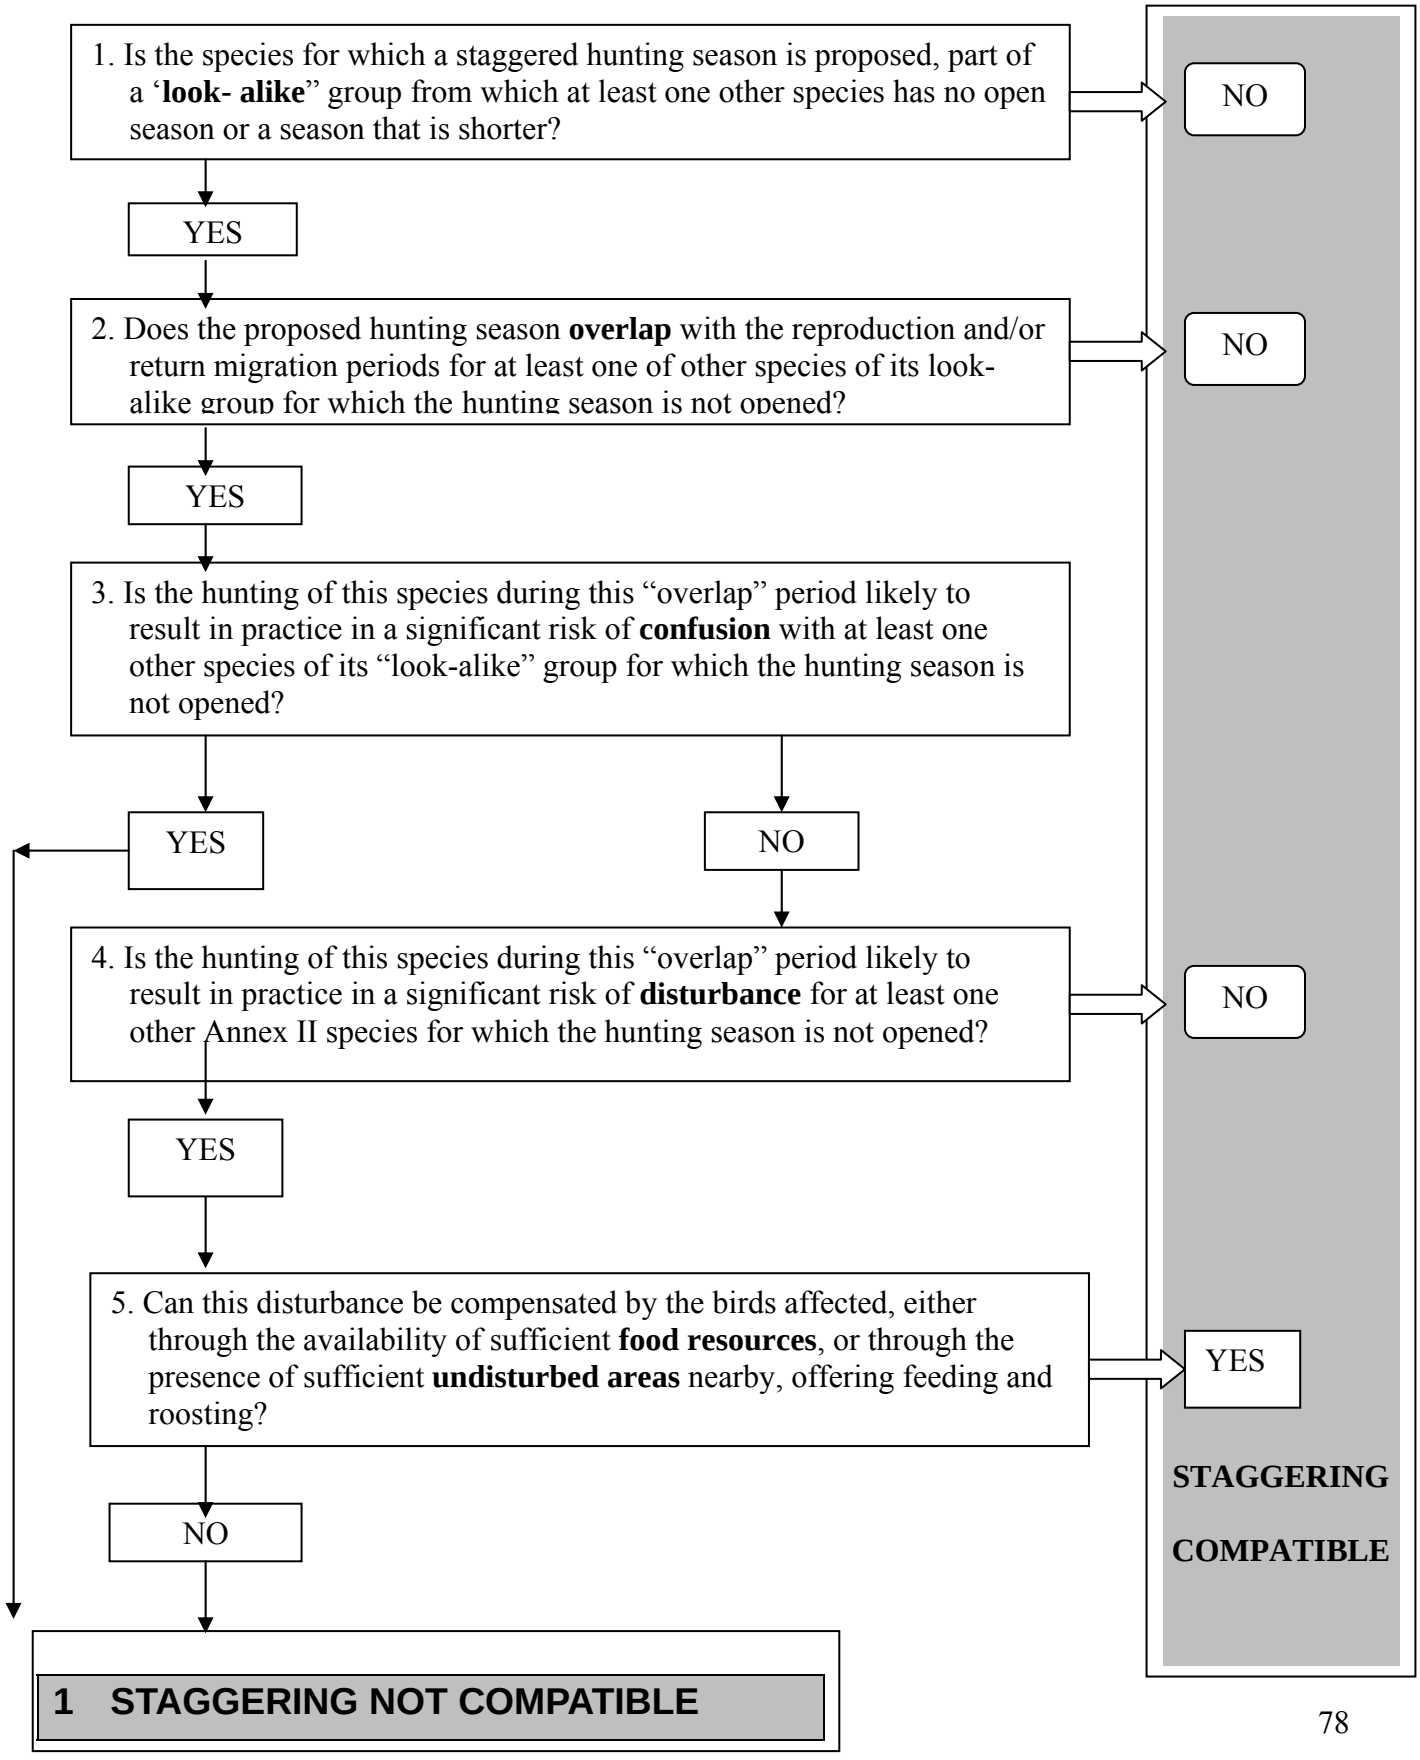

Figure 5: List of huntable species with a very favourable conservation status

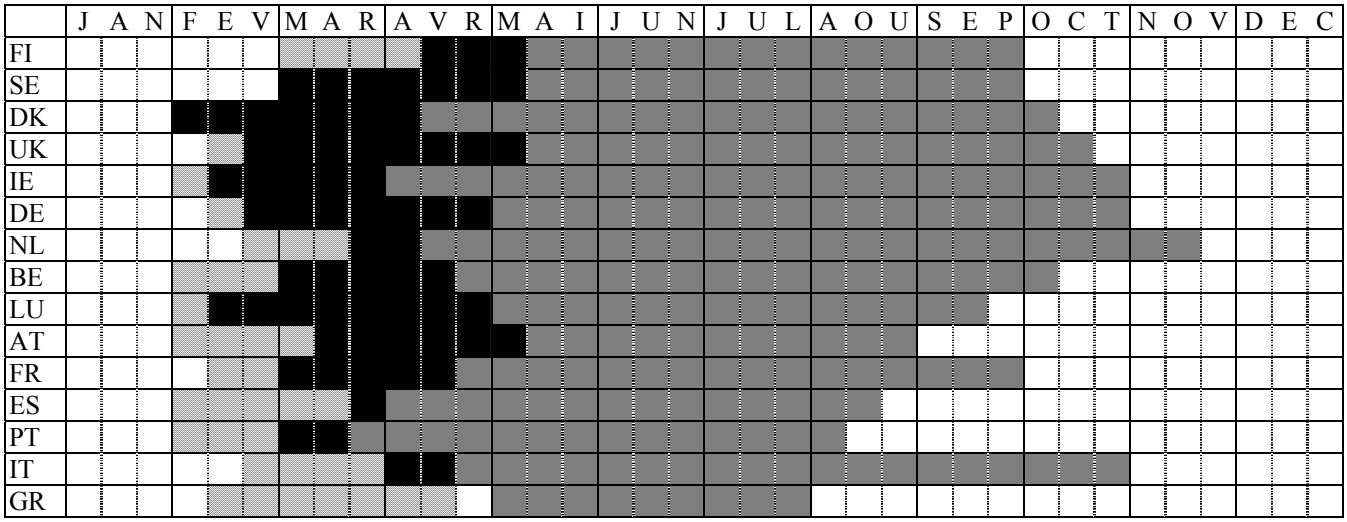
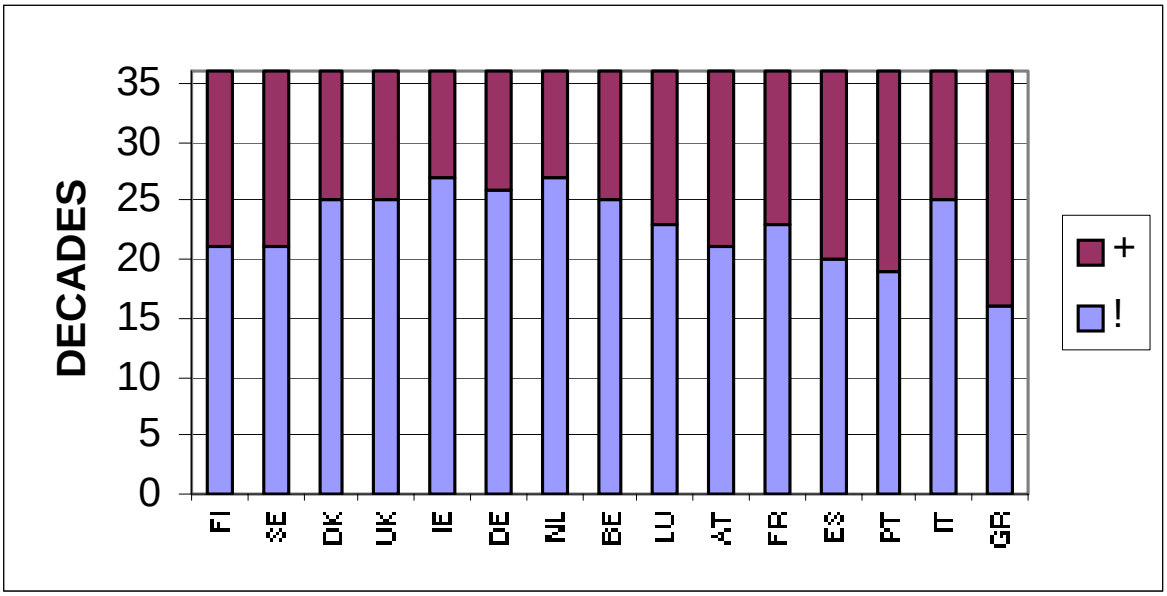


Criteria used to determine "very favourable status":

- SPEC 4 (Species whose global populations are concentrated in Europe - i.e. species with more than 50% of their global population or range in Europe – but which have a favourable conservation status in Europe) or NON SPEC species and Secure European Threat Status (SPEC = species of European conservation concern) [141],
- no important declines in the breeding or wintering populations (less than 10% of the national breeding populations declining more than 20% in size; less than 2% of the national breeding populations declining more than 50% in size; less than 10% of the national breeding populations declining more than 20% in range; less than 2% of the national breeding populations declining more than 50% in range; or less than 10% of the national wintering populations declining more than 20% in size; less than 2% of the national wintering populations declining more than 50% in size)
- very large population (> 1000000 pairs),



Species	Spec status	% of breeding population size declined by >20%	>50%	range declined by >20%	>50%	% of winter. pop. size declined by >20%	>50%
Anas platyrhynchos	Non Spec ;	9	0	7	0	1	1
Columba livia	Non Spec ;	1	0	0	0		
Columba palumbus	Spec 4	0	0	0	0		
Turdus pilaris	Spec 4	1	0	0	0		
Turdus iliacus	Spec 4	0	0	0	0		
Turdus viscivorus	Spec 4	5	0	4	0		
Garrulus glandarius	non Spec	0	0	0	0		
Pica pica	non Spec	0	0	0	0		
Corvus monedula	Spec 4	2	0	2	0		
Corvus frugilegus	Non Spec	1	0	0	0		
Corvus corone	Non Spec	0	0	0	0

! = breeding + pre-nuptial migration period

Figure 8: Some published mortality rates

Part 1: Annexe II.1 species

Species	**Mortality rate**
Anser fabalis	KVM No data (Anser brachyrhynchus: ad 26%; from 4 to 16 months 42% ; total of individuals >4 months old 21.5%) BWP No data
Anser anser	KVM Ad (Breeding IS) 23% ; Ad (Breeding DK) ca 33% BWP Icelandic population: mean annual mortality adults 23% (ringing), over 4 months old 22% (censuses), perhaps declining from 1960 to 1971; adult life expectancy 3.8 years (Boyd and Ogilvie 1972). Mean annual mortality of birds ringed Denmark as young and adults 33%; further life expectancy of full-grown young 2.3 years and of adults 2.6 years (Paludan 1973).
Branta canadensis	KVM Ad GB 22% BWP England: mean annual mortality of adults 22%; life expectancy 3.9 years (Boyd 1962)
Anas penelope	KVM Adults ringed birds: 47% BWP Mean annual mortality adults ringed north-west Europe 47%; life expectancy 1.6 years (Boyd 1962).
Anas strepera	KVM No data BWP No data
Anas crecca	KVM Ad from 47 to 60%; birds from first year with mortality rate higher than adults BWP Annual mortality. Britain 1949–55, male 49%, female 57%; Pembrokeshire, Wales, both sexes, 64% in 1934–8, 49% in 1945–8, 65% in 1949–53, but in war years 1941–5 only 39%; about three-fifths of male losses and half of female probably attributable to man (Boyd 1957a). For both sexes, 55% France, 58% Italy and Spain; in both areas, mortality of 1st-year birds higher than that for 1–2 year olds; for 1–2 year olds, mortality Europe 47%, USSR 51% (Tamisier 1972c).
Anas plathyrhynchos	KVM CH, recoveries of adult ringed birds: 58% captive bred, 52% wild birds; DK captive bred 1st year 90.6%, following years 55% (with high hunting pressure) NW Eur Ad: 48% SF first year 64%, following years 55% S 76% to 64% BWP From ringing in north-west Europe, mean annual mortality adults 48%, life expectancy 1.6 years (Boyd 1962). Finland: mortality 64% first year, 55% in succeeding years (Grenquist 1970). Sweden: mortality 76% juveniles, 64%. adults (Curry-Lindahl et al. 1970).
Anas acuta	KVM No data BWP Mean annual adult mortality, based on USSR recoveries, 48% (Boyd 1962).
Anas querquedula	KVM No data BWP No data
Anas clypeata	KVM GB Ad 44% BWP Mean annual mortality adults ringed Britain 44%; life expectancy 1.8 years (Boyd 1962).
Aythya ferina	KVM No data BWP No data
Aythya fuligula	KVM Ad varies between 20-25% and 46% BWP Mean annual mortality adults ringed northwest Europe 46%, life expectancy 1.7 years (Boyd 1962).
Lagopus l. scoticus	BWP Scotland: annual mortality c. 65% (Jenkins et al. 1967; A Watson).
Lagopus mutus	KVM No data BWP No data
Alectoris graeca	KVM No data BWP No data
Alectoris rufa	KVM No data BWP No data
Perdix perdix	KVM Dk 84%; CS 80-82% BWP Surveys of data from many areas show mean population levels determined by density dependent factors, above all nest predation. Proportion of September population shot closely related to density where shooting formalized, now varying from 20 to 30% annually. Winter losses in Britain, excluding shooting, currently c. 45%, with little annual variation; not related to density and considerable evidence that weather conditions not important. Winter losses and spring dispersal of pairs contribute little to variation in mean breeding densities (G R Potts). Annual mortality rates of reared and released Danish birds after 1 April of 2nd calendar year 84.0 ± 2.8%, compared with 80.2 ± 3.8% for birds released Italy and 82.1 ± 7.2% for birds released Czechoslovakia (Paludan 1963). In Poland, mortality in 12 months after 1 September of year of birth 77.6% and 56% in following years (Olech 1971)

Species	**Mortality rate**
Phasianus colchicus	KVM Dk first year 84%, following years 58% (high pressure of hunting) BWP No information on wild populations. Many studies on managed populations in Europe and North America show high mortality, especially in males and 1st year birds e.g. in Denmark mean annual mortality of males 78.1%, of females 62.3%, and for all birds mortality 81.4% in 1st year of life and 58.4% in succeeding years (Paludan 1959a).
Fulica atra	KVM First year 76-87%; 2nd year 48-72%; NL First year 79%; following years 25%; found dead 1st year 32%; following years 22% BWP Mortality in 1st year of life in various samples from north-west Europe between 76% and 87%, and in 2nd year between 48% and 72%; probably lower limits nearer true position (Glutz et al. 1973). Recoveries of 686 birds ringed Switzerland in winter: 371 in calendar year of ringing, 125 in 2nd year, 83 in 3rd, 51 in 4th, 19 in 5th, and 36 in 6th year and after (Glutz 1964). Annual survival mortality rates of pulli ringed Netherlands, 1934–73: shot birds (sample 93) ¾2179% 1st year, 7525% later years; found dead (sample 138)¾68) 32% 1st year, 7822% later years (Cavé 1977).
Lymnocryptes minimus	KVM No data BWP Limited data suggested annual mortality of 76%, but almost certainly too high (Boyd 1962).
Gallinago gallinago	KVM B 52-57%; Dk 47%; GB 52%; BWP Annual mortality from weighted mean of various samples 51.9 ± 5.43%, no detectable differences between rates in 1st year after fledging and later years (Boyd 1962). Belgium: mean annual mortality for birds shot 56.7% compared with 52.0% for those found dead; hunting mortality declined after 1st year (Dhondt and Van Hecke 1977). West Germany: mortality in 1st year 65 % (Glutz von Blotzheim *et al*. 1977). Denmark: mean annual adult mortality 47.1 ± 2.80 (Fog 1978). Finland: mean annual mortality 46.9% (Pertunnen 1980c).
Scolopax rusticola	KVM 1st year 55-65%; following years 40-50%.higher for fennoscandinavian populations. BWP Britain: annual mortality 54% in 1st year, 39% in succeeding years, 1 August–31 July (Kalchreuter 1975); earlier estimates (Lack 1943, Boyd 1962) gave 56% and 55% for 1st years, and 37% and 40.7% respectivelyin succeeding years, with annual adult mortality markedly higher in 1931–40 than in 1921–30, reasons unknown (Boyd 1962). Norway and Sweden; annual mortality 67% in 1st year, 52% in succeeding years (Kalchreuter 1979); Finland and Baltic 72% and 54% respectively (Kalchreuter 1975). Finland: mortality in 1st year 61.7%, 48.4% in succeeding years (Pertunnen 1980a). Fenno-Scandia: 65.6% in 1st year, 50.6% in succeeding years (Clausager 1974). Netherlands: annual adult mortality 50.0% (Clausager 1974).
Columba livia (1)	KVM No data BWP England (Salford): mortality in 1st year of life 43 ± 7.3%, annual adult mortality 33.5 ± 4.9% (Murton et al. 1972b). England (Flamborough Head): annual adult mortality from shot sample c. 30% (Murton and Clarke 1968).
Columba palumbus	KVM GB 35-41%, juv 60-70%; Dk juv 54.3%; Ad 41.3%; NL ca 46% BWP Britain: juvenile mortality c. 74%, annual adult mortality c. 36% (Murton 1965b). Netherlands: 1911–53 (when no bounty paid for shooting) 1st-year mortality 49%, annual adult mortality 50%; 1959–62 (bounty) 1st-year 55%, adult 61% (Doude van Troostwijk 1964a); 1911–81 1st-year and adult both 46% (Glutz and Bauer 1980). Denmark: 1st-year mortality 54.7%, adult mortality 41.3% (Søndergaard 1983). Finland: 1st-year mortality 41.7%, 2nd-year mortality 47.6%, mortality in later years 30.5% (Saari 1979b)

(1) the populations quoted here are wild populations of *Columba livia* and not the populations from domestic pigeons.

Part 2: Annexe II.2 species

Species	Mortality rate
Cygnus olor	KVM GB 1st year: 58%; 2nd and 3rd years: 30%; 4 th and 5th years 22% (Coleman & Minton 1980); ca 30% after 1 year; 30% 2nd year; 25% 3 rd and 4th year (Bacon 1980). BWP Britain: annual mortality 3–12 months 32.1%, 1–2 years 35.4%, 2–3 years and 3–4 years 25.0%, breeders over 4 years 18–20%; life expectancy at 4 years 4•8 years (Beer and Ogilvie 1972). Denmark: annual mortality 26% (Bloch 1971). Sweden: annual mortality 1965–70, 28.5%, but only 21.0% at most if severe winter of 1969–70 excluded (Mathiasson 1973a).
Anser brachyrhynchus	KVM ad 26%; from 4 to 16 months 42% ; total of individuals > 4 months old 21.5% BWP Mean annual mortality of adults 26%, and of 4–16 months old 42% (from ringing). Mean annual mortality of all over 4 months 21.5% (from censuses), with evidence of decline in rate 1950–72 (Boyd and Ogilvie 1969).
Anser albifrons[142]	KVM KVM *A. a. albifrons* : > 1an 30.9%; *Anser a. flavirostris*: 34% BWP A. a. albifrons: mean annual mortality (birds wintering Britain) 28% birds wintering Netherlands, 30.9% (Doude van Troostwijk 1974) A. a. flavirostris: mean annual mortality 34%;
Branta bernicla	KVM Ad GB 17%, positively correlated with reproduction BWP Mean adult annual mortality of B. b. bernicla wintering Britain 14%, and B. b. hrota from Spitsbergen 17% (Boyd 1962).
Netta rufina	KVM No data BWP No data
Aythya marila	KVM No data BWP Mean annual mortality adults ringed Iceland 52% (Boyd 1962).
Somateria mollisima	KVM Ad 20-40% BWP Netherlands: annual mortality of birds ringed as fledglings 1965–70 averaged 17%; femelle annual mortality ranged from 15%–61% in 1964—68 reflecting poisoning by chlorinated hydrocarbons, and 2%–8% from 1969–71 after control measures (Swennen 1972). Denmark: annual mortality 20% (Paludan 1962). Adults ringed north-west Europe: mean annual mortality 39%, life expectancy 2.1 years (Boyd 1962)
Clangula hyemalis	KVM No data BWP Mean annual mortality of adults ringed Iceland 28%; life expectancy 3.1 years (Boyd 1962).
Melanitta nigra	KVM No data BWP Birds ringed Iceland: mean annual mortality of adults 23%; life expectancy 3.8 years (Boyd 1962)
Melanitta fusca	KVM No data BWP No data
Bucephala clangula	KVM Nesting female: 37% BWP Annual mortality (breeding femelle) Sweden: c. 37%; life expectancy ca 3 years (adult life expectancy ca 2 years, Nilsson 1971).
Mergus serrator	KVM No data BWP No data
Mergus merganser	KVM No data BWP Adult mean annual mortality 40%, life expectancy 2.0 years (Boyd 1962).
Bonasa bonasia	KVM No data BWP No data
Lagopus l . lagopus	KVM No data BWP USSR: 60–86% for adults and 90–95% for 1st-year birds (in years 1971–5 when lemming *Lemmus lemmus* scarce on Bolshezemolsk tundra, predatory pressures led to high mortality of (Vorgnin 1976)). (for *Lagopus lagopus scoticus* in Scotland : annual mortality ca 65% (Jenkins *et al*. 1967).No data for EU
Tetrao tetrix[143]	KVM SF imm. first winter 64% ; Ad population stable 47% BWP In Finland, mean annual adult mortality probably varies from 40% to 60%, with annual and local fluctuations (Helminen 1963).

[142] These mortality rates are considered too high for *Anser albifrons flavirostris*. Most recent analyses for this sub-species give first year mortality of 32.2% and adult mortality of 21.5% (Fox, A.D. & Stroud, D.A. 2002. *Anser albifrons flavirostris* Greenland White Fronted Goose. BWP Update. In press).

[143] According to long term data the first winter mortality rate (September to the following spring) of Capercaillie *Tetrao urogallus* is 76% and of Black Grouse *Tetrao tetrix* is 64%. In stable populations the annual mortality rates of adult Capercaillie and Black Grouse are 29% and 47% respectively. Both species present sex-related differences in juvenile mortality. Linden, H. 1981 Estimation of juvenile mortality in the Capercaillie *Tetrao urogallus* and the Black Grouse *Tetrao tetrix*, from indirect evidence. Finnish Game Research 39 : 35-51.

Species	Mortality rate
Tetrao urogallus	KVM USSR Ad ca 54-59%; SF 30% BWP USSR: in 2 areas survival mortality from hatching to 1 September 48 52 % for males and 59 41 % for females; in following year rates 46 54 % and 33 67 % and in subsequent years 59 41 % and 54 46 % respectively (Semenov-Tyan-Schanskii 1959).
Alectoris barbara	KVM No data BWP No data
Alectoris chukar	KVM No data BWP No data
Coturnix coturnix	KVM No data BWP No data
Meleagris gallopavo	KVM No data BWP No data
Rallus aquaticus	KVM No data BWP No data
Gallinula chloropus	KVM Data from ringing (recoveries) 1st year 69% BWP Of 90 ringed West Germany, 69% died in 1st year of life and 23% in 2nd year (Glutz et al. 1973).
Haematopus ostralegus	KVM GB from fledging to sexual maturity total mortality rate of 74-80%; imm 40%; BWP Netherlands: mean mortality in first year after fledging 36 %; from 1 to 15 years old 15.9% annually (Boyd 1962). Mortality from hatching to I month after fledging, Wales, 84 % (Harris 1969). Mortality from fledging to sexual maturity 74 % and 80 % calculated from Harris (Harris 1969, Harris 1970 respectively) (Glutz et al. 1975); mean annual mortality of immatures c. 40 % (Harris 1967). West Germany: mean mortality from fledging to average age (5–6 years) when first caught breeding c. 62 %; survival mortality rate of breeding birds 1949–63 constant for all age-groups at c. 94 6 % (Schnakenwinkel 1970); in Wales, 1963–8, survival mortality rate of breeding birds 872-13–98 % (Harris 1970b).
Pluvialis apricaria	KVM GB 1st winter 41%, following winters 22% (Parr 1980); NL recoveries of rings 1st year 53%; following years 39%. BWP Netherlands: 123 recoveries of autumn-ringed full-grown birds showed 53% died in 1st year after ringing, thereafter 39.0 ± 5.42% annually. Iceland: 31 recoveries of nestlings and juveniles indicated mortality 66% in 1st calendar year and 46.5 ± 10.3% annually thereafter (Boyd 1962). Scotland: adult mortality c. 22% (Parr 1980).
Pluvialis squatarola	KVM No data BWP No data
Vanellus vanellus	KVM 1st year (from 1 August to 31 March) GB 38%; Central Europe 40%; Scandinavia 40%, Dk 44%; following years GB 32%; Central Europe 29%; Scandinavia 33%, Dk 33%; varies from 30 to 36% between 2nd and 11th year, after that ca 43%. BWP Europe. Mortality of young from 31 August to following 31 March (thus excluding high mortality in early weeks) 39.7%, varying from 30.4% to 57.5% for birds ringed in different countries, with 37.5% in Britain and Ireland, 40.1% in central Europe, and 40.4% in Scandinavia. Thereafter, annual mortality 32.2% (33.9% Britain and Ireland, 29.4% central Europe, 33.1% Scandinavia). For further details and discussion, see Glutz et al. (Glutz et al. 1975).
Calidris canutus	KVM No data BWP Average annual adult mortality 32.4±3.18% (Boyd 1962)
Philomachus pugnax	KVM various sources (ring) 47% BWP Annual mortality 47.6 ± 3.61%, with little difference between 1st and later years; possibly sex difference not significant (Boyd 1962)
Limosa limosa	KVM NL 1st year 38%; 2nd year 32%; 3rd and following years 37% BWP Netherlands: annual mortality in 1st year (to 15 May) 37.6%, in 2nd year 32%, and in later years average 36.9% (Glutz et al. 1977).
Limosa lapponica	KVM No data BWP Annual mortality rate 29.5 ± 7.9%, but apparently c. 79% in ‚1st calendar year after ringing' (Boyd 1962).
Numenius phaeopus	KVM No data BWP According to small sample (13) annual mortality 30.8 ± 9.1% (Boyd 1962).
Numenius arquata	KVM GB 1st year (after fledging) 53%; 2nd year 37% following years 26% NL 1st year (ringed as pulli) 66%; 2st to 4th year 28%; SF 64% up to 31.12 of first year; 55% following years BWP Britain: mean annual mortality (n = 287) 53.0% in 1st year from fledging, 37.0% in 2nd year and 26.4%, subsequently (Bainbridge and Minton 1978). Netherlands: mean annual mortality (n = 137) in 1st year after ringing as pulli 66.4% and c. 28% for 2nd-4th years (Glutz et al. 1977). Finland: mean annual mortality (n = 245) 64% up to 31 December after ringing as pulli, and 55% in later years (Grenquist 1965).
Tringa erythropus	KVM No data BWP No data

Species	Mortality rate
Tringa totanus	KVM im 1st year >50%; following years 20-30% BWP Mortality in 1st year after fledging 55%; calculated adult mortality varied widely in various samples from 17.7% to 56.9%, probably affected by ring loss, with best estimate probably from Swedish sample (55) at 31.5% (Boyd 1962). In German colony, calculated adult mortality 28.7% in 1st year after ringing, decreasing with age in successive years (30%, 20%, and 18%), but this based on return of adults to colony, so perhaps due to increasing nest-site loyalty with age (Grosskopf 1959; Boyd 1962).
Tringa nebularia	KVM No data BWP No data
Larus ridibundus	KVM juveniles mortality 56% (surviving after fledging at the end of 1st year: 44%) Adult ca 15 to 40 % BWP Britain and Ireland: mean mortality 1945–72, 38.3% in first 6 months, 27.5% in 2nd calendar year, and c. 24% thereafter; in north-west England 1908–24 mortality much higher (c. 60% in first 6 months) due to shooting (Flegg and Cox 1975). Camargue (France): mean annual adult mortality decreased to 16% during period of expansion, largely due to exploitation of new food sources in winter (Lebreton and Isenmann 1976).
Larus cachinnans	KVM No data BWP No data
Larus canus	KVM Estonia 1st year 54%; 2nd year 25%, following years 26%; SF 29%; Former Eastern Germany 16%; NW 15%; Dk 26% and GB 34% BWP Average annual mortality of 347 birds over 2 years old ringed Denmark, 26.0% (Sørensen 1977). Average annual adult mortality, Estonia, c. 15% (Onno 1968b).
Larus fuscus	KVM No data BWP No data
Larus argentatus	KVM Ad ca 10% BWP Considerable variations in published estimates for Europe and North America. Mortality in 1st year of life: Britain 17% (Chabrzyk and Coulson 1978), 30% (Brown 1967b), 18% (Harris 1970a); Denmark 22% (Paludan 1951); North America 38–62% (Paynter 1966), 27-32% (Kadlec and Drury 1968). Mortality in 2nd year of life: Britain 7.3% (Chabrzyk and Coulson 1978). Adult mortality: Britain 6.5% (Chabrzyk and Coulson 1978), 10% (Parsons 1971a), 10% (Harris 1970a); West Germany 10% (Drost et al. 1961); Denmark 15% (Paludan 1951); North America 4–9% (Kadlec and Drury 1968), but 15–20% suggested by subsequent studies (Kadlec 1976).
Larus marinus	KVM No data BWP No data
Columba oenas	KVM 50% ; GB 44-61% BWP Britain: 1st-year mortality ca 60%, adult mortality ca 46.3%, but lower in late 1950s and early 1960s (R J O'Connor and C J Mead). Finland: 1st-year mortality 57.5%, adult mortality 44.5% (Saari 1979b)
Streptopelia decaocto	KVM GB 1st year ca 69%; following years 39%; D 50-75% and 35-55% BWP England: juvenile mortality 69% annual adult mortality 39% (Coombs et al. 1981). Sweden: annual mortality 29% (Bentz 1982). Central Europe: mortality in 1st year of life 50–75%, annual adult mortality 35–55% (Glutz and Bauer 1980).
Streptopelia turtur	KVM GB juv 64%; adult ca 50% BWP Britain: estimated 1st-year mortality c. 64%, annual adult mortality c. 50% (Murton 1968).
Alauda arvensis	KVM Ad. 30-35%, majority in winter BWP England: average annual adult mortality 33.5%; average mortality of young during 1st year after independence 38% (Delius 1965).

Species	Mortality rate
Turdus merula	KVM from ringed birds: 1st year 69%; following years 40-52% BWP Britain: annual mortality 58% in 1st year (from 1 August), 38% in 2nd, 50% in 3rd, 40% in 4th and 5th (Lack 1943); annual mortality 54% in 1st year of life (from 1 August), 40% in 2nd (Lack 1946b); annual mortality after end of 1st calendar year 44±1.5%, irrespective of age, with no significant sex difference; possibly lower in north; varied annually from 34% in 1933–4 to 69% in 1928–9 (Coulson 1961); at Oxford, annual juvenile mortality 59% (Snow 1958b); annual mortality decreased from c. 50% in 1951–2 to c. 32% in 1960–1, apparently not due to weather (Snow 1966b); annual adult mortality in London 41.8±1.0%, in rural southern England 34.9±0.5% (Batten 1973); mortality highest March–June; traffic and predation by cats have played progressively bigger role in mortality (Batten 1978); annual adult mortality 41% in males, 60% in females (Naylor 1978). Belgium: annual adult mortality 69% (Verheyen 1958); annual adult mortality 52.2±2.3%, or 45.8±2.5% excluding those shot or otherwise killed by man; annual juvenile mortality 12.4±1.9% (Van Steenbergen 1971). France: annual urban mortality 25% in males, 33% in females (Ribaut 1964). West Germany: annual mortality 49%, for urban birds 28% (Erz 1964). Finland: annual overall mortality 58–59% (Haukioja 1969). Czechoslovakia: mortality in 1st year of life 68.4%, in 2nd year 56.3%, in 3rd year 30% (Beklová 1972); mortality in 1st year 72% (Havlín 1961).
Turdus pilaris	KVM N ca 53% (higherr for birds of the first year); SF ca 65%; CH ca 69% BWP Switzerland: annual mortality 60–70%, independent of age (Furrer 1977). Finland: annual overall mortality 61–65% (Haukioja 1969).
Turdus philomelos	KVM CS 1st year 58%; following years 44%; F respectively 59% and 46%; BWP Britain: mortality in 1st year of life (from 1 August) 53%, in 2nd year 40% (Lack 1946b). Finland: annual overall mortality 54% (Haukioja 1969).
Turdus iliacus	KVM adult ca 50% BWP Finland: annual overall mortality 57–58% (Haukioja 1969).
Turdus viscivorus	KVM GB Ad 48% BWP Britain: annual adult mortality 48%; mortality of fledged young to end of 1st calendar year 62% (Snow 1969a).
Sturnus vulgaris	KVM recoveries of rings in Europe 1st year 60-73%; following years 50-68% BWP Britain: mortality in 1st year of life (from 1 August) 48%, in 2nd year 48% (Lack 1946); annual mortality 52.8% ±1•0% (Coulson 1960). Finland: annual mortality 46% ± 4.4% (Haukioja 1969). Czechoslovakia: mortality in 1st year 68.1%, in 9th year, 22.2%, in 10th year 14.2% (Beklová 1972).
Garrulus glandarius	KVM from recoveries of rings 1st year 61% BWP Britain: mortality in 1st calendar year 40%, in 2nd year 55%, and in 3rd–5th years 41% (Holyoak 1971). Europe: mortality in 1st year of life 60.7% (Busse 1969).
Pica pica	KVM Eur from recoveries of rings 1st year 69% GB male adult 25%, female adult 40%... BWP Britain and Finland: mortality in 1st calendar year 46%, in 2nd year 58%, in 3rd–5th years 55% (Holyoak 1971). Urban population, Britain: mortality in 1st year after leaving nest 44%, in successive years 30%, 24%, 32%, 46%, and 86% (Tatner 1986). Finland: annual mortality based on all recoveries 61 ± 4.3%, probably too high; for breeding birds 47 ±7.9% probably a good estimate (Haukioja 1969). Europe: mortality in 1st year of life 69.0% (Busse 1969).
Corvus monedula	KVM from recoveries of rings 1st year 46% BWP Britain: mortality in 1st calendar year 38%, in 2nd year 36%, in 3rd–5th years 43% (Holyoak 1971). Finland: annual mortality 35 ± SE 3•2% (Haukioja 1969). Europe: mortality in 1st year of life 45.5% (Busse 1969).
Corvus frugilegus	KVM from recoveries of rings 1st year 54% BWP Britain: mortality in 1st calendar year 59%, in 2nd year 51%, in 3rd–5th years 25% (Holyoak 1971). Europe: mortality in 1st year 54% (Busse 1969).
Corvus corone	KVM from recoveries of rings 1st year 62% BWP Britain and Finland: mortality in 1st calendar year 61%, 2nd year 45%, 3rd-5th years 48% (Holyoak 1971). Finland: annual mortality 47 ±2.3% (Haukioja 1969). Europe: mortality in 1st year of life 62.4% (Busse 1969)

Legend:

KVM = Kompendium der Vögel Mitteleuropas (Bezzel E. 1985. Kompendium der Vögel Mitteleuropas - Nonpasseriformes Nichtsingvögel. AULA-Verlag Gmbh, Wiesbaden & Bezzel E.

1993. Kompendium der Vögel Mitteleuropas - Passeres Singvögel. AULA-Verlag Gmbh, Wiesbaden
BWP = Birds of the Western Palearctic (Cramp S. & C M Perrins (eds). 1973-1994. Handbook of the birds of the Western Palearctic Vol 1, 2, 3, 4, 5 & 8. Oxford University Press, Oxford.)

Figure 9: Example of calculation of small number for the Water Rail (*Rallus aquaticus*), species for which no mortality data is published.

European population of *Rallus aquaticus* 130,000 pairs = 260,000 birds (from The EBCC ATLAS of European Breeding Birds)

a) adult mortality rate 25% [144]➔survival rate = 75% survival of the adults = 195,000 birds after one year

- necessary recruitment (in the hypothesis of population stability) = 65,000 birds
- young birds mortality 50% [145]➔there must be 130,000 young birds in autumn ➔on average 1 young by pair/female
- uptake is carried out therefore on (260,000 + 130,000) 390,000 birds, the mortality of which is of ca 33.33%
- 130,000 birds die, 1% of that = 1,300 birds
- 1,300 birds can be regarded as a small number (at the level of the continent)

b) if the adult mortality rate 60% [146]➔average survival rate = 40% = 104,000 birds after one year

- necessary recruitment (in the hypothesis of population stability) = 156,000 birds
- young birds mortality 6050% ➔there must be 312,000 youngs in autumn ➔on average 2.4 young by pair/female
- uptake is carried out therefore on (260,000 + 312,000) 572,000 birds, the average mortality of which is ca 60%
- 343,200 birds die, 1% of that = 3,432 birds
- 3,500 birds can be regarded as a small number (at the level of the continent)

[144] According to the data of literature 25% corresponds to the lowest mortality rate met for birds of more than one year of a Rallidae.
[145] According to the data of literature 50% corresponds to a low mortality rate for birds of first year of a Rallidae.
[146] According to the data of literature 60% corresponds to a high average mortality rate for one species of a Rallidae.

SPEC Category 2 - species whose global populations are concentrated in Europe (>50% of their global breeding or wintering populations occurs in Europe) and which have an Unfavourable Conservation Status in Europe.

SPEC Category 3 - species whose global populations are not concentrated in Europe(<50% of their global breeding or wintering populations occurs in Europe), but which have an Unfavourable Conservation Status in Europe.

[147] The listing of *Scolopax rusticola* as having unfavourable conservation status in the EU has been challenged on the basis of more recent data. According to the EU draft management plan (Ferrand, Y. and F. Gossmann (2001) Elements for a Woodcock Management plan. Game and Wildlife Science, vol. 18(1), March 2001, p. 115-139) the numbers of breeding Woodcock are considered stable or increasing in Member States, with the exception of the United Kingdom. The UK population is geographically restricted and its dynamics can be separated from the other European populations. The status of wintering birds for most European countries is not known.

Biodiversity is increasingly recognised as an inestimable element of our common heritage. The last Eurobarometer shows that European citizens take a great interest in the protection of rare and endangered species and habitats. This is the purpose of the Natura 2000 ecological network established by the 'Habitats' directive, which was adopted in 1992. The network, which also embraces areas established under the 'Birds' directive, will provide a strong protection for Europe's finest wildlife areas.

The management of the Natura 2000 sites is essential for their conservation. But to be successful it requires, in the first instance, the active involvement of the people who live in and depend upon these areas. The measures for managing Natura 2000 sites are given in Article 6 of the 'Habitats' directive. However, as this is a concise legal text, many of the key concepts are not easy to understand.

I consider it important that we have a clear and accessible understanding of these key provisions of the directive as this will provide the basis for it to be applied throughout the Community on an equal footing.

This document is therefore intended to facilitate the interpretation of Article 6 by competent authorities in the Member States. I hope it assists them in fully applying it and I would encourage them to further develop guidelines for the different actors concerned.

This important document, which aims at a better understanding of Community legislation by the citizens, should also be seen as part of the openness and transparency policy of the European Commission.

Margot Wallström
Commissioner for the Environment

Foreword

Why an interpretation guide for Article 6?

Article 6 of the 'Habitats' Directive (92/43/EEC) plays a crucial role in the management of the sites that make up the Natura 2000 network. With the spirit of integration in mind, it indicates the various tasks involved so that the nature conservation interests of the sites can be safeguarded.

Many questions have been raised about the significance of this article by Member States and operators. At first glance it seems to be broad and not well defined, but a thorough analysis, linking it with the other articles of the directive, makes it easier to understand and apply. Nevertheless, Article 6 should not be seen in isolation. In particular, if its application leads to specific requirements, it should be remembered that Article 8 envisages the co-financing of some of the measures necessary to meet the objectives of the directive.

Purpose and target of this document

This document aims at providing guidelines to the Member States on the interpretation of certain key concepts used in Article 6 of the 'Habitats' directive.

The primary targets of the document are Member State authorities and not individuals. It is however expected that it will also facilitate the understanding of the mechanics of the 'Habitats' directive by the various bodies and groups concerned, especially if it is complemented with more detailed guidance which should be drawn up by the Member States themselves.

Nature and limitations of the document

The document has been drafted by the services of the Environment Directorate-General of the European Commission, following relevant informal discussions held with the nature protection authorities of the Member States (see Annex V for a list). As such, the document reflects only the views of Commission services and is not of a binding nature. It should be stressed that in the last resort it rests with the European Court of Justice to interpret a directive.

The interpretations provided by the Commission services cannot go beyond the directive. This is particularly true for this directive as it enshrines the subsidiarity principle and as such lets a large margin of manoeuvre to the Member States for the practical implementation of specific measures related to the various sites of the Natura 2000 network. In any case, the Member States are free to choose the appropriate way they wish to implement the practical measures, provided the latter serve the general purpose of the directive.

However interpretative, this document is not intended to give absolute answers to site-specific questions. As a matter of fact, such matters should be dealt with on a case-by-case basis, while bearing in mind the orientations provided by the document.

The present version is not meant to be a definitive one; indeed, the document may be revised in the future, according to experience that will arise from the implementation of Article 6 in the Member States and from any future case law. Furthermore, the Commission services have arranged for the prepa-

ration of more specific, methodological guidance on the assessment of plans and projects under Article 6(3) and 6(4); such guidance, once ready, is intended to be complementary to this document.

Structure of the document

After an introductory note on the overall content and logic of Article 6, there follows a detailed presentation of each paragraph (6(1), 6(2), 6(3), 6(4)) according to the same general scheme. This involves an introduction to the article and its scope, and then discussion of the main concepts and issues raised, on the basis of the Commission's knowledge, existing jurisprudence of the European Court of Justice, and other relevant directives.

The key points arising from the Commission's analyses are summarised (in bold characters) at the end of each section, in order to facilitate a quick reading of the relevant conclusions. Full references of Court cases quoted throughout the text are provided as an annex at the end of the document.

1. Introduction

Article 6 in context

1.1. Placed within the overall scheme of Directives 92/43/EEC and 79/409/EEC as well as within a wider context

Before addressing Article 6 in detail, it is worth recalling its place within the overall scheme of Directive 92/43/EEC as well as that of Directive 79/409/EEC ([1]) and its relationship with a wider legal context.

The first chapter of Directive 92/43/EEC, comprising Articles 1 and 2, is entitled 'Definitions'. This chapter sets out the aim of the directive which is to '*contribute towards ensuring biodiversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the Treaty applies*' ([2]). It also provides a general orientation, referring to the need for measures taken pursuant to the directive to be designed to maintain or restore certain habitats and species '*at favourable conservation status*' ([3]), while, at the same time, referring to the need for measures taken pursuant to the directive to '*take account of economic, social and cultural requirements and regional and local characteristics*' ([4]).

The main specific requirements of Directive 92/43/EEC are grouped under the two subsequent chapters. The first is entitled 'Conservation of natural habitats and habitats of species' and comprises Articles 3 to 11 inclusive. The second is entitled 'Protection of species' and comprises Articles 12 to 16 inclusive.

The 'Conservation of natural habitats and habitats of species' chapter addresses the most ambitious and far-reaching challenge of the directive — the establishment and conservation of the network of sites known as Natura 2000. Within this chapter, Article 6 sets out provisions which govern the conservation and management of Natura 2000 sites. Seen in this context, Article 6 is one of the most important of the 24 articles of the directive, being the one which most determines the relationship between conservation and land use.

The article has three main sets of provisions. Article 6(1) makes provision for the establishment of the necessary conservation measures, and is focused on positive and proactive interventions. Article 6(2) makes provision for avoidance of habitat deterioration and significant species disturbance. Its emphasis is therefore preventive. Article 6(3) and (4) set out a series of procedural and substantive safeguards governing plans and projects likely to have a significant effect on a Natura 2000 site. Within this structure, it can be seen that there is a distinction between Article 6(1) and (2) which define a general regime and Article 6(3) and (4) which define a procedure applying to specific circumstances.

Considered globally, the provisions of Article 6 reflect the general orientation expressed in the recitals of the directive. This involves the need to promote biodiversity by maintaining or restoring certain habitats and species at 'favourable conservation status' within the context of Natura 2000 sites, while taking into account economic, social, cultural and regional requirements, as a means to achieve sustainable development.

Apart from the place of Article 6 within the overall scheme of Directive 92/43/EEC, it is also relevant to mention its *relationship with the scheme of Directive 79/409/EEC* on the conservation of wild birds.

([1]) OJ L 206, 22.7.1992, p. 7 and OJ L 103, 25.4.1979, p. 1 respectively.

([2]) Article 2(1).

([3]) Article 2(2).

([4]) Article 2(3).

- In the first place, the scheme of the earlier directive is broadly comparable with that of the latter. In particular, the 'Conservation of natural habitats and habitats of species' chapter of Directive 92/43/EEC has its parallel in Articles 3 and 4 of Directive 79/409/EEC.
- In the second place, there has been an important degree of merger or fusion between the schemes of both directives. First, special protection areas (SPAs) classified under the earlier directive are now an integral part of the Natura 2000 network ([5]). Second, the provisions of Article 6(2), (3) and (4) of Directive 92/43/EEC have been made applicable to SPAs ([6]). In this document, most comments on Article 6 are framed by reference to sites proposed under Directive 92/43/EEC. Generally speaking, these comments will apply, *mutatis mutandis*, to sites classified under Directive 79/409/EEC.

Seen in a wider context — that of the Treaty establishing the European Community — Article 6 can be regarded as a key framework for giving effect to the principle of integration, since it encourages Member States to manage the protected areas in a sustainable way and since it sets the limits of activities which can impact negatively on protected areas while allowing some derogations in specific circumstances.

Seen in an **international context**, Article 6 helps achieve the aims of relevant international nature conservation conventions such as the Berne Convention ([7]) and the Biodiversity Convention ([8]), while at the same time creating a more detailed framework for site conservation and protection than these conventions themselves do.

Article 6 is a key part of the chapter of Directive 92/43/EEC entitled 'Conservation of natural habitats and habitats of species'. It sets out the framework for site conservation and protection, and includes proactive, preventive and procedural requirements. It is relevant to special protection areas under Directive 79/409/EEC as well as to sites based on Directive 92/43/EEC. The framework is a key means of achieving the principle of environmental integration and ultimately sustainable development.

1.2. Relation with protection of species chapter

As mentioned above, the chapter of Directive 92/43/EEC entitled 'Protection of species' covers Articles 12 to 16 inclusive and deals with strictly protected animal and plant species listed in Annex IV of the directive.

Articles 12, 13 and 14, which are applicable from the date of implementation of Directive 92/43/EEC, i.e. 10 June 1994, cover certain plant and animal species which also figure in Annex II of the directive, and which therefore benefit from the provisions of Article 6 within the Natura 2000 sites hosting them.

As a consequence, an action may at the same time fall within the scope of both chapters.

([5]) Article 3(1) of Directive 92/43/EEC provides that 'the Natura 2000 network shall include the special protection areas classified by the Member States pursuant to Directive 79/409/EEC'.

([6]) Article 7 of Directive 92/43/EEC.

([7]) Council Decision 82/72/EEC of 3 December 1981 concerning the conclusion of the Convention on the Conservation of European Wildlife and Natural Habitats (OJ L 38, 10.2.1982, p. 1).

([8]) Council Decision 93/626/EEC of 25 October 1993 concerning the conclusion of the Convention on Biological Diversity (OJ L 309, 13.12.1993, p. 1).

For example, the destruction of a resting place of the brown bear, *Ursus arctos,* may contravene the prohibition of Article 12(1)(d) while also running counter to Article 6 if the resting place is within a Natura 2000 site for the species.

While this may appear to result in duplication, a few points should be noted.

- In the first place, certain species of plant and animal covered by Articles 12, 13 and 14 do not figure within Annex II. Thus, they do not benefit directly from site conservation and protection within Natura 2000.
- In the second place, for species such as *Ursus arctos* which benefit from both the chapter on conservation of natural habitats and habitats of species and the chapter on protection of species, the protection afforded by Article 6 is limited to the Natura 2000 network whereas the protection afforded by the chapter on protection of species is not geographically limited (subject to any restriction mentioned in the annexes to the directive). Thus, Article 6 is concerned with **site** conservation and protection whereas the chapter on protection of species is more narrowly focused on the species (though this will obviously have implications for sites where species occur, in particular the breeding sites and resting places of animals).

While certain plant and animal species benefit from both the chapter on conservation of natural habitats and habitats of species and the chapter on protection of species, the scope and the nature of the relevant provisions are different.

1.3. Putting Article 6 into national law: the duty of transposition

It is important to note that the provisions of Article 6 require transposition into national law (i.e. they need to be the subject of provisions of national law giving effect to their requirements). In this respect, they come within the scope of Article 23 of the directive which states that '*Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this directive within two years of its notification*'. The deadline for transposition was 10 June 1994 (or 1 January 1995 in the case of Austria, Sweden and Finland).

This reflects the type of Community instrument that has been used, namely a directive. A directive is binding as to the result to be achieved, but leaves a Member State some choice as to the form and methods of achieving that result. For most directives, the required result will need national legislation (see Annex I, point 1).

Depending on the Member State concerned, Article 6 needed to be transposed into national law by 10 June 1994 or 1 January 1995.

1.4. Time of application of Article 6: from which date do the obligations of Article 6 apply?

In general, a distinction needs to be made between the deadline for transposition of the provisions of Article 6 into national law and the date from which these provisions apply to individual sites.

As regards individual sites, a distinction needs to be drawn between special protection areas classified under Directive 79/409/EEC and other sites.

1.4.1. Special protection areas

The protection requirements regarding special protection areas (SPAs) are given in Article 4(4), first sentence of Directive 79/409/EEC which provides that, for those areas, *'… Member States shall take appropriate steps to avoid pollution or deterioration of habitats or any disturbances affecting the birds, in so far as these would be significant having regard to the objectives of this Article …'.*

After the entry into force of Directive 92/43/EEC the above obligations are replaced pursuant to Article 7 of Directive 92/43/EEC which provides as follows:

> *'Obligations arising under Article 6(2), (3) and (4) of this directive shall replace any obligations arising under the first sentence of Article 4(4) of Directive 79/409/EEC in respect of areas classified pursuant to Article 4(1) or similarly recognised under Article 4(2) thereof, as from the date of implementation of this directive or the date of classification or recognition by a Member State under Directive 79/409/EEC, where the latter date is later.'*

Thus, the provisions of Article 6(1) do not apply to special protection areas (SPAs). However, analogous provisions apply to SPAs by virtue of Article 4(1) and (2) of Directive 79/409/EEC. The date from which these similar provisions should, in principle, apply to SPAs is the date from which Directive 79/409/EEC became applicable in the Member States (see Annex I, point 2).

As regards the provisions of Article 6(2), (3) and (4), it is clear from the terms of Article 7 that these now apply to already classified SPAs.

However, given the wording of Article 7, a question arises as to whether the provisions of Article 4(4), first sentence of Directive 79/409/EEC remain applicable after the 'date of implementation of this directive' (10 June 1994 for the then Member States and 1 January 1995 for Austria, Finland and Sweden) until such time as a site is classified as an SPA.

In the *Santoña Marshes* case (see Annex I, point 3), the European Court of Justice established that the provisions of Article 4(4) first sentence were applicable to an unclassified site which should have been classified as an SPA from the date of implementation of Directive 79/409/EEC (i.e. 7 April 1981 for the then Member States and the date of accession for later Member States).

The underlying rationale of *Santoña Marshes* is that sites that deserve classification should be treated in the same way regardless of whether or not they are formally classified. The Commission services therefore consider that the provisions of Article 6(2), (3) and (4) are applicable to SPAs, or to sites which should be classified as SPAs, from the date of implementation of Directive 92/43/EEC.

Article 6(1) of Directive 92/43/EEC does not apply to SPAs. However, there are analogous provisions in Article 4(1) and (2) of Directive 79/409/EEC and these apply from the date of implementation of that directive. As regards the date of application of Article 6(2), (3) and (4) of Directive 92/43/EEC to SPAs, it is reasonable to conclude that all sites classified, or qualifying for classification, as SPAs are subject to these provisions from the date of implementation of Directive 92/43/EEC.

1.4.2. Sites based on Directive 92/43/EEC

Article 6(1) applies to special areas of conservation (SACs). According to Article 4(4) of the directive, SACs come into being by way of designation by the Member States. Such designation is only possible after a site has been adopted as a site of Community importance (SCI) in accordance with Article 4(2) of the directive. An SCI must be designated as an SAC *'as soon as possible and within six years at the*

most'. This means that the final deadline for SAC designation — and therefore for compliance with Article 6(1) — is 10 June 2004.

Article 4(5) of Directive 92/43/EEC provides as follows:

> '*As soon as a site is placed on the list referred to in the third subparagraph of paragraph 2 it shall be subject to Article 6(2), (3) and (4).*'

Thus, in contrast to the provisions of Article 6(1) which apply only when an SCI has been designated as an SAC, the provisions of Article 6(2), (3) and (4) become applicable as soon as a site becomes an SCI and before it is designated as an SAC. Member States are also free to choose an earlier date for the implementation of Article 6(2), (3) and (4), and some national legislation already provides for such earlier implementation.

According to Article 4 of Directive 92/43/EEC, Member States ought to have submitted their national lists by 10 June 1995 and the Commission adopted the Community list by 10 June 1998. However, no Community list could be adopted by 10 June 1998 owing to delays in submission of complete national lists.

The text of Directive 92/43/EEC seems to indicate that Member States do not need to pay attention to the provisions of Article 6 before the Community list has been adopted. However, other provisions of Community law as interpreted by the European Court of Justice need to be taken into consideration.

Article 10 (ex Article 5) of the Treaty establishing the European Community provides as follows:

> '*Member States shall take all appropriate measures, whether general or particular, to ensure fulfilment of the obligations arising out of this Treaty or resulting from action taken by the institutions of the Community. They shall facilitate the achievement of the Community's tasks. They shall abstain from any measure which could jeopardise the attainment of the objectives of this Treaty.*'

The European Court of Justice has, on several occasions, held that, even in the absence of transposing measures or the implementation of specific obligations resulting from a directive, the national authorities, when interpreting national law, should take all possible measures in order to achieve the results aimed at by a directive.

Furthermore, the European Court of Justice ruled in *Santoña Marshes* that a Member State could not escape from its duty to protect a site which, according to relevant scientific criteria, deserved protection, by not classifying it as a special protection area. It is possible that this principle could be used, by analogy, in questions arising from Directive 92/43/EEC.

In the light of the foregoing, Member State authorities are advised to ensure that sites on their national list of proposed SCIs are not allowed to deteriorate before the Community list of SCIs is adopted. Where the national list remains incomplete, they are advised to also ensure the non-deterioration of sites that, according to scientific evidence based on the criteria of Annex III of Directive 92/43/EEC, should be on the national list. One practical suggestion is to make correct use of environmental impact assessment (EIA) under Directive 85/337/EEC (impact assessment) in relation to potentially damaging projects. The European Court of Justice has already confirmed the importance which should be attached to sensitive natural sites when deciding whether projects should undergo an EIA under this directive (see Annex I, point 4).

The above considerations can be summarised in the following table:

Site status	pSCI	SCI	SAC
Deadline foreseen by the directive	June 1995	June 1998	June 2004
Applicability of Article 6 provisions	Optional for 6(1), (2), (3) and (4), need for measures to avoid site deterioration	6(2), (3) and (4)	6(1), (2), (3) and (4)

Once the Community list is established, the position will become clear as to what requires site protection under the directive, and the advice on provisional site protection will no longer be applicable.

As regards sites based on Directive 92/43/EEC, it can be argued that Member States, particularly after the date for adoption of the Community list expired on 10 June 1998, have certain obligations to act in a way so as to ensure that the aims of the directive are not jeopardised. Even in the absence of a Community list, Member States' authorities are therefore advised to at least abstain from all activities that may cause a site on the national list to deteriorate. Where a complete national list has not been submitted, the same advice applies to a site which, on the basis of the scientific criteria of the directive, clearly ought to be on the national list.

2. Article 6(1)

Clarification of the concepts of conservation measures; statutory, administrative or contractual measures; and management plans.

2.1. The text

'For special areas of conservation, Member States shall establish the necessary conservation measures involving, if need be, appropriate management plans specifically designed for the sites or integrated into other development plans, and appropriate statutory, administrative or contractual measures which correspond to the ecological requirements of the natural habitat types in Annex I and the species in Annex II present on the sites.'

2.2. Scope

Article 6(1) lays down a general conservation regime which has to be established by the Member States for the special areas of conservation (SAC).

Article 6(1):

- provides for **positive** measures, involving management plans and statutory, administrative or contractual measures, which aim to achieve the general objective of the directive. In that regard, Article 6(1) is distinguished from the three other paragraphs of Article 6 which provide for preventive measures to avoid deterioration, disturbance and significant effects in the Natura 2000 sites;
- has a value of **reference** for the logic and the overall comprehension of Article 6; the structured reading and the comprehension of the three other paragraphs of Article 6 require a preliminary reading and comprehension of paragraph 1;
- establishes a general conservation regime which applies to **all** SACs of the Natura 2000 network without exception and to **all** the natural habitat types of Annex I and the species of Annex II present on the sites, except those identified as non-significant in the Natura 2000 standard data form (see Section 4.5.3);
- concerns the **SACs specifically**: Article 6(1) does not apply to the special protection areas (SPAs), unlike Article 6(2), (3) and (4). In this way, the legislator established:
  - — a regime laying down special conservation measures for the **SPAs** classified under the 'Birds' directive, according to its Article 4(1) and (2);
  - — a regime laying down conservation measures for the **SACs** designated under the 'Habitats' directive, according to its Article 6(1);
- relates to Article 2(3) which specifies that *'the measures … take account of economic, social and cultural requirements and regional and local characteristics'.*

For all the SACs, Member States are required to draw up conservation measures. These are positive and apply to all the natural habitat types of Annex I and the species of Annex II present on the sites, except those whose presence is non-significant according to the Natura 2000 standard data form.

2.3. What should be the content of the 'necessary conservation measures'?

2.3.1. The conservation concept

The conservation concept appears in the sixth recital of the directive which reads: *'Whereas, in order to ensure the restoration or maintenance of natural habitats and species of Community interest at a favourable conservation status, it is necessary to designate special areas of conservation in order to create a coherent European ecological network according to a specified timetable';* and in its eighth recital: *'whereas it is appropriate, in each area designated, to implement the necessary measures having regard to the conservation objectives pursued'.*

It is then defined in Article 1, point (a) of the directive: '*(a) conservation means a series of measures required to maintain or restore the natural habitats and the populations of species of wild fauna and flora at a favourable status as defined in (e) and (i);*'.

Member States have to adopt the conservation measures necessary to achieve the general aim of the directive as set out in its Article 2(1): '*The aim of this directive shall be to contribute towards ensuring biodiversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the Treaty applies*'. There is therefore a **result obligation.**

Article 2(2), in particular, specifies the objective of the measures to be taken under the terms of this directive: '*Measures taken ... shall be designed to maintain or to restore, at a favourable conservation status, natural habitats and species of wild fauna and flora of Community interest*'. These measures have, according to Article 2(3), to '*take account of economic, social and cultural requirements and regional and local characteristics*'.

Article 3 specifies that it is the Natura 2000 network '*composed of sites hosting the natural habitat types listed in Annex I and habitats of the species listed in Annex II*' which has to ensure the objective pursued by Article 2(2).

The necessary conservation measures have therefore to aim at maintaining or restoring the favourable conservation status of the natural habitat types and the species of Community interest. They are connected with the general objective of the directive which applies to the Natura 2000 network, as defined in Article 3.

The fulfilment of the aim laid down in Article 2(1) largely depends on conservation measures that the Member States have to take in order to maintain or restore the natural habitat types and species at a favourable conservation status. These measures are implemented through the Natura 2000 network defined in Article 3(1), taking into account economic, social and cultural requirements and regional and local characteristics.

2.3.2. The conservation status

The conservation status is defined in Article 1 of the directive:

- For a **natural habitat**, Article 1(e) specifies that it is: '*the sum of the influences acting on a natural habitat and its typical species that may affect its long-term natural distribution, structure and functions as well as the long-term survival of its typical species ...*'.
- For a **species**, Article 1(i) specifies that it is: '*the sum of the influences acting on the species concerned that may affect the long-term distribution and abundance of its population ...*'.

The Member State has therefore to take into account all the influences of the environment (air, water, soil, territory) which act on the habitats and species present on the site.

The **favourable conservation status** is also defined by Article 1(e) for natural habitats and Article 1(i) for species.

- For a **natural habitat**, it occurs when:
  - '*its natural range and areas it covers within that range are stable or increasing;*
  - *the specific structure and functions which are necessary for its long-term maintenance exist and are likely to continue to exist for the foreseeable future;*
  - *the conservation status of its typical species is favourable*'.

- For a **species**, it occurs when:
  - — *'the population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats;*
  - — *the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future;*
  - — *there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis'*.

The favourable conservation status of a natural habitat or species has to be considered across its natural range, according to Articles 1(e) and 1(i), i.e. at biogeographical and, hence, Natura 2000 network level. Since, however, the ecological coherence of the network will depend on the contribution of each individual site to it and, hence, on the conservation status of the habitat types and species it hosts, the assessment of the favourable conservation status at site level will always be necessary.

The conservation status of natural habitat types and species present on a site is assessed according to a number of criteria established by Article 1 of the directive. This assessment is done both at site and network level.

2.3.3. The ecological requirements

Article 6(1) specifies that the necessary conservation measures have to correspond *'to the ecological requirements of the natural habitat types of Annex I and the species in Annex II present on the sites'*. It is therefore in relation to the ecological requirements of the natural habitat types and the species that Member States have to determine the conservation measures.

Although the directive does not contain any definition of the 'ecological requirements', the purpose and context of Article 6(1) indicate that these involve all the ecological needs of abiotic and biotic factors necessary to ensure the favourable conservation status of the habitat types and species, including their relations with the environment (air, water, soil, vegetation, etc.).

These requirements rest on scientific knowledge and can only be defined on a case-by-case basis, according to the natural habitat types of Annex I, the species of Annex II, as well as the sites which host them. Such knowledge is essential to make it possible to draw up the conservation measures, on a case-by-case basis.

The ecological requirements can vary from one species to another but also for the same species from one site to another.

Thus, for the bats included in Annex II of the directive, the ecological requirements differ between the period of hibernation (when they rest in underground environments, in hollow shafts or in dwellings) and the active period, from spring onwards (during which they leave their winter quarters and resume their activities of insect hunting).

For the Annex II amphibian *Triturus cristatus*, the ecological requirements vary during its life cycle. The species hibernates in the ground (cavities, fissures), then lays its eggs in spring and at the beginning of the summer in ponds. It then leaves the aquatic environment and lives on land during the summer and autumn. For the same species, the ecological requirements can therefore vary according to the sites (aquatic or land).

The identification of the ecological requirements of the natural habitat types of Annex I and the species of Annex II present on the sites is the **responsibility of the Member States.** The latter may wish to exchange their knowledge in this field, with the support of the European Commission and the European Environment Agency — European Topic Centre for Nature Conservation.

The conservation measures have to correspond to the ecological requirements of the natural habitat types in Annex I and of the species in Annex II present on the site. The ecological requirements of those natural habitat types and species involve all the ecological needs necessary to ensure their favourable conservation status. They can only be defined on a case-by-case basis and on the basis of scientific knowledge.

2.4. What form can the necessary conservation measures take?

The conservation measures can take at least two forms: the form of '*appropriate statutory, administrative or contractual measures…'* and '*if need be',* the form of '*appropriate management plans'.*

2.4.1. Management plans

The necessary conservation measures can involve '*if need be, appropriate management plans specifically designed for the sites or integrated into other development plans'.* Such management plans should address all foreseen activities, unforeseen new activities being dealt with by Article 6(3) and (4).

The words 'if need be' indicate that management plans may not always be necessary. If management plans are chosen by a Member State, it will often make sense to establish them before concluding the other measures mentioned in Article 6(1), particularly the contractual measures. Contractual measures will often involve a relationship between the competent authorities and individual landowners and will be limited to individual land-holdings which are normally smaller than the site. In such circumstances, a management plan focused on the site will provide a wider framework, and its contents will provide a useful starting point for the specific details of contractual measures.

The management plans must be '*appropriate and specifically designed for the sites*', therefore be targeted at the sites of the Natura 2000 network, **or '***integrated into other development plans*'. The latter provision is in conformity with the principle of integration of the environment in the other Community policies. This integration has to contribute to the coherence of the network mentioned in Article 3(1). In any case, it may be necessary to apply Article 6(3) to those aspects of the management plan which are not connected to conservation management (see commentary on Article 6(3) under Section 4.3.3).

While no indication of the specific contents of management plans can be given, Annex II at the end of this document provides a number of important considerations that can be made in view of the preparation of such plans. Furthermore, Annex IIa provides an indicative list of LIFE-Nature projects which have produced management plans or other statutory, administrative or contractual measures (see below) aiming at site conservation.

Member States can establish management plans which superimpose themselves on the other categories of measures. They are not always necessary but, if they are used, they should take into account the characteristics specific to each site and all foreseen activities. They may be stand-alone documents or incorporated into other development plans when those exist.

2.4.2. Statutory, administrative or contractual measures

The phrase *'if need be'* refers only to the management plans and not to the statutory, administrative or contractual measures. Thus, even if a Member State considers that a management plan is unnecessary, it will nonetheless have to take such measures.

The division into these three categories of measures has to be considered in a broad sense. A variety of measures may be considered as appropriate to achieve the aim of the directive. In principle, this involves measures having a **positive effect** but, in some exceptional cases, it can also involve measures requiring **no action**. On the other hand, these measures are not necessarily new measures, since existing measures can be considered sufficient if they are appropriate.

Among measures involving positive action, *agri-environmental* or *sylvi-environmental* measures serve as a good example to illustrate how socioeconomic requirements can be taken into account according to Article 2(3).

1. *Agri-environmental measures:* for certain man-made, semi-natural Annex I habitat types (meadows, pastures) and Annex II species hosted in these habitats, agreements with farmers within the new rural development regulation ([9]) will be in most cases a sufficient contractual measure aiming at maintaining a favourable conservation status of habitat types and species.
2. *Sylvi-environmental measures:* appropriate measures might be an initiative by a forest company within the framework of a certain certification scheme provided that this initiative ensures that favourable conservation status is maintained.

In this perspective, all suitable EU funds (e.g. LIFE, rural development and regional funds) should be considered as a means for implementing these measures.

The choice between statutory, administrative or contractual measures, or even of the management plans, is left to the Member States. This is in conformity with the principle of subsidiarity. However, Member States must choose at least one of the three categories, i.e. statutory, administrative, contractual.

There is no hierarchy between these three categories. Thus Member States have the choice to use, on a Natura 2000 site, just one category of measures (e.g. only contractual measures) or combined measures (e.g. combination of statutory and contractual measures according to the conservation issues of the natural habitat types in Annex I and the species in Annex II present on the site). Moreover, in addition to the selected obligatory measures, Member States can establish and implement management plans.

The three categories of measures are qualified as 'appropriate'. This qualifier is not defined in the directive. However, in the case of Article 6(1), the statutory, administrative or contractual measures are embraced within the concept of conservation measures. The qualifier 'appropriate' has no other objective than to recall that whatever the type of measure chosen by the Member States, there is an obligation to respect the general objectives of the directive.

Thus, if a Member State chooses the contractual measures, it always has the obligation to establish in a permanent way the necessary conservation measures which correspond to *'the ecological requirements*

([9]) Council Regulation (EC) No 1257/1999 of 17 May 1999, OJ L 160, 26.6.1999, p. 80.

of the habitats of Annex I and the species of Annex II present on the sites' and respect the general aim of the directive defined in Article 2(1).

For SACs, Member States are required to use the appropriate statutory, administrative or contractual measures. These measures shall take into account socioeconomic requirements according to Article 2(3). They have to (a) correspond to the ecological requirements of habitats of Annex I and species of Annex II present on the sites and (b) fulfil the general objective of the directive to maintain or restore at a favourable conservation status the natural habitats and the species of fauna and flora of Community interest.

3. Article 6(2)

Clarification of the concepts of *deterioration; disturbance; and significant effect*

3.1. The text

'Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbances of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this directive.'

3.2. Scope

The article takes as a starting point the **prevention principle**: *'Member States shall take appropriate steps **to avoid**, in the special areas of conservation, the deterioration... as well as disturbances...'.*

These measures go beyond the simple management measures necessary to ensure conservation since these are already covered by Article 6(1). The words *'avoid'* and *'could be significant'* stress the anticipatory nature of the measures to be taken. It is not acceptable to await until deterioration or disturbances occur before taking measures (see under Section 4.4.2 the interpretation of *'likely to'* in Article 6(3)).

This article should be interpreted as requiring Member States to take all the appropriate actions which it may reasonably be expected to take, to ensure that no significant deterioration or disturbance occurs.

The scope of this article is broader than that of Article 6(3) and (4) which apply only to plans and projects requiring an authorisation. It is also applicable to the performance of activities which do not necessarily require prior authorisation, like agriculture or fishing.

Article 6(2):

- applies **permanently** in the special areas of conservation (SACs). It can concern past, present or future activities or events (for instance, in the case of a toxic spill affecting a wetland, this article would mean that all preventive measures should have been taken to avoid the spillage, even if its location is distant from the wetland). If an already existing activity in a SAC causes deterioration of natural habitats or disturbance of species for which the area has been designated, it must be covered by the necessary conservation measures foreseen in Article 6(1). This may require, if appropriate, that the negative impact is brought to an end either by stopping the activity or by taking mitigating measures. This can include economic compensation.

- **is not limited to intentional acts**, but could also cover any chance events that could occur (fire, flood, etc.), as long as they are predictable. In case of catastrophes this concerns only the obligation to take (relative) precautionary measures to decrease the risk of such catastrophes as long as they could jeopardise the aim of the directive.

The legislator envisaged certain **limits** to the responsibility of the Member States:

- **Spatial limit**. Measures aim only at species and habitats located *'in the SACs'*. On the other hand, measures may need to be implemented **outside** the SAC, i.e. if external events may have an impact on the species and the habitats inside the SAC. Indeed, the article does not specify that measures have to be **taken** in the SAC but to **avoid** in the SAC.

- **Limit of habitats and species concerned**. The appropriate measures concern only habitats and species *'for which the areas have been designated'*. In particular, the habitats and species concerned by the measures to be taken are those identified in the Natura 2000 standard data forms (see Sections 2.2 and 4.5.3). The aim is not therefore to take general conservation measures, but rather to take measures focused on the species and habitats which justified the selection of the special area of conservation. The disturbances and/or deterioration will thus be determined by the information which has been communicated by the Member States and which has been used to ensure the coherence of the network for the species and habitats concerned.

Member States are required to take preventive measures to avoid deterioration and disturbances connected with a predictable event. These measures apply only to the species and habitats for which the sites have been designated, and should also be implemented, if necessary, outside the sites.

3.3. Does implementation differ for deterioration and disturbance?

In terms of **disturbance of species**, Article 6.2 specifies that appropriate steps have to be taken to avoid it '*in so far as such disturbance could be significant* ***in relation to the objectives*** *of this directive*'.

The disturbance in question has to be relevant to (have an impact on) the conservation status of the species in relation to the objectives of the directive. It is therefore in relation to these **objectives** that the Member State has to determine whether or not disturbance is significant.

In terms of **deterioration of habitats** however, the effect in relation to the objectives of the directive is not mentioned in the text of the directive. It is simply stated that the deterioration of habitats must be avoided. The purpose of all the measures taken under this directive has to correspond to the objectives of the directive and to respect the principle of proportionality. The deterioration of habitats is therefore also to be assessed against the objectives of the directive. Indeed, it seems difficult to assess deterioration in absolute terms without reference to measurable limits. As presented below, connecting deterioration to the objectives of the directive makes it possible to use Article 1 of the directive to interpret the limits of what one can regard as deterioration.

Disturbance and deterioration should be assessed against the objectives of the directive.

3.4. Which conditions should trigger measures by the Member States?

There exists an apparent difference between the limit of acceptability for the deterioration of a habitat or the disturbance of a species.

- In the case of **disturbance**, the latter has to be **significant** (a certain degree of disturbance is tolerated). In addition, it is not necessary to prove that there will be a real significant effect, but the likelihood alone (*'could be'*) is enough to justify corrective measures. This can be considered consistent with the prevention and precautionary principles.
- In the case of **deterioration**, the legislator did not explicitly give this margin. This does not exclude however some room for manoeuvre in determining what can be described as deterioration (see below).

Deterioration is a physical degradation of a habitat. It can be directly assessed through a series of indicators (see below), for example, a reduction in the area or characteristics of the habitat.

On the other hand, disturbances do not directly affect the physical conditions. However, if they are significant, they may trigger changes in physical parameters, which have the same result as deterioration. If disturbances are significant enough to trigger changes in this way, they can be assessed in the same way as deterioration, using indicators of conservation status (see below).

Disturbances are assessed in the same way as deterioration as long as they trigger change in indicators of the conservation status of protected species in such a way as to affect the conservation status of the species concerned.

3.5. When should measures in relation to disturbance and deterioration be taken?

First, it should be stressed that measures must be **appropriate**. This means that they should fulfil the main objective of the directive in contributing to the conservation status of the habitats or species concerned while taking account of *'economic, social and cultural requirements and regional and local characteristics'*.

The inter-linkage of the recitals and articles of the directive provides the context for considering the appropriate measures to be taken by the Member States (see Section 2.3).

As mentioned in the previous paragraph 3.4, disturbance and deterioration should be assessed against the conservation concept, bearing in mind that according to Article 3(1) the network is composed of **sites** and shall enable the natural habitats types and the species' habitats concerned to be maintained at **favourable conservation status** in their natural range.

The favourable conservation status, as defined in Article 1 of the directive, can serve as a term of reference to fix the limit of acceptable disturbance and deterioration with respect to the objectives of the directive and to determine if the appropriate measures are properly implemented (see below).

The conservation status of a habitat or species in a site will be assessed according to the contribution of this site to the ecological coherence of the network, either:

- against its initial status at the time of transmission of site-related information provided in the Natura 2000 standard data forms (see Section 4.5.3) if this conservation status is favourable; or
- against an aim of improving the conservation status announced at the time of the setting-up of the network. Indeed, if a Member State is obliged to propose the classification of habitats in an unfavourable conservation status, it is only logical to assume that it will set a restoration target for these habitats so as to ensure their sustainability. When Community funds are granted for the improvement of the conservation status of a habitat or species in a site, it is this improved status that will be taken into consideration.

On a particular site the conservation status should reflect the dynamic nature of the habitats and species concerned. In that regard, the importance of **surveillance** of the conservation status of habitats and species, as required by Article 11 of the directive, should be stressed.

Deterioration or disturbance is assessed against the conservation status of species and habitats concerned. At a site level, the maintenance of the favourable conservation status has to be evaluated against the initial conditions provided in the Natura 2000 standard data forms when the site was proposed for selection or designation, according to the contribution of the site to the ecological coherence of the network. This notion should be interpreted in a dynamic way according to the evolution of the conservation status of the habitat or of the species.

3.6. Indicators of disturbance and deterioration

The conditions which govern the concepts of disturbance and deterioration are well defined, but they should be assessed by the Member State, on the one hand, against the general conservation status of the species or the habitats concerned (at biogeographical level) and, on the other hand, against the local conditions (at site level). As a general rule, on a particular site, disturbance or deterioration is assessed on a case-by-case basis, using indicators (see below), with respect to the significance of their change in value. This is measured against (a) the conservation status of the natural habitat or species concerned, and (b) the contribution of the site to the coherence of the Natura 2000 network.

3.6.1. Deterioration of habitats

Deterioration is a physical degradation affecting a habitat. The definition of the conservation status (Article 1(e) — see Section 2.3), means that the Member State has to take into consideration all the influences on the environment hosting the habitats (space, water, air, soils). If these influences result in making the conservation status of the habitat less favourable than it was before, the deterioration can be considered to have occurred.

To assess this deterioration against the objectives of the directive, one can refer to the definition of the **favourable conservation status of a natural habitat** set out in Article 1(e), on the basis of the following factors:

- *'The **natural range** and **areas** it covers within that range are **stable or increasing**'.*

Any event which contributes to the reduction of the areas covered by a natural habitat for which this site has been designated can be regarded as deterioration. For example, the importance of reduction of the area of the habitat has to be assessed in relation to the total surface occupied in the site according to the conservation status of the habitat concerned;

- *'The **specific structure and functions of the area necessary for its long-term maintenance exist** and are likely to continue to exist in the foreseeable future'.*

Any impairment of the factors necessary for the long-term maintenance of the habitats can be regarded as deterioration.

The functions necessary for the long-term maintenance depend of course on the habitat concerned (it would be useful to have common indicators enabling to assess these elements for each habitat type). Member States have to know these requirements (by means of studies, data collection, etc.) since Article 6(1) provides that they have to take measures *'which correspond to the ecological requirements of the habitats in Annex I and species in Annex II'.*

- *'The **conservation status of its typical species** is favourable as defined in (i)' (see Section 2.3 for the definition of item (i) of Article 1).*

Habitat deterioration occurs in a site when the area covered by the habitat in this site is reduced or the specific structure and functions necessary for the long-term maintenance or the good conservation status of the typical species which are associated with this habitat are reduced in comparison to their initial status. This assessment is made according to the contribution of the site to the coherence of the network.

3.6.2. Disturbance of species

Contrary to deterioration, disturbance does not directly affect the physical conditions of a site; it concerns the species and it is often limited in time (noise, source of light, etc.). The intensity, duration and frequency of repetition of disturbance are therefore important parameters.

In order to be significant a disturbance must affect the conservation status. The conservation status of a species is defined in Article 1(i) (see Section 2.3).

In order to assess whether a disturbance is significant in relation to the objectives of the directive, reference can be made to the definition of the **favourable conservation status of a species** given in Article 1(i), on the basis of the following factors.

- *'**Population dynamics data** on the species concerned indicate that it is maintaining itself on a long-term basis as a viable element of its natural habitats'.*

Any event which contributes to the long-term decline of the population of the species on the site can be regarded as a significant disturbance.

- *'The **natural range** of the species is **neither being reduced** nor is likely to be reduced for the foreseeable future'*

Any event contributing to the reduction or to the risk of reduction of the range of the species within the site can be regarded as a significant disturbance.

- *'There is, and will probably continue to be, a **sufficiently large habitat** to maintain its populations on a long-term basis'.*

Any event which contributes to the reduction of the size of the habitat of the species within the site can be regarded as a significant disturbance.

Disturbance of a species occurs on a site when the population dynamics data for this site show that the species could no longer constitute a viable element of it in comparison to the initial situation. This assessment is done according to the contribution of the site to the coherence of the network.

4. Article 6(3)

Clarification of the concepts of *plan or project; significant effect; appropriate assessment; site's conservation objectives; competent authorities; opinion of the public; integrity of the site*

4.1. The text

'Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.'

4.2. Scope

As regards **purpose and context**, the role of the third and fourth paragraphs of Article 6 needs to be considered in relation to that of the first (or, in the case of SPAs, with that of the first and second paragraphs of Article 4 of Directive 79/409/EEC) and second paragraphs of Article 6. In particular, it is important to remember that, even if it is determined that an initiative or activity does not fall within the scope of Article 6(3), it will still be necessary to make it compatible with the other aforementioned provisions.

It may be noted that ecologically positive or ecologically compatible activities may already be accommodated within Article 6(1) and (2) — for example, traditional farming practices which sustain particular habitat types and species. The provisions of Article 6(3) and (4) constitute a form of development regime, setting out the circumstances within which plans and projects with negative effects may or may not be allowed. The provisions thus ensure that negative economic and other non-ecological requirements can be balanced against conservation objectives.

Article 6(3) and (4) define a **step-wise procedure** for considering plans and projects ([10]).

(a) The first part of this procedure consists of an assessment stage and is governed by Article 6(3), first sentence.

(b) The second part of the procedure, governed by Article 6(3), second sentence, relates to the decision of the competent national authorities.

(c) The third part of the procedure (governed by Article 6(4)) comes into play if, despite a negative assessment, it is proposed not to reject a plan or project but to give it further consideration.

The applicability of the procedure and the extent to which it applies depend on several factors, and in the sequence of steps, each step is influenced by the previous step.

As regards **geographical scope**, the provisions of Article 6(3) are not restricted to plans and projects which exclusively occur in or cover a protected site; they also target developments situated outside the site but likely to have a significant effect on it.

Article 6(3) and (4) set out the circumstances within which plans and projects with negative effects may or may not be allowed. Activities not falling within the scope of Article 6(3) will still have to be compatible with the provisions of Article 6(1) — or, in the case of SPAs, Article 4(1) and (2) of Directive 79/409/EEC — and 6(2) of Directive 92/43/EEC.

4.3. What is meant by 'plan or project not directly connected with or necessary to the management of the site'?

In as much as Directive 92/43/EEC does not define 'plan' or 'project', due consideration must be given to general principles of interpretation, in particular the principle that an individual provision of Community law must be interpreted on the basis of its wording and of its purpose and the context in which it occurs.

([10]) A simplified flow chart of this procedure is presented in Annex III at the end of this document.

There are two arguments for giving a broad interpretation to 'plan' or 'project'.

- Firstly, the directive does not circumscribe the scope of either 'plan' or a 'project' by reference to particular categories of either. Instead, the key limiting factor is whether or not they are likely to have a significant effect on a site (see Annex I, point 5).
- Secondly, a corollary of the continued applicability of Article 6(2) to activities excluded from the scope of Article 6(3) and (4) is that, the more narrowly 'plan' and 'project' are defined, the more potentially restricted is the means to balance a conservation interest against a damaging non-conservation interest. This may produce disproportionate or inconsistent results.

4.3.1. Project

Support for a broad definition of 'project' is reinforced, by analogy, if we refer to **Directive 85/337/EEC on the assessment of the effects of certain public and private projects on the environment** (as amended by Directive 97/11/EC) ([11]). That directive operates in a similar context, setting rules for the assessment of environmentally significant projects. Article 1(2) of Directive 85/337/EEC provides that 'project' means:

'*the execution of construction works or of other installations or schemes — other interventions in the natural surroundings and landscape including those involving the extraction of mineral resources*.'

As can be seen, this is a very broad definition (see Annex I, point 6), which is not limited to physical construction. For example, a significant intensification of agriculture which threatens to damage or destroy the semi-natural character of a site may be covered.

4.3.2. Plan

The word 'plan' has a potentially very broad meaning ([12]). This point has already been noted in an Advocate-General opinion (see Annex I, point 7).

Of obvious relevance are **land-use plans**. Some have direct legal effects for the use of land, others only indirect effects. For instance, regional or geographically extensive spatial plans are often not applied directly but form the basis for more detailed plans or serve as a framework for development consents, which then have direct legal effects. Both types of land-use plans should be considered covered by Article 6(3) to the extent that they are likely to have relevant significant effects on a Natura 2000 site.

Sectoral plans can also be considered as within the scope of Article 6(3), again in so far as they are likely to have a significant effect on a Natura 2000 site. Examples might include transport network plans, waste management plans and water management plans.

However, a distinction needs to be made with 'plans' which are in the nature of policy statements, i.e. policy documents which show the general political will or intention of a ministry or lower authority. An example might be a general plan for sustainable development across a Member State's territory or a region. It does not seem appropriate to treat these as 'plans' for the purpose of Article 6(3), particularly if any initiatives deriving from such policy statements must pass through the intermediary of a land-use or sectoral plan. However, where the link between the content of such an initiative and likely significant effects on a Natura 2000 site is very clear and direct, Article 6(3) should be applied.

([11]) OJ L 175, 5.7.1985, p. 40 and OJ L 73, 14.3.1997, p. 5 respectively.

([12]) The Commission has proposed a directive on the environmental assessment of plans and programmes (COM(96) 511 final, amended proposal COM(1999) 73) which may be of assistance in considering the term 'plan'. In that context, the terms 'plans' and 'programmes' can be used alternatively.

Where one or more specific projects are included in a plan in a general way but not in terms of project details, the assessment made at plan level does not exempt the specific projects from the assessment requirements of Article 6(3) in relation to details not covered by the plan assessment.

4.3.3. Not directly connected with or necessary to the management ...

From the context and purpose of Article 6, it is apparent that the term 'management' is to be treated as referring to the 'conservation' management of a site, i.e. the term 'management' is to be seen in the sense in which it is used in Article 6(1).

In making provision for conservation management plans, Article 6(1) of Directive 92/43/EEC envisages flexibility for Member States as regards the form such plans can take. The plans can either be specifically designed for the sites or 'integrated into other development plans'. Thus it is possible to have a 'pure' conservation management plan or a 'mixed' plan with conservation as well as other objectives.

The words '*not directly connected with or necessary to ...*' ensure that a non-conservation component of a plan or project which includes conservation management amongst its objectives may still require assessment.

For example, commercial timber harvesting may form part of a conservation management plan for a woodland designated as a special area of conservation. In as much as the commercial dimension is not necessary to the site's conservation management, it may need to be considered for assessment.

There may be circumstances where a plan or project directly connected with or necessary for the management of one site may affect another site.

For example, in order to improve the flooding regime of one site, it may be proposed to build a barrier in another site, with a possible significant adverse effect on the latter. In such a case, the plan or project should be the subject of an assessment as regards the affected site.

The term 'project' should be given a broad interpretation to include both construction works and other interventions in the natural environment. The term 'plan' also has a broad meaning, including land-use plans and sectoral plans or programmes but leaving out general policy statements. Plans and projects related to conservation management of the site, either individually or as components of other plans and projects, should generally be excluded from the provisions of Article 6(3).

4.4. How to determine whether a plan or project is 'likely to have a significant effect thereon, either individually or in combination with other plans or projects'

This phrase encapsulates a cause-and-effect relationship. On the one hand, it is necessary to explore what sorts of effects are covered (*'significant effect'*), and then to explore what sorts of causes are likely to create such effects (*'likely to have ... either individually or in combination'*).

Determining whether a plan or project is likely to have a significant effect will have practical and legal consequences. Therefore, when a plan or project is proposed, it is important that, firstly, this key issue is considered, and that, secondly, the consideration is capable of standing up to scientific and expert scrutiny.

Proposals that are considered as not likely to have significant effects can be processed without reference to the succeeding steps of Article 6(3) and (4). However, Member States are advised that the reasons for reaching such a conclusion should be justified, and that it is good and prudent practice to record them.

4.4.1. Significant effect

The notion of what is a 'significant' effect cannot be treated in an arbitrary way. In the first place, the directive uses the term in an objective context (i.e. it does not qualify it with discretionary formulae). In the second place, a consistency of approach to what is 'significant' is necessary to ensure that Natura 2000 functions as a coherent network.

While there is a need for objectivity in interpreting the scope of the term 'significant', clearly such objectivity cannot be divorced from the specific features and environmental conditions of the protected site concerned by the plan or project. In this regard, the conservation objectives of a site as well as prior or baseline information about it can be very important in more precisely identifying conservation sensitivities. Some of this information will be present in the data that accompanies the site selection process under Article 4 of Directive 92/43/EEC (see Section 4.5.3). Member States may also have available detailed site conservation management plans which describe variations in sensitivity within a site.

Against this background, it is clear that what may be significant in relation to one site may not be in relation to another (see Annex I, point 8).

For example, a loss of a hundred square metres of habitat may be significant in relation to a small rare orchid site, while a similar loss in a large steppic site may be insignificant.

The notion of what is 'significant' needs to be interpreted objectively. At the same time, the significance of effects should be determined in relation to the specific features and environmental conditions of the protected site concerned by the plan or project, taking particular account of the site's conservation objectives.

4.4.2. Likely to have ...

The safeguards set out in Article 6(3) and (4) are triggered not by a **certainty** but by a **likelihood** of significant effects. Thus, in line with the precautionary principle, it is unacceptable to fail to undertake an assessment on the basis that significant effects are not certain.

It is again useful to refer to Directive 85/337/EEC, since the formula 'likely to have a significant effect' is almost identical to the basic formula used to create the assessment duty of Member States under the earlier directive ([13]). Directive 85/337/EEC and amending Directive 97/11/EEC are also of assistance in setting out a range of factors which may contribute to a likelihood of a significant effect.

([13]) See Article 2(1) of Directive 85/337/EEC.

Any proposal which is deemed to require an assessment under Directive 85/337/EEC on the grounds, *inter alia*, that it is likely to significantly affect a Natura 2000 site can be judged to also come under the assessment requirement of Article 6(3).

Directive 85/337/EEC in its Article 2(1) refers in particular to the factors of nature, size and location of the project. Amending directive 97/11/EEC in its Annex III presents a more detailed set of factors comprising, *inter alia*: the size of a project; the production of waste; pollution and nuisances; the risk of accidents; existing land use; the relative abundance, quality and regenerative capacity of natural resources in the area; the absorption capacity of the natural environment, with particular attention to natural areas and sites classified or protected under Directives 79/409/EEC and 92/43/EEC; the extent of the potential impact; the magnitude and complexity of the impact; the probability of the impact; the duration, frequency and reversibility of the impact.

A likelihood of significant effects may arise not only from plans or projects located **within** a protected site but also from plans or projects located **outside** a protected site. For example, a wetland may be damaged by a drainage project located some distance outside the wetland's boundaries. For this reason, it is important that Member States, both in their legislation and in their practice, allow for the Article 6(3) safeguards being applied to development pressures which are external to a Natura 2000 site but which are likely to have significant effects within it.

The procedure of Article 6(3) and (4) is triggered not by a certainty but by a likelihood of significant effects, arising not only from plans or projects located within but also outside a protected site.

4.4.3. ... either individually or in combination with other plans or projects

A series of individually modest impacts may in combination produce a significant impact. Article 6(3) tries to address this by taking into account the combination of effects from other plans or projects. It remains to be determined what other plans and projects are covered. In this regard, Article 6(3) does not explicitly define which other plans and projects are within the scope of the combination provision.

It is important to note that the underlying intention of this combination provision is to take account of cumulative impacts, and these will often only occur over time. In that context, one can consider plans or projects which are **completed; approved but uncompleted**; or **not yet proposed**:

- In addition to the effects of those plans or projects which are the main subject of the assessment, it may be appropriate to consider the effects of already completed plans and projects in this 'second level' of assessment. Although already completed plans and projects are excluded from the assessment requirements of Article 6(3), it is important that some account is still taken of such plans and projects in the assessment, if they have continuing effects on the site and point to a pattern of progressive loss of site integrity.

  Such already completed plans and projects may also raise issues under Article 6(1) and (2) of Directive 92/43/EEC if their continued effects give rise to a need for remedial or countervailing conservation measures or measures to avoid habitat deterioration or species disturbance.

- Plans and projects which have been approved in the past and which have not been implemented or completed should be included in the combination provision.
- On grounds of legal certainty, it would seem appropriate to restrict the combination provision to other plans or projects which have been **actually proposed**. At the same time, it must be evident that, in considering a proposed plan or project, Member States do not create a presumption in favour of other as yet unproposed plans or projects in the future.

For example, if a residential development is considered not to give rise to a significant effect and is therefore approved, the approval should not create a presumption in favour of further residential developments in the future.

When determining likely significant effects, the combination of other plans or projects should also be considered to take account of cumulative impacts. It would seem appropriate to restrict the combination provision to other plans or projects which have been actually proposed.

4.5. What is meant by 'appropriate assessment of its implications for the site in view of the site's conservation objectives'?

The 'appropriate assessment' raises questions concerning form and content.

4.5.1. Form of the assessment

As pointed out above, the trigger for an assessment under Directive 85/337/EEC is almost identical to the trigger for an assessment under Directive 92/43/EEC, being essentially related to the likelihood of significant effects.

- The European Court of Justice has emphasised that, in relation to the transposition of Directive 85/337/EEC (and by implication its application), it is necessary to take into account sensitivity of location (see Annex I, point 9). For a project likely to have a significant effect on a site protected by Article 3, it will therefore often be appropriate to undertake an assessment that fulfils the requirements of Directive 85/337/EEC.

  Where an assessment for the purposes of Article 6(3) takes the form of an assessment under Directive 85/337/EEC, this will provide obvious assurances in terms of records and transparency.

- Where an assessment for the purposes of Article 6(3) does not take the form of an assessment under Directive 85/337/EEC, questions arise as to what may then be considered 'appropriate' in terms of form.

  In the first place, an assessment should be **recorded**. A corollary of the argument that the assessment should be recorded is the argument that it should be **reasoned**. Article 6(3) and (4) requires decision-makers to take decisions in the light of particular information relating to the environment. If the record of the assessment does not disclose the reasoned basis for the subsequent decision (i.e. if the record is a simple unreasoned positive or negative view of a plan or project), the assessment does not fulfil its purpose and cannot be considered 'appropriate'.

Finally, **timing** is also important. The assessment is a step preceding and providing a basis for other steps — in particular, an approval or refusal of a plan or project. The assessment should therefore be considered as only comprising what is in the record of the assessment pre-dating these further steps. Of course, where a plan or project undergoes redesign before a decision is taken on it, it is quite in order to revise the assessment as part of an iterative process. However, it should not be open to authorities to add retrospectively to an assessment once the succeeding step in the sequence of steps set out in Article 6(3) and (4) has been taken.

In some cases, an assessment under Directive 85/337/EEC (as amended by Directive 97/11/EC) could accommodate an assessment under Article 6(3). The latter should anyhow be recorded and provide a basis for other steps; in particular it should be sufficiently reasoned to allow the right decision to be taken.

4.5.2. Content of the assessment

As regards content, an Article 6(3) assessment is narrower in scope than an assessment under Directive 85/337/EEC, being confined to implications for the site in view of the site's conservation objectives.

However, the ecological impacts of the plan or project may not be properly assessed in many cases without an assessment of the other environmental components (i.e. soil, water, landscape, etc) set out in Article 3 of Directive 85/337/EEC.

Furthermore, even allowing for an exclusively conservation focus, the assessment in its methodology can usefully draw on the methodology envisaged by Directive 85/337/EEC. In particular, Directive 85/337/EEC envisages that an assessment may contain information on several points, including a description of the project, a description of the aspects of the environment likely to be affected by the project and a description of the project's likely significant effects ([14]).

It is worth noting that, although, for purposes of Article 6(3), an assessment does not, strictly speaking, need to look beyond the plan or project proposed to address alternative solutions and mitigation measures, there may be a range of benefits from doing so.

In particular, an examination of possible **alternative solutions and mitigation measures** may make it possible to ascertain that, in the light of such solutions or mitigation measures, the plan or project will not adversely affect the integrity of the site.

As regards **mitigation measures**, these are measures aimed at minimising or even cancelling the negative impact of a plan or project, during or after its completion.

Mitigation measures are an integral part of the specifications of a plan or project. They may be proposed by the plan or project proponent and/or required by the competent national authorities. For example, they may cover:

- the dates and the timetable of implementation (e.g., not to operate during the breeding season of a particular species);

([14]) That directive makes reference to 'direct effects and any indirect, secondary, cumulative, short, medium and long-term, permanent, positive and negative effects' — see footnote 1 of Annex III.4 of the directive, which is identical to footnote 1 of Annex IV.4 of Directive 97/11/EC.

- the type of tools and operation to be carried out (e.g., to use a specific dredge at a distance agreed upon from the shore in order not to affect a fragile habitat);
- the strictly inaccessible areas inside a site (e.g., hibernation burrows of an animal species).

Mitigation measures are distinguishable from compensatory measures *sensu stricto* (see Section 5.4). Of course, well-implemented mitigation measures limit the extent of the necessary compensatory measures by reducing the damaging effects which require compensation.

Even where a broad assessment does not lead to the conclusion that the plan or project will not adversely affect the integrity of a site, the provisions of Article 6(4) suggest the practical value of such a broad exercise.

As regards **alternative solutions**, once it is proposed to consider approving a damaging plan or project, these become relevant (for more details, see under Section 5.3.1). Moreover, a reference to such solutions may also be needed to satisfy the independent requirements of Directive 85/337/EEC.

All these aspects above may be considered as ideally forming part of an iterative process seeking to improve the siting and design of a plan or project at the earliest stages.

Finally, the 'in combination' reference in Article 6(3) (see Section 4.4.3) has two implications in terms of the content of an assessment.

- Firstly, it means that the content of an assessment should address the potential for 'in combination' effects to arise from a specific plan or project under consideration in an approval procedure and other plans or projects not under consideration in the same approval procedure.
- Secondly, it means that the contents of the assessments of different plans or projects under consideration at the same time should include references to and take account of each other in so far as the different plans and projects give rise to 'in combination' effects.

An Article 6(3) assessment should focus on the implications for the site in view of the site's conservation objectives. It could in its methodology usefully draw on the methodology envisaged by Directive 85/337/EEC. In particular, an examination of possible mitigation measures and alternative solutions may make it possible to ascertain that, in the light of such solutions or mitigation measures, the plan or project will not adversely affect the site. 'In combination' effects need also to be addressed in an assessment.

4.5.3. How are 'the site's conservation objectives' established?

Article 4(1) requires Member States to propose a list 'indicating which natural habitat types in Annex I and which species in Annex II that are native to its territory the sites host'. According to its second paragraph, the information on each site shall include a map of the site, its name, location, extent and the data resulting from the application of the criteria specified in Annex III (Stage 1) provided in a format established by the Commission ([15]).

The format requires that all Annex I habitat types present on a site and all Annex II species occurring at the site should be mentioned in the appropriate place in the data form. This information forms the basis for a Member State establishing 'the site's conservation objectives', for example through a man-

([15]) Standard data form, established by Commission Decision 97/266/EC of 18 December 1996 (OJ L 107, 24.4.1997, p. 1).

agement plan. The reason for a site's inclusion in the network is evidently the protection of those habitats and species. Sometimes, there may be competition between different habitat types and species, and it may, of course, be appropriate to prioritise when establishing the site's conservation objectives (for example, by giving precedence to a priority habitat type as against a competing non-priority habitat type).

Where the presence of the Annex I habitat type or Annex II species is deemed to be 'non-significant' for purposes of the format, these should not be considered as included in 'the site's conservation objectives'. The Member States are also invited to present information on other important species of flora and fauna than those listed in Annex II (point 3.3). This information has no relevance either for the determination of a site's conservation objectives.

The information provided according to the standard data form established by the Commission forms the basis for a Member State's establishment of the site's conservation objectives.

4.6. Decision-making

4.6.1. The 'competent national authorities'

It is clear that the word 'national' in this expression has been used in contrast with the word 'Community' or 'international'. Thus, the term refers not only to authorities within the central administration but also to regional, provincial or municipal authorities, which have to give an authorisation or consent to a plan or project.

A court can constitute a competent authority if it has the discretion to make a decision on the substance of a proposed plan or project for purposes of Article 6(3).

Competent national authorities are those entitled to give an authorisation or consent to a plan or project.

4.6.2. When is it appropriate to obtain the opinion of the general public?

Directive 92/43/EEC does not indicate when it is appropriate to obtain the opinion of the general public. However, consultation of the public is an essential feature of Directive 85/337/EEC. Clearly therefore, where the assessment required by Article 6(3) takes the form of an assessment under Directive 85/337/EEC, public consultation is necessary.

In this context, it is worth mentioning the possible longer-term implications of the Aarhus Convention ([16]) which emphasises the importance of public consultation in relation to environmental decision-making.

Public consultation should be considered in the light of the provisions of Directive 85/337/EEC and the Aarhus Convention.

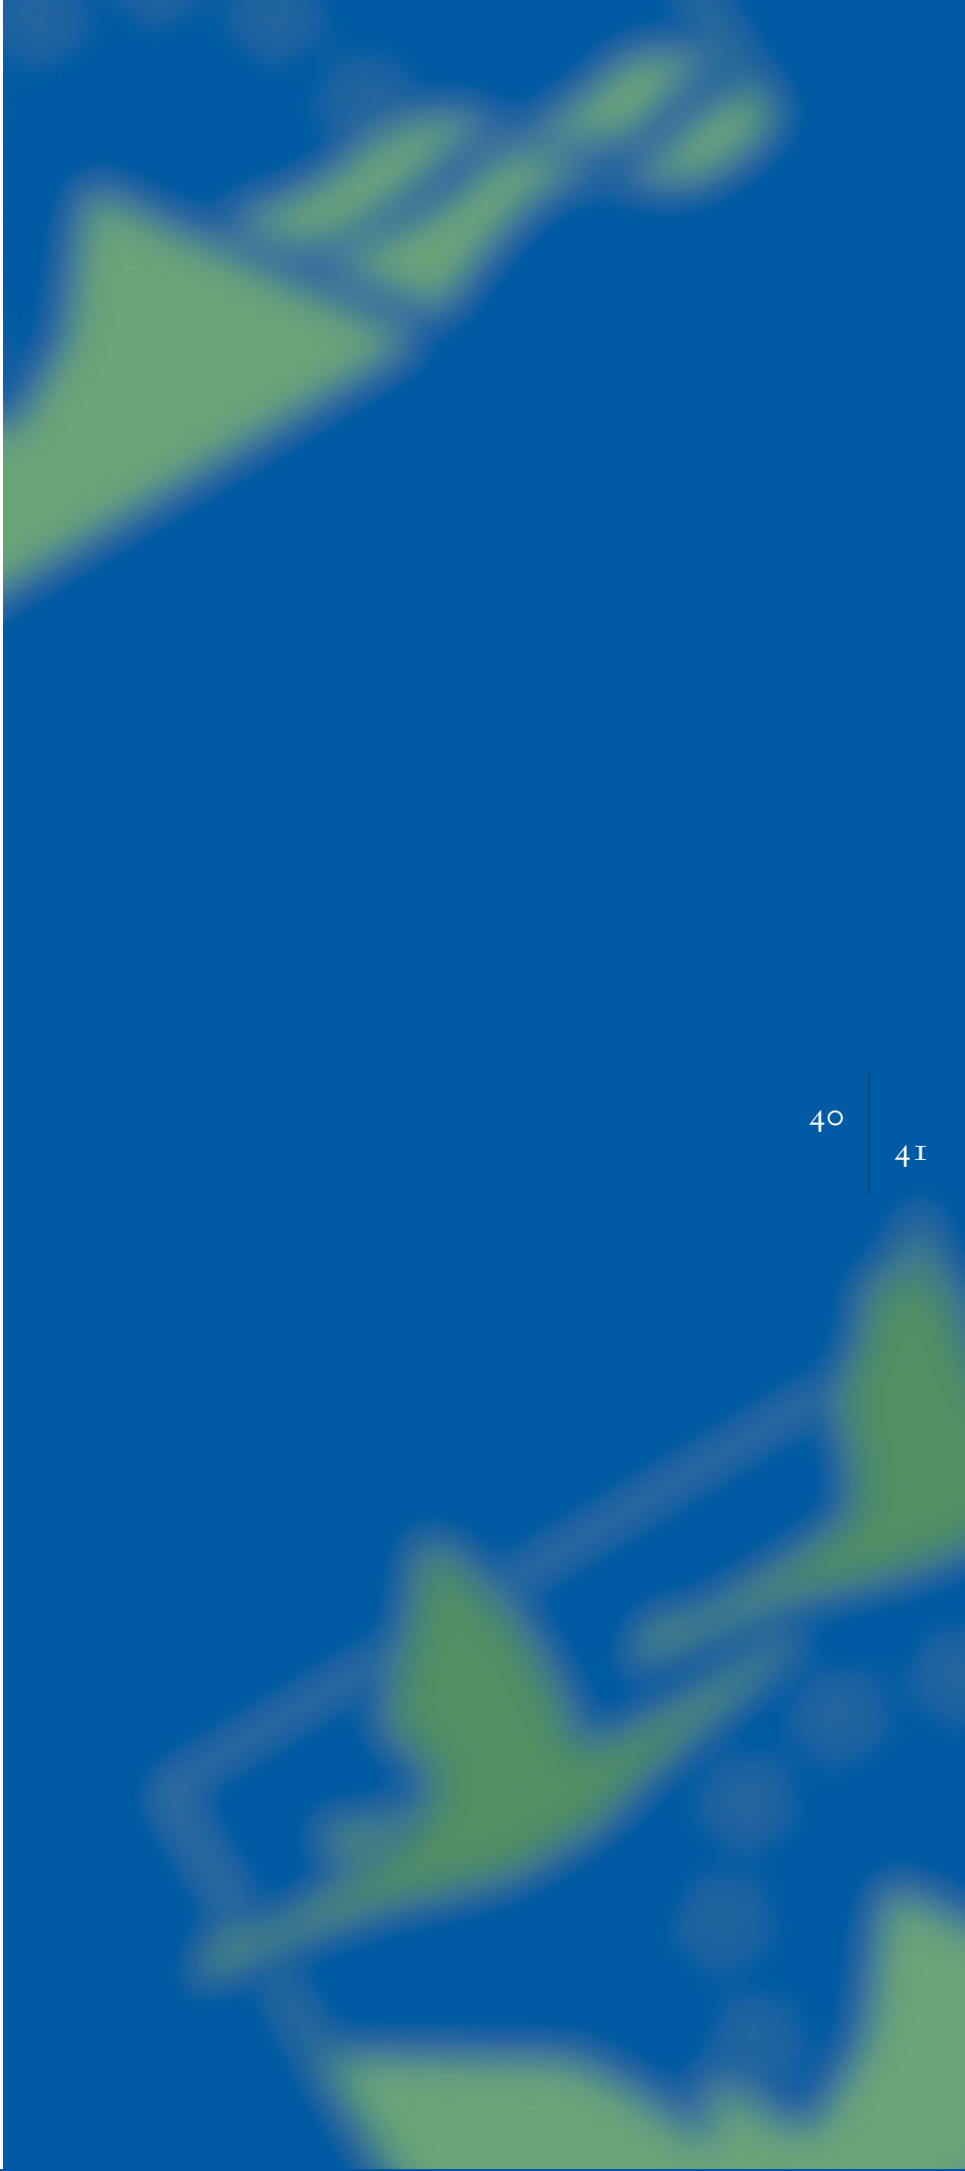
([16]) Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters. This Convention was concluded in Aarhus, Denmark in June 1998. The European Community is one of the signatories.

4.6.3. The concept of the 'integrity of the site'

It is clear from the context and from the purpose of the directive that the 'integrity of the site' relates to the site's conservation objectives (see Section 4.5.3 above). For example, it is possible that a plan or project will adversely affect the integrity of a site only in a visual sense or only habitat types or species other than those listed in Annex I or Annex II. In such cases, the effects do not amount to an adverse effect for purposes of Article 6(3), provided that the coherence of the network is not affected.

On the other hand, the expression 'integrity of the site' shows that focus is here on the specific site. Thus, it is not allowed to destroy a site or part of it on the basis that the conservation status of the habitat types and species it hosts will anyway remain favourable within the European territory of the Member State.

As regards the connotation or meaning of 'integrity', this can be considered as a quality or condition of being whole or complete. In a dynamic ecological context, it can also be considered as having the sense of resilience and ability to evolve in ways that are favourable to conservation.



The 'integrity of the site' has been usefully defined as '*the coherence of the site's ecological structure and function, across its whole area, or the habitats, complex of habitats and/or populations of species for which the site is or will be classified*' ([17]).

A site can be described as having a high degree of integrity where the inherent potential for meeting site conservation objectives is realised, the capacity for self-repair and self-renewal under dynamic conditions is maintained, and a minimum of external management support is required.

When looking at the 'integrity of the site', it is therefore important to take into account a range of factors, including the possibility of effects manifesting themselves in the short, medium and long-term.

The integrity of the site involves its ecological functions. The decision as to whether it is adversely affected should focus on and be limited to the site's conservation objectives.

([17]) PPG 9, UK Department of the Environment, October 1994.

5. Article 6(4)

Clarification of the concepts of *alternative solutions; imperative reasons of overriding public interest; compensatory measures; overall coherence; opinion of the Commission*

5.1. The text

'If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest'.

5.2. Scope

This provision forms part of the procedure of the assessment and possible authorisation, by the competent national authorities, of plans and projects likely to affect the special area of conservation (SAC). Two fundamental considerations arise.

- On the one hand, it addresses specific situations (exceptions) with regard to the general rule of Article 6(3) according to which authorisation can only be granted to plans or projects not affecting the integrity of the sites concerned.
- On the other hand, its concrete application has to be done in respect of the various steps provided for and in the sequential order established.

The preliminary assessment of the impacts of a plan or project on the site, provided for in Article 6(3), enables the competent national authorities to arrive at conclusions regarding the consequences of the initiative envisaged in relation to the integrity of the site concerned. If these conclusions are positive, in the sense that there is a high degree of certainty that the initiative in question will not affect this site, the competent authorities can give their consent on the plan or project. In case of doubt, the precautionary principle should be applied and procedures under Article 6(4) followed, as in the case of negative conclusions.

Being a derogation from Article 6(3) this provision has to be **interpreted in a restrictive way**, so that its application is limited to circumstances where all the conditions required are satisfied. In this regard, it falls on whoever wants to make use of this exception to prove, as a prerequisite, that the aforementioned conditions indeed exist in each particular case.

The provisions of Article 6(4) apply when the results of the preliminary assessment under Article 6(3) are negative or uncertain. The sequential order of its steps has to be followed.

5.3. Initial considerations

5.3.1. Examining alternative solutions

The **first step** of the competent authorities is to examine the possibility of resorting to alternative solutions which better respect the integrity of the site in question. Such solutions should normally already have been identified within the framework of the initial assessment carried out under Article 6(3). They could involve alternative locations (routes in case of linear developments), different scales or designs of development, or alternative processes. The 'zero-option' should be considered too.

In conformity with the principle of subsidiarity, it rests with the competent national authorities to make the necessary comparisons between these alternative solutions. It should be stressed that the reference parameters for such comparisons deal with aspects concerning the conservation and the maintenance of the integrity of the site and of its ecological functions. In this phase, therefore, other assessment criteria, such as economic criteria, cannot be seen as overruling ecological criteria.

It rests with the competent national authorities to assess alternative solutions. This assessment should be made against the site's conservation objectives.

5.3.2. Examining imperative reasons of overriding public interest

In the absence of alternative solutions — or in the presence of solutions having even more negative environmental effects on the site concerned, with regard to the abovementioned conservation aims of the directive — the **second step** of the competent authorities is to examine the existence of imperative reasons of overriding public interest, including those of a social or economic nature, which require the realisation of the plan or project in question.

The concept of '*imperative reason of overriding public interest*' is not defined in the directive. However, Article 6(4) second subparagraph mentions human health, public safety and beneficial consequences of primary importance for the environment as examples of such imperative reasons of overriding public interests. As regards the '*other imperative reasons of overriding public interest*' of social or economic nature, it is clear from the wording that only public interests, promoted either by public or private bodies, can be balanced against the conservation aims of the directive. Thus, projects that lie **entirely** in the interest of companies or individuals would not be considered to be covered.

So far the European Court of Justice has not given clear indications for the interpretation of this specific concept. It may therefore be helpful to refer to other fields of Community law, where similar concepts appear.

The 'imperative requirement' concept was worked out by the Court of Justice as an exception to the principle of free movement of goods. Among these imperative requirements which can justify national measures restricting freedom of movement, the Court recognised public health and environment protection, as well as the pursuit of legitimate goals of economic and social policy.

In addition, Community law also knows the concept of 'service of general economic interest', evoked in Article 86(2) (ex 90(2)) of the Treaty, within the framework of the exception to the rules of competition envisaged for companies responsible for the management of such services. In a communication on services of general interest in Europe ([18]), the Commission, taking account of case law on the matter, gave the following definition of services of general economic interest: '*they describe activities of commercial service fulfilling missions of general interest, and subject consequently by the Member States to specific obligations of public service* ([19]). *It is the case in particular of services in transport, energy, communication networks*'.

Having regard to the **structure of the provision**, in the specific cases, the competent national authorities have to make their approval of the plans and projects in question subject to the condition that the balance of interests between the conservation objectives of the site affected by those initiatives and the abovementioned imperative reasons weighs in favour of the latter. This should be determined along the following considerations.

(a) The public interest must be **overriding:** it is therefore clear that not every kind of public interest of a social or economic nature is sufficient, in particular when seen against the particular weight of the interests protected by the directive (see, for example, its fourth recital stating '*Community's natural heritage')* (see Annex I, point 10).

(b) In this context, it also seems reasonable to assume that the public interest can only be overriding if it is a **long-term interest**; short-term economic interests or other interests which would only

([18]) COM(96) 443, of the 11.9.1996.

([19]) The public service obligations, in their turn, are characterised for the respect of some essential principles of operation, such as continuity, equal access, universality and transparency, but can vary from one Member State to the other, according to different situations, such as geographical or technical constraints, political and administrative organisation, history and traditions.

yield short-term benefits for society would not appear to be sufficient to outweigh the long-term conservation interests protected by the directive.

It is reasonable to consider that the 'imperative reasons of overriding public interest, including those of a social and economic nature' refer to situations where plans or projects envisaged prove to be indispensable:
— within the framework of actions or policies aiming to protect fundamental values for citizens' lives (health, safety, environment);
— within the framework of fundamental policies for the State and society;
— within the framework of carrying out activities of an economic or social nature, fulfilling specific obligations of public service.

5.4. Adopting compensatory measures

5.4.1. What is meant by 'compensatory measures' and when should they be considered?

The term '*compensatory measures*' is not defined in the 'Habitats' directive. Experience would suggest the following distinction.

- Mitigation measures in the broader sense, which aim to minimise or even cancel the negative impacts on the site itself (see Section 4.5).
- Compensatory measures *sensu stricto*: independent of the project, they are intended to compensate for the effects on a habitat affected negatively by the plan or project. For example, general tree-planting to soften a landscape impact does not compensate for the destruction of a wooded habitat with quite specific characteristics.

Measures required for the 'normal' implementation of the 'Habitats' or 'Birds' directives cannot be considered compensatory for a damaging project. For example, the implementation of a management plan or the proposal/designation of a new area, already inventoried as of Community importance, constitute 'normal' measures for a Member State. Compensatory measures should be additional to proper implementation.

The compensatory measures should be considered only after having precisely ascertained a negative impact on the integrity of a Natura 2000 site. Proposing compensatory measures from the beginning could not exempt from the need to respect beforehand the steps described in Article 6, in particular the study of alternatives and the comparative assessment of the interest of the project/plan in relation to the natural value of the site.

The compensatory measures constitute measures specific to a project or plan, additional to the normal practices of implementation of the 'Nature' directives. They aim to offset the negative impact of a project and to provide compensation corresponding precisely to the negative effects on the species or habitat concerned. The compensatory measures constitute the 'last resort'. They are used only when the other safeguards provided for by the directive are ineffectual and the decision has been taken to consider, nevertheless, a project/plan having a negative effect on the Natura 2000 site.

5.4.2. Content of compensatory measures

The compensatory measures *sensu stricto* have to ensure the maintenance of the contribution of a site to the conservation at a favourable status of one or several natural habitats '*within the biogeographical region concerned*'. It results from the fact that:

- a site should not be irreversibly affected by a project before the compensation is indeed in place. For example, a wetland should normally not be drained before a new wetland, with equivalent biological characteristics, is available for inclusion in the Natura 2000 network;
- compensation must be additional in relation to the Natura 2000 network to which the Member State should have contributed in conformity with the directives.

In terms of the **'Birds' directive**, compensation cannot be the designation of an inventoried area which should have already been classified by the Member State. One could on the other hand accept, as a compensation, work to improve the biological value of an area (to be designated) or of a SPA (designated) so that the carrying capacity or the food potential are increased by a quantity corresponding to the loss on the site affected by the project. *A fortiori*, the re-creation of a habitat favourable to the bird species concerned is acceptable provided the created site is available at the time when the affected site loses its natural value.

In terms of the '*Habitats' directive*, the compensation could, similarly, consist of the re-creation of a comparable habitat, the biological improvement of a substandard habitat or even the addition to Natura 2000 of an existing site the proposal of which under the directive had not been deemed essential at the time of the drawing up of the biogeographical list.

In the latter case, one could argue that overall, the project will result in a loss for this habitat type at Member State level. However, at Community level, a new site will benefit from the protection provided for in Article 6, thus contributing to the objectives of the directive.

The compensatory measures can consist of:
— recreating a habitat on a new or enlarged site, to be incorporated into Natura 2000;
— improving a habitat on part of the site or on another Natura 2000 site, proportional to the loss due to the project;
— in exceptional cases, proposing a new site under the 'Habitats' directive.

The result has normally to be operational at the time when the damage is effective on the site concerned with the project unless it can be proved that this simultaneity is not necessary to ensure the contribution of this site to the Natura 2000 network.

5.4.3. 'Overall coherence' of the Natura 2000 network

The expression '*overall coherence*' appears in Article 6(4) in the context where a plan or project is allowed to be carried out for imperative reasons of overriding public interest and the Member State has to take measures to compensate for the loss.

It also appears in Article 3(1) which states that Natura 2000 is '*a coherent European ecological network of special areas of conservation*' and in Article 3(3) which stipulates that '*where they consider it necessary, Member States shall endeavour to improve the ecological coherence of Natura 2000 by maintaining, and where appropriate developing, features of the landscape which are of major importance for wild fauna and flora, as referred to in Article 10.*'

Article 10, which deals more generally with land-use planning and development policy, stipulates that

> *'Member States shall endeavour, where they consider it necessary, in their land-use planning and development policies and, in particular, with a view to improving the ecological coherence of the Natura 200 network, to encourage the features of the landscape which are of major importance for wild fauna and flora.*
>
> *Such features are those which, by virtue of their linear and continuous structure (such as rivers with their banks or their function as stepping stones (such as ponds or small woods), are essential for the migration, dispersal and genetic exchange of wild species.'*

The word 'ecological' is used both in Article 3 and Article 10 to explain the character of the coherence. It is obvious that the expression '*overall coherence*' in Article 6(4) is used in the same meaning.

Article 6(4) requires to 'protect' the overall coherence of Natura 2000. Thus, the directive presumes that the 'original' network has been coherent. If the derogation regime is used, the situation must be corrected so that the coherence is fully restored.

- Under the **'Habitats' directive** the selection of a site for the Natura 2000 network rests on:
  - — the taking into account of habitat and species in proportions (surfaces, populations) described in the standard data form;
  - — the inclusion of the site in a biogeographical region within which it is selected;
  - — the selection criteria established by the 'Habitats' Committee and used by the European Topic Centre — Nature Conservation to advise the Commission to retain a site on the Community list.
- The **'Birds' directive** does not provide for biogeographical regions, or selection at Community level. By analogy, one could consider that **the overall coherence of the network** is ensured if: 46 47
  - — compensation is ensured along the same migration path;
  - — the compensation site(s) are accessible with certainty by the birds usually occurring on the site affected by the project.

In order to ensure the overall coherence of Natura 2000, the compensatory measures proposed for a project should therefore: (a) address, in comparable proportions, the habitats and species negatively affected; (b) concern the same biogeographical region in the same Member State; and (c) provide functions comparable to those which had justified the selection criteria of the original site.

The distance between the original site and the place of the compensatory measures is not therefore an obstacle, as long as it does not affect the functionality of the site and the reasons for its initial selection.

5.4.4. Who bears the cost of the compensation measures?

It appears logical that, in line with the 'polluter pays' principle, the promoter of a project bears the cost of the compensatory measures. It may include it in the total budget submitted to the public authorities in the event of co-financing. In this connection, the European funds could, for example, co-finance the compensatory measures for a transport infrastructure retained under the TEN (trans-European network).

A subsidy granted by a public authority for measures taken in order to compensate for damage to a Natura 2000 site can be considered as a **State aid** (within the meaning of Article 87 (ex 92) of the Treaty), should it be granted to an undertaking established in a Natura 2000 site, designated before or after the establishment of the undertaking. However, in the case of an undertaking acting as a contractor for a public authority to build an infrastructure, the subsidy would not be considered as a State aid as long as it is granted in exchange of works carried out.

The Member State is bound to compensatory measures as from the entry into force of Article 6. Their financing can fall within its competence.

5.4.5. Communication to the Commission of the compensatory measures

The competent national authorities have to communicate to the Commission the compensatory measures adopted. The provision in question specifies neither the form, nor the purpose of this communication. However, in order to facilitate that process the Commission services have prepared a standard format ([20]) for supplying information to the Commission according to the provisions of Article 6(4)1 or 6(4)2. In any case, it is not the Commission's role either to suggest compensatory measures, or to validate them scientifically.

This communication should enable the Commission to appreciate the manner in which the conservation objectives of the site in question are pursued in the particular case. While the national authorities are only specifically obliged to communicate the compensatory measures adopted, the communication of certain elements relating to the studied alternative solutions and to the imperative reasons for overriding public interest which required the realisation of the plan or project can also prove necessary, insofar as these elements affected the choice of the compensatory measures.

The communication of compensatory measures must enable the Commission to appreciate the manner in which the conservation objectives of the site in question are pursued in the particular case. However, it is not the Commission's role to suggest compensatory measures.

5.5. What happens with sites hosting priority habitats and/or species?

The second subparagraph of Article 6(4) provides for a special treatment whenever the plan or project concerns a site hosting priority habitats and/or species. The realisation of plans or projects likely to adversely affect these sites could be justified only if the evoked imperative reasons of overriding public interest concern human health and public safety or overriding beneficial consequences for the environment, or if, before granting approval to the plan or project, the Commission expresses an opinion on the initiative envisaged.

In other words, damage to the sites would only be accepted as overruling the fulfilment of the objectives of the directive when the specific imperative reasons mentioned above occur or, alternatively, after the additional procedural safeguard of an independent appraisal by the Commission.

This provision raises a number of questions relating to:

- the identification of sites concerned;

([20]) This format is presented in Annex IV of this document.

- the interpretation of the concepts of human health, public safety and the primary beneficial consequences for the environment;
- the procedure for the adoption of the Commission's opinion and the consequences which arise from this opinion.

5.5.1. The sites concerned

Article 6(4), second subparagraph, applies when the realisation of the plan or project is likely to affect a site hosting priority habitats and/or species. In this regard, it would be reasonable to consider that a plan or project:

(a) not affecting, in any manner, a priority habitat/species; or

(b) affecting a habitat/species which has not been taken into account in the selection of a site ('non-significant presence' in the standard data form)

should not de facto justify that a site should be subject to this second subparagraph.

Article 6(4), second subparagraph may be understood as applying to all sites hosting priority habitats and/or species, when these habitats and species are affected.

5.5.2. The concepts of 'human health', 'public safety' and 'primary beneficial consequences for the environment'

Human health, public safety and primary beneficial consequences for the environment constitute the most important imperative reasons of overriding public interest. However, like the concept of 'imperative reasons of overriding public interest' these three categories are not defined expressly.

48 49

Community law refers to public health and public safety reasons as ones which can justify the adoption of restrictive national measures to the free movement of goods, workers and services as well as to the right of establishment. In addition, the protection of persons' health is one of the fundamental objectives of Community policy in the field of the environment. In the same view, the primary beneficial consequences for the environment constitute a category which must be included in the aforementioned fundamental objectives of environmental policy.

Within the framework of the principle of subsidiarity, it rests with the competent national authorities to check whether such a situation occurs. Of course, any situation of this kind is likely to be examined by the Commission within the framework of its activity of control on the correct application of Community law.

As regards the concept of 'public safety', it is useful to refer to the judgement of the Court of Justice of 28 February 1991 in Case C-57/89, *Commission* v *Germany* (*'Leybucht Dykes'*). That decision preceded the adoption of Directive 92/43/EEC and hence Article 6. However, the decision retains relevance, not least because the Court's approach influenced the drafting of Article 6. At issue were construction works to reinforce dykes on the North Sea at Leybucht. These works involved a reduction in the area of an SPA. As a matter of general principle, the Court stated that the grounds justifying such a reduction must correspond to a general interest which is superior to the general interest represented by the ecological objective of the directive. In the specific case, the Court confirmed that **the danger of flooding and the protection of the coast** constituted sufficiently serious reasons to justify the dyke works and the strengthening of coastal structures as long as those measures are confined to a strict minimum.

The national authorities can authorise the realisation of the plan or project only if the proof of the existence of the aforesaid reasons of overriding public interest is given and within the limits within which the plan or project in question proves necessary for the fulfilment of the public interest in question.

5.5.3. Adoption of the Commission's opinion — its consequences

In the case of imperative reason of overriding public interest other than human health, safety and environmental benefits, the prior opinion of the Commission is necessary. Article 6(4), second subparagraph, does not specify a procedure or the specific contents of such an opinion ([21]). One must therefore refer once again to the economy and to the aims pursued by the provision in question. The opinion has to cover the assessment of the ecological values which are likely to be affected by the plan or project, the relevance of the invoked imperative reasons and the balance of these two opposed interests, as well as an evaluation of the compensation measures. That assessment involves both a scientific and economic appraisal as well as an examination of the necessity and proportionality of the realisation of the plan or project with regard to the invoked imperative reason.

From its nature, the opinion is not an act having binding legal effects. The national authorities can move away from it and decide to implement the plan or project, even if the opinion is adverse. In the latter case however, one can reasonably expect that the decision will address the Commission's arguments and explain why its opinion has not been followed. In any case the Commission can assess whether the implementation of the plan or project is in conformity with the requirements of Community law and, if necessary, initiate appropriate legal action.

The Commission, in delivering its opinion, should check the balance between the ecological values affected and the invoked imperative reasons, and evaluate the compensation measures. The opinion is not binding but in a case of non-conformity with Community law, legal action may be taken.

([21]) The relevant standard format (Annex IV) also covers the request for a Commission opinion according to the provisions of Article 6(4)2.

Annexes

Annex I

Court case references

(1) The need for a strict transposition of Article 6 has already been signalled in a case brought before the European Court of Justice (Opinion of Advocate General Fennelly in Case C-256/98, *Commission* v *France*, delivered on 16 September 1999).

(2) See the decision of the European Court of Justice in Case C-355/90, *Commission* v *Spain* [1993] ECR I-4221 ('*Santoña Marshes*') and its decision of 18 March 1999 in Case C-166/97, *Commission* v *France (Seine Estuary)*.

(3) As above.

(4) Case C-392/96, *Commission* v *Ireland*, judgment of ECJ of 21 September 1999.

(5) This point is also underlined by Advocate General Fennelly of the European Court of Justice in the case above under (1).

(6) The relevant case law of the European Court of Justice further emphasises that the concept of 'project' is to be broadly interpreted — see in particular judgment of 24 October 1996 in Case C-72/95, *Kraaijeveld*.

(7) As above under (1).

(8) To see what in practice may be considered 'significant', it is helpful to refer to the case law of the European Court of Justice, in particular Case C-355/90, *Commission* v *Spain* [1993] ECR I-4221 ('*Santoña Marshes*'). Although that case was not decided by reference to Article 6(3) and (4) of Directive 92/43/EEC (being decided by reference to the preceding protection regime for SPAs under Directive 79/409/EEC), it serves to indicate some of the types of activity which may be considered as having significant effects on a protected site.

(9) The Court has stated that '*Even a small-scale project can have significant effects on the environment if it is in a location where the environmental factors set out in Article 3 of (Directive 85/337/EEC) such as fauna and flora … are sensitive to the slightest alteration.*' (Case C-392/96, *Commission* v *Ireland*, judgment of ECJ of 21 September 1999).

(10) See also the emphasis the ECJ placed on the common responsibilities of the Member States in the context of the 'Birds' directive in Cases C-252/85 and C-262/85 (Respectively: *Commission* v *France* [1988] ECR 2243 and *Commission* v *Italy* [1987] ECR 3073).

Annex II

Considerations on management plans

While the appropriate management plans are not always necessary, at both the Galway seminar ([22]) and the Bath Conference ([23]), participants stressed that the management plans could constitute an effective means to fulfil the obligations provided for by the 'Habitats' directive.

The following extract from the conclusions of the Galway seminar sets out a number of considerations which may be helpful in view of the preparation of management plans:

1. Methodology

- Is a management plan for the site really needed? Explain why
- Who will initiate the plan? Who will be responsible for the plan?
- What is important about the site (both natural value and socioeconomic context)?
- What are its main threats?
- What do we want to achieve?
- How do we want to achieve it, according to what precise time schedule?
- How much will it cost? Will it optimise the benefits for nature conservation?

2. Objectives

The objectives of the management plan for the site have to correspond to the ecological requirements of the natural habitats and species significantly present on it in order to ensure their favourable conservation status. They must be as clear as possible, realistic, quantified and manageable. Use clear language with concrete formulation, to be understandable by everybody.

- What is the favourable conservation status for each habitat type and species present on the site?
- How does it contribute to the integrity of the site and the coherence of the network?
- Is it assessed in a dynamic way according to the evolution of the conservation status of the habitats or species concerned?

3. Consultation and implementation

It is an essential part of the process to establish a management plan needing a multidisciplinary and professional approach.

- Have you identified all the local actors?
- Have you involved them according to a bottom-up approach?
- When do you involve them?

An illustration of the consultation method is the *document d'objectifs* in France where all interest groups are invited to participate under the responsibility of the competent authorities (*préfet de région*).

([22]) Organised by the Irish authorities from 9 to 11 October 1996 in Galway, Ireland on SAC Site Management.

([23]) Organised by the Commission and the UK presidency from 28 to 30 June 1998 in Bath, UK, on Natura 2000 and People.

4. Monitoring and evaluation

These issues are one of the most important parts of the plan, especially for determining whether you have been successful with your plan. As with the objectives of the management plan, monitoring has to be clearly and accurately defined, including an analysis of financial matters.

Annex II *A*

Examples of LIFE-Nature projects ([24]) that have involved management plans or statutory, administrative or contractual measures

For each project, its relevant aspects are indicated below:

Belgique-België

- *Protection through acquisition and management of the last calcareous mires in Belgium (B4-3200/95/435)*

  The provincial authority has secured the bulk of this very valuable site by leasing it from the owners.

- *Integral Coastal Conservation Initiative (B4-3200/96/483)*

  Preparation of management plans for both the coastal (dune) and the marine habitats (offshore).

Deutschland

- *Protecting great bustard habitats in Brandenburg (B4-3200/92/14529)*

  Contractual arrangements with farmers were concluded, involving land purchase and leasing, or management agreements.

- *Preservation and re-establishment of the Trebeltal fen* and *Restoration and conservation of riverine fens in Mecklenburg-Vorpommern (B4-3200/94/731* and *B4-3200/95/260)*

  Elaboration and implementation of a management plan to restore riverine and fen habitats, through close cooperation with conservation and water authorities.

- *Transnational programme for the conservation of bats in western-central Europe (B4-3200/95/842)*

  Contractual arrangements with landowners and public authorities, and establishment of a management plan.

- *Conservation and development of nature of the Federseelandscape (B4-3200/96/489)*

  Rural land consolidation procedure, supported through agri-environment measures.

([24]) Further information can be found on Internet at: http://europa.eu.int/comm/life/nature/databas.htm

Ελλαδα - Greece

- *Management and protection of the threatened biotopes of western Crete with ecotopes and priority species (B4-3200/95/850)*

  Preparation of management plans with direct involvement of local authorities.

- *The Mediterranean monk seal in Greece: Conservation in action (B4-3200/96/500)*

  Drawing up management plans in permanent consultation with the various stakeholders.

España

- *First, second and third phases of the action programme for the conservation of the brown bear and its habitat in the Cantabrian mountains (B4-3200/92/15185 & 94/736 & 95/523)*

  Agreements with hunters for the management of hunting areas in a way that is compatible with bear conservation

- *First and second phases of the creation of a network of flora micro-reserves and purchase of land of significant botanical interest in the Valencia region (B4-3200/93/766 & 95/521)*

  Agreements with the land-owners and implementation of management plans for the microreserves (160 sites)

- *First and second phases of the conservation programme for three threatened vertebrate species in the Pyrenees (sub-project Spain) (B4-3200/93/772, 95/277, 95/524)*

  Agreements with hunters for the maintenance of reserve areas for the Gypaetus barbatus, and compensation payments to avoid timber cutting in forest within the brown bear distribution area.

- *Conservation of the little bustard, great bustard and lesser kestrel in the SPAs of Extremadura (B4-3200/96/507)*

  Agreement with farmers for the improvement of the steppe habitat.

France

- *Protection programme for bogs in France (B4-3200/95/518)*

  Preparation of a manual for the management of bog habitats.

- *Experimental drawing up of management plans for future French Natura 2000 sites (B4-3200/95/519)*

  Testing of management plans on 35 sites and drafting of a methodological guide for preparing management plans for Natura 2000 sites.

Ireland

- *Development of management plans and emergency actions aimed at candidate SACs (B4-3200/95/837)*

  Developing management plans for potential SACs

Österreich

- *Bear protection programme for Austria (B4-3200/95/847)*

  Elaboration of a management plan in cooperation with all authorities and interest groups concerned and a strong public participation input.

- *Wetland management in the Upper Waldviertel. (B4-3200/96/539)*

  Developing management plans for numerous small wetland sites (bogs, ponds, small river-areas), and partly implementing them in close contact with the affected landowners and users.

Portugal

- *Second phase of the project for conservation of the stepparian bird fauna of Castro Verde (B4-3200/95/510)*

- *New technology applied to nature conservation in Guadiana valley (B4-3200/95/511)*

  Both projects involved the preparation and implementation of management plans for areas that after the end of the projects were integrated into SPAs.

Suomi-Finland

- *Protection of biodiversity, and particularly of flying squirrel habitats, in the Nuuksio area (B4-3200/95/508)*

  Preparation of a management plan for recreation and conservation in privately owned areas.

- *Saimaa ringed seal management plan for Lake Pihlajavesi (B4-3200/95/505)*

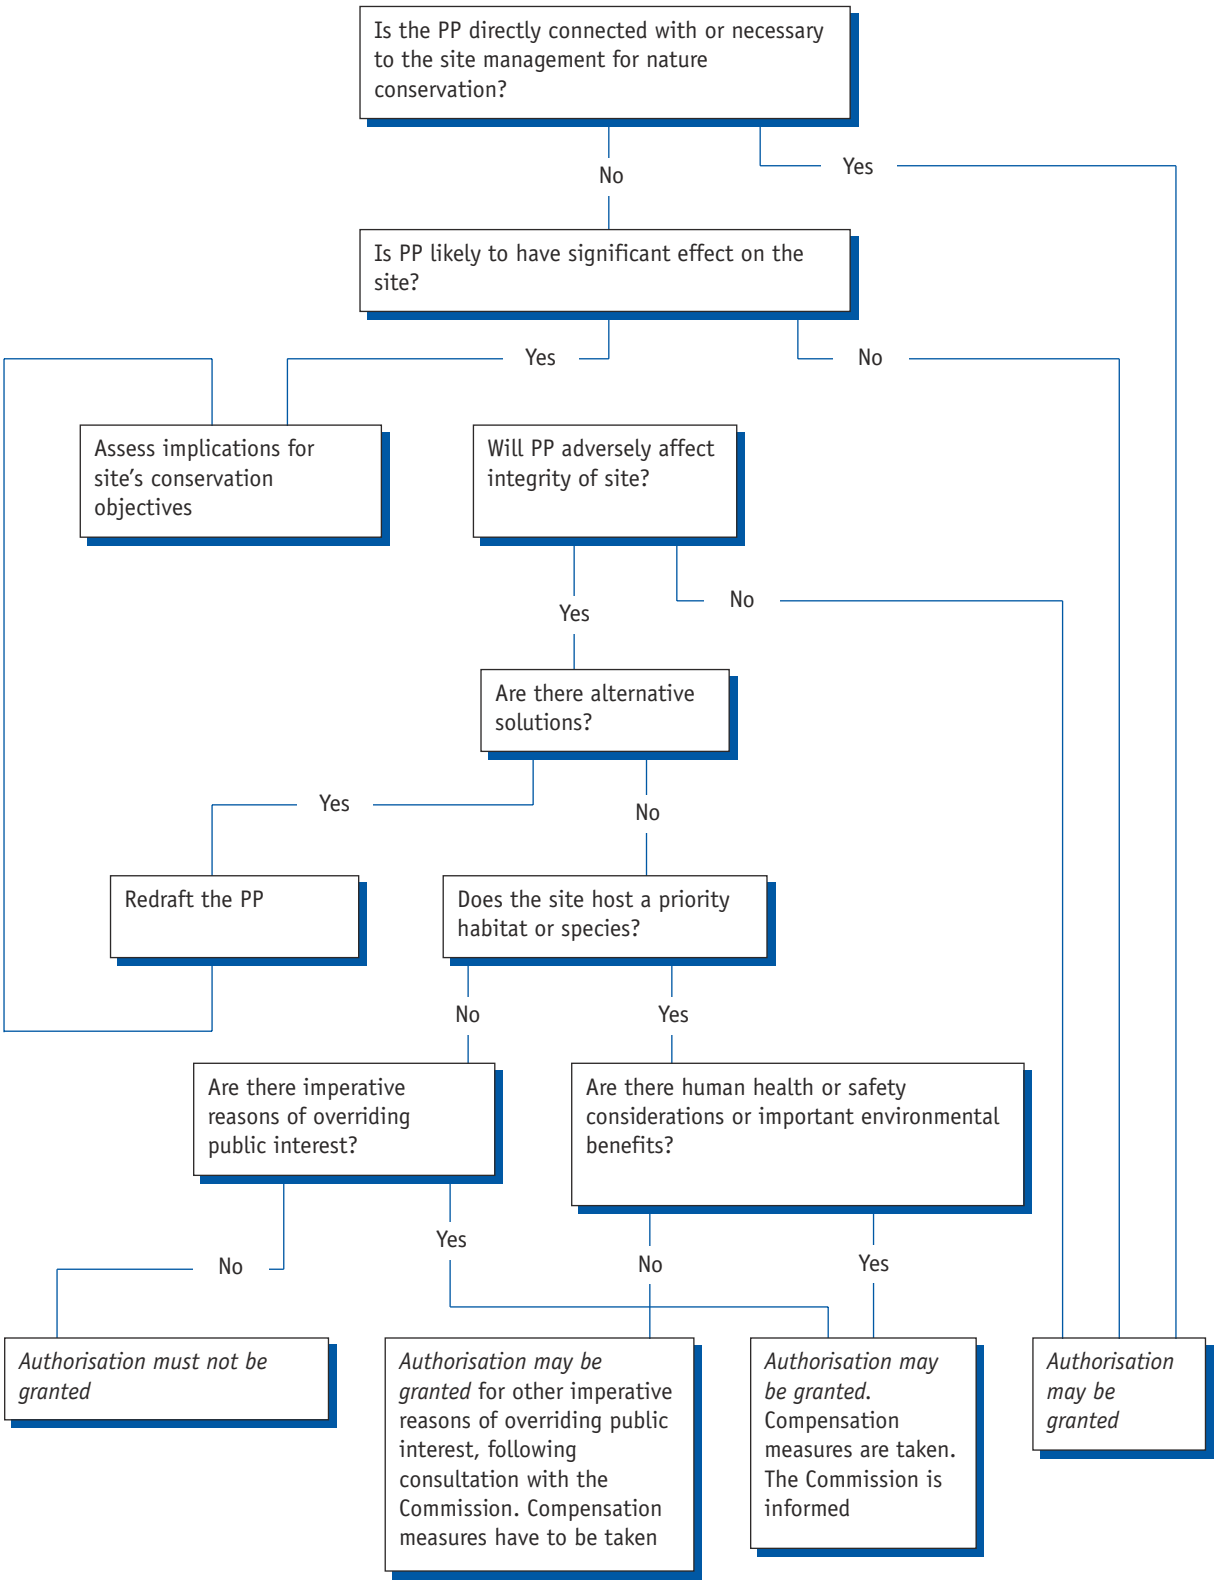
  Land use plans focusing on seal conservation.

Sverige

- *Protection and restoration of Stora Alvaret on Öland Island, south-east Sweden (B4-3200/96/547)*

- *Preservation of the hermit beetle, Osmoderma eremita (B4-3200/97/288)*

  Use of agri-environmental schemes for the long-term management of the sites.



United Kingdom

- *Conservation management of priority upland habitats through grazing: guidance on management of upland Natura 2000 sites (B4-3200/95/854)*

  Development of a practical manual for grazing management planning.

Annex III

Consideration of plans and projects affecting Natura 2000 sites

Annex IV

Form for submission of information to the European Commission according to Article 6(4)

Member State: Date:

Information to the European Commission
according to Article 6 of the 'Habitats' directive
(Directive 92/43/EEC)

Documentation sent for: ☐ information (Article 6(4)1) ☐ opinion (Article 6(4)2)

Competent national authority:

Address:

Contact person:

Tel., fax, e-mail:

1. Plan or project

Name and code of Natura 2000 site affected:

This site is:

☐ an SPA under the 'Birds' directive

☐ a proposed SCI under the 'Habitats' directive

☐ hosting a priority habitat/species

Summary of the plan or project having an effect on the site:

2. Negative effects

Summary of the assessment of the negative effects on the site:

NB: This summary should focus on the adverse effect expected on the habitats and species for which the site has been proposed for the Natura 2000 network, include the appropriate maps and describe the already decided mitigation measures.

3. Alternative solutions

Summary of alternative solutions studied by the Member State:

Reasons why the competent national authorities have concluded that there is absence of alternative solutions:

4. Imperative reasons

Reason to nevertheless carry out this plan or project:

- ☐ Imperative reasons of overriding public interest, including those of a social or economic nature (in the absence of priority habitat/species)
- ☐ human health
- ☐ public safety
- ☐ beneficial consequences of primary importance for the environment
- ☐ other imperative reasons of overriding public interest

Short description of the reason:

5. Compensation measures

Foreseen compensatory measures and timetable:

Guidance document on Article 6(4) of the 'Habitats Directive' 92/43/EEC

CLARIFICATION OF THE CONCEPTS OF: *ALTERNATIVE SOLUTIONS*, *IMPERATIVE REASONS OF OVERRIDING PUBLIC INTEREST*, *COMPENSATORY MEASURES*, *OVERALL COHERENCE*, *OPINION OF THE COMMISSION*.

January 2007

This guidance document should be read in conjunction with the booklet published by the European Commission in 2000 and entitled "Managing Natura 2000 sites. The provisions of Article 6 of the 'Habitats' Directive 92/43/EEC". The current document intends to further develop and replace the section on Article 6(4) of this earlier publication leaflet. The document reflects the views of Commission services only and it is not of a binding nature.

Table of content

1.1. The text

1.2. Scope

1.2.1. Substantial scope

1.2.2. Temporal scope

1.3. Initial considerations

1.3.1. Examining alternative solutions

1.3.2. Examining imperative reasons of overriding public interest

1.4. Adopting compensatory measures

1.4.1. What is meant by "compensatory measures" and when should they be considered?

1.4.2. "Overall coherence" of the Natura 2000 Network

1.4.3. Objective and general contents of compensatory measures

1.4.4. What to include in the programme of compensation measures?

1.5. Criteria for designing compensatory measures

1.5.1. Targeted compensation

1.5.2. Effective compensation

1.5.3. Technical feasibility

1.5.4. Extent of compensation

1.5.5. Location of compensatory measures

1.5.6. Timing of compensation

1.5.7. Long term implementation

1.6. Who bears the cost of the compensatory measures?

1.7. Communication to the Commission of the compensatory measures

1.8. What happens with sites hosting priority habitats and/or species?

1.8.1. The sites concerned

1.8.2. The concepts of "human health", "public safety" and "primary beneficial consequences for the environment"

1.8.3. The adoption of the Commission's opinion – its consequences

1.1. The text of Article 6.4 of the Habitats Directive

"If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.

Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest".

1.2. Scope

1.2.1. Substantial Scope

This provision forms part of the procedure of assessment and possible authorisation, by the competent national authorities, of plans and projects likely to affect a Special Area of Conservation (SAC), a Special Protected Area (SPA) or a Site of Community Importance (SCI)[1]. Two fundamental considerations arise:

- On the one hand, it addresses exceptions with regard to the general rule of Article 6(3) according to which authorisation can only be granted to plans or projects not affecting the integrity of the site(s) concerned.

- On the other hand, its concrete application has to be done in the respect of the various steps provided for and in the sequential order[2] established by the Directive.

The preliminary assessment of the impacts of a plan or project on the site, provided for in Article 6(3), enables the competent national authorities to arrive at conclusions regarding the consequences of the initiative envisaged in relation to the integrity of the site concerned. If these conclusions are positive, in the sense that no reasonable scientific doubt remains as to the absence of effects in the site, the competent authorities can give their consent on the plan or project. In case of doubt, or negative conclusions, the precautionary and preventive principles should be applied and procedures under art. 6(4) followed. Furthermore, taking into account the precautionary principle and applying a preventive approach might also lead to the decision not to proceed with the plan or project.

[1] Article 6(2), 6(3) and 6(4) only applies to sites which are placed on the list of sites selected as sites of Community importance (SCI). Thus, these provisions do not apply to sites eligible for identification as sites of Community importance on the national lists transmitted to the Commission (pSCI). The protection regime for the pSCI is defined in case C-117/03 (Judgement of the Court of 13 January 2005, Dragaggi) and in case C-244/05 (Judgement of the Court of 14 September 2006, Bund Naturschutz).

[2] In its Opinion for the case C-239/04 the Advocate General (paragraphs 44-46) seems to consider that there is no a sequential order between the examination of alternative solutions and imperative reasons of overriding public interest.

To this effect, the Court has already held, in case C-127/02 *Waddenvereniging and Vogelbeschermingsvereniging*[3] and confirmed in C-6/04 *Commission v United Kingdom of Great Britain and Northern Ireland*[4], that Article 6(3) of the Habitats Directive makes the requirement for an appropriate assessment of the implications of a plan or project conditional upon there being a probability, or a risk, that it will have a significant effect on the site concerned. In the light, in particular, of the precautionary principle, such a risk is considered to exist if it cannot be excluded, on the basis of objective information, that the plan or project will have a significant effect on the site concerned.

The above mentioned approach is also reflected in the Judgement of the Court of 26 October 2006 in the case C-239/04[5] regarding the construction of a motorway in Portugal, where it is mentioned that any reasonable scientific doubt as to the absence of adverse effects on the integrity of the site must be removed before the project is authorised.

The decision to go ahead with a plan or project must meet the requirements of Article 6(4). In particular, it must be documented that:

1 The alternative put forward for approval, is the least damaging for habitats, for species and for the integrity of the Natura 2000 site, regardless of economic considerations, and that no other feasible alternative, exists that would not affect the integrity of the site.

2 There are imperative reasons of overriding public interest, including 'those of a social or economic nature'.

Being an exception to Article 6(3), this provision can only be applied to circumstances where all the conditions required by the Directive are fully satisfied. In this regard, it falls on whoever wants to make use of this exception to prove, as a prerequisite, that the aforementioned conditions do indeed exist in each particular case.

3 Once the lack of suitable alternatives and the acceptance of imperative reasons of overriding public interest are fully ascertained and documented, all compensatory measures that are needed to ensure the protection of the overall coherence of the Natura 2000 network have to be taken. Therefore, compensatory measures should be considered only when the application of other safeguards, such as mitigation measures, is not sufficient. The compensatory measures adopted must **always** be communicated to the Commission.

The provisions of Art. 6(4) apply when the results of the preliminary assessment under Art. 6(3) are negative or uncertain. That is:
1. The plan or project will adversely affect the integrity of the site
2. Doubts remain as to the absence of adverse effects on the integrity of the site linked to the plan or project concerned
"The sequential order of its steps has to be followed".

[3] Judgement of the Court of 7 September 2004 in case C-127/02, paragraphs 57 and 61.

[4] Judgement of the Court of 20 October 2005 in case C-6/04, paragraph 54.

[5] Judgement of the Court of 26 October 2006, Commission/Portugal (case C-239/04, paragraph 24).

1.2.2. Temporal scope

The judgement delivered by the Court of Justice in relation to the case C-209/04 states the principles with regard to the temporal applicability of Article 6(3) and consequently Article 6(4) of the Habitats Directive. In order to determine whether projects must be subject to an environmental assessment in accordance with Article 6(3), the Court uses a formal criterion: the date of the application for the authorisation for a project. Thus, if the application for authorisation was formally lodged before the expiry of the time-limit for transposition of the Directive or before the accession to the EU, the project is not subject to the requirements laid down in Article 6(3) and (4). However, if the application for authorisation was formally lodged after the expiry of the time-limit for transposition of the Directive or after the accession to the EU, the project is subject to the requirements laid down in Article 6(3) and (4).

1.3. Initial considerations

Ensure quality of appropriate assessment under article 6 (3)

Appropriate assessments of the implications of the plan or project for the site concerned must precede its approval and take into account the cumulative effects which result from the combination of that plan or project with other plans or projects in view of the site's conservation objectives. This implies that all aspects of the plan or project which can, either individually or in combination with other plans or projects, affect those objectives must be identified in the light of the best scientific knowledge in the field.

Assessment procedures of plans or projects likely to affect Natura 2000 sites should guarantee full consideration of all elements contributing to the site integrity and to the overall coherence of the network, both in the definition of the baseline conditions and in the stages leading to identification of potential impacts, mitigation measures and residual impacts. These determine what has to be compensated, both in quality and quantity.

Regardless of whether the provisions of Article 6(3) are delivered following existing environmental impact assessment procedures or other specific methods, it must be ensured that:

- Article 6(3) assessment results allow full traceability of the decisions eventually made, including the selection of alternatives and any imperative reasons of overriding public interest.
- The assessment should include all elements contributing to the site's integrity and to the overall coherence of the network as defined in the site's conservation objectives and Standard Data Form, and be based on best available scientific knowledge in the field. The information required should be updated and could include the following issues:
    - Structure and function, and the respective role of the site's ecological assets
    - Area, representativity and conservation status of the priority and non-priority habitats in the site

- Population size, degree of isolation, ecotype, genetic pool, age class structure, and conservation status of species under Annex II of the Habitats Directive or Annex I of the Birds Directive present in the site
- Role of the site within the biographical region and in the coherence of the Natura 2000 network
- Any other ecological assets and functions identified in the site

- It should include a comprehensive identification of all the potential impacts of the plan or project likely to be significant on the site, taking into account cumulative impacts and other impacts likely to arise as a result of the combined action of the plan or project under assessment and other plans or projects.
- The assessment under Article 6(3) applies the best available techniques and methods, to estimate the extent of the effects of the plan or project on the biological integrity of the site(s) likely to be damaged.
- The assessment provides for the incorporation of the most effective mitigation measures into the plan or project concerned, in order to avoid, reduce or even cancel the negative impacts on the site.
- The characterisation of the biological integrity and the impact assessment should be based on the best possible indicators specific to the Natura 2000 assets which must also be useful to monitor the plan or project implementation.

To meet the requirements of Article 6(3) assessment, it seems most appropriate that the Natura 2000 authorities set up the specific formal requirements regarding the type of information and criteria to follow when carrying out the appropriate assessment. Dissemination and training to the relevant parties (E.g. authorities at a different level of government, consultants and plan or project developers) it is highly recommended.

1.3.1. Examining alternative solutions

In line with the need to prevent undesired impairment to the Natura 2000 network, the thorough revision and/or withdrawal of a proposed plan or project should be considered when significant negative effects on the integrity of a site have been identified. This should be observed especially in the case of effects on priority habitats and/or species protected under the Habitats Directive or globally endangered bird species listed in Annex I of the Birds Directive. The competent authorities have to analyse and demonstrate first the need of the plan or project concerned. Thus, the zero option should be considered at this stage.

Subsequently, the competent authorities should examine the possibility of resorting to alternative solutions which better respect the integrity of the site in question[6]. All feasible alternatives, in particular, their relative performance with regard to the conservation objectives of the Natura 2000 site, the site's integrity and its contribution to the overall coherence of the Natura 2000 Network have to be analyzed. Such solutions should normally already have been identified within the framework of the initial assessment carried out under Article 6(3). They could involve alternative locations or routes, different scales or designs of development, or alternative processes.

[6] In its Opinion for the case C-239/04, the Advocate General (paragraph 44) considers that "among the alternatives short-listed "*the choice does not inevitably have to be determined by which alternative least adversely affects the site concerned. Instead, the choice requires a balance to be struck between the adverse effect on the integrity of the SPA and the relevant reasons of overriding public interest."*

In conformity with the principle of subsidiarity, it rests with the competent national authorities to asses the relative impact of these alternatives solutions on the site concerned. It should be stressed that the reference parameters for such comparisons deal with aspects concerning the conservation and the maintenance of the integrity of the site and of its ecological functions. In this phase, therefore, other assessment criteria, such as economic criteria, cannot be seen as overruling ecological criteria.

It rests with the competent national authorities to assess alternative solutions. This assessment should be made against the site's conservation objectives.

1.3.2. Examining imperative reasons of overriding public interest

In the absence of alternative solutions - or in the presence of solutions having even more negative environmental effects on the site concerned, with regard to the above-mentioned conservation aims of the Directive - the competent authorities have to examine the existence of imperative reasons of overriding public interest, including those of a social or economic nature, which require the realisation of the plan or project in question.

The concept of *"imperative reason of overriding public interest"* is not defined in the Directive. However, Article 6 (4) second subparagraph mentions human health, public safety and beneficial consequences of primary importance for the environment as examples of such imperative reasons of overriding public interests. As regards the *"other imperative reasons of overriding public interest"* of social or economic nature, it is clear from the wording that only public interests, irrespective of whether they are promoted either by public or private bodies, can be balanced against the conservation aims of the Directive. Thus, projects developed by private bodies can only be considered where such public interests are served and demonstrated.

So far the European Court of Justice has not given clear indications for the interpretation of this specific concept. It may therefore be helpful to refer to other fields of Community law, where similar concepts appear.

The "imperative requirement" concept was worked out by the Court of Justice as an exception to the principle of free movement of goods. Among the imperative requirements which can justify national measures restricting freedom of movement, the Court recognised public health and environmental protection, as well as the pursuit of legitimate goals of economic and social policy.

In addition, Community law also recognises the concept of "service of general economic interest", evoked in Article 86(2) (ex 90(2)) of the Treaty, within the framework of the exception to the rules of competition envisaged for companies responsible for the management of such services. In a communication on services of general interest in Europe[7], the Commission, taking account of case law on the matter, gave the following definition of services of general economic interest: "*they describe activities of commercial service fulfilling missions of general interest, and subject consequently by the Member States to specific*

[7] COM (96) 443, of the 11.09.1996.

obligations of public service[8]*. It is the case in particular of services in transport, energy, communication networks*".

Having regard to the *structure of the provision*, in the specific cases, the competent national authorities have to make their approval of the plans and projects in question subject to the condition that the balance of interests between the conservation objectives of the site affected by those initiatives and the above-mentioned imperative reasons weighs in favour of the latter. This should be determined according to the following considerations:

a) the public interest must be **overriding**: it is therefore clear that not every kind of public interest of a social or economic nature is sufficient, in particular when seen against the particular weight of the interests protected by the Directive (see e.g. its 4th recital stating *"Community's natural heritage"*) (see Annex I point 10).

b) in this context, it seems also reasonable to assume that the public interest can only be overriding if it is a **long-term interest**; short term economic interests or other interests which would only yield short-term benefits for the society would not appear to be sufficient to outweigh the long-term conservation interests protected by the Directive.

It is reasonable to consider that the "imperative reasons of overriding public interest, including those of social and economic nature" refer to situations where plans or projects envisaged prove to be indispensable:
- within the framework of actions or policies aiming to protect fundamental values for the citizens' life (health, safety, environment);
- within the framework of fundamental policies for the State and the Society;
- within the framework of carrying out activities of economic or social nature, fulfilling specific obligations of public service.

In order to provide readers with a more precise indication of what might legitimately considered as potential imperative reasons of overriding public interest, some **examples** have been extracted from the Opinions delivered by the Commission in the framework of Article 6(4) and are related to the reasoning given by Member States.

Intersection of the Peene Valley (Germany) by the planned A 20 motorway (Germany)
A 20 motorway is part of the trans-European road network. An east-west link has to be created in Mecklenburg-Western Pomerania in order to link it with central regions of the Community.
Mecklenburg-Western Pomerania suffers from an exceptionally high unemployment. For several years its unemployment rate has been almost the double of that in the old Länder. The gross national product created in Mecklenburg-Western Pomerania, as compared to the percentage of the population, is significantly lower than the average gross national product.

[8]The public service obligations, in their turn, are characterised for the respect of some essential principles of operation, such as continuity, the equal access, universality and transparency, but can vary from one Member State to the other, according to different situations, such as geographical or technical constraints, political and administrative organisation, history and traditions.

Project Mainport Rotterdam" Development Plan (The Netherlands)
Portuary and industrial activity in the Rotterdam area is one of the main pillars of Dutch economy. The harbour of Rotterdam is an essential multimodal crossroads in the TEN-T Network and is therefore of Community importance. Expected growth in global container handling and chemical industrial activity will lead to increased demand for space which will have to be met if the competitive position of the Rotterdam harbour in the Hamburg – Le Havre range has to be maintained.
The development of the Rotterdam port, also brings into focus the question of promoting modal-shift particularly in relation to freight transport. It is clear that shifting freight from road to water will have considerable benefits in terms of reduced green-house gas emissions, reduced atmospheric pollution and reduced congestion. These benefits should be recognised in assessing questions of public interest.

Extension of the site of Daimler Chrysler Aerospace Airbus Gmbh in Hamburg-Finkenwerder (Germany)
Outstanding importance for the region of Hamburg and northern Germany and the European aerospace industry. Project will contribute to the technological advance and foster the European co-operation in the aviation business. Positive effect on the economic and social situation of the bordering regions and positive impact on the competitiveness of the European aeronautic industry. Important number of highly qualified new jobs, needed to counterbalance the considerable loss of jobs in the industrial sector of the region.

High speed line (TGV East) (France)
Lack of options for linking the existing lines. The European TGV East project was viewed favourably in the Council of Ministers of the European Community on 1990 and was chosen as a priority project by the European Council in 1994, having benefited from Union decisions regarding the priority of infrastructure projects to be implemented.

Operational master plan ("Rahmenbetriebsplan") of the Prosper Haniel Colliery (Germany)
Due to its geological and infrastructure qualities the Prosper Haniel coal mine and the continuation of its mining activities contribute to achieving the general objectives of the German long term energy policy at the federal and regional level, and in particular the interest of supply security and to maintain the leading position of European mining and coal energy technologies. The closure of the Prosper Haniel mine would have unacceptable direct and indirect economic and social consequences at the regional level with a direct loss of jobs in coal mining and in up-stream industries and downstream services.

La Breña II Reservoir Project (Spain)
Provide enough water for human consumption, industrial uses and agriculture, which cannot be available in the current situation of the River Guadalquivir basin.

For further examples and information concerning the Opinions delivered by the Commission: http://ec.europa.eu/environment/nature/nature_conservation/eu_nature_legislation/specific_articles/art6/index_en.htm

1.4. Adopting compensatory measures

1.4.1. What is meant by "compensatory measures" and when should they be considered?

In the context of article 6 of the Habitats Directive, mitigation measures must be clearly distinguished from compensatory measures.

The term *"compensatory measures"* is not defined in the 'Habitats' Directive. Experience would suggest the following distinction:

- mitigation measures in the broader sense, are those measures which aim to minimise, or even cancel, the negative impacts on a site that are likely to arise as a result of the implementation of a plan or project. These measures are an integral part of the specifications of a plan or project (see section 4.5 of the leaflet "Managing Natura 2000 sites. The provisions of Article 6 of the Habitats Directive"), and

- compensatory measures *sensu stricto*: are independent of the project (including any associated mitigation measures). They are intended to offset the negative effects of the plan or project so that the overall ecological coherence of the Natura 2000 Network is maintained.

For instance, an extension of underground coal mining activities of the colliery into areas which so far had not been exploited will cause large scale ground subsidence, accompanied by flooding and increase of ground water levels with considerable impacts on all ecosystems in the area. To compensate for the negative effects of the project, land will be selected following ecological criteria for the creation of non-priority habitat types (beech and oak forests) by re-afforestation or transformation/improvement of existing forests. It is also considered the creation and improvement of alluvial forests and restoration or optimisation of riverbeds to compensate for the loss of priority habitat type (Residual alluvial forests - *Alnion glutinoso-incanae*) and non-priority habitat type (water courses of plain to montane levels with floating vegetation). The measure will contribute also to compensate the negative impact of the project on the species *Lampetra planeri.*

Compensatory measures should be additional to the actions that are normal practice under the Habitats and Birds Directives or obligations laid down in EC law. For example, the implementation of a management plan, or the proposal/designation of a new area, already inventoried as of Community importance, constitute "normal" measures for a Member State. Thus, compensatory measures should go beyond the normal/standard measures required for the protection and management of Natura 2000 sites.

Another example of compensation can be given in the case of a harbour extension leading to the destruction of a roosting site for birds and the diminution of low depth inter-tidal mudflats and reedbeds. The recreation of a high tide roosting site and of shallow beaches associated to mudflats as well as habitat restoration of reedbeds and wet meadows through hydraulic works, environmental measures for the agricultural use of reedbeds and meadows, and management of hunting pressure, would compensate for the negative impact caused by the project.

Consequently, compensatory measures are not a means to allow the implementation of plans or projects while escaping the obligations of Article 6. They should be considered only after having ascertained a negative impact on the integrity of a Natura 2000 site. Specifically, the logic and rationale of the assessment process requires that if a negative impact is foreseen then an evaluation of alternatives should be carried out as well as an appreciation of the interest of the plan/project in relation to the natural value of the site. Once it is decided that the project/plan should proceed, then it is appropriate to move to a consideration of compensation measures. This approach has also been confirmed in the opinion given by the advocate general in the case C 239-/04 (paragraph 35).

The compensatory measures constitute measures specific to a project or plan, additional to the normal practices of implementation of the "Nature" Directives. They aim to offset the negative impact of a project and to provide compensation corresponding precisely to the negative effects on the species or habitat concerned. The compensatory measures constitute the "last resort". They are used only when the other safeguards provided for by the directive are ineffectual and the decision has been taken to consider, nevertheless, a project/plan having a negative effect on the Natura 2000 site.

1.4.2. "Overall coherence" of the Natura 2000 network

The expression *"overall coherence"* appears in Art. 6(4) in the context where a plan or project is allowed to be carried out for imperative reasons of overriding public interest and the Member State has to take measures to compensate for the loss.

It also appears in Art. 3(1) which states that Natura 2000 is *"a coherent European ecological network of special areas of conservation that shall enable the natural habitats types and species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range"*. Hence, two different criteria are considered, on the one hand the targeted species and habitats in terms of quantity and quality, and on the other hand the role of the site in ensuring the adequate geographical distribution in relation to the range.

Art. 3(3) stipulates that *"where they consider it necessary, Member States shall endeavour to improve the ecological coherence of Natura 2000 by maintaining, and where appropriate developing, features of the landscape which are of major importance for wild fauna and flora, as referred to in Article 10."*

Art. 10, which deals more generally with land use planning and development policy, stipulates that

> *"Member States shall endeavour, where they consider it necessary, in their land-use planning and development policies and, in particular, with a view to improving the ecological coherence of the Natura 2000 network, to encourage the features of the landscape which are of major importance for wild fauna and flora.*
>
> *Such features are those which, by virtue of their linear and continuous structure (such as rivers with their banks or their function as stepping stones (such as ponds or small woods), are essential for the migration, dispersal and genetic exchange of wild species."*

The word “ecological” is used both in Art. 3 and Art. 10 to explain the character of the coherence. It is obvious that the expression *“overall coherence”* in Art. 6(4) is used in the same meaning.

Having said this, it is clear that the importance of a site to the coherence of the network is a function of the conservation objectives of the site, the number and status of the habitats and species found within the site, as well as the role the site plays in ensuring an adequate geographical distribution in relation to the range of species and habitats of species concerned.

Art. 6(4) requires to “protect” the overall coherence of Natura 2000. Thus, the Directive presumes that the “original” network has been coherent. If the exception regime is used, the situation must be corrected so that the coherence is fully restored.

With regard to a plan or project, the compensatory measures defined to protect the overall coherence of Natura 2000 network will have to address the criteria mentioned above. This would mean that compensation should refer to the site's conservation objectives and to the habitats and species negatively affected in comparable proportions in terms of number and status. At the same time the role played by the site concerned in relation to the bio-geographical distribution has to be replaced adequately.

At this stage it would be useful to recall that under the Habitats Directive the selection of a site for the Natura 2000 Network rests on:

- the taking into account of the habitat(s) and species in proportions (surface areas, populations) described in the standard data form;
- the inclusion of the site in a biogeographical region within which it is located;
- the selection criteria established by the ‘Habitats’ Committee and used by the European Topic Centre on Biological Diversity to advise the Commission to retain a site on the Community list.

Competent authorities should be looking at these criteria when designing the compensatory measures for a project, and should ensure that they provide the properties and functions comparable to those which had justified the selection of the original site.

The *‘Birds’ Directive* does not provide for bio-geographical regions, or selection at Community level. However by analogy, it could be considered that *the overall coherence of the network* is ensured if:

- compensation fulfils the same purposes that motivated the site's designation in accordance with Article 4(1) and 4(2) of the Birds Directive;
- compensation fulfils the same function along the same migration path;
- the compensation site(s) are accessible with certainty by the birds usually occurring on the site affected by the project.

For instance, if an SPA which has a specific function to provide resting areas for migratory bird species in their way towards the north is negatively affected by a project, the compensatory measures proposed should focus on the specific function played by the site. Therefore, compensating with measures that could recreate the necessary conditions for resting of the same species in an area out of the migratory path or within the migratory path but far away would not be sufficient to ensure the overall coherence of the network. In this case, compensation should provide for suitable resting areas for the targeted species correctly located in the migratory path so that they will be realistically accessible to the birds which would have used the original site affected by the project.

In order to ensure the overall coherence of Natura 2000, the compensatory measures proposed for a project should therefore: a) address, in comparable proportions, the habitats and species negatively affected; b) provide functions comparable to those which had justified the selection criteria of the original site, particularly regarding the adequate geographical distribution. Thus, it would not be enough that the compensatory measures concern the same biogeographical region in the same Member State.

The distance between the original site and the place of the compensatory measures is not necessarily an obstacle as long as it does not affect the functionality of the site, its role in the geographical distribution and the reasons for its initial selection.

1.4.3. Objective and general contents of compensatory measures

The compensatory measures *sensu stricto* have to ensure the maintenance of the contribution of a site to the conservation at a favourable status of natural habitats types and habitats of species "*within the biogeographical region concerned"*. In short, ensure the maintenance of the overall coherence of the Natura 2000 Network. It results from this:

- that, as a general principle, a site should not be irreversibly affected by a project before the compensation is indeed in place. However, there may be situations where it will not be possible to fill this condition. For example, the recreation of a forest habitat would take many years to ensure the same functions as an original one negatively affected by a project. Therefore, best efforts should be made to assure compensation is in place beforehand and in the case this is not fully achievable, the competent authorities should consider extra compensation for the interim losses that would occur in the meantime.

- that the compensation must be additional in relation to the Natura 2000 network to which the Member State should have contributed in conformity with the Directives.

Member States should pay particular attention when the negative effects of a plan or project are produced in rare natural habitats types or in natural habitats that need a long period of time to provide the same ecological functionality. Under these circumstances, the zero option should be seriously considered.

While designations of new Natura 2000 sites can be part of a compensation package under Article 6(4), the designations on their own are insufficient without the accompanying measures.

In terms of the *'Birds' Directive*, this could include, as a compensation, work to improve the biological value of an area, which is either designated or will be designated, so that the carrying capacity or the food potential are increased by a quantity corresponding to the loss on the site affected by the project. *A fortiori*, the re-creation of a habitat favourable to the bird species concerned is acceptable provided the created site is available at the time when the affected site loses its natural value.

In terms of the '*Habitats' Directive*, the compensation could, similarly, consist of the re-creation of a comparable habitat or the biological improvement of a substandard habitat within an existing designated site, or even the addition to the Natura 2000 Network of a new site of comparable quality to the original site. In the latter case, one could argue that overall, the project will result in a loss for this habitat type at Member State level. However, at Community level, a new site will benefit from the protection provided for in Article 6, thus contributing to the objectives of the directive.

Compensatory measures appropriate or necessary to adverse effects on Natura 2000 site can consist of:

- Restoration or enhancement in existing sites: restoring the habitat to ensure the maintenance of its conservation value and compliance with the conservation objectives of the site or improving the remaining habitat in proportion to the loss due to the plan or project on a Natura 2000 site;
- Habitat Recreation: recreating a habitat on a new or enlarged site, to be incorporated into Natura 2000;
- As described above and in association with other works, proposing a new site under the Habitats and Birds Directive.

The range of compensatory measures found in current practice within the EU in the frame of the Habitats Directive also includes:

- Species reintroduction.
- Species recovery and reinforcement, including reinforcement of prey species.
- Land purchase.
- Rights acquisition.
- Reserve creation (including strong restrictions in land use).
- Incentives for certain economic activities that sustain key ecological functions.
- Reduction of (other) threats, usually upon species, either through action on a single source or though co-ordinated action on all threat factors (E.g. resulting from space-crowded effects).

In principle, the result of implementing compensation has normally to be operational at the time when the damage is effective on the site concerned. Under certain circumstances where this can not be fully fulfilled, overcompensation would be required for the interim losses.

The option of habitat banking as compensatory measure under Article 6(4) is of very limited value due to the tight criteria mentioned in relation to the need for compensation to ensure the protection of the coherence of the network *(Section 1.4.2)*.

Nevertheless, there could be a potential use of the concept of habitat banking in a constraint regime linked to Article 6(1). For instance, where a development is foreseen it might be appropriate to consider and implement within the management plan designed for the site or integrated into other development plans, the necessary compensatory measures that would be required in the context of such development and consequently before any decision is made by the competent authorities.

1.4.4. What to include in the programme of compensation measures?

The compensatory measures under Article 6(4) must address all issues, whether technical and/or legal or financial, necessary to accomplish the objective of offsetting the negatives effects of a plan or project and preserving the overall coherence of the Natura 2000 network. The following provides an overview of the issues to include in the programme of compensatory measures.

- Tight coordination and cooperation between Natura 2000 authorities, assessment authorities and the proponent of the compensatory programme (i.e. plan or project proponent and external consultants involved).
- Clear objectives and target values according to the conservation objectives of the site.
- Analysis of the technical feasibility of the measures in relation to their conservation objectives.
- Analysis of the legal and/or financial feasibility of the measures according to the timing required.
- Explanation of the time-frame in which the achievement of the conservation objectives is expected.
- Timetable for implementation and their co-ordination with the schedule for the plan or project implementation.
- Public information and/or consultation stages.
- Specific monitoring and reporting schedules based on progress indicators according to the conservation objectives.
- The appropriate budget programme approved during the suitable period to guarantee the success of the measures.

1.5. Criteria for designing compensatory measures

1.5.1. Targeted compensation

Compensatory measures under the Habitats Directive must be established according to reference conditions that are defined after the characterisation of the biological integrity of the site likely to be lost or deteriorated, and according to the likely significant negative effects that would remain after mitigation. Biological integrity can be defined as all those factors that contribute to the maintenance of the ecosystem including structural and functional assets. In the framework of the Habitats Directive, the biological integrity of a site is linked to the conservation objectives for which the site was designated as part of the Natura 2000 network.

Targeted compensation requires that an appropriate Article 6(3) assessment has been correctly undertaken in line with the provisions mentioned in the previous chapter.

Once the biological integrity likely to be damaged and the actual extent of the damage have been identified, the measures in the compensation programme must address specifically those effects, so that the elements of integrity contributing to the overall coherence of the Natura 2000 network are preserved in the long term. Thus, these measures should be the most appropriate to the type of impact predicted and should be focused on objectives and targets clearly addressing the Natura 2000 elements affected. This requires that measures clearly refer to the structural and functional aspects of the site integrity, and the related types of habitat and species populations that are affected.

This entails that the compensatory programme must necessarily consist of ecological measures, for example in the form of habitat restoration or enhancement, population reinforcement and/or any other actions that may be suitable for the purpose. Therefore, payments to members or towards special funds, regardless of whether these are ultimately directed to nature conservation projects are not suitable under the Habitats Directive. In addition, any secondary or indirect measure that might be proposed to enhance the performance of the core measures or the outcome of the compensation scheme, must have a clear relationship to the objectives and targets of the compensatory scheme.

As an example, in designing compensation, clear objectives must be established:

- Identify the total numbers of species affected
- Identify the principle species affected and the broad proportion of the total population(s) that these occur in;
- Identify the principle function(s) of the habitats that will be adversely affected that the species depend on e.g. feeding, roosting, etc;
- Identify the likely populations of species and the habitat functions at favourable conservation status;
- Identify the measures needed to offset the damage to the habitat functions and species affected so that they are restored to a state that reflects the favourable conservation status of the area affected.

Any uncertainty over the precise nature and/or magnitude of the adverse effects should be thoroughly tested. Where appropriate, a precautionary approach should be adopted and the assessment of adverse effect based on a worse-case scenario.

1.5.2. Effective compensation

The feasibility and effectiveness of compensatory measures are critical to the administration of Article 6(4) of the Habitats Directive in agreement to the precautionary principle and good practice. In ensuring effectiveness, technical feasibility must go hand in hand with the appropriate extent, timing and location of the compensatory measures.

Compensatory measures must be feasible and operational in reinstating the ecological conditions needed to ensure the overall coherence of the Natura 2000 network (i.e. the ecological structure and functions impaired and the habitats and species involved). The estimated timescale and any maintenance action required to enhance performance should be known and/or foreseen right from the start in view of the implementation of the measures. This must be based on the best scientific knowledge available, complemented with specific investigations for the precise location where the compensatory measures will be implemented. Measures for which there is no reasonable guarantee of success should not be considered

under Article 6(4), and the likely success of the compensation scheme should influence the final approval of the plan or project in compliance with the preventive principle.

In addition, the most effective option, which allow for the greatest chances of success must be chosen when it comes deciding between different possibilities for compensation.

The programme of compensatory measures needs to include detailed monitoring during implementation to ensure effectiveness in the long term. Being in the framework of the Natura 2000 network, such monitoring should be co-ordinated with, and eventually integrated into, that foreseen under Article 11 of the Habitats Directive.

Measures showing in practice a low level of effectiveness in contributing to the objectives should be modified accordingly.

1.5.3. Technical feasibility

According to current knowledge, it is highly unlikely that the ecological structure and function as well as the related habitats and species populations can be reinstated up to the status they had before the damage by a plan or project. To overcome the intrinsic difficulties standing in the way of full success for the reinstatement of ecological conditions, compensatory measures must be designed:

- Following scientific criteria and evaluation in accordance with best scientific knowledge,

- and taking into account specific requirements of the ecological features to be reinstated (e.g. soil, humidity, exposure, genetic pool, existing threats and other conditions critical to the success of reinstatement).

The critical aspects to technical feasibility will determine the suitability of the location of compensatory measures (spatial feasibility), the appropriate timing and their required extent.

In addition, the choice of particular measures and their design must respect the existing guidance for each particular practice, habitat creation, habitat restoration, population reinforcement, species reintroduction, or any other measure considered in the compensatory programme.

1.5.4. Extent of compensation

The extent required for the compensatory measures to be effective has a direct relationship to the quantitative and qualitative aspects inherent to the elements of integrity (i.e. including structure and functionality and their role in the overall coherence of the Natura 2000 network) likely to be impaired and to the estimated effectiveness of the measures.

Consequently, compensation ratios are best set on a case-by-case basis and must be initially determined in the light of the information managed during Article 6(3) assessment and ensuring the minimum requirements to meet ecological functionality. The ratios may then be redefined according to the results observed when monitoring the effectiveness, and the final decision on the proportion of compensation must be justified.

There is wide acknowledgement that ratios should be generally well above 1:1. Thus, compensation ratios of 1:1 or below should only be considered when it is demonstrated that with such an extent, the measures will be 100% effective in reinstating structure and functionality within a short period of time (e.g. without compromising the preservation of the habitats or the populations of key species likely to be affected by the plan or project).

1.5.5. Location of compensatory measures

Compensatory measures should be located to accomplish the highest effectiveness in maintaining the overall coherence of the Natura 2000 network. This entails a set of pre-conditions that any compensatory measure should meet:

- The area selected for compensation must be within the same biogeographic region (for sites designated under the Habitats Directive) or within the same range, migration route or wintering area for bird species (i.e. sites designated under the Birds Directive) in the Member State concerned. Further on, the area should provide functions comparable to those which had justified the selection criteria of the original site, particularly regarding the adequate geographical distribution.
- The area selected for compensation must have -or must be able to develop- the specific features attached to the ecological structure and functions, and required by the habitats and species populations. This relates to qualitative aspects like the uniqueness of the assets impaired and demands the consideration of local ecological conditions.
- Compensatory measures must not jeopardize the preservation of the integrity of any other Natura 2000 site contributing to the overall coherence of the network. When carried out in existing Natura 2000 site(s), the measures must be consistent with the conservation objectives of the site(s) and must not be understood as a means to undertake the overall management required for the site(s).

In addition, there is general agreement that the local conditions necessary to reinstate the ecological assets at stake are found as close as possible to the area affected by the plan or project. Therefore, locating compensation within or nearby the Natura 2000 site concerned in a location showing suitable conditions for the measures to be successful seems the most preferred option. However, this is not always possible and it is necessary to set a range of priorities to be applied when searching locations that meet the requirements of the Habitats Directive:

1) Compensation within the Natura 2000 site provided the necessary elements to ensure ecological coherence and network functionality exist within the site.

2) Compensation outside the Natura 2000 site concerned, but within a common topographical or landscape unit, provided the same contribution to the ecological structure and/or network function is feasible. The new location can be another site designated as Natura 2000 or a non-designated location. In the latter case, the area must be designated as Natura 2000 site itself and be subject to all the requirements of the 'nature' directives.

3) Compensation outside the Natura 2000 site, in a different topographical or landscape unit. The new location can be another site designated as Natura 2000. If compensation takes place on a non-designated location, the area must be designated as Natura 2000 site itself and be subject to all the requirements of the 'nature' directives.

New designations as part of compensation measures shall be submitted to the Commission before those are implemented and before the realisation of the project but after its authorisation. The new designations should be made available to the Commission through the established channels and procedures as in the process of adoption of the SCI lists and SPA designations *(business as usual)*.

Best cooperation and coordination shall be ensured by Member States when dealing with the location of compensatory measures in the frame of transboundary projects.

1.5.6. Timing of compensation

Timing the compensatory measures demands a case-by-case approach, where the schedule adopted must ensure the continuity of the ecological processes essential for maintaining the biological structure and functions that contribute to the overall coherence of the Natura 2000 network. This requires a tight coordination between the implementation of the plan or project and the implementation of the measures, and relies on issues such as the time required for habitats to develop and/or for species populations to recover or establish in a given area. In addition, other factors and processes must also be considered:

- A site must not be irreversibly affected before compensation is in place.
- The result of compensation should be effective at the time the damage occurs on the site concerned. Under certain circumstances where this can not be fully achieved, overcompensation would be required for the interim losses.
- Time lags might only be admissible when it is ascertained that they would not compromise the objective of 'no net losses' to the overall coherence of the Natura 2000 network.
- Time lags must not be permitted, for example, if they lead to population losses for any species protected in the site under Annex II of Directive 92/43/EEC or Annex I of Directive 79/409/EEC, requiring particularly attention when it entails priority species.
- It may be possible to scale down in time compensatory measures according to whether the significant negative effects would presumably arise in the short, medium or long term.

The application of specific measures to outweigh interim losses that would occur until the conservation objectives are met may be advisable. All necessary provisions, technical, legal or financial, necessary to implement the compensatory measures must be completed before the plan or project implementation starts, so as to prevent any unforeseen delays that may hinder the effectiveness of the measures.

1.5.7. Long term implementation

Compensatory measures require that a sound legal and financial basis for long-term implementation and for their protection, monitoring and maintenance be secured in advance of impacts upon habitats and/or species occur. This could involve:

- Making effective a temporary protection, even if the SCI/SPA status is only granted later.

– Devising binding enforcement tools at the national level aimed to ensure the full implementation and effectiveness of compensation (e.g. linked to liability under EIA directive, if applicable, or to the Environmental Liability Directive when in force; subsidising plan or project approval to the robustness of the relevant provisions for implementation of compensatory measures).

– Devising the necessary legal means in case land or rights purchase is deemed essential for the effective implementation of the measures according to good practice (e.g. typified procedures for compulsory purchase on grounds of nature conservation).

– Establishing monitoring programmes for the whole life of the project, including objectives, responsible bodies and resources needs, indicators, and requirements on reporting to the Commission. This could be best performed by independent bodies specifically set up for the purpose and in close coordination and cooperation with the Natura 2000 authorities.

1.6. Who bears the cost of the compensation measures?

It appears logical that, in line with the 'polluter pays' principle, the promoter of a project bears the cost of the compensatory measures. It may include it in the total budget submitted to the public authorities in the event of co-financing. In this connection, the European funds could, for example, co-finance the compensatory measures for a transport infrastructure retained under the TEN (Trans European Network). In particular, financial assistance from the European Regional Development Fund (ERDF) is possible for compensatory measures associated to projects that are being financed with this fund and provided it is given according to the objectives, rules and procedures applicable to this fund.

A subsidy granted by a public authority for measures taken in order to compensate for damage to a Natura 2000 site can be considered as a *State Aid* (within the meaning of Art. 87 (ex 92) of the Treaty), should it be granted to an undertaking established in a Natura 2000 site, designated before or after the establishment of the undertaking. However, in the case of an undertaking acting as a contractor for a public authority to build an infrastructure, the subsidy would not be considered as a state aid as long as it is granted in exchange of works carried out.

The Member State is bound to compensatory measures as from the entry into force of Article 6. Their financing can fall within its competence.

1.7. Information to the Commission of the compensatory measures

The competent national authorities have to inform the Commission of the compensatory measures adopted. The provision in question specifies neither the form, nor the purpose of this communication. However, in order to facilitate the process the Commission services have prepared a standard format[9] for supplying information to the Commission according to the

[9] This format is presented in Annex IV of this document.

provisions of Art. 6(4). In any case, it is not the Commission's role either to suggest compensatory measures, or to validate them scientifically.

The information should enable the Commission to appreciate the manner in which the conservation objectives of the site in question are pursued in the particular case. While the national authorities are only specifically obliged to communicate the compensatory measures adopted, the communication of certain elements relating to the studied alternative solutions and to the imperative reasons for overriding public interest which required the realisation of the plan or project can also prove necessary, insofar as these elements affected the choice of the compensatory measures.

The information about compensatory measures must enable the Commission to appreciate the manner in which the conservation objectives of the site in question are pursued in the particular case. However, it is not the Commission's role to suggest compensatory measures.

When in the planning process must the Commission be informed about compensatory measures and who is responsible for this information?

In order to allow the Commission to request additional information on the measures taken or to take actions in case it considers that the legal requirements of the directive were not correctly applied, compensatory measures should be submitted to the Commission **before** they are implemented and indeed before the realisation of the plan or project concerned but after its authorisation. It is therefore advised that compensatory measures should be submitted to the Commission as soon as they have been adopted in the planning process in order to allow the Commission, within its competence of guardian of the treaty, to assess whether the provisions of the Directive are being correctly applied.

As responsible bodies for the preservation of the overall coherence of, and for updating the information on, the Natura 2000 network, the authorities responsible for Natura 2000 in each Member State must play an important role in this process, and the information would be submitted through the national authority via the Permanent Representations of each Member State as with the process for the adoption of site lists.

1.8. What happens with sites hosting priority habitats and/or species?

The second subparagraph of Art. 6(4) provides for a special treatment whenever the plan or project concerns a site hosting priority habitats and/or species and is likely to affect these priority habitats and/or species. The realisation of plans or projects likely to adversely affect these sites could be justified only if the evoked imperative reasons of overriding public interest concern human health and public safety or overriding beneficial consequences for the environment, or if, before granting approval to the plan or project, the Commission expresses an opinion on the initiative envisaged.

In other words, damage to the sites would only be accepted as overruling the fulfilment of the objectives of the directive when the specific imperative reasons mentioned above occur or, alternatively, after the additional procedural safeguard of an independent appraisal by the Commission.
This provision raises a number of questions relating to:

- the identification of sites concerned;
- the interpretation of the concepts of human health, public safety and the primary beneficial consequences for the environment;
- the procedure for the adoption of Commission's opinion and the consequences which arise from this opinion.

1.8.1. The sites concerned

Article 6(4), second subparagraph, applies when the realisation of the plan or project is likely to affect a site hosting priority habitats and/or species. In this regard, it would be reasonable to consider that a plan or project:

a) not affecting, in any manner, a priority habitat/species; or

b) affecting a habitat/species which has not been taken into account in the selection of a site ("non-significant presence" in the Standard Data Form)

should not de facto justify that a site should be subject to this second subparagraph.

Since the Birds Directive does not rank any species as priority, compensatory measures aiming to offset effects on SPAs' bird populations would never require the Commissions' opinion.

Art. 6(4), second subparagraph may be understood as applying to all sites hosting priority habitats and/or species, when these habitats and species are affected.

1.8.2. The concepts of "human health", "public safety" and "primary beneficial consequences for the environment"

Human health, public safety and primary beneficial consequences for the environment constitute the most important imperative reasons of overriding public interest. However, like the concept of "imperative reasons of overriding public interest" these three categories are not defined expressly.

Community law refers to public health and public safety reasons as reasons which can justify the adoption of restrictive national measures to the free movement of goods, workers, services as well as to the right of establishment. In addition, the protection of persons' health is one of the fundamental objectives of the Community policy in the field of the environment. In the same view, the primary beneficial consequences for the environment constitute a category which must be included in the aforementioned fundamental objectives of the environmental policy.

Within the framework of the principle of subsidiarity, it rests with the competent national authorities to check whether such a situation occurs. Of course, any situation of this kind is likely to be examined by the Commission within the framework of its activity of control on the correct application of Community law.

As regards the concept of "public safety", it is useful to refer to the judgement of the Court of Justice of 28 February 1991 in Case C-57/89, Commission v Germany ("*Leybucht Dykes")*. That decision preceded the adoption of Directive 92/43/EEC and hence Article 6. However, the decision retains relevance, not least because the Court's approach influenced the drafting of Article 6. At issue were construction works to reinforce dykes on the North Sea at Leybucht. These works involved a reduction in the area of an SPA. As a matter of general principle, the Court stated that the grounds justifying such a reduction must correspond to a general interest which is superior to the general interest represented by the ecological objective of the directive. In the specific case, the Court confirmed that the danger of flooding and the protection of the coast constituted sufficiently serious reasons to justify the dyke works and the strengthening of coastal structures as long as those measures are confined to a strict minimum.

The national authorities can authorise the realisation of the plan or project only if the proof of the existence of the afore mentioned reasons of overriding public interest is given and within the limits within which the plan or project in question proves necessary for the fulfilment of the public interest in question.

1.8.3. The adoption of Commission's opinion - its consequences

As confirmed by the Judgement of the Court of 14 September 2006 in case C-244/05, the Commission would only deliver an opinion under Article 6(4) when dealing with sites which are placed on the list of sites selected as sites of Community importance (SCI).

In the case of imperative reasons of overriding public interest other that human health, safety and environmental benefits, the prior opinion of the Commission is necessary. Article 6(4), second subparagraph, does not specify a procedure or the specific contents of such an opinion[10]. One must therefore refer once again to the economy and to the aims pursued by the provision in question. The opinion has to cover the assessment of the ecological values which are likely to be affected by the plan or project, the relevance of the invoked imperative reasons and the balance of these two opposed interests, as well as an evaluation of the compensation measures. That assessment involves both a scientific and economic appraisal as well as an examination of the necessity and proportionality of the realisation of the plan or project with regard to the invoked imperative reason.

From its nature, the opinion is not an act having binding legal effects. The national authorities can move away from it and decide to implement the plan or project, even if the opinion is adverse. In the latter case however, one can reasonably expect that the decision will address Commission's arguments and explain why its opinion has not been followed. In any case the Commission can assess whether the implementation of the plan or project is in conformity with the requirements of Community law and, if necessary, initiate the appropriate legal action. While the Directive does not include any specific deadline regarding the adoption of the Commission's opinion, Commission services will make all necessary efforts to carry out the assessments and to draw the appropriate conclusions as speedily as possible.

[10] The relevant standard format (Annex IV) covers also the request for a Commission opinion according to the provisions of Art. 6(4)2.

The Commission, in delivering its opinion, should check the balance between the ecological values affected and the invoked imperative reasons, and evaluate the compensation measures. The opinion is not binding but in case of non-conformity with Community law, legal action may be taken.

EXECUTIVE SUMMARY

This document provides sector specific guidance on the implementation of the Birds and Habitats Directives in estuaries and coastal zones. The guidance has benefitted from discussions held in the context of a specific working group with representatives from Member States, stakeholder organisations and environmental NGOs.

Its development followed a request of the ports and maritime services sector. Ports, especially in Western Europe, are often situated in or near estuaries. These are dynamic and highly productive ecosystems and in many cases designated Natura 2000 sites. Estuaries provide the necessary shelter and suitable conditions for maritime access to ports.

Ports fulfil a strategic role in the development and realisation of global trade and they periodically need to expand. Previously not subject to many environmental requirements, the application and interpretation of environmental legislation, including the EU nature directives, has presented new challenges to the sector which, in recent years, has sometimes resulted in delays in port development projects.

Ports play an essential role in economic development and seek legal certainty as a prerequisite for new development projects. The European Port's policy, as formulated by the European Commission, has recommended reviewing legal constraints that may hinder development projects ('fast track procedure'). The present guidance document provides a number of recommendations and elements of good practice to enhance port development and management in or near Natura 2000 sites.

Some key recommendations are:

- The design of plans or projects should always be based on mutually beneficial strategies with a view to achieving dual goals of both Natura 2000 conservation objectives and socio-economic objectives, according to the 'working with nature' concept.
- Damage prevention or avoidance measures should always be preferred to compensation measures.
- Pre-assessments to evaluate the potential for impact of a plan or project on Natura 2000 sites should always be foreseen. This is necessary in order to decide whether a plan or project is likely to have significant effects on a Natura 2000 site and whether an 'appropriate assessment' in the sense of Article 6(3) of the Habitats Directive is required.
- Thorough and timely stakeholder consultation is always recommended in order to prevent the raising of objections during the project permitting process.
- Maintenance of ports and navigational access should be dealt with in the context of integrated management plans for the entire waterway or the affected Natura 2000 site. Capital dredging operations should be designed as a part of sustainable dredging and sediment management schemes.
- In case of any remaining minor scientific uncertainty with regard to the effects of a plan or project or the related mitigation or compensatory measures, the measures should include a pre-defined and validated scheme to monitor the actual impacts and a framework to adapt the mitigation and compensation measures to the actual impacts.

Introduction

Estuaries and coastal zones are among the most productive ecosystems in the world, with both high ecological and economic values. They are of prime importance for wildlife, especially migrating and breeding birds and of major value in terms of their rich natural resources (e.g. as nursery grounds for commercially important fish). In addition, they also offer a wide variety of ecosystem services such as shoreline stabilization, nutrient regulation, carbon sequestration, detoxification of polluted waters and supply of food and energy resources (Millennium Ecosystem Assessment, 2005).

As a result they provide a wide range of economic benefits to many sectors, including fishermen, industrial complexes and amenity services such as tourism and recreation. Estuaries are also often ideal locations for ports, harbours and shipyards as they provide the necessary shelter for ships as well as access further inland along major rivers.

Estuaries and coastal zones are however also amongst the most dynamic and complex ecosystems in the world. They are made up of a wide range of different habitats, which exist in an ever-changing mosaic structure. Typical habitats that make up an estuary include sand banks, mudflats and sand flats, salt marshes and at their coastal edge sand dunes, coastal lagoons, shallow inlets and bays, reefs, islets and small islands, sandy beaches, sea cliffs.

Most of these habitat types are protected under Directive 92/43/EEC on the conservation of natural habitats and wild flora and fauna (commonly referred to as 'the Habitats Directive'). Shorebirds are dependent on estuaries and coastal zones during their migrations from breeding to wintering grounds. Furthermore, numerous bird species breed in estuarine and coastal habitats. As a result, many estuaries and coastal areas are also protected under Directive 2009/147/EC on the conservation of birds (commonly referred to as 'the Birds Directive').

Over a long history and even more so today, many of Europe’s ports are logistic hubs handling cargo from all over the world. The importance and demand for maritime transport has increased significantly in the last 30 years and is likely to continue to do so in the future. The European Commission supports this transport network through its ports policy, and through the promotion of the “Motorways of the Sea” and Short Sea Shipping.

As stated in the Communication on a European Ports Policy[1], more than 1 200 merchant ports cover some 100 000 km of European coasts. They are key points of modal transfer and are of vital interest to handle 90% of Europe's international trade. In support of the EU’s general transport policy[2], they handle 40% of the volume of tonne-kilometres carried out in intra-Community trade. The European Commission has recognized this fact through its Communication on ‘An Integrated Maritime Policy for the European Union’ which states that seaports and shipping allow Europe to benefit from the rapid growth in international trade and to play a leading role in the global economy[3].

Maritime ports, especially those connected with or situated far inland in estuaries connected with navigable inland waterways and railways, can also play a significant role in reducing CO_2 emissions, but will also have to face the effects of climate change.

[2] COM(2006) 314.
[3] (EC, 2007)

Inevitably there will be occasions where port and fairway developments and maintenance and Natura 2000 designation overlap and at times fail to coincide. The Habitats and Birds Directives do not, a priori, preclude the possibilities for further development and use of estuaries and coastal zones within or around Natura 2000 sites. Instead they lay down stepwise procedures to ensure that any such developments are done in a way that is compatible with the protection of species and habitats of European importance for which the sites have been designated. In the case of projects of overriding public interest, and in the absence of alternative solutions, the Directive provides a mechanism that can allow damaging developments, provided that compensation and adaptation ensures that the overall coherence of the Natura 2000 Network is not compromised.

The pressure on coastal zones and estuaries has encouraged a shift towards more integrated and efficient spatial planning. This, combined with early stakeholder dialogue, has proven over the years to be an effective way to promote sustainable development in line with the EU environmental legislation (including for nature protection, water and the marine environment), the European port policy and the European Integrated Maritime Policy.

Purpose of this document

The European Commission has already published several guidance documents to support Member States in implementing the Birds and Habitats directives in the protection of Natura 2000 (see annex 1); this guidance also helps citizens and stakeholders in better understanding key provisions of the Directives. However, there is a need for further clarifications, explanations and even prospective views on the application of the EU nature legislation to port development and the management of estuaries and coastal zones, especially in light of their importance as access-routes for seagoing ships.

The aim of the present guidance document is to explain the protection regime, defined under Article 6 of the Habitats Directive that applies to Natura 2000 sites in the specific context of estuaries and coastal zones. The primary focus is on clarifying, explaining and elaborating on the implementation of EU nature legislation for Natura 2000 sites located in estuaries and overlapping with, fairway channels and coastal zones, with particular attention to port-related activities, including dredging and industry (e.g. shipyards).

Other environmental legislation such as the Water Framework Directive (2000/60/EC), the Marine Strategy Framework Directive (2008/56), the directive 2001/42/EC on strategic environmental assessments (SEA) or the directive 85/337/EEC on environmental impact assessments are beyond the scope of this document and therefore not addressed in detail in this document. Aspects related to urbanisation, agriculture or other developments in the same areas or related to pressures resulting from inland waterborne transport are not considered in this work, but these activities will also need to be considered in management plans for estuarine Natura 2000 sites and in integrated coastal zone management as well as when assessing cumulative effects of different activities.

The present guidelines have benefited from discussions within a specific working group on estuaries, coastal zones and ports established by the European Commission (DG ENV and DG TREN). This group included stakeholders from different sectors and met six times during 2007-2009. In addition to the guidelines, a supporting technical document with technical and scientific background information has been prepared.

The Technical Supporting Document includes general information on the study approach, the literature used and the results of the exchange of information between the Working Group and the consultancy firm that was in charge of the overall coordination. The Technical Supporting Document can be downloaded from the public Circa Platform: http://circa.europa.eu/Public/irc/env/estuary/home.

The present guidelines are intended to be faithful to the text of the relevant Directives and the wider principles underpinning EU law on the environment and port-related activities. They are not legislative in character, they do not provide any new rules but give further clarification, building on existing guidelines. The guidelines reflect the views of the Commission services on the implementation of the directives in estuaries and coastal zones.

They are not of a binding nature. It should be stressed that any interpretation of EU legislation rests exclusively with the EU Court of Justice. The guidelines are intended to respect the existing case law and may need to be adapted in light of any emerging new jurisprudence of the Court.

The present guidelines have the ambition to reconcile the needs for port development and for environmental protection. The target audiences and users of these guidelines are local, regional and national or federal competent authorities, port and waterway authorities, operators, industries, dredging companies and associations, maritime service industry, Environmental NGOs, Conservation agencies and Natura2000 site managers.

1. POLICY BACKGROUND

1.1. Estuaries, coastal zones and the EU Nature legislation,

In response to the rapid global decline in biodiversity, the European Union has set itself the goal, at the European Summit in Gothenburg in 2001, "to halt the decline of biodiversity in the EU by 2010"[4] and to "restore habitats and natural systems"[5]. This commitment is now firmly embedded in all aspects of EU policy. 'Nature and biodiversity' is one of four priority areas for action under the 6th Environment Action Programme (6th EAP)[6], which sets out the framework for environmental policy-making in the EU for the period 2002-2012. The 6th EAP also advocates, in accordance with the Treaty, the full integration of environmental protection requirements, including those related to biodiversity conservation, into all other EU policies and actions.

Together, the "Birds" and "Habitats" Directives are the cornerstones of EU biodiversity policy. They enable EU Member States to work together, within the same strong legislative framework, to protect Europe's most valuable species and habitats across their entire natural range within the EU, irrespective of political or administrative boundaries.

Both directives require Member States to designate specific terrestrial and marine sites, which together constitute the Natura 2000 network. This network consists of Special Protected Areas (SPAs) -protecting bird species and Special Areas of Conservation (SACs) - protecting habitats and other species of EU conservation concern. The aim of the Natura 2000 network is to assure the long-term survival of Europe's most threatened species and habitats. Other provisions of the directives include a strict system of species protection, as well as monitoring and reporting schemes.

Article 6 of the Habitats Directive plays a crucial role in the management and sustainable use of the sites that make up the Natura 2000 network. In the spirit of integration, it provides a series of procedural safeguards to ensure that economic development goes hand in hand with nature conservation. It is the responsibility of the Member States to transpose the directives into their respective national legislation and to put in place appropriate mechanisms to implement the provisions in practice.

Article 6 of the Habitats Directive includes three types of measures:

1. Positive conservation measures for the Special Areas of Conservation (SACs) as foreseen by article 6.1 involving e.g. management plans and statutory, administrative or contractual measures[7],
2. Preventive measures for all sites as foreseen under article 6.2 to avoid the deterioration of natural habitats (as well as significant disturbance of species) and under article 6.3, to assess the effects of new plans and projects,
3. Procedural safeguards, including a derogation and compensation regime, under article 6.4 for authorising plans or project that are likely to have adverse effects on Natura 2000 sites.

---

[4] Presidency Conclusions, Göteborg European Council 15 and 16 June 2001
[5] COM (2001) 264 final
[6] Decision No 1600/2002/EC, OJ L 242, 10.9.2002, p.1
[7] For SPAs, obligations of article 4.1 & 4.2 of the birds directive will apply and there are considered as positive measures also.

Article 6 of the "Habitats" Directive 92/43/EEC

1. *For special areas of conservation, Member States shall establish the necessary conservation measures involving, if need be, appropriate management plans specifically designed for the sites or integrated into other development plans, and appropriate statutory, administrative or contractual measures which correspond to the ecological requirements of the natural habitat types in Annex I and the species in Annex II present on the sites.*

2. *Member States shall take appropriate steps to avoid, in the special areas of conservation, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated, in so far as such disturbance could be significant in relation to the objectives of this Directive.*

3. *Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives....competent authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site....*

4. *If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected....where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety....*

Coastal and estuarine habitats protected under the Habitats Directive cover a total area of more than 45,000 km² of the EU territory (see Table 1, only the marine and intertidal part, excluding dune systems or other related fresh wetlands).

These protected habitats also provide resting areas for birds and seals, spawning areas for fishes, feeding areas for mammals as well as specific plant habitats. Estuarine and coastal ecosystems can also include other protected habitats of Community interest, such as Grey Dunes (habitat code 2130).

Table 1*: Area of coastal and estuarine habitats protected under EU Nature legislation (according to the Natura 2000 Database – November 2009)*

Coastal and estuarine Natura 2000 habitats of relevance to the present document	**Total area in the EU-27 territory (2009)**
Estuaries – habitat code: 1130 (306 sites)	643.704,44 ha
Coastal lagoons*– habitat code: 1150 (644 sites)	503.263,71 ha
Large shallow inlets and bays – habitat code: 1160 (373 sites)	1.250.743,52 ha
Sandbank which are slightly covered by sea water all the time – habitat code: 1110 (517 sites)	2.436.613,35 ha
Mudflats and sand flats not covered by seawater at low tide – habitat code 1140 (422 sites)	809.204,53 ha
Total	5.643.529,55 ha

The following EU environmental directives on environmental assessments are also directly relevant to development plans and projects in estuaries and coastal zones (see chapter 3.3.3):

- Directive 2001/42/EC on the evaluation of the effects of certain plans and programmes on the environment (commonly referred to as the '**SEA' Directive**)[8] The purpose of the SEA Directive 2001/42/EC is to ensure that the environmental consequences of ***certain plans and programmes*** are identified, assessed and taken into account during their preparation and before their adoption.

[8] OJ L 197, 21.7.2001, p. 30–37 – see http://ec.europa.eu/environment/eia/home.htm

- Directive 85/337/EEC on the assessment of the effects of certain public and private projects on the environment, as amended in 1997 (97/11/EC), 2003 (2003/35/EC) and 2009 (2009/31/EC) – (commonly referred to as the '**EIA' Directive**[9].) While the SEA process operates at the level of public plans and programmes, Environmental Impact Assessments (EIA) operate at the level of ***individual public and private projects***.

Estuaries and coastal water bodies are also of interest under the **Water Framework Directive 2000/60/EC** (WFD). The WFD establishes a framework for the protection of all surface waters (rivers, lakes, transitional and coastal) and groundwater at EU level and aims to achieve a good ecological status (or a good ecological potential for heavily modified water bodies) and a good chemical status by 2015.

Estuaries and coastal waters are identified as transitional or coastal water bodies. According to the WFD their deterioration should be prevented and their aquatic ecosystem status protected and enhanced. There is frequently a geographical overlap between Natura 2000 sites and WFD water bodies in estuarine and coastal ecosystems. Although the principal aim of the WFD and the Nature directives is to protect ecosystems, their objectives, measures and tools are not entirely complementary. Attention should be given to the synergies between the nature Directives and the WFD where they both apply.

Under the Water Framework Directive, a Common Implementation Strategy (CIS) was developed in order to address the challenges in a co-operative and coordinated way and a series of guidance documents have been produced (see annex 1). It is important to remember that Article 4(2) of the WFD states that if the conservation objectives of the Habitats Directive are more stringent than the requirements of the WFD then those of the former will apply. The same is also true of the converse. Detailed information and guidelines on the implementation of the WFD can be found on the following website: http://ec.europa.eu/environment/water/water-framework/index_en.html

The Marine Strategy Framework Directive (MSFD, 2008/56/EC) provides a more comprehensive view and deals also with ecosystem services in marine areas. It establishes a framework for the protection and restoration of marine ecosystems. According to this directive, Member States must take the necessary measures to achieve or maintain a good environmental status (GES) in the marine environment by the year 2020. The geographical scope of the MSFD overlaps with the WFD in coastal waters. The MSFD environmental status only applies in the latter insofar as particular aspects of the environmental status of the marine environment are not already addressed through that Directive (e.g. litter, noise, cetaceans). The MSFD, however, does not apply to transitional waters such as estuaries.

The two more recent directives complement the nature directives by putting increased emphasis on the role of ecosystems. As mentioned above, estuaries are ecosystems with very dynamic characteristics: they are subject to daily and seasonal changes as well as hydro-morphological evolution. Their biodiversity parameters and typical species will also evolve over time. Although concern for biodiversity is a common denominator, it is not difficult to imagine that, while habitats change in response to morphological evolution, some habitats may even disappear or change significantly. Especially in estuaries it is important to recognize the dynamic nature of this environment.

[9] OJ L 156, 25.6.2003, p. 17, OJ L 140, 5.6.2009, p. 114 – see http://ec.europa.eu/environment/eia/home.htm

1.2. The Integrated Maritime Policy and the European Ports Policy

The economic importance of the European coastline was underlined in the Commission's Communication on an Integrated Maritime Policy[10]; Maritime regions account for some 40% of the EU's GDP and population. Shipbuilding and shipping, ports and fisheries remain key maritime activities, but offshore energy and coastal and maritime tourism generate massive revenues. According to the European Maritime Policy, the capacity development of ports and coastal fairway channels must mirror the growth of Europe's domestic and international trade and occur in a way that is compatible with related EU policy objectives, in particular its environmental and competitiveness goals.

The Communication on a European Ports Policy[11] aims at a performant European port system able to cope with the future challenges of European transport needs. One of the objectives of the action plan under this Communication is to increase the carrying capacity of ports in order to allow a further increase of maritime and fluvial transport. There are more than 1200 merchant ports in Europe, comprising key points of modal transfer and of vital economic interest as they handle 90% of Europe's international trade. Even if these figures will fluctuate due to economic ups and downs, the long term trends remain one of continued growth; at the same time waterborne transport features low CO_2 emission rates, compared to other transport modes (mainly road but also railways).

During the consultation phase, prior to the adoption of the Communication on a European Ports Policy, the issue of environmental concerns in ports emerged. Port stakeholders expressed fears about legal uncertainty in relation to the implications for their activities arising from the Birds and Habitats Directives. On the other hand: in order to generate a license for growth, ports are increasingly embracing a more sustainable development approach.

Many ports and navigation channels are located in estuaries and coastal zones that host environmentally sensitive areas with high ecological value. The need to designate Natura 2000 sites in estuaries and coastal zones and the need to increase the carrying capacity of ports in order to meet the European transport needs is proving to be a challenge to many Member States; this has resulted in local disputes and several EU Court of Justice decisions and jurisprudence. However, in response to this challenge some Member States have already developed approaches to facilitate port development in line with the requirements of the Habitats Directive.

In its Communication on a European Ports Policy the Commission recognized the challenges in combining port infrastructures and environmental Directives. Consequently, the Commission services have responded to the request by port industry to provide guidelines on the interpretation of both nature Directives. This constitutes the policy background to the present guidelines, which have the ambition to reconcile the need for port development with EU environmental protection standards.

[11] European Commission, (2007), Communication on European Ports Policy, COM (2007) 616, 18.10.2007

2. ISSUES OF CONCERN

2.1. Pressures on estuaries and coastal zones

Human activities in coastal and estuarine areas include navigation, dredging, aggregate and sand extraction, fisheries, aquaculture, industry (including oil and gas extraction, wind farms development), drainage of sewage and waste water, water extraction (e.g. for power stations and industry), safety (including sea defence and flood protection), recreation including bird watching and hunting, urbanisation, cover for cables, pipes and tunnels, military activities and research activities.

All these activities taken individually or in combination can potentially generate significant effects on the nature conservation objectives of estuaries and coastal zones. Impacts directly related to waterways and port related activities are illustrated below.

1. Dredging operations

Capital and maintenance dredging and the relocation of dredged material affects the hydrodynamic regime and geomorphology of the estuary: Natural sedimentation takes place in estuaries depending on the hydraulic forces in the basin and the amount of sediment available. Sediment is either supplied from erosion in the catchment area or from the marine environment or both. Beyond a certain point, a sort of balance is reached and the estuary begins to release sediment, rather than retain it. Any factor influencing the hydrodynamic regime and/or the geomorphology may modify the balance and the flux of sediments and lead to modifications in the localisation of habitats composing estuarine and coastal ecosystems (e.g. mudflats or sandbanks).

Capital dredging needs special attention because it may reverse the trend of estuarine infilling and affect the equilibrium state of the estuary. This occurs because deepening an estuary may permit a salt wedge intrusion to travel further upstream, increase shoreline wave action, change tidal range and tidal currents, and suspended sediment load and sedimentation. Additionally, the hydrodynamic changes and their effect on sediment erosion, deposition and transport may cause secondary geomorphological changes away from the dredging location, including the potential erosion of mudflats and salt marshes.

Maintenance dredging is the periodic or continuous activity necessary to maintain the navigable depth in an estuary or on the open coast. The effects of maintenance and capital dredging on a site can be similar. The critical difference is that whilst capital dredging imposes the major change, maintenance dredging prevents the system from returning to its original state, albeit in smaller stages. This means that there will be ongoing issues that will need to be addressed if habitats and species are to be maintained at favourable conservation status. Some of these impacts can be rectified by modifying dredging practices and by using sediment feeding techniques, but they are not universally applicable.

There are also circumstances where dredged materials can be put to beneficial uses such as increasing sediment supplies to beaches, although care needs to be taken to avoid smothering of important sub-tidal communities. This illustrates the need for careful assessment of hydrodynamic effects in estuaries and coastal waters. Careful design of dredging and relocation of dredged material is an integral part of sediment management schemes.

2. Maintenance activities

Maintenance activities other than maintenance dredging, such as the maintenance or replacement or installation of navigation marks, piles, lights, vessel traffic schemes and moorings, the extension of slipways and jetties and the maintenance of soft sea walls, flood defences and wave screens may have adverse effects on conservation objectives in estuaries and coastal zones.

3. Commercial shipping operations

Commercial shipping operations within ports can be divided into two broad categories, vessel operation and movements and cargo operations. The movement of ships through estuarine and coastal waters may potentially affect the characteristics of a habitat both through the generation of waves and propeller-induced turbidity in the water column. The effects of vessel movement can either be harmful, e.g. intertidal erosion of estuaries and/or putting sediments back into suspension, or beneficial, e.g. aeration of the water column.

Noise (above and under water) associated with shipping has the potential to cause disturbance to protected marine animals. The anchoring of vessels (outside an anchoring area) may disturb or damage animals and plants on the seabed (e.g. shellfish beds, soft corals, sea grasses). Ship emissions into the air, waste handling and ballast water treatment can have an impact on nearby coastal habitats.

Cargo handling of dry bulk cargos may cause dust emissions and air pollution (nitrogen, sulphur). Handling of liquid bulks may require discharge through pipelines, which provides a potential risk for leaks, emissions and spillages. Accidental release of cargoes into the marine environment may have important environmental effects. The spread of invasive alien species imported via ballast water or otherwise by vessels can also have a negative influence on protected areas. Last but not least vessel movement poses a risk of disasters (oil or cargo spilling).

Operational aspects of commercial shipping (waste handling, ballast water management, air pollution…) are subject to national or international rules and regulations (such as the ballast water treaty of the International Maritime Organization and MARPOL protocols annex 1-6). In addition there is a voluntary port authorities initiative to promote “Green shipping” by developing an Environmental index. This index is focusing mainly on air pollution coming from sea going vessels.

4. Port reclamation and land use

The port itself may have impacts on Natura2000 because it leads to the building of new infrastructures (terminals, rail, pipeline, roads, new industries and large areas for logistic companies) that may affect nearby Natura 2000 sites. In certain areas the available space is insufficient and ports may need to reclaim land from the sea. Land reclamation in Natura 2000, be it on land or on sea, will in most cases, require nature compensation schemes.

5. Industrial complexes

Port areas often include industrial complexes such as refineries, energy plants, dry and wet bulk hubs and container terminals. The cumulative effects of industrial operations, shipping and traffic can lead to adverse ecological effects on nearby Natura 2000 sites. Environmental issues such air quality, noise and waste are regulated by specific legislation and policies which is not, however, covered by the present guidelines. The use of the best available

technologies is often mandatory and can as such limit environmental pressure on protected sites as well.

2.2 Main concerns of the port sector with regard to the implementation of the Birds- and Habitats directives

One of the key issues for port sector development is the capability to plan new projects well ahead and securely. Delays in the planned dates for terminal extension have been experienced in various European ports during recent years. The European Sea Ports Organisation (ESPO) attributes these delays to a number of different causes, ranging from internal politics within the port, environmental objections, investigations into market share implications, funding difficulties, court cases, etc.(ESPO, 2007).

ESPO has already published in 2007 its Code of Practice on the Birds and Habitats Directives (ESPO, 2007), which contains a number of recommendations to port authorities faced with the legal implications of the provisions of the Birds and Habitats Directives in their wider port development areas. The last chapter of the Code of Practice presents a list of topics for which further guidance from the European Commission was invited.

The following are some concerns presented from a port authority point of view when it comes to the development and operation of ports near or in a protected estuarine or coastal zone. With the exception of the issue of cost sharing among relevant stakeholders, most of these concerns are being addressed in the present guidance document.

1. How could a proactive approach and integral planning lead to more legal certainty?
2. How can early agreements between all stakeholders be reached through wide public consultation and involvement of interested parties in project design?
3. How can costs be shared amongst all relevant stakeholders who can benefit from integrating socio-economic development objectives with nature conservation objectives in Natura 2000 areas?
4. How can compensation requirements be avoided through the systematic application of efficient mitigation measures, in a way that negative effects can be avoided beforehand?
5. How can the cooperation between project developers, environmental agencies and NGOs be enhanced with a view to promoting flexible approaches and mutual benefit situations?

Another important issue for port and waterway operators is how to handle maintenance activities such as dredging within or adjacent to Natura 2000 sites. Whereas extensive guidelines in relation to Article 6 of the Habitats Directive already exist for new plans and projects, ongoing activities have so far been less covered. Chapter 3.3.4 will therefore provide further guidance on this issue.

For port developers it is also important to know how much detail is actually necessary to sufficiently assess the potential effects of new plans or projects in order to comply with the requirements of the Birds and Habitats directives. Guidance on how to deal with uncertainties is an important issue in this regard. ESPO produced a checklist that is useful as a self guidance document (se Annex 3).

2.3 Climate change: A particular issue of concern for estuaries and coastal zones

Coastal zones and floodplains are among the most vulnerable areas to climate change as they are vulnerable to sea level rise combined with increased risks of storms, intense rainfall and flash floods leading to widespread damage to built-up areas and infrastructure.

Flood protection measures such as dyke construction, land reclamation and other types of sea defences may lead to the "coastal squeeze" phenomenon whereby less and less space is available for natural coastal processes to accommodate eroding forces or adjust to changes such as sea-level rise. "Coastal squeeze" occurs especially in low-lying and inter-tidal areas, which would naturally adjust to the changes in sea level, storms and tides, but cannot do so due to the construction of inflexible barriers such as roads, dykes, urbanisation, port and industrial infrastructure.

Innovative measures to prevent coastal squeeze should be taken in estuaries and coastal zones. Natural squeeze with similar effects occurs where the coast abuts rising ground and there is nowhere for eroded habitats to be displaced onto because the land is rising.

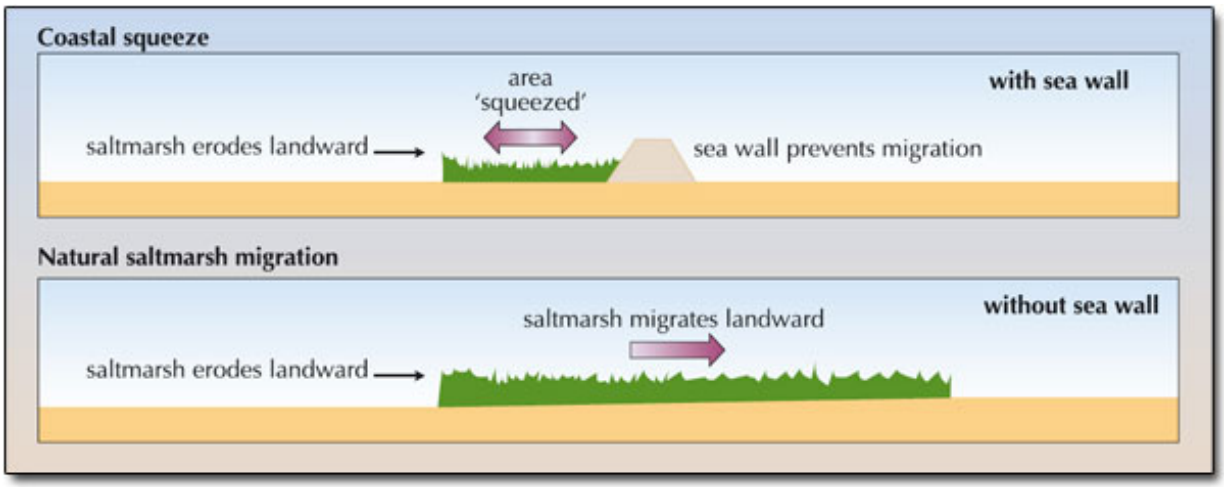

Figure 1: Coastal Squeeze is created when habitat migration (in response to sea-level rise) is prevented by tidal/flood defences (Environment Agency, UK, 2005).

Climate change will heavily affect Europe's natural environment and nearly all sections of society and the economy. Sea-level rise will reduce the sheltering effect of breakwaters and quay walls, but also periods of decreased precipitation in the river catchment areas can lead to lower rates of freshwater run-off and higher sedimentation rates within the estuary. As a result low river water levels during dry summer periods can hamper inner shipping to inland ports as well.

Sea level rise induced by climate change obviously leads to changing tidal characteristics like higher tidal amplitude and resulting current velocities. This may lead to a further increase of tidal pumping, an effect that can further reduce valuable shallow water areas and cause unwanted sedimentation even leading to a loss of biodiversity and last but not least increase the need for dredging. But the main problem with sea level rise is that there may not be sufficient sediment to allow mudflats and sandflats to keep pace with sea level rise. In such cases this is likely to lead to an increase in sub-tidal habitats. There may be a problem in a very small number of European ports from sub-tidal sedimentation but there is a greater problem with possible sediment export and increased erosion because of insufficient accommodation space to allow rollover to take place.

3. GUIDELINES

The present guidelines are intended to provide national competent authorities, port and waterway authorities and operators as well as environmental NGOs with a practical set of recommendations on the implementation of the Birds and Habitats Directives in estuaries and coastal zones with special attention to port development and dredging operations. The following main aspects have been covered: Conservation objectives in dynamic environments, integrated planning, new developments and adaptive strategies. The application of these guidelines should lead to more efficient planning and development approaches and support "fast-track procedures" for port expansion, according to the Communication on strategic goals and recommendations for the EU's maritime transport policy until 2018, COM (2009) 8.

Practice has shown that early cooperation among interested and affected parties is often a prerequisite for successful planning and elimination of delays. Estuaries and coastal zones are very complex and dynamic environments that attract interest from a wide range of sectors. They generally have an exceptionally rich nature conservation and socio-economic interest. This makes the planning of development projects a complex process but one that can nevertheless be carried out in a balanced, cost-effective, timely and integrated manner. A key objective is, provided all parties are aware of the obligations imposed on them under law, the basic understanding of how estuaries function as ecosystems.

3.1. Conservation objectives in dynamic environments

3.1.1. Understanding and managing estuaries and coastal zones as complex and dynamic ecosystems

Before setting conservation objectives in dynamic environments such as estuaries and coastal zones, it is important to understand how such complex ecosystems function, how they evolve "morphologically" and how they may be influenced by anthropological pressures and climate change. The balance between the different components (physical, chemical, biological and hydro morphological) of the estuarine and coastal ecosystems is very complex and can be easily affected by human activities such as port related activities, agriculture or flood alleviation measures. Both ecological and economic values of such ecosystems will have to be maintained in order to satisfy societal needs.

An Ecosystem approach, as outlined in the Marine Strategy Framework Directive[12], is well adapted to the management of complex systems such as estuaries and coastal zones. The ecosystem approach considers the ecosystem as an ecological entity with typical structure, processes and functions that interact with the surrounding environment. The ecosystem approach brings the analysis to a higher spatial level than just the habitats/ water body approach. Climate change will have potential impacts on the biodiversity and hydromorphology of estuarine and coastal areas, as well as on human activities such as port development and operation.

[12] 2008/56/EC (Official Journal of the EU of 25.6.2008): General provisions, article 1.3: ecosystem-based approach to the management of human activities, ensuring that the collective pressure of such activities is kept within levels compatible with the achievement of conservation objectives, good ecological and good environmental status, and that the capacity of estuarine, coastal and marine ecosystems to respond to human-induces changes is not compromised, while enabling the sustainable use of marine goods and (ecosystem) services by present and future generations.

Guidelines for planning and decision-making based on ecosystem knowledge

- The physical processes and morphological evolution of the specific estuaries and coastal zones should be investigated in detail. A best available and sound scientific knowledge on these elements should be established by the competent authorities as a basis for the establishment of nature conservation objectives for such ecosystems.
- Before setting conservation objectives in estuaries and coastal zones designated as Natura 2000 sites, the presence, geographic distribution and actual conservation status of all habitats and species protected under the nature directives, as well as the potential threats to which those elements are exposed, should be established in detail.
- Integrated management plans for estuaries should be established and implemented as an important instrument to conserve and protect critical processes, areas and species whilst providing space for sustainable economic development. Where possible these management plans should be part of the overall river basin management plan.
- Nature conservation objectives and socio-economic development objectives should be considered together for the establishment of integrated management plans for Natura 2000 sites. An ecosystem-approach should be applied which enables the sustainable use of goods and services that fully respects the site's conservation objectives.
- When an estuary or a coastal zone evolves, the presence or absence of species and habitats will also evolve. Therefore, the conservation objectives and measures for Natura 2000 sites should take into account the system-specific dynamics and evolutionary trends. There is also a need to take account of the difference between natural trends and those driven by human influences, namely coastal squeeze and morphological changes imposed by channel deepening.
- Where uncertainties or lack of knowledge on physical, morphological or biological processes still exist, these should be minimized as far as possible by additional research; where uncertainty remains adaptive monitoring programmes should be foreseen. New evidence and scientific information should be fed back into the management plan and where necessary lead to an appropriate adaptation of the management measures and monitoring schemes.
- Possible adaptation measures to climate change should also be considered when developing conservation objectives. In particular, regional sediment unbalance should be addressed. Shortage of sediment may lead to further erosion, e.g. from marshes, Wadden Sea areas (1110, 1130, and 1140), sandbanks, beaches and dunes.
- Proactive and strategic approaches to coastal management should be developed, giving priority to increasing coastal safety and ecosystem resilience and to maintaining a good sediment balance in the coastal and estuarine systems.
- Where possible, nature areas should be expanded proactively rather than reacting to catastrophic or climate change impacts. Dispersal corridors for species should be foreseen as an important adaptation tool.
- Where changes in sedimentation rates lead to loss of important habitats such as shallow waters, adapted sediment management schemes should be considered as an instrument to achieving conservation objectives.

3.1.2. Protecting habitats and species of Community interest

On the North-East Atlantic coast, estuaries are subject to the tide. River estuaries are coastal inlets where, unlike 'large shallow inlets and bays' there is generally a substantial freshwater influence. The mixing of fresh water and seawater and the reduced current flows in the shelter of the estuary lead to deposition of fine sediments, often forming extensive intertidal sand and mud flats. Estuarine ecosystems are characterized by subtidal and intertidal habitats (slikke) including salt marshes (schorre). Baltic, Mediterranean and Black sea river mouths are considered as being estuary subtypes with brackish water and nearly no tide.

Estuaries and coastal zones are dynamic systems consisting at the same time of several habitat types and habitats of species. Sand banks (1110[13]), sand flats and mudflats (1140), reefs (1170) and salt marshes (1310 to 1330) may also be a component part of habitat 1130 Estuaries. They also include corridors for migratory species (as fishes) and resting areas for many birds. Estuaries and coastal zones are sometimes related to coastal lagoons (1150*) or to large shallow inlets and bays (1160).

Channels and/or shipping lanes, where present, form an integral part of the habitat type 'Estuaries' in all geographical conditions; they play a role in the hydrological functioning of estuaries and nearby coastal zones, including the circulation of water and the deposition of sediments.

An estuary is generally to be considered as a complex of different habitats. Other adjacent coastal areas must be considered when setting conservation objectives for estuaries or coastal zones. For the definition of habitats, further guidance is provided by the Interpretation Manual of European Union Habitats. The manual was revised in 2007 for some habitats (e.g. marine habitats 1110, 1170 and 1180). Some national guidance documents also exist. However, for the habitat-type estuaries-1130, different definitions/interpretation exist, depending on the Member States.

Several key parameters determine the biological functioning within estuaries and coastal zones. The presence or absence of species (angiosperms, benthic invertebrate fauna, fish fauna, birds and mammals…) depend on the system's behaviour and its ecological food web. They are influenced by physical parameters such as turbidity and salinity. Significant changes in the physical elements of estuaries and coastal zones, such as port and waterway development projects, can possibly affect the survival of specific species in the food chain.

Regarding specific aquatic habitats targeted by the Habitats Directive, the chemical, biological and hydromorphological elements covered by good ecological status according to the Water Framework Directive (WFD) already contribute towards the achievement of the objectives of the nature directives. Some of the typical species of Annex 1 habitats are used as indicators for the assessment of ecological status under the WFD (angiosperms, benthic fauna, fish).

The conservation status of species and habitats protected under the nature directives may not entirely rely on the good ecological quality of water bodies as defined under the WFD, even if this is certainly a key contribution. The local conservation status of species may rely on other specific elements that have to be defined on a case by case basis.

[13] Habitat code according to the Habitats Directive

Additional measures to those foreseen by the WFD but possibly required under the birds or habitats directive could be for example: quiet resting areas for seals or feeding zones on intertidal habitats for otter or for birds at low tide or even the creation of suitable nesting sites for birds. Main challenge should be to look for an approach generating mutual benefits and to harmonize goals, objectives, and measures from both WFD and Natura2000 at an early stage.

Guidelines on the designation Natura 2000 sites and integration with the WFD

- An estuary or coastal zone forms an ecological unit with the surrounding terrestrial and subtidal coastal habitat types. In terms of nature conservation, these different habitat types should not be treated separately, and this reality should be taken into account when defining the site boundaries.
- Navigation channels and/or shipping lanes remain an integral part of designated Natura 2000 sites and should be covered by the management plans.
- Member States and local authorities should coordinate the setting of conservation objectives and the implementation and monitoring of measures under the Nature and Water Framework Directives. Where possible integrated WFD and Natura 2000 management plans should be established.

3.1.3. Setting conservation objectives for the estuarine and coastal habitats

The development of conservation objectives for estuaries and coastal areas is a real challenge as these areas are very complex and dynamic ecosystems. The final responsibility for developing appropriate conservation objectives, priorities and instruments that are adapted to national, regional and local contexts always lies with the Member States.

The following questions may arise in this context:
- How are conservation objectives set at national/ local level?
- How can Natura 2000 management plans follow an ecosystem approach and yet assist in quantifying conservation objectives and establishing conservation measures for habitats and species?
- How can socio-economic objectives be integrated within the Natura 2000 conservation objectives and management plans?

Conservation objectives and conservation measures have to be established both at the national and at the site level. According to Article 2.1 of the Habitats Directive, the aim of the Directive is to contribute towards ensuring bio-diversity through the conservation of natural habitats and of wild fauna and flora in the entire "European territory of the Member States to which the Treaty applies".

According to Article 4.4 of the Habitats Directive, the Member States must designate the sites of Community importance as special areas of conservation, "establishing priorities in the light of the importance of the sites for the maintenance or restoration, at a favourable conservation status, of a natural habitat type in Annex I or a species in Annex II and for the coherence of Natura 2000, and in the light of the threats of degradation or destruction to which those sites are exposed."

According to Article 6.1., Member States must establish conservation measures for each particular special area of conservation. Specific site level conservation objectives take into account the priorities established according to Article 4.4. They will help to determine specific site-related conservation measures.

Conservation objectives at Member state level and site level have a complementary nature because Natura 2000 is a network where each site will have a specific function in the overall coherence of the system. It means that conservation objectives at site level will also contribute to achieving conservation objectives at the national level.

When determining the specific conservation measures at the site level, Article 2.3 of the Habitats Directive allows "*to take account of economic, social and cultural requirements and regional and local characteristics*". This consideration cannot , however, jeopardize the overall objective of the Natura 2000 network which is *'to enable the natural habitat types and the species' habitats concerned to be maintained or, where appropriate, restored at a favourable conservation status in their natural range*". All the sites will have a specific contribution to this objective, but the contributions of all sites are not necessarily equivalent.

Three kinds of obligations can be described for the SACs: proactive conservation measures as foreseen by article 6.1, preventive measures as foreseen by article 6.2 to avoid the deterioration of natural habitats and specific measures for assessing and authorising new plans and projects as foreseen by article 6.3 & 6.4. The conservation objectives for a specific site have to consider all these obligations. The special conservation measures under Article 4 of Birds Directive require equivalent measures to Article 6(1) Habitats Directive for Special Protection Areas. The provisions under Article 6.2, 6.3 and 6.4 also apply to Special Protection Areas under the Birds Directive.

Guidelines for setting conservation objectives

- Once a site of Community importance has been adopted in accordance with the procedure laid down in Article 4(2) of the Habitats Directive, the Member State concerned shall designate that site as a special area of conservation as soon as possible and within six years at most, establishing priorities in the light of the importance of the sites for the maintenance or restoration, at a favourable conservation status, of a natural habitat type in Annex I or a species in Annex II and for the coherence of Natura 2000, and in the light of the threats of degradation or destruction to which those sites are exposed (Article 4.4 of the Habitats Directive).
- When considering conservation objectives, the national competent authorities should consider the dynamic nature of estuaries and coastal waters and the related natural range of fluctuations of protected species and habitats types.
- Consideration of conservation objectives should have full regard to the morphological, chemical and biological processes. The ecological functions of estuaries und coastal waters should be recognised, such as hydrological functions, function as spawning area, nursery or seasonal habitats for migratory species.
- Conservation objectives and measures for a Natura 2000 site should be based on the assessment of the local conservation status of protected habitats and species, the relative importance of the site for the coherence of Natura 2000 and for the maintenance or restoration, at a favourable conservation status of such habitats and species. They should also reflect the threats of degradation or destruction to which the site is exposed. The effects of a plan or project on the integrity of the site must be assessed (art. 6.3) in the light of the site's conservation objectives.
- The conservation status at the date of designation of the site should be used as a reference value for evaluating its deterioration (art. 6.2). In this context, gains made as a result of restorative measures taken or other improvements e.g. bird population increases, due to pressure elsewhere or response to climate change, as well as

losses caused by natural developments or climate change also need consideration. The site's Standard Data Form (SDF) remains an important reference document with this regard.

- Port and waterway authorities should be consulted in the early processes of the development and implementation of conservation measures for those Natura 2000 sites situated near ports or connected with navigational access. When establishing conservation measures for a particular site, economic, social and cultural requirements and regional and local characteristics such as the actual situation in ports and the expected future economic developments should be taken into account while not jeopardizing the contribution of the respective site to achieving the overall objective of the Natura 2000 network and the coherence of the Natura 2000 network.
- Conservation objectives should not be static; on the contrary, they need to be adapted to the actual evolution of the conservation status of species and habitats and to the evolution of other ecological factors in a complex and dynamic environment.
- Monitoring schemes should be established to monitor short and long term evolution, such as morphological dynamics and sediment circulation/ re-distribution. On the basis of measured trends the conservation objectives and management measures can be revisited where and when necessary (applying the principles of adaptive management).

3.2. Integrated planning

3.2.1. Management plans

Management plans are recommended for Natura 2000 sites but not mandatory under the Habitats Directive. They appear to be an appropriate solution to reflect transparent conservation objectives and develop measures to preserve or enhance the natural values in line with the system's processes. A management plan creates opportunities to reconcile sustainable economic development, safety issues, accessibility with nature conservation objectives. It offers the possibility to integrate recurring and routine maintenance activities with conservation objectives.

Management plans also provide an appropriate tool for reconciling recurring and routine activities, such as maintenance dredging, with environmental protection and for engaging port authorities and other stakeholders in the management of Natura 2000 sites.

If maintenance activities are directly connected with the management of the site and as such integrated into a Natura 2000 management plan they will be designed in such a way that they are not likely to have adverse effects on the integrity of the site or compromise its conservation objectives. In this case, such activities can be authorised without appropriate assessment according to Article 6(3) of the Habitats Directive.

The integration of Strategic port plans, WFD river basin management plans and Natura 2000 management plans may offer opportunities for reducing administrative burden, delays and legal uncertainties.

Guidelines for Natura2000 management plans:

- Integrated management plans should be established for Natura 2000 sites, in particular for sites that are adjacent to port operations or other industrial activities.
- Port and waterway authorities should be actively involved in the setting up of management plans for Natura 2000 sites near ports and related waterways.
- Strategic port plans, WFD river basin management plans and Natura 2000 management plans should be coordinated and where possible integrated, so as to fully benefit of potential win-win situations.
- Recurring maintenance activities necessary to facilitate port operations and navigational access should be integrated into the management plans and designed in a way that they are not detrimental to the conservation objectives of the site.

3.2.2. Spatial planning

Spatial planning and integrated management, based on prospective and proactive approaches, can help achieve implementation of conservation measures on the sites and greater legal certainty for port development projects. Integrated planning is a way to look for synergies and complementarity ; it provides a tool to promote social responsibility and sustainable development. It should help to avoid paradoxes, conflicts, and ultimately competition for space. Anticipating frictions will save time and avoid procedural 'battles'.

The European Commission Recommendation 2002/413/EC on Integrated Coastal Zone Management (ICZM) paves the way for better strategic planning. Integrated Coastal Zone Management shall implement an « *environmentally sustainable, economically equitable, socially responsible, and culturally sensitive management of coastal zones, which maintains the integrity of this important resource while considering local traditional activities and customs that do not present a threat to sensitive natural areas and to the maintenance status of the wild species of the coastal fauna and flora* » (Janssen, 2005).

The strategic approach proposed by ICZM emphasizes the protection of the coastal environment (based on an ecosystem approach preserving its integrity and functioning) but also the threat posed by climate change or unsustainable economic activities and employment options. ICZM Recommendation proposes some principles as the "use of a combination of instruments designed to facilitate coherence between sectoral policy objectives and coherence between planning and management".

Similarly, the Marine Strategy Framework Directive 2008/56 (MSFD) requires Member States to adopt by 2016 programmes of measures, which can include "spatial and temporal distribution controls: management measures that influence where and when an activity is allowed to occur" (Annex VI). It thereby provides a regulatory basis for maritime spatial planning for marine waters under the scope of the MSFD.

Integrated spatial planning offers opportunities for anticipating difficulties and adverse environmental impacts and avoiding potential conflicts and delays in project development. Resolving problems at a spatial level means that individual projects will have to face fewer difficulties for consent if the project leaders and the permitting authority can rely on those overarching plans during a decision making process based on a pre- or appropriate assessments that have been carried out at the spatial level.

Spatial and integrated planning is not in contradiction with the concept of fast track procedures proposed by the European Commission[14] as anticipation may solve problems encountered later on. Better planning needs some additional time, but as a consequence, it allows the avoidance of conflicts during the authorization procedures and finally it contributes to eliminating "uncertainties" and causes for delays.

Land-use plans and sectoral plans, including flood risk management plans are of obvious relevance. Some have direct legal effects for the use of land, others only indirect effects. For instance, regional or geographically extensive spatial plans are often not applied directly but form the basis for more detailed plans or serve as a framework for development consents, which then have direct legal effects. Integrated strategic plans are designed to ensure in advance that the baseline conditions exist to undertake integrated projects. Such plans should be submitted to strategic environmental assessments and appropriate assessments in the framework of Article 6.3 of the Habitat Directive.

Land use planning is an integrative process, in which different claims of utilization are subject to an evaluation process. Appropriate assessments according to Article 6(3) of the Habitats Directive critically evaluate the potential impacts of the plan on Natura 2000 sites and identify possible amendments to policies or proposals so that adverse effects on Natura 2000 sites can be avoided. One of the key benefits of the appropriate assessment at plan level is that it requires decisions to be made on the content of the plan that will help avoid possible significant negative effects on Natura 2000 sites and therefore also possible conflicts and delays at the project level. In this sense, the provisions of Article 6 are not only a legal requirement but also a valuable tool in strategic planning.

The resilience of estuarine and coastal ecosystems can be strengthened by proactive nature development measures. Such measures can also be implemented on land owned by port or waterway authorities and which are dedicated to future port or waterway development but not currently in use for such a purpose or land owned by other parties (government, nature conservation organizations or private landowners). Integrated management plans for Natura 2000 estuaries offer a framework for dealing with the management and protection to be applied to such areas.

Finally, it is important to emphasize that involvement of the public and NGOs through a participatory approach is fundamental for a successful planning process. Transparency and a qualitative approach should facilitate public involvement and appropriation, even if this will not necessarily prevent the risk of contentious actions.

Guidelines for spatial planning

- Land use planning should be based on a solid and well substantiated knowledge base that includes all necessary information, both on nature conservation objectives and on ports and port-related development objectives. Economic need for additional capacity on waterways and in ports is a crucial issue that should be clearly demonstrated through middle/long term strategic planning and the use of existing capacities should be optimised (including improved coordination of infrastructures and capacities between different European ports).
- Spatial planning should be carried out at the appropriate level (competent national, regional or local authorities, port authorities…).

[14] European Commission, (2009), Strategic goals and recommendations for the EU's maritime transport policy until 2018, Communication from the Commission to the Council, The European Parliament, the European Economic and Social Committee and the Committee of the Regions, 13 p.

- Integrated spatial planning, submitted to strategic environmental assessment should be applied wherever possible as a way for anticipating difficulties and adverse environmental impacts and avoiding potential conflicts and delays in project development.
- For better integration of nature and port policies, strategic planning should be developed for the most accurate ecological unit (e.g. estuary, river basins,…).
- Spatial planning should make a clear distinction between the strategic level and the project level. Assessments at the strategic plan level can be simplified when the consideration of mere project-related details is avoided.
- Integrated spatial plans should find the right balance between economic and nature conservation objectives. They should be considered as instruments of reconciliation and integration of business and biodiversity goals.
- The national, regional and local competent authorities responsible for Natura 2000 site selection and management should work in close cooperation with the authorities in charge of spatial planning. All relevant stakeholders including port and waterway authorities, terminal operators, environmental NGOs and other public stakeholders should be involved from an early planning phase, with the objective of reconciling social and economic interests with nature conservation objectives in or nearby Natura 2000 sites.
- Port authorities and waterway administrations should be involved in all relevant planning exercises (including Natura 2000 management plans) as strategic planning will help to secure synchronized investments, to solve cross border issues, to identify less damaging alternative solutions and, where justified, imperative reasons of overriding public interest and to promote pro-active nature development.
- If a strategic plan or programme does not contain enough details to undertake a full appropriate assessment according to Article 6(3) of the Habitats Directive, the environmental report prepared for the Strategic Environmental Assessment (SEA) should help pave the way to make, at project level, an appropriate assessment and, if needed, to help prepare a derogation procedure following Article 6.4 of the Habitats Directive. In this case the SEA should already identify projects likely to have significant negative effects on Natura 2000 sites and which would need to be subject to an appropriate Art. 6(3) assessment during the project authorisation process.
- Cumulative effects of projects should best be identified and assessed already during the elaboration of spatial plans.
- Port and waterway authorities should aim for efficient land use by optimising space allocation of port industrial activities and making optimal use of different transport modes such as shipping, inland navigation and rail.
- Port and waterways authorities should consider the possibility of proactive nature development measures aimed at improving the resilience of estuarine ecosystem. The creation of temporary nature areas should be considered where land dedicated to port development is temporarily not used for such purpose. The management and protection of such land should then be dealt with in the context of integrated management plans.

3.2.3. Benefiting from partnerships and public participation

Guidelines for public participation:

- Developers of new projects should pre-assess the effects of the development and consult the competent nature conservation authorities on whether the plan is likely to have significant negative effects on the integrity of Natura 2000 site or its conservation objectives. Planning authorities should start consultation with competent authorities and non-governmental organisations (NGOs) early in the plan-making process.
- Given the complexity of environmental and zoning law, structured consultations and communication processes between various competent authorities, stakeholders and NGOs are recommended. Transport and environment administrations should be in regular communication and cooperate to ensure that the process runs efficiently at both plan and project levels. Port and waterway authorities, operators or users as well as environmental NGOs should be represented in implementation processes, including in transboundary conditions.
- Special consideration needs to be given to plans and projects that will have an impact across national borders. Neighbouring countries should inform each other and cooperate early on in the planning process.

3.3. Project development and maintenance activities

A widespread misunderstanding is that the EU nature directives are based on a “no-unless” approach. This is an interpretation based on the view that environmental policy objectives always take precedence over economic policy objectives. This approach is in contradiction with sustainable development principles, which balances environmental benefits and societal and economic requirements (see article 2.3 of the Habitat Directive). Early integral planning and the development of integrated projects are crucial, as they will promote a “yes, if” approach and pave the way for win-win solutions.

In the field of waterways and ports, the EU TEN-T status or other national priorities should help projects to qualify as being of overriding public interest. Nevertheless, if a plan or a project is being authorised on the basis of imperative reasons of overriding public interest (IROPI), then the Habitats Directive demands a justification of the arguments for IROPI.

Alternative solutions with less or no adverse effects must always be considered in sufficient detail beforehand and a plan or project with significant adverse effects on a Natura 2000 can only be authorised in the absence of such alternative solutions. Permitting procedures may cause legal uncertainty since permits may need to be reviewed, updated or eventually also be terminated. However a correct application of the provisions of the Habitats Directive and the integration of nature conservation objectives from a very early planning phase will reduce uncertainty.

The following guidelines propose recommendations on the concept of integrated projects, the correct use of the appropriate assessments and “significant impact” issues, the use of adaptive management and the assessment of compensation needed as a last resort.

3.3.1. Integrated projects and working with nature

In 2008, PIANC, the world association for waterborne transport infrastructure[15], published a position paper entitled "*Working with Nature*". It calls for an important shift in thinking in the approach to navigation development projects to help deliver mutually beneficial solutions. It promotes a proactive, integrated approach which focuses on:

- achieving the project objectives in an ecosystem context rather than assessing the consequences of a predefined project design;
- identifying mutually beneficial solutions rather than simply minimising ecological harm.
- "*Working with Nature*" thus considers the project objectives firstly from the perspective of the natural system rather than from the perspective of technical design. It is an approach which needs to be applied early in a project when greater flexibility is still possible. A proactive approach such as "*Working with Nature*" should not only be applied at project level but also to the development of strategic plans and programmes (see integrated planning).

If the design concept for a project has progressed before environmental issues are considered, the environmental impact assessment necessarily becomes an exercise of mitigation or damage limitation, potentially resulting in sub-optimal solutions and missed opportunities. "*Working with Nature*" is about more than avoiding or mitigating the environmental impacts of a pre-defined design. Rather, it sets out to identify ways of achieving the project objectives while working with natural processes and delivering environmental protection, restoration or enhancement outcomes.

A similar approach has also been tested within flood alleviation projects in the Netherlands and developed within the Interreg SAND project. It was called "*Integral Design*" and was based on different plans, which are integrated in a way that maximizes the benefits for all whilst delivering the overall objective in a cost-effective and efficient approach.

This general approach can be strongly recommended as it is in coherence with the principle that environmental damage should as a priority be avoided or rectified at the source. It is in line with the Habitats Directive. Appropriate assessment, however, still needs to be applied (article 6.3) if significant effect on a Natura 2000 site cannot be excluded. As a general rule prevention or avoidance measures are to be preferred to compensation.

Guidelines for working with nature:

- Project design should aim to be based on win-win strategies with a view to achieving dual goals of both Natura 2000 conservation objectives and socio-economic objectives.
- Projects should be 'designed' using the 'working with nature' concept. This means that the relevant Natura 2000 conservation objectives should be considered together with the technical project objectives from an early stage in project design and development.
- As a general rule, damage prevention or avoidance measures should always be preferred to compensation measures.

[15] http://www.pianc.org

3.3.2. How to handle 'appropriate assessment' and 'likely significant impact'?

The European Commission has already published guidance documents to assist Member States and operators to understand and apply Article 6 of the Habitats Directive (see annex 1). The present guidelines specify recommendations for waterways and port-related activities.

Ecology and biodiversity depend on local conditions (variability and complexity of abiotic and biotic factors), as well as on evolution in space and time. The words “appropriate” or “significant” are not normative concepts and assessments have to consider local conditions (case-by-case basis). As highlighted by Stojanovic & al. (2006), the “fact that each port is unique in terms of its geography, hydrography and commercial profile means that a “one-size-fits-all” strategy of prescribed environmental management response may not be appropriate even though there are many issues in common”.

The same can be said for the management of estuaries, as ecosystem features are depending among others on the geographical location of the estuary. Therefore a site-specific analysis is always necessary. An "appropriate" assessment means that it is an assessment which takes into account all local factors and conservation objectives. It also has to be based on the best available scientific evidence.

3.3.3. The relationship between SEA, EIA and Appropriate Assessments (AA)

There are many similarities between the procedures for SEA and EIA, and the Appropriate Assessments carried out for plans or projects affecting Natura 2000 sites under the Habitats Directive. But this does not mean they are one and the same, as there are also some important distinctions. Therefore, an SEA or an EIA cannot replace, or be a substitute for, an Appropriate Assessment as neither procedure overrides the other.

They may of course run alongside each other or information pertaining to the Appropriate Assessment may form part of the EIA/SEA process but, in such cases, the Appropriate Assessment should be clearly distinguishable and identifiable in the SEA’s Environmental Report or in the EIA’s Environmental documentation, or should be reported on separately so that its findings can be differentiated from those of the general EIA or SEA.

One of the key distinctions between SEAs/ EIAs and Habitats Directive’s Appropriate Assessments, apart from the fact that they measure different aspects of the natural environment and have different criteria for determining ‘significance’, is how the outcome of the Assessment is followed. In this regard, the assessments under the SEA and EIA lay down essentially procedural requirements and do not establish obligatory environmental standards; on the contrary, the assessment under the Habitats Directive lays down obligations of substance, mainly because it introduces an environmental standard, i.e. the conservation objective of a Natura 2000 site and the need to preserve its integrity.

In other words, if the Appropriate Assessment can not ascertain that the plan or project will not adversely affect the integrity of a Natura 2000 site, the authority cannot agree to the plan or project as it stands unless, in exceptional cases, they invoke special procedures for plans or projects for which there are no less damaging alternative solutions and which are deemed to be of overriding public interest.

The SEAs/ EIAs on the other hand are designed to make the planning authorities fully aware of the environmental implications of the proposed plan or project so that these *are taken into account* in their final decision. The considerations above are summarised in the table in Annex 4.

Guidelines for assessments:

- The significance of the effects of a plan or a project is strongly dependent on the site's characteristics and conservation objectives (which will be outlined in the Standard Data Form, Special Area of Conservation designation acts, conservation priorities, management plan…).
- When a port or related waterway development project is proposed, in a first step a pre-assessment must be carried out. If this pre-assessment demonstrates that there will be no likely significant effect on Natura 2000 sites, the competent authority may remove the obligation of going through an appropriate assessment of its implications for the site in view of the site's conservation objectives, according to Article 6(3) of the Habitats Directive. The assessment of the risk of significant effects must be made on the basis of scientific criteria and in the light inter alia of the characteristics and specific environmental conditions of the site concerned by such a plan or project. Factors such as the extent, the magnitude, the complexity, the probability, the duration, the frequency and the possible reversibility of the impact should be considered. This exercise should be done by the competent authorities.
- If it cannot be excluded, on the basis of objective information, that a project will have a significant effect on a Natura 2000 site, either individually or in combination with other plans or projects then the project is to be subject to a proper Article 6(3) assessment.
- Following a thorough appropriate assessment that includes collecting all relevant data, and subject to the reversibility of actions, minor remaining uncertainties should however not block or restrain projects indefinitely. This needs to be judged on a case by case basis. In case of uncertainty on particular mechanisms of complex estuarine or coastal ecosystems port and waterway developers should assess the nature of the remaining uncertainties and manage them through targeted monitoring and adaptive strategies. Monitoring schemes should be designed in a way that they signal any unexpected developments at a stage where effective corrective measures can still be taken.
- The absence of adverse effects is sometimes related to predicted effects not exceeding specified threshold values; the monitoring of effects relative to the threshold is then important. The threshold values should always be justified on the basis of scientific criteria.
- In the context of an appropriate assessment, information should be provided on the full characteristics of the project or plan which may affect the site, the total range or area that will be affected, the characteristics of other projects or plans which may cause cumulative impacts with the project, any planned or existing nature conservation initiatives likely to affect the status of the site in the future, the relationship (e.g. distances…) between the project or plan and the Natura 2000 site, the requirements (e.g. EIA/SEA) of the authorisation body or agency.
- Information on the protected site should include: the conservation objectives of the Natura 2000 site, the conservation status and other key attributes of Annex I habitats or Annex II species on the site, the physical and chemical characteristics of the site that may be affected by the project, the dynamics of the habitats, species and their

ecology, aspects of the site that are sensitive to change, key structural and functional relationships that create and maintain the site's integrity, other conservation issues relevant to the site, including likely future natural changes taking place and the degree to which those changes need to be managed to deliver the site's conservation objectives.

- Measures to eliminate or reduce significant effects (mitigation) should be foreseen during the project design phase. If necessary, they can be completed during the appropriate assessment (design revision, complementary mitigation). The project can then possibly reach a level where it will have no adverse effects on the integrity of the site.

3.3.4. Compensation schemes and their follow-up

Important notice: The Commission has issued guidelines directly related to the provisions of Article 6.4 of the Habitats Directive which should be read in conjunction with the following section (see Annex 1 for references).

Guidelines for compensation:

- In instances where damaging developments are, in the absence of alternative solutions, to be allowed to proceed there will be a need for compensation measures to fully offset any loss or damage to the site. These should be precisely adapted to the type of impact predicted and should be focused on the coherence of the Natura 2000 network and the particular elements affected at site level. This requires that measures refer to the structural and functional aspects of the site integrity, the related types of habitat and species populations that are affected and the contribution of these elements to the overall coherence of the Natura 2000 network.
- Compensatory measures must be feasible and operational in protecting the overall coherence of the Natura 2000 network. The estimated timescale and any maintenance action required to enhance performance should be specified as early as possible in the project. Once the compensation scheme is agreed, the permits granted and a monitoring programme in place, unforeseen uncertainties should in principle not significantly hamper the core of a plan or project. Such possible new uncertainties should, however, trigger targeted investigations and if necessary extended monitoring and adaptive or corrective measures.
- 'Losses' should be quantified with respect to key habitats and species: according to current knowledge and expert judgement. Compensation measures must be designed on the basis of best scientific knowledge and should accomplish the ecological functions necessary to support the affected species and habitats.
- Environmental damage/ environmental benefit from compensation ratio should be assessed: there is wide acknowledgement that compensation/ damage ratios should be generally well above 1:1. Thus, compensation ratios of 1:1 or below should only be considered when it is demonstrated that such measures will be 100% effective in restoring good structure and functionality within a short period of time.
- Appropriate compensation sites should be selected by considering the following:
  (a) Compensation within the Natura 2000 site if the necessary elements to ensure ecological coherence and network functionality exist within the site.
  (b) Compensation outside the Natura 2000 site if the same contribution to the ecological network is feasible. The new location can be another site designated as

Natura 2000 or a non-designated location. In the latter case, the area has to be designated as a Natura 2000 site itself.

- The compensatory measures must ensure the continuity of the ecological processes essential for maintaining the overall coherence of the Natura 2000 network. The compensation scheme should be 'effective' at the time the negative effects occur on the site concerned. Early implementation is of the essence. The application of specific mitigation measures to overcome possible interim losses may be necessary.
- All necessary provisions, technical, legal or financial, necessary to implement the compensatory measures should be completed before implementation of the plan or project starts, so as to prevent any unforeseen delays that may hinder the effectiveness of the measures.
- Financing, monitoring and reporting: Compensatory measures imply that a sound legal and financial basis for long-term implementation, protection, monitoring and maintenance be secured in advance.

3.3.5. Addressing dredging and maintenance activities

In the case of ports situated in or near estuaries, it is common that the navigational access runs through designated Natura 2000 sites. For most ports dredging is a necessity to keep the waterways and shipping lanes accessible. Potential conflicts with the obligation to preserve the integrity of a Natura 2000 site may come up. Nevertheless, maintenance dredging activities such as continuous or periodic maintenance dredging can usually be designed in a way that they do not adversely affect the integrity of Natura 2000 sites or their conservation objectives.

There are possibilities to deal with dredged materials in an estuary-friendly way. If appropriate sediment placement strategies are applied (e.g. in case of relocation of sediments in a part of an estuary where there is a lack of sediments) dredging operations can even have positive effects on the conservation status of estuaries. Recent knowledge and best practices have shown that a well-thought out relocation plan can help rebuild valuable morphological structures inside estuaries with interesting environmental benefits.

The development of innovative dredging concepts accompanied by strict monitoring schemes can contribute to achieving both navigation objectives and Natura 2000 conservation objectives. In the context of finding appropriate solutions for sustainable maintenance dredging the concept of a sustainable dredging and sediment management scheme is favoured. Such schemes will help avoiding problems, conflicts and delays and, where possible, maximising potential positive effects on the conservation status of estuaries and coastal zones.

The use of sustainable dredging and sediment management practices will further mitigate the potential impact of maintenance operations in the navigation channels. This will not, however, automatically obviate the need for assessment under Article 6(3) of the Habitats Directive. Sustainable dredging strategies should provide the necessary background information for the competent authority to make a judgement on the likelihood of possible adverse effects on a Natura 2000 site.

As a recurring activity, maintenance dredging and relocation of sediments can be used in the context of a sustainable dredging and sediment management scheme for both achieving navigation objectives and contributing to Natura 2000 conservation objectives.

The following six steps are essential in the preparation and implementation of sustainable dredging and sediment management schemes:

- Understanding of the physical setting (morphology, hydrology, salinity, etc) of the area concerned.
- Collecting the necessary information on the dredging operation in order to assess the environmental impact in detail.
- Proceeding with the assessment of the impacts of the dredging operation on the natural environment (on estuarine morphology and hydrodynamics, on sensitive habitats and species, in the short and the long term).
- Selecting optimal practices, describing all possible solutions for mitigating adverse effects and, as a last resort, examining possible compensatory measures that would be undertaken if not all significant adverse effects can be avoided through the application of mitigation measures.
- Implementing a monitoring programme determining the achievement of environmental objectives.
- Ensuring stakeholder participation all along the process in order to avoid complaints and delaying of the procedure.

The assessment of dredging operations and disposal of dredged material in marine environments is regulated under international conventions such as the London Convention, OSPAR, HELCOM, the Barcelona and Bucharest Conventions.

Guidelines for capital dredging

- Capital dredging operations should be designed as part of sustainable dredging and sediment management schemes. Where significant effects on a Natura 2000 site cannot be excluded, also in combination with other plans or projects, they must be subject to an appropriate assessment according to Article 6(3) of the Habitats Directive.
- The application of smart dredging and relocation strategies should help mitigate adverse effects and where possible restore or develop valuable morphological structures and, thus, generate ecological benefits ("working with nature").
- Dredging and sediment relocation strategies should be designed in a way that their potential positive effects are maximized. They should be underpinned by effective monitoring schemes.

Guidelines for recurring maintenance activities including maintenance dredging:

- Recurring maintenance activities should be designed and performed in a way to ensure that they do not adversely affect the integrity of Natura 2000 sites or their conservation objectives. Where possible, their potential positive effects on the conservation status of estuaries and coastal zones should be maximised through the application of sustainable sediment management strategies.
- Recurring maintenance activities where applicable should be included in integrated Natura 2000 management plans, equivalent management plans or river basin management plans to make sure that they are being assessed and reviewed in a structured manner in the overall context of the conservation of the sites.
- Maintenance operations in or near a Natura 2000 site should be specifically designed for each estuary or coastal zone and underpinned by a monitoring scheme that

enables the detection and timely correction of unforeseen adverse effects on conservation objectives.

- If, having regard in particular to the regularity or nature of maintenance operations or the conditions under which they are carried out, such operations can be regarded as constituting a single operation, in particular where they are designed to maintain a navigable channel at a certain depth by means of regular dredging necessary for that purpose, those maintenance works can be considered to be one and the same project for the purposes of the Habitats directive.

  In that case, if such a project has been authorised before the expiry of the time-limit for transposing the directive, it will not be subject to the prior assessment of the implications of the project for the site concerned. Nevertheless, in a Natura 2000 site, the carrying out of maintenance works will be subject to a general obligation of protection under Article 6(2) of the Habitats Directive consisting in avoiding deterioration of natural habitats and species' habitats and significant disturbance that affects the species for which the site has been designated[16].

- Maintenance operations, at the time of each intervention in the navigable channel, may sometimes need to be regarded as constituting distinct projects for example because of changing techniques, conditions or regularity under which they are carried out. In such a case each of those projects must, to the extent that they are likely to have a significant effect on the site concerned, undergo an assessment of their implications pursuant to Article 6(3) of the Habitats Directive.

- As the provisions of Article 6(2) always remain applicable, the Member States should review whether ongoing operations are likely to give rise to deterioration of habitats, or habitats of species and, where necessary, take appropriate steps to avoid such deterioration.

3.4. Dealing with uncertainties: adaptive management

In carrying out appropriate assessments for plans or projects in the sense of Article 6(3) of the Habitats Directive, it may be necessary to take recourse to the precautionary principle. The focus of the assessment should be on objectively demonstrating, with supporting evidence, including undertaking the necessary studies, and based on best available scientific knowledge, that there will be no adverse effects on the integrity of the Natura 2000 site. However adaptive management also helps to address situations when, because of science limits or uncertainty about the functioning of complex and dynamic ecosystems, it is not possible for the competent authorities to fully ascertain the absence of adverse effects.

When the absence of significant adverse effects of a plan or a project on a Natura 2000 site cannot be ascertained, the derogation scheme under article 6.4 of the Habitats Directive foresees that the plan or project can only be authorised in the absence of alternative solutions, if the plan or project is justified by imperative reasons of overriding public interest and if the necessary compensatory measures are undertaken to protect the overall coherence of the Natura 2000 network. If a plan or project falls under these provisions (which is likely for most port development projects), then it is essential that the different aspects are clarified at a very early stage in the plan or project development, as they are key elements for its design, financing, and, last but not least, permitting procedure.

[16] See also judgement of the Court of Justice of the European Union of 14 January 2010 in Case C-226/08 (Stadt Papenburg v Bundesrepublik Deutschland).

An adaptive approach for the implementation of a plan or project or a compensation scheme may be particularly useful to address cases where, due to uncertainty associated with different contributory factors (location, confidence, unexpected delays), it is impossible to define all the effects of the plan or project or of a compensation scheme in sufficient details and if such uncertainty cannot be factored in through increased ratios. In such a situation, a rigorous monitoring scheme and a pre-defined validated package of appropriated corrective measures must be foreseen. Such measures must allow to adjust mitigation and/or compensatory measures to the reality of the impacts and by that way, make sure that the initially unforeseen adverse effects are being neutralized.

Extensive guidance on the concept of imperative reasons of overriding public interest and on how to examine alternative solutions has already been published in existing guidance documents (see annex 1).

Guidelines for adaptive management:

- If significant negative impacts cannot be avoided even with mitigation measures, the decision to authorise the project is ultimately driven by the existence of imperative reasons of overriding public interest and the absence of less damaging alternative solutions according to the provisions of Article 6(4) of the Habitats Directive.
- In case of any remaining scientific uncertainty with regard to the effects of mitigation or compensatory measures, the measures must include a pre-defined and validated scheme to monitor the actual impacts and a framework, such as a Natura 2000 management plan, integral plan or a programme of measures, to adapt mitigation and compensation measures to the actual impacts.

Guidelines for considering alternative solutions

- Where negative effects are predicted, a range of alternative solutions of achieving the objectives of the plan or project should be identified and these alternatives should be assessed against their likely impact upon the conservation objectives of Natura 2000 sites.
- The competent authorities should not limit their consideration of alternative solutions to those suggested by the project or plan proponents. It is the competent authority's responsibility to consider alternative solutions.
- When assessing alternative solutions all relevant agencies and other bodies should be consulted. Detailed information on the alternative solutions and their impact on affected Natura 2000 site should be provided with indication of sources. The precautionary principle should be applied when assessing alternatives.

Annex 1: European Commission Communications and guidance documents

EC guidance documents related to the Birds and Habitats Directives

Annex 2: Selected private initiatives involving the port sector

1. Ecoports (see www.ecoports.com)
Ecoports is a research and development project launched in 2002 and initially co-funded by the European Commission and 12 ports and port organisations. The main goal of Ecoports was to harmonise the environmental management approach of port administrations in Europe, through the establishment of an environmental management system as well as the exchange of experiences and the implementation of good practices in respect of port-related environmental issues.

2. ESPO, Environmental Codes of Practice (see www.espo.be)
In 1994, the European Sea Ports Organisation (ESPO) published its first European Environmental Code of Practice, which was intended to be an expression of the collective commitment of the port administrations to environmental improvement. It therefore made a series of recommendations on the integration of environmental protection policies into all aspects of their operations. In 2002, ESPO carried out a survey on the impact of the Birds and Habitats Directives on port development. The main findings and recommendations were published in 2007 in the ESPO Code of Practice on the Birds and Habitats Directives.

3. Paralia Nature (see www.imiparalianature.org)
The Paralia Nature project was set up in December 2000 as an informal platform for the discussion of the Habitats Directive and related issues and projects. It is intended to bring about a broad multidisciplinary cooperation between governments, ports, universities, NGOs and knowledge centres in terms of exchanging experiences and information.

4. NEW! Delta project (Interreg IIIB - North West Europe, see www.newdelta.org)
The NEW! Delta project, which was launched in July 2004, also focused on the implementation of the Birds and Habitats Directives. The project brought together 10 partners from 4 countries in North-West Europe (England, France, Belgium and The Netherlands) including port authorities, regional administrations and research institutions.

5. SedNet (5th RTD Framework Programme, see www.sednet.org)
The Sediment Network (SedNet) is a European network, whose purpose is to incorporate sediment-related issues and knowledge into European strategies to support environmental goals and to develop new tools for sediment management.

6.TIDE (Interreg IV B North Sea Programme,see www.tide-project.eu/)
The Interreg project TIDE was set up in September 2009. It aims at the integrated management of estuaries serving as shipping channels to important sea ports with strong tidal influence and considerable sediment transport rates. A partnership of port authorities, environmental agencies and Science from the Elbe, Scheldt, Humber and Weser estuaries will exchange experience and develop tools and pilot measures for an integrated estuary management.

Annex 3: ESPO checklist on good practice for balancing Natura2000 with port and waterway development and operations (December 2009)

This checklist can be seen as an example that Member States may consider to adopt in order to provide guidance and legal certainty to the activities of port and waterway developers and operators.

Spatial and integrated planning

- Existing Port and waterway activities are thoroughly assessed, considered and weighed within all relevant levels of spatial planning.
- New developments and future growth of existing ports and waterways are an integral part of the relevant spatial planning processes.
- Port and waterways activities are thoroughly considered and weighed within a balanced and integrated Natura 2000 management plan.

Planning of new port and waterway projects

- Sustainable port development is a key element of a license for growth of port related activities (optimising port-industrial use and space, improving operation of scale, efficient use of transport modes).
- Effects of sea going shipping activities in or nearby ports are subject to international regulation schemes and treaties (UNCLOS, IMO, MARPOL). Sustainable shipping is promoted through voluntary schemes (e.g. Environmental Ship Index).
- Shareholders´, public and stakeholders' opinions are considered from the beginning using a well defined stakeholder process. Agreements on all relevant issues have been reached as far as possible using the best available scientific knowledge.
- If a significant effect can not be excluded in a pre-assessment, then the further steps of Art. 6 of the HD are followed (full assessment, alternatives, mitigation, compensation - see ESPO Code of Conduct and specific EU-guidelines).
- Competent authority shall approve and underpin the results of the stakeholder process and the port development assessments and incorporate and secure those (including decisions made during the process) in the relevant integrated plans.

Maintenance dredging

- A maintenance dredging strategy has been set up taking into account hydro-morphological and ecological aspects.
- Based on latest information and a feedback-process involving all relevant stakeholders, dredging activities are – in compliance with economical and legal requirements - aiming to achieve the least impact on Natura 2000 conservation objectives possible.
- A sustainable maintenance dredging strategy or scheme is part of an integral management plan. Based on general principles in compliance with conservation objectives, dredging is flexible according to the requirements of a dynamic tidally influenced estuarine, river or costal system.

- Dredging activities have been optimized according to the following order:
  - Technical feasibility, availability of dredgers
  - Safety, nautical requirements, navigability
  - Legally binding ecological requirements (BHD, WFD, etc.)
  - Administrative regulations (e.g. management plans, site specific objectives)
  - Full integration of long-term comprehensive hydro morphologic, sediment-related and ecological criteria
  - short-term and/or local criteria
  - cost-effectiveness
  - other non-binding aspects such as agreements with stakeholders

Natura 2000 site management and maintenance measures

- The aim should be to meet feasible conservation objectives for sites in balance with long term ports and waterways development.
- Port and waterways authorities should be actively involved in the setting up of management plans from the start.
- In dealing with uncertainties (ecosystem knowledge, cause-effect relationship), research and monitoring schemes should be included as part of the management plan.

Annex 4: Comparison of procedures under AA, EIA and SEA

	AA	EIA	SEA
Which types of developments are targeted?	Any **plan** or **project** which - either individually or in combination with other plans/projects - is likely to have a significant effect on a Natura 2000 site (excluding plans or projects directly connected to the management of the site for conservation).	All **projects** listed in Annex I. For projects listed in Annex II the need for an EIA shall be determined on a case by case basis and depending on thresholds or criteria set by Member states (taking into account criteria in Annex III).	Any **Plans** and **Programmes** which are (a) prepared for agriculture, forestry, fisheries, energy, industry, transport, waste management, water management, telecommunications, tourism, town and country planning or land use and which set the framework for future development consent of projects listed in Annexes I and II to Directive 85/337/EEC, or (b) which, in view of the likely effect on sites, have been determined to require an assessment pursuant to Article 6 or 7 of Directive 92/43/EEC.
Which impacts need to be assessed relevant to nature?	The Assessment should be made in view of the site's conservation objectives (which relate to the species/ habitat types ***for which the site was designated.***) The impacts should be assessed to determine whether they will not adversely affect the integrity of the site concerned, or otherwise.	Direct and indirect, secondary, cumulative, short, medium and long-term, permanent and temporary, positive and negative significant effects on ….'fauna and flora'.	Likely significant effects on the environment, including on issues such as biodiversity, population, human health, fauna, flora, soil, water, air, climatic factors, material assets, cultural heritage including architectural and archaeological heritage, landscape and the interrelationship between the above factors.
Who carries out the Assessment?	It is the responsibility of the competent authority to ensure that the AA is carried out. In that context the developer may be required to carry out all necessary studies and to provide all necessary information to the competent authority in order to enable the latter to take a fully informed decision. In so doing the competent authority may also collect relevant information from other sources as appropriate.	The developer.	The competent planning authority.

Are the public/ Other authorities consulted?	Not obligatory but encouraged ('if appropriate').	Compulsory consultation to be done before adoption of the development proposal. Member States shall take the necessary measures to ensure that the authorities likely to be concerned by the project by reason of their specific environmental responsibilities are given an opportunity to express their opinion on the request for development consent. Ditto for the public	Compulsory –consultation to be done before adoption of the plan or programme. The authorities and the public shall be given an early and effective opportunity within appropriate time frames to express their opinion on the draft plan or programme and the accompanying environmental report before the adoption of the plan or programme or its submission to the legislative procedure. Member States must designate the authorities to be consulted which, by reason of their specific environmental responsibilities, are likely to be concerned.
How binding are the outcomes ?	Binding. The competent authorities can agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site.	The results of consultations and the information gathered as part of the EIA ***must be taken into consideration*** in the development consent procedure.	The environmental report, as well as the opinions expressed ***shall be taken into account*** during the preparation of the plan or programme and before its adoption or submission to the legislative procedure;

GLOSSARY

Alternative solutions: Different ways of achieving the objectives of a plan or project. The Commission services suggest that 'they could involve alternative locations, different scales or designs of development, or alternative processes (EC guidance on art. 6 (3) and (4), 2001).

Appropriate Assessment (AA): The process under Article 6(3) of the Habitats Directive by which the potential effects of a plan or project upon a Natura 2000 site are assessed in view of the site's conservation objectives in order to ascertain whether the plan or project will not adversely affect the integrity of the site.

Compensatory measures: A requirement set out in Article 6(4) where damage to a European site has been justified in the absence of alternatives and for imperative reasons of overriding public interest (IROPI). Compensatory measures must be designed to protect the overall coherence of the Natura 2000 network. This normally entails the creation of appropriate habitat as close as possible to where the damage will occur and fully functioning before the damage occurs.

Cumulative impacts: Impacts that accumulate over space and time from multiple plans/projects.

Deterioration: physical degradation affecting a habitat, or a breeding site or resting place of a species. In contrast to destruction, such degradation may occur slowly and gradually reduce the functionality of the site in terms of quality or quantity and might over a certain period of time lead to its complete loss.

Disturbance: A temporary or permanent change in environmental conditions (e.g. by noise, source of light) that may have a negative effect on a natural habitat or a species. Disturbance may be detrimental for a protected species e.g. by reducing survival chances, breeding success or reproductive ability and may give rise to additional indirect effects (e.g. increased competition for food resources).

Favourable Conservation Status: The conservation status of a natural habitat will be taken as "favourable" when: its natural range and areas it covers within that range are stable or increasing; the specific structure and functions which are necessary for its long-term maintenance exist and are likely to continue to exist for the foreseeable future; and the conservation status of its typical species is favourable (Article 1.e of the Habitats Directive).

The conservation status of a species will be taken as "favourable" when: viable population is maintained on a long-term basis; the natural range of the species is neither being reduced nor is likely to be reduced in the future; and there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis.

Habitat of Community Interest: a natural habitat type in Annex I of the Habitats Directive.

Imperative Reasons of Overriding Public Interest (IROPI): A requirement set out in Article 6(4) which, in limited circumstances, permits a plan or project to go ahead even after an AA has failed to ascertain that the integrity of a Natura 2000 site will not be adversely affected.

Mitigation: Measures aimed at minimising or even cancelling the negative impact of a plan or project, during or after its completion.

Monitoring: Collection and analysis of repeated observations or measurements to evaluate changes in condition and progress toward meeting a management objective.

Natura 2000 site: sites designated to form the Natura 2000 network, which include Special Protection Areas (SPA) and Sites of Community Importance (SCI) approved by the European Commission and declared as Special Areas of Conservation (SAC) by the Member States.

Offset: Biodiversity offsets are conservation actions intended to compensate for the residual, unavoidable harm to biodiversity caused by development projects, so as to aspire to no net loss of biodiversity.

Precautionary principle: where scientific evidence is insufficient, inconclusive or uncertain and there are indications through preliminary objective scientific evaluation that there are reasonable grounds for concern that the potentially dangerous effects on the environment, human, animal or plant health may be inconsistent with the chosen level of protection, lack of scientific knowledge shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation (Rio Declaration, 1992 & EC, 2000).

Qualifying Interest: a natural habitat type listed in Annex I or a species listed in Annex II of the Habitats Directive, a species listed in Annex I of the Birds Directive or regularly occurring migratory species not listed in Annex I, for which a Natura 2000 is designated.

Site of Community Importance (SCI): it is defined in the Habitats Directive (92/43/EEC) as a site which, in the biogeographical region or regions to which it belongs, contributes significantly to the maintenance or restoration at a favourable conservation status of a natural habitat type in Annex I or of a species in Annex II and may also contribute significantly to the coherence of Natura 2000, and/or to the maintenance of biological diversity within the biogeographical region or regions concerned. SCIs are proposed to the Commission by the Member States and once approved, they must be designated as Special Areas of Conservation (SACs) by the Member States.

Special Area of Conservation (SAC): site of Community importance designated by the Member States through a statutory, administrative and/or contractual act where the necessary conservation measures are applied for the maintenance or restoration, at a favourable conservation status, of the natural habitats and/or the populations of the species for which the site is designated.

Special Protection Area (SPA): Protected area designated in accordance with the Birds Directive for species listed on Annex I of the Directive and/or regularly occurring migratory species, and included in the Natura 2000 network.

Species of Community Interest: a species listed in in Annex II and/or Annex IV or V of the Habitats Directive.

Stakeholders: People or organisations that will be affected by, or will influence a programme, project or action.

Surveillance: An extended programme of surveys systematically undertaken to provide a series of observations to ascertain the variability that might be encountered over time.

This document has been prepared with the assistance of Ecosystems LTD (part of the N2K Group EEIG) under contract to the European Commission (contract N° 070307/2008/513837/SER/B2).

It has also greatly benefitted from discussions with, and information supplied by, experts from Member States and key stakeholder groups, within the framework of an ad hoc group on wind energy and nature conservation.

TABLE OF CONTENTS

PURPOSE OF THIS GUIDANCE ..... p 5

1. WIND ENERGY DEVELOPMENTS IN THE EU ..... p 7

1.1 Wind energy in Europe – 20 years of sustained growth ..... p 7
1.2 The EU Policy Framework for promoting renewable energy sources ..... p 8
1.3 Wind power development: predictions for 2020 and beyond ..... p 9
1.4 Wind energy development in different Member States ..... p 10
1.5 Offshore wind power ..... p 11
1.6 Balancing wind farm developments with broader societal needs ..... p 12

2. THE EU'S POLICY FRAMEWORK AND LEGISLATION ON NATURE AND BIODIVERSITY ..... p 15

2.1 Introduction ..... p 15
2.2 The EU's commitment to halting biodiversity loss ..... p 16
2.3 The Habitats and Birds Directives ..... p 17
2.3.1 Overall objectives of the Birds and Habitats Directives ..... p 17
2.3.2 A general system of strict protection for species ..... p 17
2.3.3 Habitat protection provisions: the Natura 2000 Network ..... p 19
2.3.4 Managing and conserving Natura 2000 sites ..... p 20
2.3.5 New developments affecting Natura 2000 sites ..... p 21
2.3.6 Improving the ecological coherence of the Natura 2000 Network ..... p 22
2.4 The EU nature Directives and wind farm development ..... p 22
2.5 The SEA Directive and the EIA Directive ..... p 23
2.5.1 The SEA Directive ..... p 23
2.5.2 Environmental Impact Assessment ..... p 23
2.5.3 The relationship between SEA, EIA and Appropriate Assessments ..... p 24
2.6 Relevant international nature and biodiversity Conventions and Agreements ..... p 26

3. POTENTIAL IMPACTS OF WIND ENERGY DEVELOPMENTS ON NATURE AND WILDLIFE ..... p 29

3.1 Positive and negative impacts: the need for a case by case approach ..... p 29
3.2 Identifying potential impacts during different phases of wind farm development. p 31
3.3 An overview of potential impacts ..... p 31

PURPOSE OF THIS GUIDANCE

Background

In December 2008, the EU adopted an ambitious and far-reaching 'climate change and energy' package which, amongst others, commits the EU-27 countries to increasing the share of renewable energy to 20% of Europe's total energy production by 2020. As a clean, renewable source of electricity, wind energy is destined to make a significant contribution to achieving this 20% target.

Wind energy in Europe has been growing rapidly over the last decade. In 2008, it accounted for around 4.8% of the EU's total electricity consumption. This share is expected to at least triple by 2020. It is clear therefore that the number of wind farm installations across the EU is likely to increase radically in the short to medium term. It will be important to ensure that such a rapid expansion is sustainable in all respects and is done in accordance with EU environmental legislation, including the Habitats and Birds Directives.

Evidence to date shows that, whereas, in general, wind energy does not represent a serious threat to wildlife, poorly sited or designed wind farms can pose a potential threat to vulnerable species and habitats, including those protected under the Habitats and Birds Directives.

Purpose of this Guidance document

The purpose of this document is to provide guidance on how best to ensure that wind energy developments are compatible with the provisions of the Habitats and Birds Directives. It focusses in particular on the procedures to follow under Article 6 of the Habitats Directive when dealing with wind farm related plans and projects which could affect a Natura 2000 site and provides clarifications on certain key aspects of this approval process. The Habitats Directive does not, a priori, exclude wind farm developments in or adjacent to Natura 2000 sites. These need to be judged on a case by case basis.

As such, the document is designed principally for use by competent authorities and developers, as well as consultants, site managers and other practitioners who are involved in the planning, design, implementation or approval of wind farms plans or projects. It may also be of interest to other organisations such as NGOs and international bodies. During the course of its preparation, the document benefitted greatly from discussions with, and information supplied by, experts from Member States and key stakeholder groups, within the framework of an ad hoc group on wind energy and nature conservation.

Structure and Contents

The document is made up of 5 main sections:

- **Chapter 1** provides an overview of wind energy development in Europe and of the policy framework at EU level.

- **Chapter 2** introduces the key provisions of the EU's biodiversity policy and the Habitats and Birds Directives. It also explores the relationship between Strategic Environmental Assessments under the SEA Directive, Environmental Impact Assessments under the EIA Directive and Appropriate Assessments under the Habitats Directive.

- **Chapter 3** reviews the potential impacts wind energy developments might have on various species such as birds, bats, marine mammals, and habitat types, such as blanket bogs. The information presented here is derived from an extensive review of existing scientific literature and other recognised sources of information.

- **Chapter 4** examines the benefits of strategic planning for wind farm developments as a means to achieving a more efficient and integrated decision-making process that helps to avoid or minimise conflicts later on at the project level and, in particular, to encourage a appropriate siting of wind farms in areas of potentially low or no conflicts for wildlife. Various good practice examples are given of how this has been achieved in different parts of the EU.

- **Chapter 5** focusses specifically on the provisions of Article 6 of the Habitats Directive and offers a step-by-step guide to the procedures to follow when assessing wind farm plans or projects that might affect Natura 2000 sites in particular. It provides advice and guidance on how to carry out an Appropriate Assessment and how to ensure that there is a sufficiently sound scientific information base upon which to determine whether or not the project is likely to have an adverse effect on the integrity of a Natura 2000 site.

Limitations of the document

This guidance document is intended to be bound by, and faithful to, the text of the Birds and Habitats Directives and to the wider principles underpinning EU policy on the environment and renewable energies. It is not legislative in character, it does not make new rules but rather provides further guidance on the application of those that already exist. As such, it reflects only the views of the Commission services and is not of a legally binding nature.

It rests with the EU Court of Justice to provide definitive interpretation of a Directive. Wherever relevant, existing case law has been included when clear positions have already been taken by the Court.

The document also does not replace the Commission's existing general interpretative and methodological guidance documents on the provisions of Article 6 of the Habitats Directive[1]. Instead, it seeks to clarify specific aspects of these provisions and place them in the context of wind farm development in particular. The present guide is therefore best read in conjunction with the existing general guidance and the two Directives.

Finally, the guidance recognises that the two nature Directives are enshrined in the principle of subsidiarity and it is for Member States to determine the procedural requirements arising from the Directives. The good practice procedures and proposed methodologies described in this document are not prescriptive in their intent, rather they aim to offer useful advice, ideas and suggestions based on an extensive review of existing experiences and good practices across the EU and beyond. For further reading, references to various national guidance documents and other sources of information are provided in the annexes.

1. WIND ENERGY DEVELOPMENTS IN THE EU

- *In December 2008, the EU adopted an ambitious and far-reaching 'climate change and energy' package which, inter alia, commits the EU-27 countries to increasing the share of renewable energy to 20% of Europe's total energy production by 2020;*
- *As a clean, renewable source of electricity, wind energy is destined to make a significant contribution to achieving this 20% target. It will also help to substantially reduce greenhouse gas and air pollutant emissions, as well as freshwater consumption associated with conventional power generation in the EU;*
- *Wind energy has grown rapidly over the last decade. In 2009, it accounted for some 4.8% of the EU's total electricity consumption. This is expected to at least triple by 2020. This could imply an annual expansion in wind farms, both onshore and offshore, of more than 10 GW per year until 2020;*
- *A minority of Member States are currently responsible for the bulk of the EU's wind power. Even accepting the variations in wind resources, the availability of other renewable energy and different national priorities, wind energy is likely to grow siginifcantly in most if not all countries;*
- *The latest EU commitments towards renewable energy create a favourable legislative environment for wind power development whilst ensuring that it is done in accordance with EU environmental legislation.*

1.1 Wind energy in Europe – 20 years of sustained growth

Thanks to recent technological advances, the wind energy sector in Europe has undergone a rapid and sustained growth over the last 20 years. In 2009, some 4.8% of the EU-27's total electricity consumption was provided by wind energy.

An important driver behind this fast growth is the need for Europe to have a secure supply of energy that is not reliant on external sources of gas and oil. A second major driver is the significant contribution wind energy can make in reducing greenhouse gas emissions. As a clean, renewable resource, wind energy is already playing - and will continue to play - an important role in mitigating against climate change, while at the same time bringing benefits in terms of reductions in air pollutant emissions and cooling water consumption associated with many conventional power generation technologies.

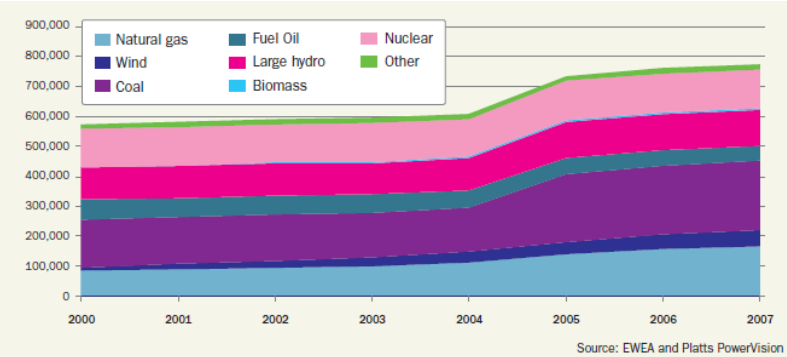

Figure 1: Installed power capacity EU 2000-2007 (MW) - EWEA 'Pure Power', March 2008

1.2 The EU Policy Framework for promoting renewable energy sources

Climate change and renewable energy are both high on the EU political agenda. The EU's renewable energy policy goes back to 1997 with the adoption of the Commission's White Paper entitled: '*Energy for the future: renewable sources of energy*'[2]. It recommended that the share of renewable energy in gross energy consumption be doubled to 12% by 2010. This was translated into law in 2001 through the adoption of Directive 2001/77/EC on the '*promotion of electricity from renewable energy sources*'[3] and Directive 2003/30/EC "*on the promotion of the use of biofuels or other renewable fuels for transport*"[4]. Directive 2003/87/EC established a trading scheme for greenhouse gas emission allowance.

In January 2008 the Commission proposed an ambitious and far reaching '*Climate Change and Energy Package*' that was agreed politically by the EU Heads of State in December 2008[5].

The package commits the EU Member States to the following targets:

- Cutting greenhouse gas emissions by at least 20% by 2020 compared to 1990 levels (rising to 30% if other developed countries make comparable efforts in the framework of a new global climate change agreement)[6];
- Increasing the use of renewable energy sources to 20% of Europe's gross final energy consumption by 2020, including a specific target of 10% renewables in transport;
- Cutting energy consumption by 20% of projected 2020 levels by improving energy efficiency[7].

As a follow up, in April 2009, Directive 2009/28/EC[8] *on the promotion of the use of energy from renewable sources* (the 'RES' Directive) was adopted which set mandatory national targets for each Member State to ensure the delivery of the overall EU target of 20% energy from renewable energy sources (see Table 1).

Under the RES Directive, each Member State is required to draw up a clear action plan to demonstrate how they intend to achieve their renewable energy targets. These *National Renewable Energy Action Plans* (NREAPs), to be adopted by 30 June 2010, contain details about national sectoral targets and support schemes, amongst others.

They should also provide an assessment of the role that different technologies will play in reaching the targets for that country and outline the measures that will be taken to increase the use of renewable energy e.g. by reducing administrative barriers and improving access conditions to electricity grids.

Renewable energy sources

Renewable energy sources come in a variety of forms: wind, solar, aerothermal, geothermal, hydrothermal and ocean energy, hydropower, biomass, biowaste and biogasses. They are also used in a variety of ways: to produce electricity, heating and cooling or fuel for transport.

Wind power is used specifically to generate electricity. Electricity is just one of several types of energy used in the EU. The 20% renewable energy target covers all forms of energy.

1.3 Wind power development: predictions for 2020 and beyond

It is clear that the new EU targets will require a significant change in renewable energy development over a relatively short period of time.

According to the Commission's Renewable Energies Roadmap, 34% of all electricity consumption in 2020 is expected to come from renewable sources by 2020, and around 12% could be generated by wind power alone. This would entail a threefold increase in the current share that wind power has in the EU's electricity consumption (some 4.8% in 2008).

One of the reasons why wind power is expanding so rapidly is that wind power technology has evolved significantly in the past 20 years. Turbine size onshore has increased from less than 50 KW in the 1980s to more than 3 MW today. Rotor diameter has also increased from an average of 15m to 100m or more.

Nowadays, 3 bladed upwind, variable speed, pitch regulated turbines generating between 750 -3000 KW are predominant, representing around 90% of the EU market[9]. The cost of installing wind turbines has also dropped substantially over the years[10] which has not only made wind farm developments more affordable but also more attractive to investors.

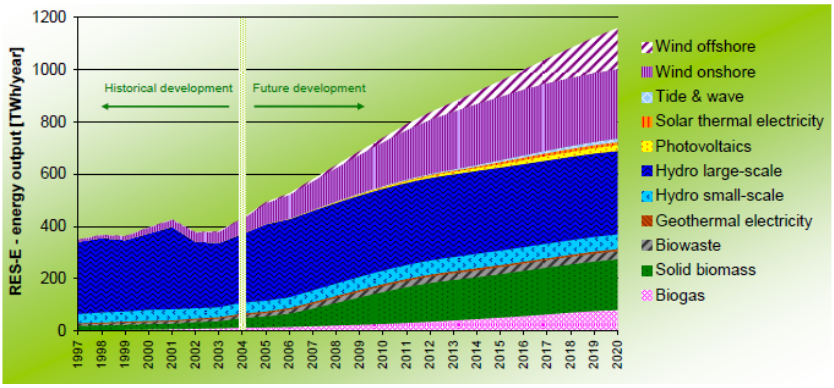

Figure 2: Renewables growth: electricity projections by 2020[11]

Overall, wind power capacity in the EU has increased more than a hundred fold in the past 12 years from 4,753 MW in 1997 to 74,767 MW in 2009 (EWEA). In 2009, over 39% of all new electricity generating capacity added to the European grid came from wind power.

In its 2nd Strategic Energy Review[12], the Commission estimates that wind power will expand even further in the short to medium term, and, according to some of the scenarios used for the impact assessment of the climate-energy package, the total capacity could exceed 161 GW by 2020. EWEA predictions are even higher, with a target of 230 GW by 2020, including 40 GW offshore.

1.4 Wind energy development in different Member States

Europe is now the world leader in wind energy technology and development. Eleven European countries had more than 1000 MW of wind power installed on their territory by the end of 2008 (Germany, Spain, Denmark, Italy, France, Portugal, Netherlands, Sweden, Ireland, Greece and UK) and five of them (Denmark, Spain, Portugal, Ireland, Germany) have more than 5% of their total electricity demand covered by wind power.

This does not mean that wind energy will play an equally important role in all countries. Wind resources differ significantly from country to country as does the availability of alternative renewable energy sources such as biomass or geothermal energy. The capability of current transmission networks and other generation plants to integrate large amounts of wind energy also varies and depends to some extent on historical developments. All these and other factors will be important in the strategic planning of wind farm development in the EU and in determining the contribution that wind energy will make in different Member States to reaching their targets under the RES Directive.

---

[9] Small and very small turbines are still also used to meet specific needs, for instance as a traditional part of rural electrification eg to power isolated homes, boats and telecommunication facilities. Micro generation may become more popular in urban areas but for the moment they represent only a small share the market.

[10] The average wind turbine in Europe costs 1.23 mil/MW onshore and 2-2.2 mi/MW offshore.

[11] Commission Communication COM(2006) 848 final, 10.1.2007 'Renewable Energy Road Map'

[12] COM (2008) 738 final, 13.11.2008

1.5 Offshore wind power

In contrast to onshore wind power, offshore wind power is still in its infancy and only accounts for about 2% of the total installed wind power capacity in Europe. Most of the development so far has been in the North Sea and in the Baltic Sea, mostly in shallow waters less than 30 m deep and less than 40 km from the shore.

Compared to onshore wind farms, offshore installations are more complex and costly to put in place. The technology is subject to greater requirements given the harsher and less accessible operational environment. There are also still significant bottlenecks to overcome in the supply chain (lack of installation vessels or harbour facilities, lack of skilled work force) and in gaining access to the electricity grid.

Nevertheless, considering that the average turbine size is expected to be significantly bigger offshore (ca 5 MW), the potential for offshore wind energy to grow as technology evolves is considerable.

In its Communication of November 2008[13], entitled '*Offshore wind energy: action needed to deliver on the Energy Policy Objectives for 2020 and beyond*', the Commission estimates the potential for wind power offshore by 2020 is likely to be some 30-40 times the capacity installed at that time (some 1,1 GW by end of 2007, which had grown to 2.06 by the end of 2009).

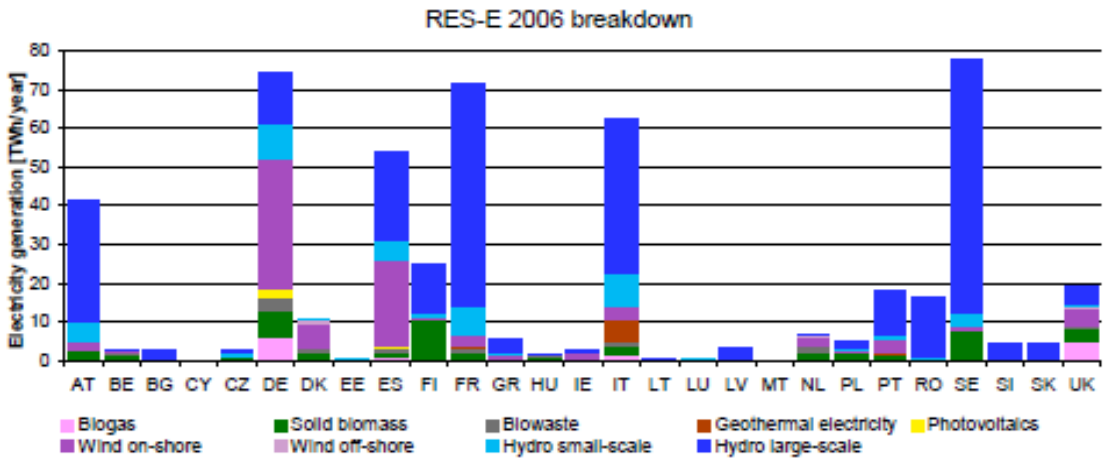

Figure 3: promotion and growth of renewable energy sources and systems across EU[14].

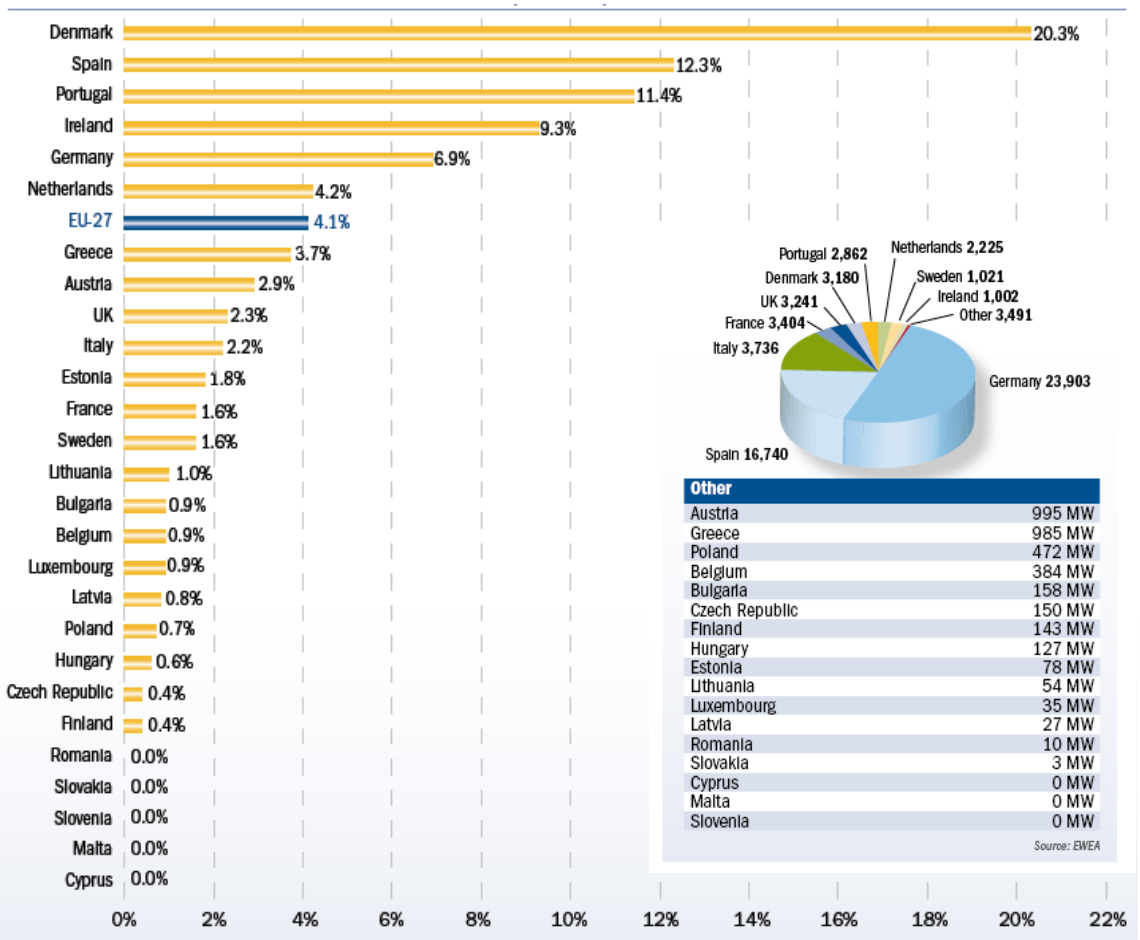

Figure 4 (above): wind power's share of electricity demand (2008)
Figure 5 (right): End 2008 Member State share of total capacity of wind power (EWEA)[15]

1.6 Balancing wind farm developments with broader societal needs

The rapid expansion of wind farm installations in the coming years will bring many benefits to society, not least in reducing greenhouse gases. In addition to the reduction of greenhouse gases, wind power helps economies to reduce energy dependency and their exposure to volatile or high fuel and carbon costs. Wind power is also a source of employment creation, technology development, social cohesion and exports.

But, like all developments, this expansion needs to be in balance with other broader social, economic and environmental concerns to ensure it grows in a sustainable manner and is publicly acceptable.

There are still a number of hurdles to overcome in order for wind energy to play a role that is commensurate to its potential. Amongst others, this means ensuring better access to the electricity grid, removing administrative barriers to the use of renewable energy over other

[15] EWEA Pure power : wind energy targets for 2020 and 2030, p26 and 23 (Dec 2009) http://www.ewea.org/fileadmin/ewea_documents/documents/publications/reports/Pure_Power_Full_Report.pdf

more traditional forms of energy, and improving the technology, especially for offshore developments.

From a social perspective, apprehensions over wind farm developments vary significantly and will need to be addressed on a case by case basis to ensure that local interests are properly considered. Typical concerns include the potential level of noise generated by wind farms, visual impacts, issues of safety, effects on the landscape, archeology, heritage, as well as possible interference with aviation or shipping navigation etc…

There is also a concern over the potential impact of poorly sited wind farms can have upon nature and wildlife which, in view of the scale of development foreseen, cannot be ignored. The EU's environmental legislation provides a common legal framework applicable across all Member States to address this concern. The mechanisms established through the EU's existing environmental legislation can ensure that wind energy is developed in a way that is both sustainable and minimises its impact on the natural environment.

These procedures and the potential impacts of wind farms on nature and wildlife are examined further in this guidance document. But it is important to bear in mind that potential conflicts with nature and wildlife are just one of a range of possible constraints that a wind farm developer may face depending on the local context. A clear distinction must therefore be made between these different constraints so that each can be analysed in its proper context and not mistakenly used as a reason for objecting to developments on other grounds.

This requires a clear understanding of the type of potential impacts of wind farms on nature and wildlife as well as the legal obligations that must be respected when planning and executing wind farm developments.

2. THE EU'S POLICY FRAMEWORK AND LEGISLATION FOR NATURE AND BIODIVERSITY

- *Like climate change and renewable energy, biodiversity conservation is a high political priority. The EU is committed to halting the decline in biodiversity in the EU and this commitment is now firmly embedded in all aspects of EU policy.*
- *The EU 'Habitats' and 'Birds' Directives are the cornerstones of the EU's biodiversity policy. They enable all Member States to work together to protect and ensure the survival of Europe's most endangered and vulnerable species and habitat types.*
- *Central to the two Directives is the creation of the Natura 2000 Network, an ecological network of sites spanning 27 EU countries. Nearly 26,000 sites are included in the Network so far, covering almost 18% of the EU's land area. There are additionally significant marine areas but this component of the Network is not yet complete.*
- *Wind farms likely to have an adverse effect on a Natura 2000 site must be subject to an Appropriate Assessment in light of the site's conservation objectives. Such developments may proceed under certain conditions where the procedural safeguards foreseen by the two nature Directives are respected.*
- *The two Directives also require that wind energy developments do not cause any significant damage or disturbance to species of Community interest (i.e. those covered by the Directives) or their key habitats in the broader countryside.*
- *New wind farm plans and projects may also be subject to the provisions of the SEA and the EIA Directives but these are distinct and different from the Appropriate Assessment undertaken under the Habitats Directive.*

2.1 Introduction

It is clear that the number of wind farm installations in the EU is likely to grow at a very significant rate in the short to medium term in some parts of Europe. Given that wind power is universally recognised as a source of clean, renewable energy and is, as such, also a major contributor in climate change mitigation, it will be important to ensure that its expansion is sustainable in all respects and is achieved without unnecessary damage to the natural environment and Europe's natural heritage.

Like any other industrial activities entailing the use of land or sea, wind energy development inevitably has an ecological footprint that still needs to be considered and addressed where relevant.

This chapter outlines the EU's key environmental laws and international commitments that need to be respected when developing wind farms in the EU. Chapter 5 provides further detailed guidance as regards developments affecting Natura 2000 sites in particular.

2.2 The EU's commitment to halting biodiversity loss

Like climate change and renewable energy, biodiversity conservation is high on the EU political agenda. It is identified as one of the key operational objectives of the Sustainable Development Strategy (SDS)[16] and the Lisbon partnership for growth and jobs.

The 6th Environment Action Programme (6th EAP)[17] sets out the framework for environmental policy-making in the EU for the period 2002-2012 and has 'nature and biodiversity' as one of four priority areas for action[18]. The detailed measures be undertaken are laid down in the European Commission's EU Biodiversity Action Plan adopted in 2006[19].

The EU Action Plan represents an important new approach for EU biodiversity policy as it is the first time that all the relevant economic sectors and policy areas are addressed in a single strategy document and apportioned a share of the responsibility in its implementation. It recognises that change will only happen if there is a concerted effort from all economic sectors to help deliver the biodiversity targets.

The EU Plan also stresses the important ecosystem services that nature provides, and upon which our economy and social wellbeing depends. Healthy ecosystems help purify the air and water, and regulate the climate. They provide basic goods such as food, fibre and wood. As such, they will have a major role to play in mitigating the effect of climate change in years to come.

The Commission plans to present a new EU biodiversity strategy by the end of 2010 on the basis of the Communication on an EU vision and target for biodiversity beyond 2010[20] and the EU Council Conclusions on biodiversity post-2010 adopted on 15 March 2010. This strategy should set a limited number of measurable sub-targets for different ecosystems, driving forces, pressures and responses, and ensure their integration into relevant internal and external EU sectoral policies. An innovative aspect of the 2020 biodiversity strategy will be the establishment of a biodiversity baseline that will enable assessment of progress towards reaching the target. The EU strategy[21] will be developed with a view to the global post-2010 biodiversity framework that is to be adopted under the United Nations Convention on Biological Diversity in October 2010.

Biodiversity and climate change

The Intergovernmental Panel on Climate Change (IPCC) predicts that average surface temperatures across the globe will rise by 2–6.4°C by 2100 compared to pre-industrial levels. The impact on biodiversity and ecosystems is hard to estimate but is expected to be very considerable. Already studies show that many species are experiencing difficulties in adapting to the changing climate and that this is exposing them to an even greater risk of extinction.

Climate change also puts at risk the valuable ecosystems upon which society depends for important goods and services, such as flood prevention or carbon storage. Healthy ecosystems are an essential component of any climate mitigation strategy but, like wildlife, they are under significant pressure from habitat loss and degradation which is largely caused by urban sprawl, intensifying land uses and inappropriate development. The ability of ecosystems to assist us in mitigating against climate change will be determined by how effectively they are protected and managed.

[21] Further developments can be followed at http://ec.europa.eu/environment/nature/biodiversity/policy/index_en.htm

2.3 The Habitats and Birds Directives

The Birds and Habitats Directives are the cornerstones of the EU's biodiversity policy. They enable all 27 EU Member States to work together, within a common legislative framework, to conserve Europe's most valuable species and habitats across their entire natural range within the EU, irrespective of political or administrative boundaries.

The Directives have two main objectives:

- they protect species in their own right across the EU (through species protection provisions);
- they conserve the core areas for certain rare and endangered species (through habitat protection provisions leading to the establishment of the Natura 2000 Network)

In the case of the latter, it is important to note that the Natura 2000 Network is not a system of strict nature reserves where all human activities are excluded. Instead, the two Directives provide a common legislative framework, applicable in all EU countries, which ensures that human activities – *inter alia* wind energy activities – are undertaken in a way that does not adversely affect the integrity of Natura 2000 sites.

Article 6 of the Habitats Directive lays down procedural safeguards to be followed in the case of new developments. Its provisions are explained in greater detail in subsequent chapters. But first it is useful to understand the general purpose of the two Directives.

2.3.1 Overall objectives of the Birds and Habitats Directives

The overall objective of the Birds Directive[22] is to maintain and restore the populations of naturally occurring wild bird species present in the EU (ca 500 species) at a level which will ensure their survival over the long term. The Habitats Directive[23] has similar objectives to the Birds Directive but covers species other than birds as well as habitat types. Its aim is to ensure the conservation of a further 1000 endangered wild animals and plants as well as 230 rare and threatened habitat types which are in danger of disappearing.

It should be noted that the Habitats Directive does not cover *every* species of plant and animal in Europe (ie not all of the EU's biodiversity). Instead, it focuses on a sub-set of around 1500 species - often referred to as species of Community interest (or species of European importance) - which are so rare and threatened that they need protection in order to ensure their long-term survival within the EU.

2.3.2 A general system of strict protection for species

As regards species protection, both Directives require that Member States establish a general system of protection for all wild bird species in the EU and for species listed in Annex IV of the Habitats Directive throughout their natural range within the EU. These provisions apply both inside and outsite protected sites.

---

[22] Directive 2009/147/EC of the European Parliament and of the Council (codified version of Council Directive 79/409/EEC on the conservation of wild birds, as amended) – see http://ec.europa.eu/environment/nature/legislation/index_en.htm

[23] Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora, consolidated version reference 01992L0043 of 01.01.2007 - see http://ec.europa.eu/environment/nature/legislation/index_en.htm

The exact terms are laid down in article 5 of the Birds Directive and Article 12 (for animals) and Article 13 (for plants) of the Habitats Directive.

As some protected species are potentially vulnerable to wind farms, these provisions may also need to be taken into account by developers and planners when considering developments outside Natura 2000. This could apply for instance if a proposed development is situated along a major migration route as it could cause significant disturbance or damage to protected birds, bats or other species during their migration.

Whatever measures are applied to meet the strict protection provisions of the two Directives, they must be proportional to the assessed impact on the conservation status of the species concerned.

Article 5 of Birds Directive

Member States should take the requisite measures to establish a general system of protection for all wild bird species throughout their natural range within the EU. In particular they should prohibit the following:

- *deliberate killing or capture by any method;*
- *deliberate destruction of, or damage to, their nests and eggs or removal of their nests;*
- *taking their eggs in the wild and keeping of eggs;*
- *deliberate disturbance of these birds particularly during the period of breeding and rearing, in so far as this would have a significant negative effect on the birds;*
- *keeping the birds in captivity and their sale.*

Article 12 and 13 Habitats Directive

Member States should take the requisite measures to protect the species listed in Annex IV throughout its natural range within Europe.

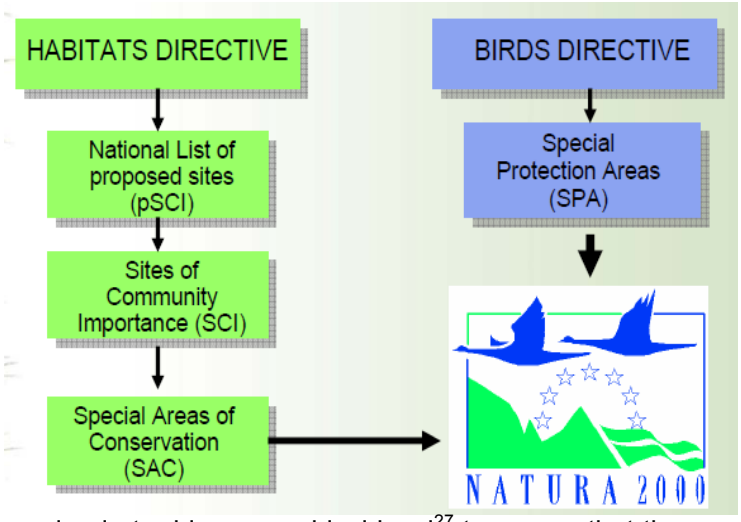
*In the case of **protected animals** this means prohibiting the:*

- *deliberate killing or capture by any method;*
- *deliberate disturbance, particularly during breeding, rearing, hibernation and migration;*
- *deliberate destruction or taking of eggs in the wild;*
- *deterioration or destruction of breeding sites or resting places;*
- *the keeping, sale and transport of specimens the from the wild.*

*In the case of **protected plants** this mean prohibiting:*

- *the deliberate picking, collecting, cutting, uprooting or destruction of such plants in the wild;*
- *the keeping, transport of sale of such species taken from the wild.*

Derogations to these species protection provisions are allowed in some circumstances (e.g. to prevent serious damage to crops, livestock, forests, fisheries and water) provided that there is no other satisfactory solution and the consequences of these derogations are not incompatible with the overall aims of the Directives.



The conditions for applying derogations are set out in Article 9 of the Birds Directive and Article 16 of the Habitats Directive. With reference to wind farms, it is primarily reasons related to 'the interests of public health and public safety, or for 'other imperative reasons of public interest' (ref. Article 16(1c)) that might apply. The Commission has produced guidelines on the strict species protection provisions for animals protected under the Habitats Directive[24].

[24] Guidance document on the strict protection of animal species of Community interest under the 'Habitats' Directive 92/43/EEC http://ec.europa.eu/environment/nature/conservation/species/guidance/index_en.htm

2.3.3 Habitat protection provisions: the Natura 2000 Network:

The two Nature Directives also require the protection of key sites for certain species and habitat types listed in the respective annexes. Together, these sites form part of the Natura 2000 Network which spans 27 EU countries.

- **Under the Habitats Directive**, core sites need to be protected for the habitat types listed in annex I and species in annex II[25]. The first step is for Member States to propose their national list of possible Sites of Community Importance (SCIs). It is important to note that the selection of SCIs must be done on scientific grounds only. Member States may not take economic aspects into account at this stage.[26]

  These proposed SCIs are then examined at a biogeographical level[27] to ensure that they offer sufficient coverage for the protected species and habitat types concerned before they are approved by the Commission. Member States then have six years to designate the approved SCIs as a Special Area of Conservation (SAC) by which time they must also establish the necessary conservation measures to maintain and restore the habitats and species at a favourable conservation status.

- **Under the Birds Directive**, core sites need to be classified for ca 190 species of birds listed in Annex I of the Directive. Member States must also classify sites for other regularly occurring migratory bird species not listed in Annex I, bearing in mind the need to protect their breeding, moulting and wintering areas and staging posts along their migration routes, eg wetlands of international importance. These sites are called Special Protection Areas (SPAs) and are included directly into the European Natura 2000 Network[28].

By December 2009, about 26,000 SCIs and SPAs were included in the Natura 2000 Network[29]. Together, they cover around 18% of the land area in the EU-27 with signficant additional marine areas[30]. At this stage, there were 1391 SCIs and 619 SPAs in marine waters but further sites will need to be protected to complete the marine component of the network. This should be achieved by 2012.

[25] There is considerable overlap between the species listed in annex II and those listed in annex IV but not all Annex IV species require specific site protection under Natura 2000 so they are not all listed in annex II.
[26] ECJ Ruling C-371/98, First Corporate Shipping LTD.
[27] The EU has 9 biogeographical regions, each with its own characteristic blend of vegetation, climate, topography and geology. Working at this level makes it easier to check species and habitat conservation trends under similar natural conditions, irrespective of national boundaries.
[28] In contrast to the Habitats Directive, there is no intermediary step of selecting sites according to biogeographical region in the case of SPAs. These are included directly into the Natura 2000 Network
[29] European Commission, http://ec.europa.eu/environment/nature/natura2000/barometer/index_en.htm
[30] There is sometimes considerable overlap between SPAs and SCIs so the figures are not cumulative

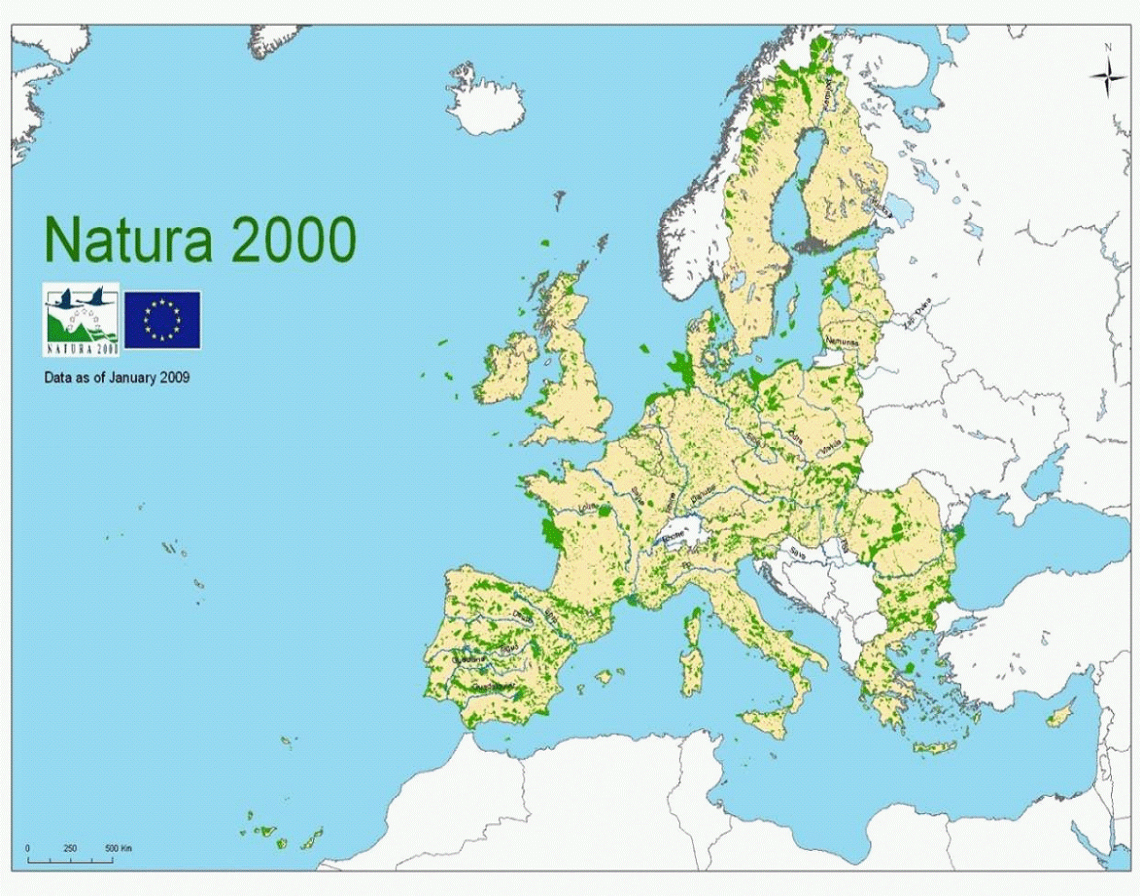


Figure 6: the European Natura 2000 Network across EU-27, status January 2009

2.3.4 Managing and conserving Natura 2000 sites

Within Natura 2000 sites, Member States must:

- take appropriate conservation measures to maintain and restore the habitats and species *for which the site has been designated* to a favourable conservation status (Article 6.1).
- avoid damaging activities that could significantly disturb these species or deteriorate the habitats of the protected species or habitat types (Article 6.2);

The competent authorities in each country should identify the conservation measures for Natura 2000 sites at the latest 6 years after the adoption of the site as Site of Community Interest (or in the case of SPA immediately upon classification). These conservation measures are to be based on the status and ecological requirements of the habitats and species for which the site is designated Natura 2000. The ultimate objective is to ensure that the species and habitat types are maintained or restored to a favourable conservation status across their natural range.[31]

[31] The concept of Favourable Conservation Status is not mentioned in the Birds Directive but there are analogous requirements, i.e. all SPAs must still be subject to special habitat conservation measures in order to ensure the survival and reproduction of the Annex I birds in their area of distribution.

What does favourable conservation status mean in practice?

The ultimate objective of the Habitats Directive is to ensure that the species and habitat types covered reach what is called a 'favourable conservation status' and that their long-term survival is deemed secure across their entire natural range within Europe.

In the case of the species covered by the Directive (ref Article 1(i)) this means that:
- *populations are maintaining themselves over the long term and are no longer showing signs of continuing decline;*
- *their natural range is not being reduced;*
- *there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis.*

In the case of a habitat type, a favourable conservation status (ref Article 1(e)) is achieved when:
- *its natural range and the areas it covers within that range are stable or increasing; and*
- *the specific structure and function which are necessary for its long-term maintenance are present and are likely to continue to exist in the foreseeable future;*
- *the conservation status of typical species that live in these habitat types is favourable as well.*

To help decide which conservation measures should be undertaken on individual Natura 2000 sites, the Habitats Directive encourages the development of management plans which are specifically designed for the site in question or integrated into other development plans.

Management plans, where they exist, can be a useful source of information for developers since:
- they record the conservation needs of the habitats and species for which the site has been designated so that it is clear to all what is being conserved and why;
- they analyse the socio-economic and cultural context of the area and the interactions between different land-uses and the species and habitats present;
- they spell out the conservation objectives for the site;
- they identify practical management solutions that can help integrate conservation activities with other land-use practices.

2.3.5 New developments affecting Natura 2000 sites

Whereas Article 6(1) and (2) of the Habitats Directive concern the day-to-day management and conservation of Natura 2000 sites, Articles 6(3) and 6(4) lay down the procedure to be followed when planning new developments that might affect a Natura 2000 site[32].

This stepwise procedure is examined in detail in chapter 5 but, in essence, it requires that a plan or project having a likely significant negative effect on a Natura 2000 site undergoes an 'Appropriate Assessment' to study these effects in detail and to see how they relate to the site's conservation objectives.

Depending on the findings of the Appropriate Assessment, the competent authority agrees to the plan or project as it stands if it has ascertained that it will not adversely affect the integrity of the site concerned.

[32] This applies to SCIs, SACs and SPAs and concerns not just plans or projects inside a Natura 2000 sites but also those that are outside but could have a significant effect on the conservation of species and habitats within the site. For instance a dam constructed upstream on a river that could alter or stop the regular flooding of an important wetland for birds within an SPA further downstream.

Or if it has ascertained that there will be an adverse effect it may require one or more of the following, depending on the degree of impact:

- specific mitigation measures are introduced to remove the negative effects;
- certain conditions are respected during the construction, operational or decommissioning phases of the wind farm, again to remove the likelihood of negative effects or to reduce them to an insignificant level where they no longer affect the integrity of the site;
- feasible alternatives are explored instead.

In exceptional circumstances, a plan or project may still be allowed to go ahead under certain conditions, in spite of being assessed as having negative effects on the site provided the procedural safeguards laid down in the Habitats Directive are followed. This may be possible, for instance, if the plan or project is considered to be of overriding public interest and there are no alternatives available. In such cases, compensation measures will need to be implemented to ensure that the overall coherence of Natura 2000 is protected (see Chapter 5).

2.3.6 Improving the ecological coherence of the Natura 2000 Network

In addition to designating core sites under the Natura 2000 Network, Article 10 of the Habitats Directive also requires Member States to endeavour to improve the ecological coherence of the network across the broader countryside by maintaining and, where appropriate, developing features of the landscape which are of major importance for wild fauna and flora, such as wildlife corridors or stepping stones, which can be used during migration and dispersal[33].

2.4 The EU nature Directives and wind farm development

As regards wind farm developments, there are two aspects of the EU Directives to bear in mind in particular, depending on the location of the development:

- *In and around Natura 2000 sites:* any wind farm development that is likely to affect one or more Natura 2000 sites has to undergo a step-by-step Appropriate Assessment procedure and, where necessary, apply the relevant safeguards for the species and habitat types of Community interest (explained in detail in chapter 5)

- *Anywhere within the EU*: the two Directives also require that Member States protect species of Community interest *throughout their natural range within the EU* (cf. Article 5 of Birds Directive and Article 12 of Habitats Directive – see above). Thus any wind farm development must also take account of its potential impacts on species of Community interest (covered by the two Directives) *outside* Natura 2000 sites as well.

[33] Kettunen et al. (2007) for guidance on the maintenance of landscape features in consistency with Article 10 of the Habitats Directive and Article 3 of the Birds Directive; available via http://ec.europa.eu/environment/nature/ecosystems/docs/adaptation_fragmentation_guidelines.pdf

2.5 The SEA Directive and the EIA Directive

Two other key pieces of EU environmental legislation are directly relevant to wind farm developments:

- Directive 2001/42/EC on the evaluation of the effects of certain plans and programmes on the environment (commonly referred to as 'SEA' Directive)[34]
- Directive 85/337/EEC on the assessment of the effects of certain public and private projects on the environment, amended in 1997 (97/11/EC) and 2003 (2003/35/EC) – commonly referred to as the 'EIA' Directive[35].

2.5.1 The SEA Directive

The purpose of the SEA Directive 2001/42/EC is to ensure that the environmental consequences of ***certain plans and programmes*** are identified, assessed and taken into account during their preparation and before their adoption.

In this respect, Member States are required to:

- prepare an environment report which identifies and assesses the likely significant environmental effects of the plans and programmes, and of any reasonable alternatives.
- provide certain authorities and the general public with an opportunity to express their opinion on the environmental report as well as on the draft plan or programme. Consultation not only helps to ensure that the information supplied for the assessment is comprehensive and reliable but also provides more transparency in the decision making process.

Ultimately, the SEA aims to encourage a more integrated and efficient approach to territorial planning where environment, including biodiversity considerations, are taken into account much earlier on in the planning process and at a much more strategic level. This usually translates itself into fewer conflicts further down the line at the level of individual projects. It also allows for a more appropriate siting of future developments away from areas of potential conflict with nature conservation.

A Strategic Environmental Assessment is mandatory for a variety of plans and programmes (i.e. prepared for agriculture, forestry, fisheries, energy, industry, transport, waste management, water management, telecommunications, tourism, town and country planning or land use) which set the framework for future development consent of projects listed in the 'EIA Directive'. An SEA should also be carried out on any plans or programmes, which, in view of the likely significant effect on sites, have been determined to require an assessment pursuant to Article 6 or 7 of the Habitats Directive.

2.5.2 Environmental Impact Assessment

While the SEA process operates at the level of public plans and programmes, Environmental Impact Assessments (EIA) operate at the level of individual public and private projects. Thus, development consent for projects[36] which are likely to have significant effects on the environment should be granted only after an assessment of the likely environmental effects of the project has been carried out.

[34] OJ L 197, 21.7.2001, p. 30–37 –http://ec.europa.eu/environment/eia/home.htm
[35] OJ L 156, 25.6.2003, p. 17 –http://ec.europa.eu/environment/eia/home.htm
[36] The EIA Directive defines 'project' as the execution of construction works or of other installations, schemes, or interventions in the natural surroundings and landscape.

The EIA Directive distinguishes between projects requiring a mandatory EIA (so-called Annex I projects) and those where Member State authorities must determine, in a procedure called "screening", if projects are likely to have significant effects, taking into account criteria in Annex III of the Directive (so-called Annex II projects). Wind power developments are listed in Annex II.3.i of the EIA Directive[37].

Environmental Impact Assessments process (EIA)

The typical EIA procedure includes the following stages:

- *Screening (Article 4 and Annex III of the EIA Directive): to determine whether an EIA is required. Screening is required for any type of project listed in Annex II (including wind farms). The screening decision of the competent national authority is made available to the public.*
- *Scoping (Article 5): is the stage of the EIA process that determines the content and extent of the matters to be covered in the environmental information to be submitted by the developer to a competent authority. The scoping stage is an important feature of an adequate EIA regime, mainly because it improves the quality of the EIA.*
- *Preparation of an Environmental Statement or report (Article 5), presenting the following necessary environmental information: description of project, description of measures to avoid or reduce significant adverse effects, data required to identify and assess the main effects on the environment, an outline of the main alternatives studied by the developer, and an indication of the reasons for the preferred choice, taking into account the environmental effects identified. This should be made publicly available.*
- *Consultation: (Articles 6, 7 & 8) The public, the environmental authorities and Member States concerned must be informed and consulted before the decision on the request for development consent is taken. The results of consultations and the information gathered must be taken into consideration in the development consent procedure.*
- *Explanation of the Decision: (Article 9), When a decision to grant or refuse a development consent has been taken, the national authorities are obliged to make available to the public specific information, such as the content of the decision and any conditions attached thereto, the main reasons and considerations on which the decision is based, including information about the public participation process, a description, where necessary, of the main mitigation and compensatory measures.*

The EIA should address direct and indirect effects on (Article 3):

- *human beings, **fauna and flora,***
- *soil, water, climate and the landscape,*
- *material assets and the cultural heritage,*
- *the interaction between the factors mentioned in the above indents.*

Both positive and negative effects should be considered.

2.5.3 The relationship between SEA, EIA and Appropriate Assessments

There are many similarities between the procedures for SEA and EIA, and the Appropriate Assessments carried out for plans or projects affecting Natura 2000 sites under the Habitats Directive. But this does not mean they are one and the same, there are some important distinctions too (see table). Therefore, **an SEA and EIA cannot replace, or be a substitute for, an Appropriate Assessment as neither procedure overrides the other**. They may of course run alongside each other or the Appropriate Assessment may form part of the EIA/SEA assessment[38] but, in such cases, the Appropriate Assessment should be

[37] The annex refers to *"installations for the harnessing of wind power for energy production (wind farms)"*.

[38] Doing an Appropriate Assessment at the level of a plan also does not remove the need to apply the Article 6(3)-(4) procedure to individual projects as well. Of course if the Appropriate Assessment of a plan results in a

clearly distinguishable and identifiable in the SEA's Environmental Report or in the EIA's Environmental documentation, or should be reported on separately so that its findings can be differentiated from those of the general EIA or SEA[39].

One of the key distinctions between SEAs/EIAs and Habitats Directive's Appropriate Assessments, apart from the fact that they measure different aspects of the natural environment and have different criteria for determining 'significance', is how the outcome of the Assessment is followed. In this regard, the assessments under the SEA and EIA lay down essentially procedural requirements and do not establish obligatory environmental standards. On the contrary, the assessment under the Habitats Directive lays down obligations of substance, mainly because it introduces an environmental standard, i.e. the conservation objectives of a Natura 2000 site and the need to preserve its integrity.

In other words, if the Appropriate Assessment determines that the plan or project will adversely affect the integrity of a Natura 2000 site, the authority cannot agree to the plan or project as it stands unless, in exceptional cases, they invoke special procedures for projects which are deemed to be of overriding public interest. The SEAs/ EIAs, on the other hand, are designed to make the planning authorities fully aware of the environmental implications of the proposed plan or project so that these *are taken into account* in their final decision.

Table 2: Comparison of procedures under AA, EIA and SEA

	AA	EIA	SEA
Which type of developments are targeted ?	Any **plan** or **project** which - either individually or in combination with other plans/projects - is likely to have an adverse effect on a Natura 2000 site (excluding plans or projects directly connected to the management of the site)	All **projects** listed in Annex I. For projects listed in Annex II the need for an EIA shall be determined on a case by case basis and depending on thresholds or criteria set by Member states (taking into account criteria in Annex III)	Any **Plans** and **Programmes** or amendments thereof which are (a) prepared for agriculture, forestry, fisheries, energy, industry, transport, waste management, water management, telecommunications, tourism, town and country planning or land use and which set the framework for future development consent of projects listed in Annexes I and II to Directive 85/337/EEC, or (b) which, in view of the likely effect on sites, have been determined to require an assessment pursuant to Article 6 or 7 of Directive 92/43/EEC.
What impacts need to be asssessed relevant to nature?	The Assessment should be made in view of the site's conservation objectives (which are set in function of the species/ habitat types for which the site was designated.) The impacts (direct, indirect, cumulative..) should be assessed to determine whether or not they will adversely affect the integrity of the site concerned.	Direct and indirect, secondary, cumulative, short, medium and long-term, permanent and temporary, positive and negative significant effects on ….'fauna and flora'	Likely significant effects on the environment, including on issues such as biodiversity, population, human health, fauna, flora, soil, water, air, climatic factors, material assets, cultural heritage including architectural and archaeological heritage, landscape and the interrelationship between the above factors;

development being zoned into areas of low or no potential conflicts with Natura 2000 sites then it is likely that fewer projects resulting from the plan will require an Appropriate Assessment at a project level.

[39] "Assessments of plans and projects significantly affecting Natura 2000 sites. Methodological guidance on the provisions of Article 6(3) and (4) of the Habitats Directive 92/43/EEC".

Who carries out the Assessment?	It is the responsibility of the competent authority to ensure that the AA is carried out. In that context the developer may be required to carry out all necessary studies and to provide all necessary information to the competent authority in order to enable the latter to take a fully informed decision. In so doing the competent authority may also collect relevant information from other sources as appropriate.	The developer	The competent planning authority
Are the public/ Other authorities consulted?	Not obligatory but encouraged 'if appropriate'	Compulsory –consultation to be done before adoption of the development proposal Member States shall take the measures necessary to ensure that the authorities likely to be concerned by the project by reason of their specific environmental responsibilities are given an opportunity to express their opinion on the request for development consent. Ditto for the public.	Compulsory –consultation to be done before adoption of the plan or programme. The authorities and the public shall be given an early and effective opportunity within appropriate time frames to express their opinion on the draft plan or programme and the accompanying environmental report before the adoption of the plan or programme or its submission to the legislative procedure Member States must designate the authorities to be consulted which, by reason of their specific environmental responsibilities, are likely to be concerned.
How binding are the outcomes ?	Binding. The competent authorities **can agree to the plan or project only after having ascertained that it will not** adversely affect the integrity of the site.	The results of consultations and the information gathered as part of the EIA ***must be taken into consideration*** in the development consent procedure.	The environmental report, as well as the opinions expressed ***shall be taken into account*** during the preparation of the plan or programme and before its adoption or submission to the legislative procedure.

2.6 Relevant international nature and biodiversity Conventions and Agreements

The European Union and its Member States, as well as most other European countries are contracting parties to various relevant international environmental Conventions and Agreements. Thus, European and national legal frameworks on nature and biodiversity conservation must take full account of the commitments entered into under these Conventions and Agreements as well.

These Conventions have helped to shape the legal framework for biodiversity policy and legislation within the EU and also helped define the relationship between the EU and other countries. The following outlines the most relevant in the context of renewable energies - such as wind energy - and nature conservation in Europe. Several have also adopted

specific recommendations and resolutions on wind farms and wildlife. These are listed in annex I to this guide:

- The **Convention on Biological Diversity**[40] (CBD) is a global treaty, adopted in Rio de Janeiro in June 1992. It widened the scope of biodiversity conservation from species and habitats to the sustainable use of biological resources to the benefit for mankind. To date, 189 parties have ratified the convention.

- The **Convention on the Conservation of European Wildlife and Natural Habitats**[41] ('Bern Convention') came into force in 1982. It has played a significant role in strengthening the work on biodiversity conservation in Europe. It has been signed by 45 Member States of the Council of Europe, as well as the European Community and four countries in Africa. An important objective of the convention is the creation of the **Emerald Network**[42] of Areas of Special Conservation Interest (ASCIs). This operates alongside the EU Natura 2000 Network. A recommendation on effects of wind turbines on migratory species of mammals and birds was adopted in 2002.

- The **Convention on the Conservation of Migratory Species of Wild Animals**[43] (CMS, 'Bonn Convention') aims to preserve migratory species throughout their natural range. It entered into force in 1983 and has now been signed by more than 100 parties. Several agreements signed under this Convention are relevant to the management of conflicts between migrating animals and wind farms:
  - *Agreement on the Conservation of African-Eurasian Migratory Waterbirds*[44] (AEWA) calls for coordinated action throughout the migration routes or flyways. It came into force in 1999. The agreement covers 119 countries and 235 species of waterbirds. The European Community ratified AEWA in 2005.
  - *Agreement on the Conservation of Populations of European Bats*[45] (EUROBATS) concerns the protection of all 45 species of bats found in Europe. It entered into force in 1994. Currently 32 countries have signed up. Implementation of common conservation strategies and international experience-sharing are its main activities. Under this agreement, guidelines were published in 2008[46] for the consideration of bats in wind farm projects.
  - *Agreement on the Conservation of Small Cetaceans of the Baltic and North Sea*[47] (ASCOBANS): this aims to co-ordinate measures to reduce negative impact of by-catches, habitat loss, marine pollution and acoustic disturbances among the ten parties. It was launched in 1991. A resolution on adverse effects of sound on small cetaceans, and with relevance for potential impact from wind farms, was adopted in 2006 (Annex I).
  - *Agreement on the Conservation of Cetaceans in the Black Sea, Mediterranean Sea and contiguous Atlantic area*[48] (ACCOBAMS) is a cooperative framework for the conservation of marine biodiversity in the Mediterranean and Black Seas. Its main

[47] http://www.ascobans.org.
[48] http://www.accobams.org.

purpose is to reduce the threat to and improve knowledge about cetaceans in these seas. The agreement came into force in 2001.

- The **Convention of Wetlands of International Importance**[49] ('Ramsar Convention') is an intergovernmental treaty providing a framework for national action and international cooperation for the conservation and wise use of wetlands. It was adopted in 1971 and amended in 1982 and 1987. There are to date 158 parties and so far 1723 sites worldwide have been added to the 'Ramsar' list of wetlands of international importance. The Convention does not foresee ratification by supra-national bodies such as the European Union but all Member States of the EU are contracting parties.

- The **Convention for the Protection of the Marine Environment of the North-East Atlantic**[50] (OSPAR) guides international cooperation on a range of issues including the conservation of marine biodiversity and ecosystems, the impact of eutrophication and hazardous substances, and monitoring and assessment. It was launched in 1992, following of the merger of the previous Oslo and Paris Conventions (from 1972 and 1974). Several studies of potential impact of off-shore wind farms on the marine environment have been initiated under the auspices of this Convention.

- The **Convention on the protection of the marine environment of the Baltic Sea Area**[51] (HELCOM, 'Helsinki Convention') covers the Baltic Sea basin plus all inland waters in its catchment area. It was adopted in 1980 and revised in 1992. All countries around the Baltic Sea plus the EU are contracting parties.

- The **Convention for Protection against Pollution in the Mediterranean Sea**[52] ('Barcelona Convention') aims primarily to regulate and reduce the negative impact of all kinds of pollutants in the Mediterranean basin. It was set up in 1976 and last amended in 1995. Most countries bordering the sea have signed up to it.

3. POTENTIAL IMPACTS OF WIND ENERGY DEVELOPMENTS ON NATURE AND WILDLIFE

- *Evidence to date indicates that appropriately sited and well designed wind energy developments are generally not a threat to biodiversity. However, there may be occasions where individual plans or projects can cause damage to protected wildlife and nature areas.*
- *Studies suggest that various species of birds, bats and marine animals may be particularly vulnerable. The type and degree of impact is very much dependent upon a range of factors, such as location and the type of species present. The potential impacts must therefore be examined on a case by case basis.*
- *Scientific studies and monitoring work undertaken in relation to existing and future wind farm developments are an invaluable source of information. Wind farm developers as well as planners, scientists and NGOs have a key role to play in building up the information base on the interactions between wind farms and wildlife.*
- *The benefits of such studies are manifold, not just for scientists but also for the industry itself: a better scientific knowledge base will ultimately lead to better and faster decision making.*

3.1 Positive and negative impacts: the need for a case by case approach

This chapter reviews the type of possible impacts that wind farms and their associated instrastructures could have on wildlife. The information contained therein has been sourced from a wide range of published scientific studies and reviews. Its purpose is to provide developers, relevant authorities and others with an overview of the types of potential impacts on wildlife they should pay attention to when preparing a wind farm development plan or project or when assessing the potential impacts of such plans or projects on wildlife and nature.

This does not imply that wind farm developments *in general* pose a problem for wildlife. There are clearly many cases where well designed and appropriately sited developments have no or only limited and largely insignificant impacts on biodiversity. There are also examples of where wind farms have delivered overall net benefits for biodiversity, especially in areas where the natural environment is already impoverished.

But, whilst well sited and designed wind farm developments are unlikely to pose a problem for biodiversity, this does not remove the obligation to examine, through EIA/SEAs and Appropriate Assessments, the potential effects that individual plans or projects can have and to ensure that, in the event that potentially significant impacts are detected, these are minimised or avoided altogether, especially when it could affect rare and threatened species and habitat types of Community importance.

For this to be possible, those concerned - be they developers, authorities, consultants etc - ought to be aware of the kind of threats to look out for. Since the main purpose of this guidance document is to clarify the provisions of Article 6 of the Habitats Directive in relation to wind energy development, this chapter focusses on reviewing the type of potential *negative* effects that may need to be taken into consideration as part of the Appropriate Assessment.

This does not mean that all wind farms will necessarily have such impacts - there are plenty of examples, especially in areas located away from highly sensitive wildlife zones, that show this is not the case and that with careful preparation, many potential problems can be designed out early on or effectively mitigated against (see chapter 5.5.4 for an overview of possible mitigation measures).

Wind energy developmnents can bring local biodiversity benefits

If planned properly, modern wind energy activities can not only avoid impacting on wildlife but can also on occasion actively contribute to biodiversity conservation. This is especially relevant for developments that are located in an already modified or severely impoverished natural environment as the following example illustrates:

Black Law, Scotland – Bringing Degraded Land Back into Active Management
Black Law wind farm (42 wind turbines with installed capacity of 97MW) is located on an exposed stretch of severely degraded upland moorland in South Lanarkshire, Scotland. Prior to development the site bore the scars of opencast mining and had been described as a major eyesore. As required by a stipulation of the planning conditions the developer, ScottishPower, devised and implemented a Habitat Management Plan for this brownfield site in consultation with Scottish Natural Heritage, RSPB Scotland, Lanarkshire Farmland and Wildlife Advisory Group and the University of Stirling.

The management plan covered 14.4km² in the vicinity of the turbines and involved the clearance of 4km² of non-native conifer plantation to allow the regeneration of blanket bog and typical upland vegetation. One of the mines was transformed into a shallow wetland and a 300m stretch of the Abbey Burn watercourse also restored. For the benefit of farmland birds, nestboxes were installed and 'sacrificial crops' were planted and left unharvested to provide a winter food source. Species targeted to benefit from the habitat improvement work included: otter, breeding waders, farmland birds, badger, bats, long-eared owl, black grouse, kestrel, barn owl, spotted flycatcher and merlin.

According to RSPB '*Black Law has taken a badly scarred site and vastly improved it. This will benefit a range of wildlife'*. ScottishPower '*agrees with RSPB that as long as we are careful in picking wind farm locations, perhaps not next to breeding site for golden eagle, for example or a migratory route, we should be able to accommodate their concerns*[53].

Beinn an Tuirc, Scotland – Integrating Protection and Development[54]
The discovery of a pair of Golden Eagles at the site of a planned 30MW wind farm at Beinn an Tuirc in Scotland, did not prevent construction but instead inspired a considered approach to minimising the impacts of the development. Based on environmental assessment results, a means was found that accommodated the needs of the eagles without reducing the viability of the wind farm.

Firstly, some adjustment was made to the planned turbine locations to remove them from the eagles' core territory. Due to the large distances covered by Golden Eagles it was not possible to reposition the turbines outside the pair's entire territory, so an alternative habitat was created for them away from the turbines, dubbed a 'mitigation area'. The mitigation area was created by the clearance of 4.5km2 of non-native conifer plantation to allow regeneration of the traditional upland moor vegetation such as heather, blaeberry and cotton grass. This provided an attractive environment for Red Grouse – a key prey species of Golden Eagles – which, in turn, attracted the eagle pair to the new habitat.

Thus the mitigation area served two purposes: the habitat loss instigated by the turbines' arrival was offset and, by attracting the eagles away from the turbines, the risk of collision with blades was far reduced. Monitoring shows that the mitigation area habitat is developing well, and in 2008 two Golden Eagle chicks were hatched at the site.

[53] More information : http://www.scottishpower.com/search.asp?search=Black+Law&x=10&y=7
[54] Positive planning for onshore wind , RSPB and IEEP, March 2009 (Bowyer et al. 2009).

It is widely recognised, amongst others by the wind energy sector itself, that whereas the global benefits of switching to renewable energy are relatively straight forward to assess, the local interface between a particular wind farm development and the environment tends to be more complex. The effects are very much dependent on the wildlife present as well as on the location and design of the individual wind farm developments which is why it is essential to examine each plan or project on a case by case basis.

3.2 Identifying potential impacts during different phases of wind farm development

When assessing the potential impacts of wind energy developments on nature and wildlife it is important to bear in mind that these impacts may concern not just the wind turbines themselves, but also all associated installations such as access roads, site access (e.g. for maintenance works or during constuction), anemometer masts, construction compounds, concrete foundations, temporary contractors facilities, electrical cabling (e.g. overhead wires) for access to the grid, spoils, and/or possible a sub-station, control building etc…

They can also appear during any one of the phases of the wind farm's development from the initial construction phase to the actual operation and management and, on to the re-powering or decommissioning phases. As a result, the impacts may be temporary or permanent, on-site or off-site, cumulative and may come into play at different times during the project cycle.

All these factors should also be taken into consideration during the impact assessment and, where necessary, avoidance or mitigation measures should be introduced into the planning agreements and accompanying planning permits to eliminate, or at least minimise, the effects of the proposed plan or project on wildlife.

3.3 An overview of potential impacts

The type and scale of impact is very much dependant on the species involved, their ecology and state of conservation as well as the location, size and design of the wind farm plan or project. That is why it is important to examine each development plan or project on a case by case basis. As stated before, there is an increasing body of evidence to indicate that wind farm projects that avoid, or are located away from, areas of importance for wildlife generally do not have a major impact on biodiversity. But for this to be the case the developer must be aware of highly sensitive areas in the first place and of the potential impacts to look out for.

Mitigating against potentially negative effects

The potential risks of negative impacts mentioned in this chapter can sometimes be effectively mitigated against. Mitigation involves introducing measures into the plan or project to eliminate these potential negative effects or reduce them to a level where they are no longer significant. This means that they must be directly linked to the likely impacts and based on a sound understanding of the species/ habitats concerned.

In the case of wind farm plans or projects, an obvious mitigation measure is to adjust the location of the wind farm away from areas where it can cause conflicts with species and habitat types. But mitigation measures can also involve modifications to the size, design and configuration of the wind farms or the construction of turbines and associated infrastructures. Or they can take the form of temporal adjustments during the construction and operational phases. Further details, with examples of possible mitigation measures that have been used for wind farms so far, are given in chapter 5.5.4.

The type of impacts that may occur include the following:

- *Collision risk:* Birds and bats may collide with various parts of the wind turbine, or with associated structures such as electricity cables and meteorological masts. The level of collision risk depends very much on site location and on the species present, as well as on weather and visibility factors. Species that are long-lived, have low reproductive rates and/or that are rare or are already in a vulnerable conservation state (such as eagles, vultures and various species of bats) may be particularly at risk. Evidence to date indicates that wind farms that are located away from areas harbouring concentrations of wild animals or areas that are important for wildlife have relatively low rates of mortality.

- *Disturbance and displacement*: Disturbance can lead to displacement and exclusion, and hence loss of habitat use. This risk may be relevant for birds, bats and marine mammals. The species may be displaced from areas within and surrounding wind farms due to visual, noise and vibration impacts. Disturbance may also arise from increased human activity during construction work and maintenance visits, and/or as a result of opening up access to the site for others through the construction of new access roads etc.... The scale and degree of disturbance determines the significance of the impact, as does the availability and quality of other suitable habitats nearby that can accommodate the displaced animals.

- *Barrier effect.* Wind farms, especially large establishments with tens of individual wind turbines, may force birds or mammals to change direction, both during migrations and, more locally, during regular foraging activities. Whether or not this is a problem depends on a range of factors such as the size of the wind farm, the spacing of turbines, the extent of displacement of species and their ability to compensate for increased energy expenditure as well as the degree of disruption caused to linkages between feeding, roosting and breeding sites.

- *Habitat loss or degradation.* The scale of direct habitat loss resulting from constructing a wind farm and associated infrastructure depends on the size, location and design of the project. Whilst the actual land take may be comparatively limited, the effects may be more widespread where developments interfere with hydrological patterns or geomorphological processes. The significance of loss depends on the rarity and vulnerability of the habitats affected (e.g. blanket bogs or sand dunes) and/or of their importance as a feeding, breeding or hibernating place for species, especially for species of European conservation concern. Also, the potential role of some habitats as components in corridors or stepping stones important for dispersal and migration, as well as for more local movements between e.g. feeding and nesting sites, has to be taken into account.

3.4 Potential impact of wind farms on selected species and habitats

The following sections describe the type of potential impacts that wind farms can have on specific categories of species such as birds, bats and marine mammals as well as on certain vulnerable habitat types. The information is derived from a comprehensive analysis of the latest scientific literature. Overview tables are given in Annex II-IV of those species of birds, bats and marine animals that are considered to be particularly vulnerable to wind farms. Annex V provides more detailed information on the potential or confirmed impacts on certain species.

Whilst the knowledge base on the potential impacts that particular wind farms might have on certain species (particularly birds and bats) is growing fast and there is now an important body of research available, it has to be recognised that the evidence base remains low[55], and there is still a lack of long-term studies upon which to carry out risk and impact assessments.

An important part of the information will come from the studies and monitoring work undertaken in relation to existing and future wind farm developments. Like conservation NGOs and scientists, wind farm developers and planners have a key role to play in building the knowledge base on the biodiversity impacts of wind farms and how to avoid or mitigate them. The benefits of such cooperation and information sharing are manifold, not just for scientists but also for the industry itself: a better scientific knowledge base will ultimately lead to better and faster decision making.

3.4.1 Potential impact of wind farms on birds

The potential impact of wind farms on birds is the one that has been most studied. As outlined above, if there is an impact, it is likely to fall into a number of categories:

- ***Collision fatalities***

Injuries and mortalies tend to be related mostly to collisions with rotors or with other associated infrastructures such as overhead cables. Although there is increasing evidence that collision risks are generally low in most cases, there are note-worthy exceptions which must nevetheless be considered, especially for rare species such as large-sized raptors that already under threat and where wind farm fatalities may be an additional factor.

Significant collision mortality risks are primarily related to topographical bottlenecks where migrating or local birds fly through a relatively confined area, for example mountain passes or land-bridges between water-bodies. Other susceptible locations are slopes with rising winds where the birds gain lift and near wetlands or shallow seas that attract large numbers of feeding or resting birds. Flight corridors between feeding areas, roosting sites or breeding sites are also particularly susceptible[56]. However, there is also increasing evidence among various species of active avoidance behaviour[57].

Peaks in mortality may also be seasonal, for instance during spring and autumn migration when bird concentrations tend to grow significantly. Or it may be higher during the period of pre-nuptial display flights in spring, defence of breeding territories or whilst providing food for nestlings.

Other factors that could influence collision risks include the species flight height, flight type (migration or commuting flights to and from feeding areas through a windfarm), behaviour, weather conditions, topography and the scale and design of the wind turbines. However, potential increases in collision risk, e.g. during poor visibility, fog or rain, may also be partly offset by lower flight activity in such conditions[58].

Some species are more at risk than others, and effects are likely to lie somewhere in the continuum between the extremes of *additive* - increasing overall mortality - or *compensatory*

[55] E.g. Stewart et al. (2007).
[56] E.g. EEA (2009) and references therein.
[57] E.g. Hötker (2005, 2006), Petersen et al. (2006), Masden et al. (2009).
[58] E.g. Drewitt & Langston (2006) and references therein.

- replacing other causes of mortality. However, as some of the species found to be at particular risk are long-lived with low annual recruitment and high maturation age, it can be concluded that they might be susceptible to additional mortality[59]. Although more direct evidence related to wind farms is still scarce, there are nevertheless indications that raptors may be susceptible to the additive mortlity[60].

Special consideration must also be given to populations of scarce and vulnerable species already under threat from other human-induced factors such as habitat loss[61]. This include species listed in annex I of the Birds Directive, such as species of raptors and seabirds. There is also increasing concern (but as yet insufficient evidence) for night-migrating passerines[62].

Wind farm developments and the risk of collision fatalities amongst raptors

There has been a particular concern over the potential effects of collisions between various species of raptors and inappropriately sited wind farms. For instance, significant levels of mortality have been recorded for e.g. Eurasian Griffon Vulture (*Gyps fulvus*), Egyptian Vulture (*Neophron percnopterus*) and Common Kestrel (*Falco tinnunculus*) at wind farms in Spain[63] and for White-tailed Eagle (*Haliaeetus albicilla*) in Germany and Norway and for Red Kite (*Milvus milvus*) in Germany[64].

At the same time, some of these species, such as White-tailed Sea Eagle and Red Kite, have increased in numbers in large parts of Europe during the last decades, due to the removal of historical threats and problems related to e.g. reduced exposure to toxic elements and illegal persecution. Nevetheless, considering that many of these species are long-lived, with late maturity and a low annual recruitment, any additional factors affecting the adult mortality should nevertheless still be treated seriously.

Even if current studies indicate that mortality due to wind farm fatalities is low compared to other factors and may not have affected general population trends so far, the potential collision risk still needs to be studied on a case by case basis and future risks should also take account of the potential cumulative impact of the expected large expansion of wind farm establishments during the next 10-20 years[65].

Primarily, appropriate siting of wind farms is an issue of location and avoiding key areas for raptors. This has not only to do with high densities of raptors, but also with seasonality - often with enhanced risks in spring and in relation to breeding and in autumn - as well as weather conditions and topography of the landscape. On the basis of today's knowledge and experience, whilst it is not possible to make conclusive comments, several studies have recommended in areas where rapters are present, avoiding locations on the top of hills with gentle slopes (where uplift wind conditions may be poor and make manoeuvrability more difficult for soaring raptors)[66]. But because local conditions differ widely between sites decisions should be taken only after assessments based on careful case-by-case analyses.

[59] E.g. Sæther & Bakke (2000) for general conclusions.

[60] E.g. a demographic study of Golden Eagle *Aquila chrysaetos* in the Altamont Pass Wind Resource Area in California indicated that mortality caused by collision was additive to other lethal agents (Hunt & Hunt (2006), and a population model for Egyptian Vulture (*Neophron perconpterus*) showed that population size and time to extinction decreased when wind farm mortality was added (Carrete et al. 2009).

[61] E.g. Drewitt & Langston (2008).

[62] E.g. Sterner et al. (2007), Drewit & Langston (2008) see also annex V.

[63] E.g. Barrios & Rodrígues (2004, 2007), Lekuona & Ursúa (2007), Carrete et al. (2009).

[64] Hötker et al. (2006), also Follestad et al. (2007) and Bevanger at al. (2008) for White-tailed Eagle along the coast of Norway.

[65] E.g. with reference to Red Kite and Germany (Rasran et al. 2009).

[66] E.g. de Lucas et al. (2008) for European Griffon Vulture.

Collision mortality is usually measured through carcass search but this may lead to an under-estimate, especially for small birds, because corpses may be overlooked or quickly removed by scavengers. Using models may help to get more accurate estimates, although they are very dependant on reliable field data and correct assessments of avoidance by birds[67]. Recently, collision risk per megawatt (MW) has been proposed as an indicator. In view of the increasing size of wind turbines this may turn out to be a more relevant or useful measure[68].

Monitoring and assessing offshore mortality due to collision is even more difficult than for onshore locations, due to the obvious fact that carcasses are hardly ever found. Instead, techniques such as radar, thermal animal detection systems (TADS) and acoustic detection have been tested[69]. An alternative approach to overcome this problem is to assess 'sensitivity indices' for the species concerned[70].

- ***Disturbance and displacement***

Bird disturbance, leading to displacement or exclusion, and hence loss of habitat use, is a matter which may be of concern both for onshore and offshore wind developments. Such sub-lethal effects can lead to loss of body condition which is in some respects more insidious than direct mortality for a population as a whole as there may be a delay before any population-level impact is detected[71].

Disturbance can be caused by the sight, noise or vibration of the wind turbines themselves and/or by other activities related to wind farm maintenance, involving for instance vehicle, boat or helicopter usage. Also, associated road infrastructure may make the site easier to access which can in turn increase overall disturbance. Effects are variable and dependant on the individual species, seasons and sites involved. They also depend on the importance of the site for that species and the availability of other suitable habitats in the vicinity that can accommodate the displaced birds.

Breeding birds have been considered to be less affected than feeding or roosting birds[72], although recent studies suggest that this may not always be the case[73]. Some waders for instance are site-faithful, implying that their attachment to a location may outweigh any potential response to change. Hence, the true impact may not be evident until new recruits replace the old birds[74]. But again this needs to be considered on a site by site basis.

Thus, more long-term follow-up studies are needed regarding the potential for different species to habituate and recover. The first systematic reviews indicated local population declines over time for various species (e.g. among waterfowl and waders at staging and wintering sites) and no conclusive evidence of habituation[75], while more recently published

[67] Band et al. (2007), Chamberlain et al. (2006).
[68] E.g. Drewitt & Langston (2008).
[69] E.g. Desholm et al. (2006).
[70] E.g. Garthe & Hüppop (2004), Desholm (2009).
[71] Langston & Pullan (2003).
[72] E.g. Hötker et al. (2005, 2006).
[73] E.g. Pearce-Higgins et al. (2009)
[74] E.g. Drewitt & Langston (2006)
[75] Stewart et al. (2004). In a review of studies lasting over longer than one season, there were as many cases of birds occurring closer to wind farms over the years (indication of habituation) as well as birds found further away (indication of lack of habituation or even increased tendancy to disturbance; Hötker et al. 2006).

long-term studies indicate that various species may habituate, both at onshore and offshore locations[76].

On the basis of current knowledge it is evident that disturbance leading to displacement may need to be considered in impact assessments of wind farms, depending on the species present as well as the location. Also it should be remembered that even if areas affected around single wind farms may be small in relation to the total availability of habitats for breeding, foraging, staging or wintering, the cumulative effect of a series of wind farms may be significant.

- ***Barrier effect***

There is a potential risk that wind farms located along migration routes or flyways, or, at a more local level, along regular flight routes between feeding areas and resting or breeding sites may pose a barrier to species movement. Avoidance of wind farms has been documented among a wide range of bird species, particularly waterfowl and passerines. Responses are highly species-specific. During daylight, they may occur in a distance interval of 100-3000 m, whereas at night the distances are likely to be closer[77].

Although the short-term benefit of avoidance is obvious in that the risk of injury or mortality due to collision is eliminated, detours may involve increased expenditures in terms of energy and time which might in theory, in the long-term, affect fitness related parameters such as survival and reproductive capacity. However, reviews of available literature suggest that the barrier effect has not been proven to significantly impact on the fitness of bird populations[78], although the potential for cumulative impacts, e.g. if several wind farms are located along the migration route, must not be neglected[79].

The risk of causing barrier effects may also be influenced by the design of the wind farm – for instance, its size and/or the alignment of the turbines or the spacing between them. Altering the design of the wind farm may therefore be a potentially important mitigation measure.

- ***Habitat loss and degradation***

Loss of, or damage to, bird habitats, depends on local circumstances and the scale of land-take required for the wind farm and associated infrastructures. Direct habitat loss may also be additive to disturbance exclusion.

Onshore infrastructure including turbine bases, substations and access roads etc could, if placed inappropriately, involve the direct loss of breeding or feeding habitats for certain birds[80]. Offshore, direct habitat loss may be comparatively small-scale. However, increasingly large wind farms, especially on bird feeding areas such as sandbanks in shallow waters, may give cause for concern for certain species, especially in periods of high bird concentrations during spring or autumn migrations[81].

[80] E.g. Pearce-Higgins et al. (2009).
[81] 2-5% of the total development area around Danish off-shore wind turbines (Fox et al. 2006), although indications of recent recovery (Petersen et al. 2007).

Some studies have indicated the benefits of avoiding developments within buffer zones around e.g. nesting, roosting or foraging sites[82]. Although these are often purely indicative figures they may nevertheless be of interest to developers and others as they may provide some idea, for instance, of the area that might be covered by an impact assessment or areas to pay particular attention to when preparing a development plan or project.

3.4.2 Potential impacts of wind farms on bats

The concern over the potential impacts of wind farms on bat species has increased in recent years, particularly in relation to the risk of collision with rotors or turbine towers, and barotrauma caused by rapid air-pressure reduction near moving turbine-blades[83].

Bats have a low annual reproductive output and a long life expectancy, so they may be susceptible to even small additional mortality. An overview of the kinds of impacts (except barotrauma) related to siting and operation of a wind farm is given in Table 3, and species level details are summarised in Annex IV.

A typical year in the life of bats involves a period when they are active (April – October/November) and a period when they are usually less active or in hibernation (November – March). Bats mostly commute or migrate between summer roosts and hibernation sites. Timing varies for each species according to geographical location and from one year to the next depending on weather conditions but several studies have shown that there is a peak in mortality in late summer and autumn during dispersal and migration, and that migrating species may be particularly susceptible[84]. A common assumption has been that bats use echolocation to avoid wind turbines but they may not do so for energy-saving reasons when travelling over long distances in open areas[85].

The highest collision rates have been found in wind farms near forests but bat collisions have also been reported from turbines in open areas and even at offshore wind farms. Potential siting in important hibernation areas where large numbers of bats forage before and after hibernation should be carefully evaluated, and are best avoided if it is determined that this will result in a significant negative impact.

A variety of landscape features important for concentrations of various bat species should also be considered with reference to collision risks. This should include linear landscape elements such as woods[86], hedgerows and watercourses, wetlands, marshlands and wet meadows with adjacent shallow marine or freshwater lake areas[87]. These may be used as habitat corridors for movement between feeding, breeding and roosting areas.

---

[82] E.g. Bright at al. (2006, 2009), LAG-VSW 2007).

[83] E.g. Cryan & Barcley (2009). Barotrauma involves tissue damage to air-containing structures caused by rapid or excessive pressure change; pulmonary barotrauma is lung damage due to expansion of air in the lungs that is not accommodated by exhalation (Baerwald et al. 2008).

[84] Rodrigues et al. (2008) and references therein.

[85] Keeley et al,(2001).

[86] E.g. a 200 meters zone along forest edge has been recommended (Rodrigues et al. 2008); see also Mitchell-Jones & Carlin (2009) for recommendations to minimise harm; e.g. by adjustments of the location of turbines in relation to surrounding tree-lines, location of roosting sites etc.

[87] E.g. Brinkmann et al. (2006), Ahlén (2008), Rodrigues et al. (2008).

Table 3: Overview of possible impacts on bats (extract from the Eurobats guidelines for consideration of bats in wind farm projects)[88]

Possible impacts on bats related to siting		
Impact	**Summer time**	**During migration**
Loss of hunting habitats during construction of access roads, foundations etc..	*Small to medium impact, depending on the site and species present at that site.*	*Small impact.*
Loss of roost sites due to construction of access roads, foundations etc..	*Probably high or very high impact, depending on the site and species present at that site.*	*High or very high impact, e.g. loss of mating roosts.*
Possible impacts related to operating the wind farm		
Impact	**Summer time**	**During migration**
Ultrasound emission.	*Probably a limited impact.*	*Probably a limited impact.*
Loss of hunting areas because the bats avoid the area.	*Medium to high impact.*	*Probably a minor impact in spring, a medium to high impact in autumn and hibernation period*
Loss or shifting of flight corridors.	*Medium impact.*	*Small impact.*
Collision with rotors.	*Small to high impact, depending on the species*	*High to very high impact.*

Habitat loss and degradation can occur if the wind turbine is sited in or near a forest occupied by bats, as well as in more open landscapes used for foraging. Not only does the removal of trees for the installation of the wind tubine and associated structures lead to potential loss of habitat for bats but it may also create new linear features which attract bats to forage right next to the wind turbine.

Various hypotheses have been proposed for why bats may actually be attracted to wind turbines[89]. A widely accepted explanation is that insects may concentrate around wind turbines, both at onshore and offshore locations, attracted by the heat radiation from the wind turbine. In certain weather conditions bats, as well as several species of insectivorous passerine birds, may be attracted to these concentrations of insects[90].

The timing of the construction of the wind farm has also a potentially important impact for certain species of bats if it interferes, for instance, with their foraging behaviour or if it occurs at times of migration and dispersal. This requires local knowledge about bat species and an understanding of their annual life cycle[91].

[88] Rodrigues et al. (2008).
[89] E.g. Kunz et al. (2007a), Cryan & Barcley (2009).
[90] E.g. Ahlén et al. (2007, 2009).
[91] Rodrigues et al. (2008)

3.4.3 Repowering of wind farms

There is still only limited evidence about how risks related to collision fatalities may change with reference to repowering, i.e. to replace existing turbines with fewer but larger and more power-effective ones. So far, experiences both in Europe and North America indicate that repowering reduced the collision risk among birds but increased the risk for bats[92]. Increased height of the turbine tower does not seem to have any effect on birds, but the risk for bats may increase, i.e. nocturnally migrating bats may fly at a lower height than birds, and newer and larger turbines may interfere with the airspace used by bats.

3.4.4 Potential impacts of wind farms on marine animals

Marine mammals (seals and cetaceans) may be affected by offshore wind farms in several ways. Marine noise pollution has attracted much attention as it has the potential to displace animals, interfere with normal behaviour and, at very high levels, cause physical damage. During the construction phase, noise and vibration from pile driving and other works may affect the animals over a large area[93].

Monitoring of seals and harbour porpoises *Phocoena phocoena* at the Nysted and Horns Rev wind farms, Denmark, showed that pile driving temporarily expelled animals from the wind farm areas. Later in the construction phase and during operation the abundance of seals in the area was unaffected. For harbour porpoises, a substantial but short-lived effect of pile driving was observed. At Horns Rev, a slight decrease in porpoise abundance was found during construction and no effect during operation. At Nysted, a clear decrease was found during construction and operation, and this effect still persisted after two years of operation, but with indications of a slow, gradual recovery[94].

During operation, sound and vibration continue to be emitted into the water body, potentially disturbing the communication and foraging behaviour of the animals. Harbour porpoises and other cetaceans rely heavily on echolocation for navigation and foraging. Long term impacts seem to vary between different sites. The operational noise of wind farms will be clearly audible to some marine mammals, but, unlike pile-driving, the impact of this noise is expected to be small and localised[95], although it is difficult to make generalised statements on the basis of the still limited number of studies undertaken.

For various species of fish such as Atlantic salmon, operational noise may be detectable on some kilomete distance. It can have potentially lethal effects on early life stages and could risk masking intraspecific communication, although behavioural and physiological stress is expected to occur only in the very close surroundings[96].

Different mitigation measures have been proposed to reduce the potential damage caused by noise from pile driving[97] (see section 5.5.4 for details).

Some wind farm related effects of potential relevance for marine mammals

- Intense noise during piling-driving, drilling and dredging operations;
- Increased vessel activities during exploration, construction and maintenance operations;
- Increased turbidity and re-suspension of polluted sediments due to construction;
- The presence of structures (including artificial reef effects causing habitat alterations) and, potentially, changes to prey and food webs;
- The continual operational noise and vibrations emanating from the wind turbines;
- Electromagnetic impacts due to cabling that may impact navigation (this may be of particular concern for elasmobranchs);
- Effects on prey, such as changes to fish behaviour.

Extracted from proceedings of the ASCOBANS/ECS Workhop, April 2007 (Evans 2008)

Another possible impact of wind turbines on marine biodiversity is the so called 'reef' effect. Underwater constructions may function as artificial reefs, and the foundations may be colonised by algae and epifauna. This may alter the characteristics of local species composition and biological structure at a local level[98].

The reef effect may in certain circumstances increase diversity although some studies have also indicated a risk that they may contribute to the spread of invasive alien species[99]. However, it should be borne in mind that a change in habitat or species communities may still have an adverse effect on the conservation objectives of the site. If so it doesn't matter how much one increases the diversity the effect will still be adverse.

Temperature increase around cables has also attracted attention, with reference to the impact on benthos as well as increased risk of botulism infection. However, the impact should normally be negligible as cables are generally buried at a maximum depth of 3 metres in the seabed. Most benthic animals dwell in the upper 5-10 cm in open waters and the top 15 cm in intertidal area where temperature increase is small, provided that the burial depth of the cable is sufficient (although some animals will burrow deeper)[100].

Finally, the transmission of electricity through cables within the wind farm and to shore can create electromagnetic fields that may also interfere with short- and long-range orientation systems. Disturbance effects could be particularly pronounced in elasmobranchs (sharks and rays) that are highly sensitive to magnetic fields. However, except for a few metres around cables and other devices, field strength is well below that of the earth's geomagnetic field. Studies so far have judged the impact to be small although available results are not entirely conclusive.[101]

[98] E.g. Petersen and Malm (2006), see also Maar et al. (2009) for a specific study of the substantial impact on local dynamics following from the settling by blue mussels (*Mytilus edulis*) on wind farm foundations in the southern parts of the Baltic Sea.

[99] E.g. Inger at al. (2009). - Nevertheless and for Natura 2000 sites applies that any potential reef effect has to be analysed within an Appropriate Assessment procedure (ref. Article 6(3) of the Habitats Directive, see Chapter 5). Any potential reef effect, even if resulting in overall increase in e.g. species richness at the site, must not affect the integrety and conservation status of habitats or species for which the site has been designated.

[100] Data from studies at Nysted Offshore Wind Farm, Denmark, referenced by OSPAR (2008).

3.4.5 Potential impacts of wind farms on rare and vulnerable habitat types

Wind farms that are placed on or near certain rare and fragile habitat types such as blanket bogs or raised mires, wetlands, sand dunes and shallow sand banks can potentially cause the loss or deterioration of these habitats. The concern is not just over the direct loss of an area of habitat, but over potential damage caused, during construction and operation, to the habitat's structure and ecological functioning. Such damage may have a significant impact over a much larger area than the direct land-take.

Peatlands in particular can be damaged by the inappropriate siting of wind farms or their associated infrastructures, such as new or improved access roads. The damage is often caused because developments have not taken sufficient account of the underlying hydrology of the peatland. So, whilst the actual amount of peat lost may be small, the damage caused to the natural drainage system of the peat (for instance through drainage ditches etc…) may have repercussions over a much wider area and can ultimately lead to the deterioration of a more significant area of peatland and other related habitats, such as streams and other water courses located down-stream[102].

Wind farm construction on sloping peatlands and deep peat – the Derrybrien case

In October 2003, a major bog slide occurred on the southern side of Cashlaundrumlahan Mountain in Galway County on Western Ireland The cause of the bog slide was traced back to the construction works being carried out on a new wind farm on the peatland. It was found that two of the wind turbines and a proportion of the access roads which had been built across the peat had disrupted the bog's hydrology and consequently destabilised the peat layer[103].

A similar landslide occurred in August 2008, at the site of another wind farm development project in the Stacks Mountains in County Kerry, Ireland. Again, it was found that the landslide was linked to the inappropriate siting of the access roads on the peatland leading up to the wind farm.

The Derrybrien case was later taken to the European Court of Justice following an independent investigation into the construction of the wind farm. In July 2008, the European Court of Justice[104] ruled that '*Ireland has failed to take measures to ensure that checks are made to ascertain whether proposed works are liable to have significant effects on the environment in accordance with Article 2(1) of the EIA Directive'*. Wind farm developers have since been urged to carry out full scale peatland risk assessments when developing project proposals for wind farms on peatlands.

Peatlands are also an important carbon store and sink and are, as a result, an important part of Europe's climate change mitigation strategy. Wind farms sited on peatlands which hold large stocks of carbon have the potential to greatly increase overall carbon losses which would undermine the expected carbon savings associated with the wind farms as well as damage rare habitats of European importance. Impacts on the carbon sequestration processes of an 'active' or growing peatland can also occur if peat growth is arrested due for instance to hydrological changes related to the development. These changes may occur during construction or may develop over the life-span of the wind farm. The Scottish Government has developed a method to determine potential carbon losses and savings associated with wind farm developments on peatland taking into account peat removal, drainage, habitat improvement and site restoration[105].

[102] E.g. Lindsay (2007) for an overview of impacts on hydrology from wind farms developments and associated structures such as access roads. See also Fagúndez (2008) and Fraga et al. (2008) with reference to impact on blanket bog vegetation in Spain.

[103] Lindsay & Bragg (2004); for a more consice overview, see Bragg (2007).

[104] ECJ ruling C-215/06.

[105] Nayak et al. (2008); see also Grieve & Gilvear (2008) and Azkorra et al. (2008) for site-specific studies in Scotland and Spain, respectively.

Other dynamic habitat systems, such as sand dunes, wetlands or partially submerged sand banks are also vulnerable to any changes in their structure and functioning. This could be caused for instance by soil compaction, clearance of vegetation, drainage, reprofiling, etc.. which may lead to severe erosion and habitat degradation over a wider area. The scale of damage or deterioration to the habitats depends on the size of the development and on the precise location of the wind farms and their associated infrastructures.

3.5 Distinguishing between significant and insignificant effects

Identifying the species and habitats that are likely to be affected by wind farm developments is only the first step of any impact assessment. After that, it is necessary to determine whether the impact is significant or not. The legal procedure for determining 'significance' in any plans or projects specifically affecting Natura 2000 sites is described in chapter 5.

Here, some of the general principles involved in determining the level of 'significance' in the case of wildlife (irrespective of whether it is in a protected area or not) are explained in brief to help further with the general understanding of this concept.

Significance will vary depending on:

- Magnitude of impact
- Type
- Extent
- Duration
- Intensity
- Timing
- Probability
- Cumulative effects

Clearly, the assessment of significance needs to be done on a case-by-case basis, in function of the species and habitats affected. The loss of a few individuals may be insignificant for some species but may have serious consequences for others, like some populations of eagles and vultures or other threatened species.

Similarly, the displacement of animals may significantly reduce the fitness, and ultimately the survival rate of certain species, but have only a limited impact on other species, which may, for instance, have enough alternative habitats in the vicinity. Hence, population size, distribution, range, reproductive strategy and life-span will all influence the significance of the effects.

The assessment of significance should also be considered over an appropriate geographical scale. For migratory species that travel over very long distances, the impact at a specific site may have consequences for the species over a larger geographical area. Likewise, for resident species with large territories or changing habitat uses, it may still be necessary to consider potential impacts on a regional, rather than a local scale.

A common means of determining the significance of effects is through the use of key indicators (e.g. identified using the approach shown in Figure 7). Some indicators, such as amount and percentage of habitat lost, may be more significant for particularly rare habitat types or habitats with a limited distribution than for others because of their status.

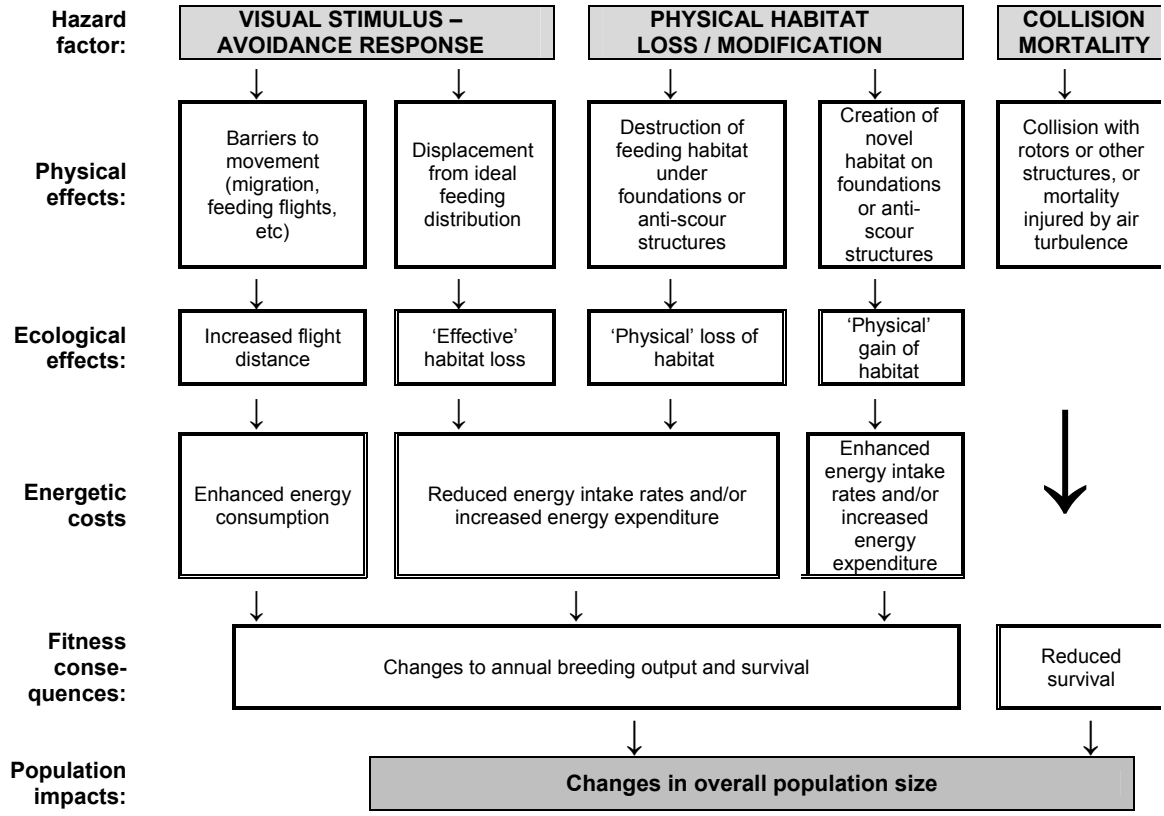

Figure 7: Flow diagram describing how three major hazard factors (shaded boxes) caused by wind farms affect birds and how they may affect survival and reproductive output, and eventually cause changes to the overall population size. The boxes with a heavy solid frame indicate potentially measurable effects, and the double framed boxes indicate processes that need to be modelled. Although the diagram focusses on birds in the offshore environment, the approach can be more widely applied. From Fox et al. (2006).

The flow chart in Figure 7 describes the interconnectivity of factors that could potentially and *significantly* influence for example a bird population. It demonstrates how *physical effects* such as barriers to movements, displacement from feeding areas, modification of habitats and mortality due to collisions cause *ecological effects* such as increased flight distances and changed access to habitats. This leads to *costs in terms of changes in energy expenditure and food intake*, potentially affecting fitness related parameters such as survival and reproductive output and thus the overall *population size*[106].

It is clear that any impact assessment should be based on the best available data. This may be data from dedicated field surveys or various types of predictive population models. In special cases such data may also be available from comprehensive, "research type" monitoring programmes.

The examples below shows how such a programme was carried out for some of the first major offshore wind farms in Denmark.

[106] The process is elaborated in more detail by Fox et al. (2006)It is presented as a ”model approach” and not used on a regular basis by the planning authorities in Denmark.

Offshore wind farm establishments in Denmark: impacts and environmental monitoring

Together with Germany and the United Kingdom, Denmark is one of the leading countries in the large-scale establishment of offshore wind farms in Europe. By the end of 2009, ten offshore wind farms were in operation; with a total of 305 turbines and a total capacity of 646 MW. 79% of the turbines are concentrated in three large establishments: two at Horns Rev in the North Sea, 15-30 km from the western coast of Jutland, and the other at Nysted in the Baltic Sea around 10 km S the town of Nysted on Lolland Island. Each covers an area of 20-35 km^2.

Screening work was initiated in 1999, the EIAs were approved in 2001 and construction started in 2002. The first two wind farms were operational by 2003. As part of this process an ambitious research and monitoring programme was launched for these two wind farms.

The studies undertaken so far have included:

- Benthic fauna and flora (with particular emphasis on the establishment of artificial hard-bottom substrates at turbines foundations).
- Distribution of fish (incl. effects of electromagnetic fields).
- Numbers and distribution of feeding and resting birds.
- Migrating birds (incl. risks for collision).
- Behaviour and reactions by marine mammals (seals and porpoises).
- Coastal morphology.

Results of the monitoring work up to the end of 2006 can be very briefly summarised as follows

- Abundance and biomass of the benthic fauna have changed, with local biomass increases of 50-150 times, primarily related to the increased habitat heterogeneity related to the introduction of hard bottom substrates onto seabeds that almost exclusively consisted of sandy sediments.
- Despite this there were no indications of attraction related to 'reef effects'. An interesting finding was that sand eels (*Ammodytes* spp.), which are sensitive to changes in the composition of sediments and an important prey for piscivorous fish as well as for birds, were not affected.
- For marine mammals, clear pile driving effects were recorded, a decrease in porpoises was recorded during construction and, so far there are indications of only a slow recovery at one of the farms. Harbour seals and grey seals on the other hand showed no general changes in behaviour;
- Very low collision rates, but clear indication of avoidance responses, were recorded for various bird species, including Eider ducks. Displacement effects, up to at least 2 km were, found for some waterbirds.

A variety of new and advanced monitoring technologies have also been tested and applied, e.g.:

- Hydroacoustic equipment for fish surveys.
- A special setup and fishing gear to study impact of electromagnetic fields.
- Acoustic monitoring of marine mammals, using stationary data-loggers, combined with remotely controlled video monitoring and tagging of animals with satellite transmitters; complemented by spatial modelling of the distribution of marine mammals on the basis of field survey data.
- Improved radar and infra-red video monitoring techniques for monitoring of bird movements.

Overall, the Danish studies have increased our knowledge of the short-term impacts on various species and marine habitats of large offshore establishments. In addition to the improved knowledge about environmental impacts, the Danish experiences have also contributed to enhanced know-how about monitoring methodologies. As such it provides a very useful example of how a scientific framework can be applied in the spatial planning of other future large-scale projects[107].

[107] The Danish Energy Authority, DONG Energy, Vattenfall and Danish Forest & Nature Agency) published an overview (until 2006) "Danish offshore wind – key environmental issues", http://ens.netboghandel.dk.

Monitoring programme for the wind farms of Beauce, France

In 2006, a four year monitoring programme was launched to analyse the impacts on birds and bats of a series of six wind farms in the Beauce Region of France. Whilst the accompanying EIAs found little or no immediate risk to wildlife (Beauce is a region dedicated to mainly intensive agriculture with resulting lower nature values), the region decided anyway to launch a four year monitoring programme to monitor any possible effects on grassland birds and bats in order to help better orientate future wind farm developments within the region.

The monitoring programme is being undertaken by a partnership of two wind farm developers, two nature conservation associations, two consultancies specialised in ecology as well as the Regional Council, the Agency reponsible for the environment and wind energy (ADEME) and the Ministry for Ecology and sustainable development (DIREN).

Together they agreed on a 4 year monitoring programme (2006-2010) to study in particular:
- any loss of habitats for, or any changes in the population structure of small grassland species (birds and bats);
- any change in the reproduction behaviour of buzzards or the way in which they use the habitats;
- fluctuations in migration patterns and the behaviour of migration birds and bats as a result of the configuration of the wind farms;
- changes in behaviour of birds in their wintering habitats and whethere they are any perturbations caused by the presence of the wind farms.

The monitoring is based on the BACI approach (Before After Control Impact) and is intended to demonstrate how to carry out a good monitoring programme to help guide the furture orientation of wind farm developments in a particular region (in this case Beauce). The final results of the study will be available at the end of 2010 but first results are already showing some useful results[108].

For instance, in the case of migrating birds, it has been found that (70-99%) circumvent the wind farms, changing direction or altitude some 500 m beforehand. Parks with dense clusters of wind farms are avoided altogether whereas birds do seem to occasionally cross those that are more open in aspect - ie where the wind turbines are in parallel lines or perpendicular to the migration route.

3.6 Cumulative effects

Cumulative effects may arise when several wind farms and their associated structures are present within an area or along a flyway corridor, or as the result of the combined impacts of wind farms and other types of activity (e.g. forestry or other industrial developments). The cumulative effect is the combined effect of all developments taken together but this does not mean that it is simply a sum of the effect of one wind farm plus the effect of a second wind farm. It may be more, it may be less.

For instance, the first wind farm may give rise to a small but acceptable level of bird mortality, which lies well within the capacity of that bird population for regeneration and hence has little effect on the overall population level. But the level of bird mortality occasioned by several wind farms taken together may exceed the capacity of the population for regeneration, in which case the bird population would go into decline. In this case, whereas the impact of the first and second projects, each on their own, is not discernable,

[108] http://volkswind.fr/documents/suivi_ornithologique_des_parcs_eoliens_en_beauce_2006_2009.pdf

the impact of both taken together could cause the bird population to collapse. This influences the planning decision for both project proposals.

The key is to determine at what point do accumulated habitat loss (including effective habitat loss due to exclusion), barrier-effect induced increases in energy costs and collision mortality, acting in concert, pose a significant impact.

It also depends on the cumulative impact of that project combined with other developments (not only wind farm projects) in a given area. The effect of a single plan or project may be insignificant but when combined with other plans or projects the cumulative effect may turn out to be significant. Habitat fragmentation may also need to be considered during the assessment of cumulative effects as this can have a deleterious impact on population structure and dynamics among a wide range of species.

4. THE IMPORTANCE OF STRATEGIC PLANNING IN WIND FARM DEVELOPMENT

- *Planning wind farm developments in a strategic manner over a broad geographical area is one of the most effective means of minimising the impacts of wind farms on nature and wildlife early on in the planning process. It not only leads to a more integrated development framework but should also reduce the risk of difficulties and delays at later stages at the level of individual projects.*
- *Evidence to date illustrates that wind power does not have to threaten wildlife but appropriate siting is critical and must be a first goal of the planning process.*
- *A recent EEA report investigated Europe's wind potential and concluded that even if all Natura 2000 and other areas designated for nature protection were theoretically excluded from wind energy development, there would still be enough wind energy available to supply 3-7 times the total estimated energy demand in 2020 and 2030.*
- *Developing wildlife sensitivity maps at the strategic planning stage enables areas to be identified where wind farm development might be considered a low, medium or high risk in terms of nature and wildlife. Several Member States have demonstrated how this can be done with success.*
- *Such wildlife sensitivity maps will also help to avoid potential conflicts with the provisions of article 5 of the Birds Directive and 12&13 of the Habitats Directive as regards the need to protect species of EU importance throughout their entire natural range within the EU (ie also outside N2000 sites).*

4.1 Strategic planning: a way to ensure more efficient, integrated decision-making

Strategic planning is a useful tool for ensuring that a rapid deployment of wind energy over a large area can be achieved whilst simultaneously protecting vulnerable wildlife from inappropriate development[109]. Strategic planning not only helps to identify the most appropriate locations and scales for expansion in function of wind energy capacity, grid access etc. but also helps to avoid and reduce the impacts on the natural environment at a very early stage in the planning process.

Evidence from Germany, Denmark, Spain and the UK illustrates that wind power does not have to threaten wildlife but appropriate siting is critical and must be a first goal of the planning development process from a conservation perspective. Despite the range of concerns, most threats can be minimised by avoiding sites with sensitive habitats and key populations of vulnerable species. Good site location will also help developers avoid costly investments in inappropriate sites.

Drawn up by public authorities, these land use or sectoral plans usually cover a broad geographical area, be it at the level of a municipality, region or country. This scale, combined with the spatial nature of the plans, enables strategic decisions to be made about the capacity and location of wind developments over a broad area.

[109] 'Positive planning for onshore wind: expanding onshore wind energy capacity while conserving nature ', report by IEEP commissioned by RSPB, March 2009 (Bowyer et al. 2009).

They also provide an opportunity to explore various alternative, and potentially less environmentally damaging, options as well as to consult early on with industry and other interested bodies.

The whole process should ideally result in a more integrated and sustainable form of spatial planning which takes on board wider societal concerns at an early stage. This in turn should provide the industry itself with a more transparent and stable framework for growth and expansion.

4.2 Marine spatial planning

Existing planning frameworks have a largely terrestrial focus. Challenges that emerge from the growing competing uses of the sea, ranging from maritime transport, fishing, aquaculture, leisure activities, off-shore energy production and other forms of sea bed exploitation must be addressed. Therefore, maritime spatial planning can be a fundamental tool for the sustainable development of marine areas and coastal regions, and for the restoration of Europe's seas to environmental health (EC 2007e).

Marine spatial planning provides a mechanism for stakeholder involvement, which is particularly important as multiple organisations have competencies in the planning and management of activities in the marine environment (WWF/Wildlife Trusts 2004).

In 2008 the European Commission launched a Communication on Maritime Spatial Planning (MSP), which focus on achieving common principles in the EU (COM(2008) 791 final). Maritime Spatial Planning is considered a key instrument for the Integrated Maritime Policy in the EU. It helps public authorities and stakeholders to coordinate their action and optimises the use of marine space to benefit economic development and the marine environment. This Communication aims to facilitate the development of MSP by Member States and encourage its implementation at national and EU level. It sets out key principles for MSP and seeks, by way of debate, to encourage the development of a common approach among Member States.

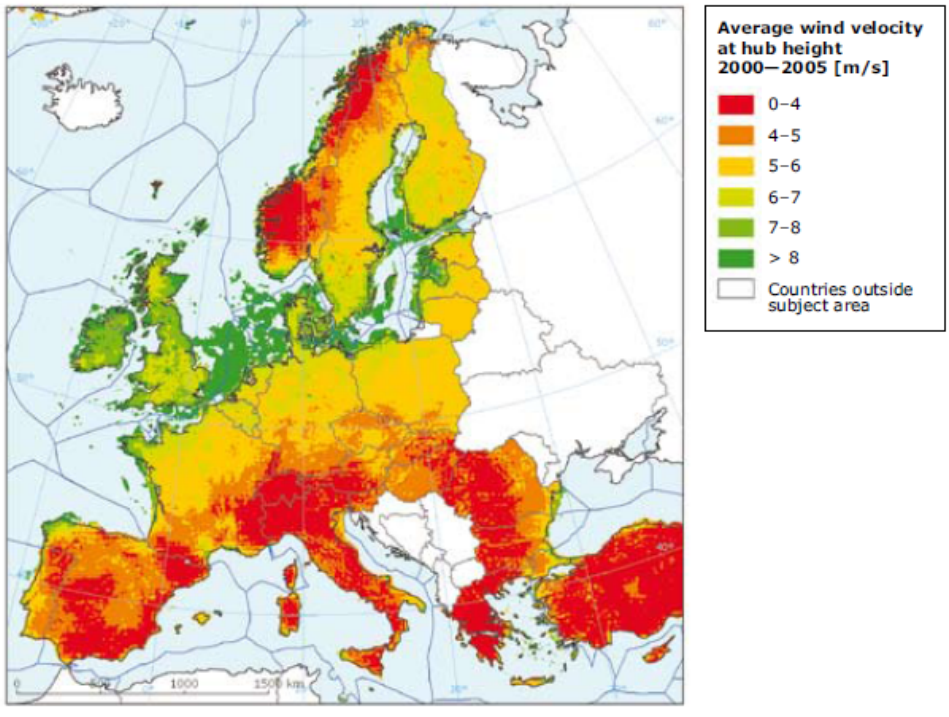
4.3 Determining suitable locations for wind farm development

A crucial first step in developing a spatial vision for wind farm development that is compatible with nature conservation interests is to determine within a given area both:

- the capacity for wind farm development - for instance in function of wind speed, access to grid, and other physical or economic constaints - and

- their suitable location in function of other land-uses and restrictions and other societal constraints, including nature conservation interests.

With the benefit of geographical Information systems (GIS) data collected on these aspects at a strategic level can be used to develop useful overlay maps which can help authorities to identify, within a given region, potentially low-risk areas – ie areas of high value for wind farm development but that also present little or no risk from a nature conservation perspective or potential high-risk areas that are best avoided or where mitigation measures and more substantial impact assessments are likely to be required.



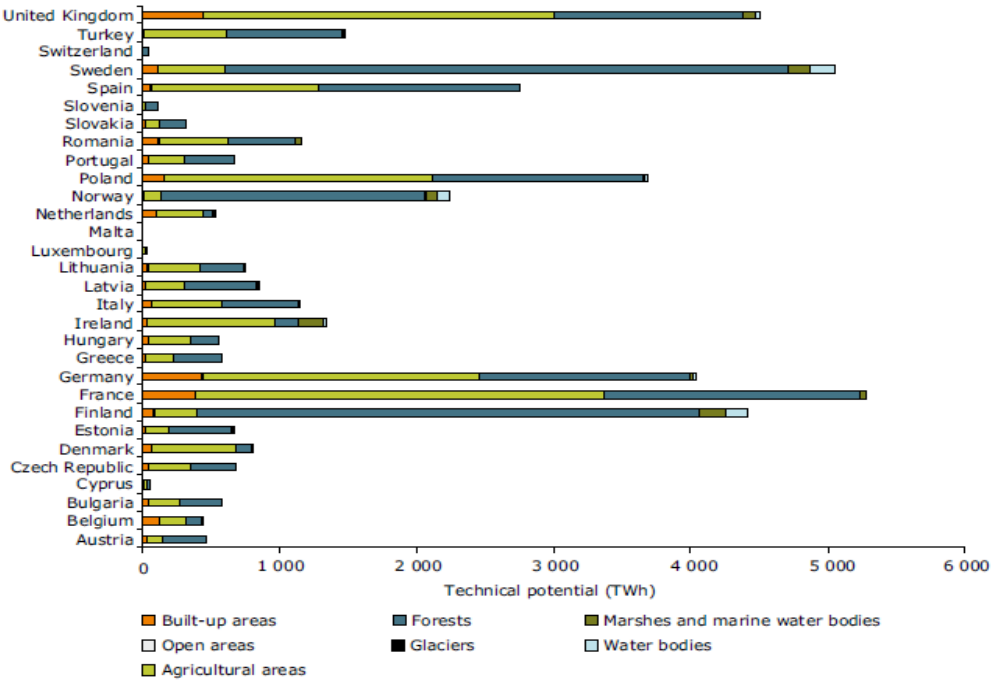
These aspects should be investigated as part of the initial development plan proposal and should also be further developed through the Strategic Environmental Assessment[110] or Appropriate Assessment, where this is required, and/or through consultation with developers and other interested parties. This will not only ensure that the final result is more integrated and acceptable to all concerned but should also reduce the risk of unforeseen difficulties and delays at later stages.

4.3.1 Europe's wind energy potential

In its recent report entitled '*Europe's onshore and offshore wind energy potential*'[111] The European Environment Agency (EEA) analysed in detail the local wind resources across the EU (based primarily on wind speed) in order to provide a Europe-wide resource assessment of onshore and offshore wind potential in a geographically explicit manner and to help Member States identify the most suitable locations for wind energy generation.

It confirms that the wind energy resources in Europe are potentially immense, but they do also vary significantly across the EU due to variations in topography and meteorology (Figures 8,9). According to the EEA report, onshore wind energy potential is concentrated in particular in agricultural and industrial areas of north-western Europe.

Likewise, the largest offshore potential can be found in low depth areas in the North Sea, the Baltic Seas and the Atlantic Ocean with some local opportunities in the areas of the Mediterranean and Black Seas.



Source: EEA, 2008.

Figure 8 Wind field data after correction for orography and local roughness (based on estimated average wind speed of 80 m onshore, 120 m offshore – from EEA technical report N°6/2009 (EEA 2009).

[110] See chapters 3 and 6

[111] EEA technical report N°6/2009 of June 2009 (EEA 2009).

From a Member State perspective the unrestricted potental for onshore wind energy also highlights very significant differences between countries.

Source: EEA, 2008.

Figure 9: Unrestricted technical potential for onshore wind energy up to 2030, based on estimated 80 m average wind speeds 2000-2005 from EEA – from EEA technical report N°6/2009 (EEA 2009).

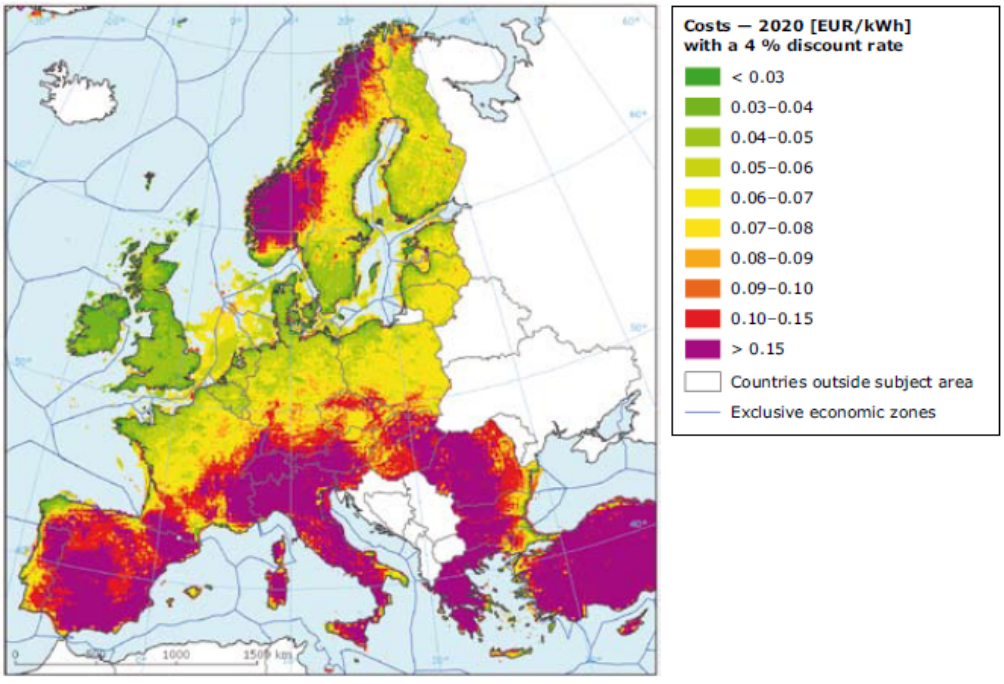


Figure 10: Generation cost for wind energy in Europe (to 2020) at 4% interest rate

However, raw unrestricted 'technical potential' is only part of the equation. There are also cost considerations and potential socio-environmental constraints to take into account. In the case of the former, the EEA has estimated the 'economically competitive potential' of wind energy development based on the forecasted costs of developing and running wind farms in 2020 and 2030 relative to projected average energy generation costs derived from the Commission's baseline scenario[112]. Again there are marked differences between different regions and countries of the EU.

The EEA also made an analysis of wind energy potential where all Natura 2000 and other protected areas are excluded from the calculations. As explained before there is no automatic presumption against wind farm development in Natura 2000 sites but such developments must respect the procedural safeguards laid down in the Habitats Directive.

The EEA's exercise illustrates that if all Natura 2000 and other areas designated for nature protection were theoretically excluded from wind energy developments, and assuming that the excluded areas are spread equally over all land cover classes, this would have only a limited impact on wind energy potential (a decrease of ca 13.7% of onshore technical potential).

To put this in perspective, the total economically competitive EU wind energy potential was estimated to be equivalent to 3-7 times the total energy demand by 2030 and 2020.

It must however be noted that the assumption that the wind potential is equally distributed between protected and non-designated areas is not necessarily appropriate. The actual effect, especially at a particular regional or national level, of a complete exclusion of wind energy development in protected areas could therefore be more or less severe than the EEA study seems to suggest. Nonetheless, the EEA study clearly demonstrates the value of undertaking such a spatial analysis as part of a strategic assessment of wind farm development.

4.3.2 Grid connections and road access

Grid connection and road access are both crucial issues for the location of wind farms. Consequently, the relationship between wind farm developments and existing grid or road infrastructures is also a key aspect of spatial planning. As both associated infrastructures are capable of having a significant impact on nature and biodiversity values, this is also best considered early on during the planning stages.

For offshore wind farms, an international perspective to grid access is strongly encouraged as it might provide more efficient and coordinated solutions, with reference to the onshore grid systems as well as underwater cables. By mapping the grid connections and capacities available, optimised locations can be determined, and the need for new grid connections and additional impact can be minimised[113].

[112] In the EEA report 'technical potential' refers to the highest potential level of wind energy generation, based on overall resource availability and the maximum likely deployment density of turbines, using existing technology or practices. 'Economically competitive potential' describes the proportion of technical potential that can be realised cost-effectively in the light of projected average energy costs in the future.

[113] COM(2008) 768 final/2; 12.12;2008

4.3.3 Wildlife sensitivity maps

Analysing the capacity and means for a region to develop wind farms is only part of the equation. A strategic development plan should also consider other land-uses and restrictions or other societal constraints at a very early stage in the planning process.

Wildlife sensitivity maps are useful tools in helping to place wind farm developments in areas that are compatible with nature conservation requirements. Sensitivity maps can be developed for selected categories of species (eg species of birds, bats, marine mammals of European importance) or for valuable wildlife in general over a pre-determined area – for instance an entire region.

When wildlife sensitivity maps are then super-imposed over the wind capacity maps for instance, areas of 'low or no risk' can be identified as well as areas of potential 'higher-risk' where particular species of conservation concern are to be found either year-round or seasonally (eg during migration). They can also highlight potential cumulative impacts of wind farm developments in a particular region and assist in establishing the likely carrying capacity of that region as regards the number of wind farm developments it can sustain.

The public resources spent for the development of these kinds of maps are likely to be more than compensated for in terms of smoother and less complicated and time-consuming site-related assessments - costs which are normally borne by the developer.

However, sensitivity maps can only provide a broad orientation of areas of potentially high-, medium- (where mitigation measures may be possible), and low risk areas (where the impact is expected to be limited or low). As such they are not a substitute for Environmental Impact Assessments (EIA) or Appropriate Assessments (AA) at project level. These may still need to be undertaken for individual wind farm development projects.

Comprehensive species surveys within the EIA or AA at individual site level will be able to determine more precisely for each site what the specific nature values and risks of impact are. In this context, the strategic level maps can already help to indicate the required level of assessment that would be needed for more detailed and stringent baseline studies at individual project level.

4.3.4 Wildlife sensitivity maps in the context of Art 12 (Habitats Directive) & Art 5 (Birds Directive)

The other significant advantage of wildlife sensitivity maps over larger scales is that they help pre-empt any potential conflicts with Articles 5 of Birds Directive and 12&13 of Habitats Directive. As explained in chapter 3, these provisions aim to ensure the protection of species of European Importance across their entire natural range in the EU, i.e. also outside Natura 2000 sites. Wind farm developers or planners must therefore be able to demonstrate that they have taken the necessary precautions to avoid compromising this species protection regime.

Distribution maps of species of EU interest can help planners and developers, for instance, to avoid areas outside Natura 2000 that are particularly important for these species, such as bottleneck migration routes for birds and bats.

In general there is a clear need for more detailed surveys and research into the spatial distribution of vulnerable species across the EU. This is best done at a supranational level so that the entire natural range of the species can be covered. Two new EU funded initiatives are currently underway (INSPIRE[114] and GMES[115]) which, although not yet fully developed, demonstrate the importance of geographical information and the value of Member States pooling their resources. In due course they should become powerful tools for developing the overlay maps mentioned above that include several variables.

Plans or projects outside the Natura 2000 sites

The establishment of the Natura 2000 Network is at the heart of both the Birds and Habitats Directives and is a fundamental to achieving the overall objective of maintaining and restoring the habitat types and key habitats of species listed in the Directives to a favourable conservation status in their natural range. But the Natura 2000 Network is only part of the equation.

Both Directives also require that Member States establish a general system of protection for all wild bird species in the EU and for species listed in Annex IV of the Habitats Directive *throughout their natural range within the EU* – ie also outside Natura 2000 sites. The specific articles that lay down the species protection provisions are Articles 12 and 13 of the Habitats Directive and Article 5 of the Birds Directive (described further in chapter 3).

As birds, bats and whales have all been found to be vulnerable to wind farms, these provisions will also need to be taken into account by developers and planners irrespective of whether their wind farm developments are to be located in a Natura 2000 site or not. In particular, information on population size and seasonal fluctuations on a local and regional level will be useful in order to be able gauge the significance of any potential impacts of a proposed wind farm plan or project in that region. This could be supplemented by data on local and regional movements and migration patterns both in the diurnal and seasonal perspectives.

The measures to be taken under these species protection provisions are not limited to the prohibition of various activities. They also include the need for preventive measures in order to anticipate threats and risks related to disturbance. For wind farms, this might include the refusal of individual projects on the grounds that their proposed location could lead to significant disturbance to migratory birds or bats, for instance a key location along a species migration route, or could lead to the destruction of breeding sites and resting places for bats or whales.

Or it could simply mean that certain safeguards or mitigation measures are introduced into the permit. This might involve, for instance, shutting down the wind farms at times when there is a high risk of disturbance (eg in Germany, one wind farm turns its turbines off for a couple of hours around dusk during August and September when there is a peak migration/dispersal period amongst local bat popualtions). Whatever measures are applied, they must be proportionate in relation to the assessed impact on the conservation status of the species concerned.

Although there is no formal obligation to carry out an Appropriate Assessment under the EU nature legislation, in contrast to what is required for Natura 2000 sites, the potential impact on species of EU importance should nevertheless be analysed during the SEA and EIA processes, keeping in mind that derogation provisions need to be interpreted narrowly and not lead to outcomes that go against the objectives of the two nature Directives. **In this respect, the development of wildlife maps could help to provide planners and developers with a useful tool to identify areas at risk.**

These issues are elaborated on in greater detail in the the Commission's guidance document on the strict protection of animal species of Community interest under the 'Habitats' Directive 92/43/EEC' [116].

[114] More information about INSPIRE available under http://www.ec-gis.org/inspire

[115] More information about GMES available under http://www.gmes.info/

[116] Guidance document on the strict protection of animal species of Community interest under the 'Habitats' Directive 92/43/EEC http://ec.europa.eu/environment/nature/conservation/species/guidance/index_en.htm

4.3.5 Natura 2000 maps

Wind farm plans or projects should also be overlaid on maps showing all the Natura 2000 sites within the area in question. However, it should be noted that such maps only give the boundaries of the sites included in the Natura 2000 Network. They do not show which parts within the Natura 2000 area are occupied or used by the different species and habitat types of EU importance for which it has been designated. This more detailed information if often essential for determining the risk of negative effects. It may sometimes be found within the Natura 2000 management plan for the site.

Nevertheless, the Natura 2000 map will allow planners and developers to identify at a very early stage in the process where additional planning procedures are likely to apply (for instance, under article 6 of the Habitats Directive) and whether more detailed site level mapping may be needed at project level.

Offshore, the situation is rather more complex as there is still a major gap in the designation of marine Natura 2000 sites. This is partly due to poorer scientific knowledge about species and habitats, including marine mammals in the marine environment. In this respect, it will be important to ensure that Member States designate marine protected areas under the Habitats and Birds Directives as soon as possible in order to remove legal uncertainties about the potential suitability of a given marine site for wind farms.

The Natura 2000 online viewer:

With the assistance of the European Environment Agency, the European Commission has developed a public Natura 2000 viewer which makes it possible to explore Natura 2000 sites in every part of the EU at the press of a button. Built on state of the art GIS technology, the public viewer is an interactive and user-friendly tool that allows the user to view Natura 2000 sites over different types of backgrounds (street maps, satellite imagery, bio-geographical regions, Corine Land Cover, etc.) and to quickly locate related information on species and habitats of interest such as the Natura 2000 Standard Data Forms.

The Natura 2000 v*iewer is available under* http://natura2000.eea.europa.eu/

4.4 Good practice examples of planning wind farm developments strategically to ensure appropriate siting from a conservation perspective

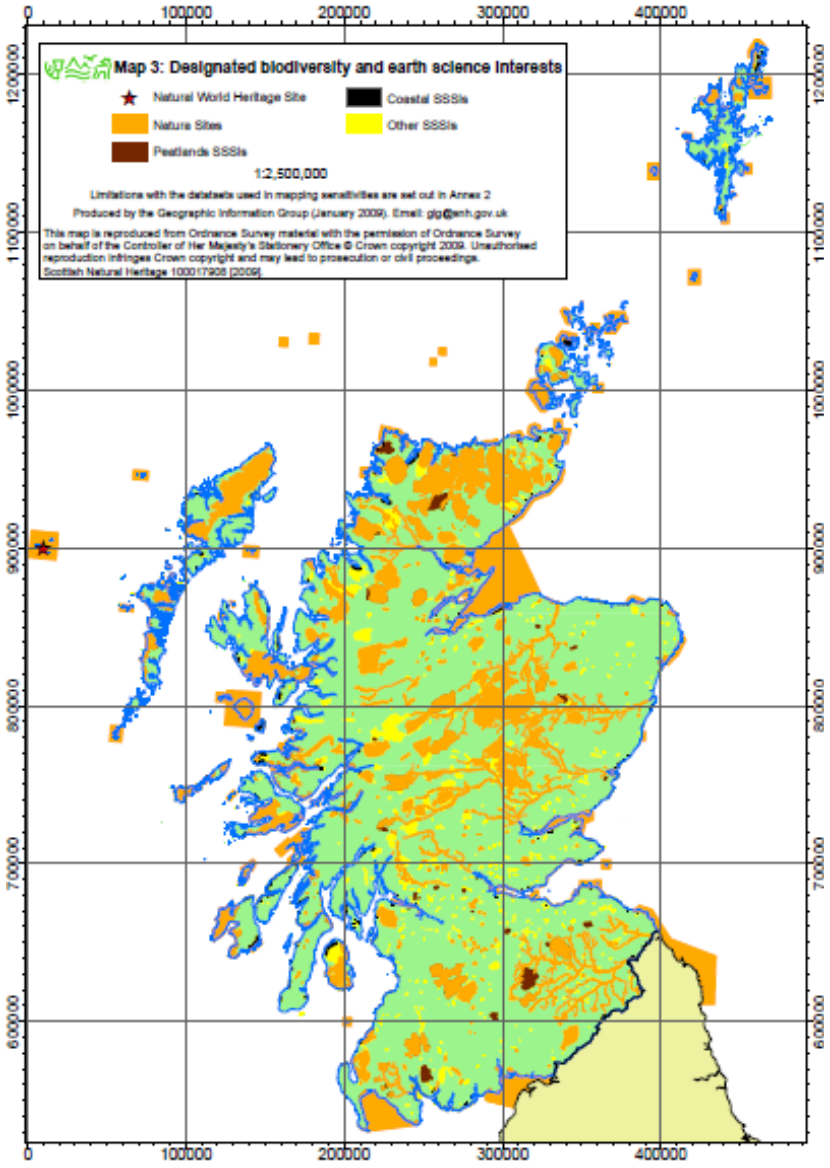
Experience in several countries has already shown that in practice wildlife sensitive maps are a very useful part of the strategic planning process. The examples presented below demonstrate this and help to illustrate further the different approaches for creating and using wildlife sensitivity maps. They concern both onshore and offshore plans.

Scotland: Strategic Locational Maps for onshore wind farms in respect of natural heritage

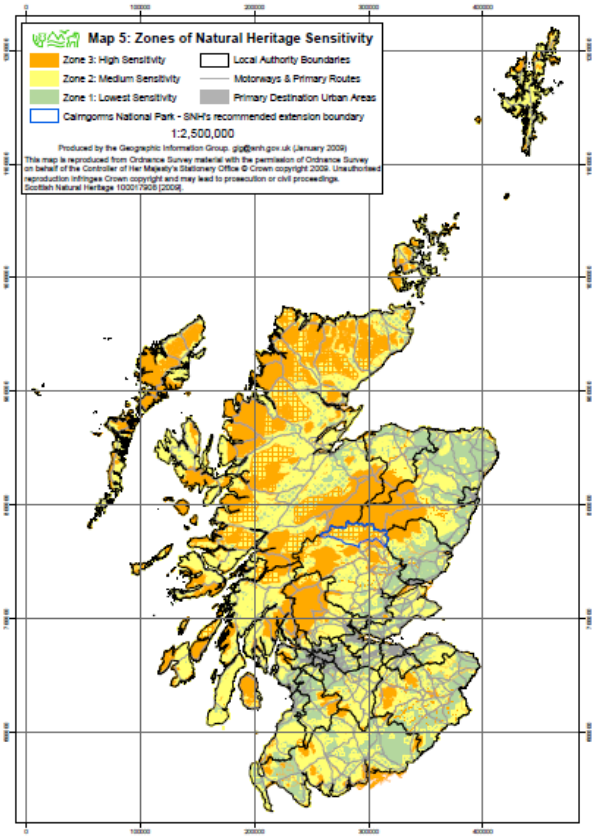
Scotland is likely to see a rapid expansion in wind energy in coming years in response to the region's ambitious target of 50% of Scotland's electricity coming from renewable energy sources by 2020. To plan for this increase in an efficient and proactive manner, the Scottish government has adopted a strategic approach to wind farm development. It requires planning authorities to develop spatial frameworks for windfarms identifying areas which are afforded significant protection, broad areas of search and other areas where criteria will apply.

To assist planning authorities in this process, Scottish Natural Heritage (the statutory body responsible for nature conservation and biodiversity) has adopted a strategic locational guidance note for onshore wind farms in March 2009 which includes a series of sensitivity maps (SNH 2009a). The aim of these is to 'guide wind development towards the locations and the technologies most easily accommodated within Scotland's landscapes and habitats without adverse impact, and which safeguards elements of the natural heritage which are nationally and internationally important'.
As such, it offers a strategic view of the sensitivities of the natural heritage across Scoland and a broad steer over which parts of the country are most suited to wind farm development.

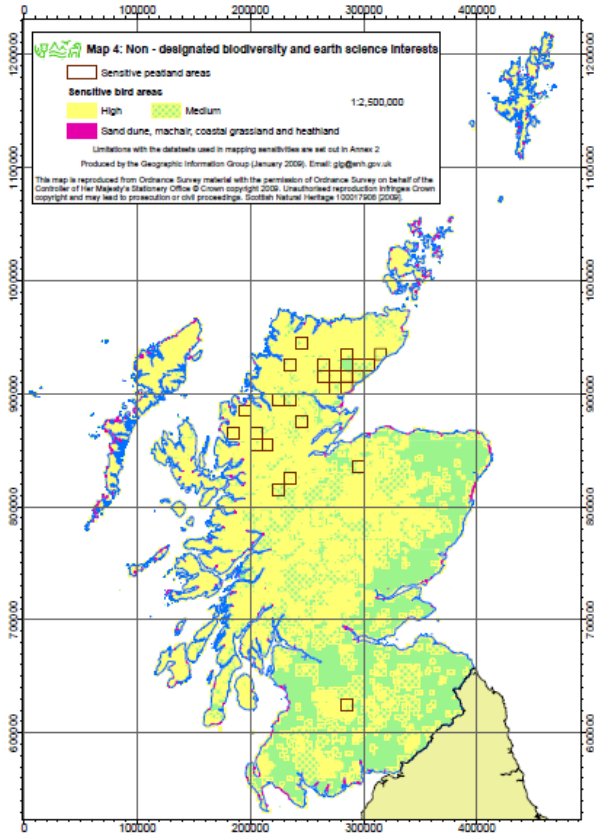
Altogether 5 maps have been developed. Maps 1 and 2 describe sensitivity associated with landscape and recreation interests, covering designated areas and wild land issues respectively. Maps 3 and 4 describe sensitivity arising from biodiversity and earth science interests, covering designated areas and non designated habitats and species respectively. The final map, Map 5, combines these sensitivities into three broad zones representing relative levels of opportunity and constraint:



- ***Zone 1:*** *Lowest natural heritage sensitivity - identifies areas at the broad scale with least sensitivity to wind farms, with the greatest opportunity for development, within which overall a large number of developments could be acceptable in natural heritage terms, so long as they are undertaken sensitively and with due regard to cumulative impact.*
- ***Zone 2:*** *Medium natural heritage sensitivity - identifies areas with some sensitivities to wind farms. However, by careful choice of location within these areas there is often scope to accommodate development of an appropriate scale, siting and design (again having regard to cumulative effects) in a way which is acceptable in natural heritage terms.*
- ***Zone 3****: High natural heritage sensitivity (including Natura 2000 sites) - identifies areas of greatest sensitivity to wind farms, which place the greatest constraint on their development, and where, in general, proposals are unlikely to be acceptable in natural heritage terms. There may, however, be some sites in this zone where wind farm development of appropriate scale and careful design could be accommodated if potential impacts on the natural heritage are fully explored and guarded against by employing the highest standard in siting and design.*



Map 4 on sensitive bird areas was developed jointly by SNH and the conservation NGO, RSPB. It focuses on species listed in annex I of the Birds Directive that are present in Scotland and provides data at 2kmx 2km resolution.



Overall the maps provide a broad overview of where there is likely to be greatest scope for wind farm development and where there are the most significant constraints, in natural heritage terms. There are however a number of caveats to bear in mind. As they are drawn at a strategic scale, they cannot be relied upon to provide guidance on the acceptability of any particular proposal in any given location. This is because the broad scale does not allow the presence of important species and habitats to be presented in detail which means that some areas may have a higher sensitivity than indicated in these overview maps.

Scotland faces particular challenges in relation to the extensive area of peatland landscapes, which are highly sensitive to hydrological disruption arising from wind farms and its ancillary developments. Notwithstanding, the maps are to be used as information tools alongside the detailed guidance but they have no status as a planning tool.

More details available on SNH website. The SNH 'Strategic Locational Guidance for Onshore Wind farms in respect of the natural Heritage' is available from http://www.snh.gov.uk/planning-and-development/renewable-energy/onshore-wind The RSPB bird sensitivity map (Bright et al 2006) and the research report is available from www.rspb.org.uk/Images/sensitivitymapreport_tcm9-157990.pdf. More recently a similar study has been done for England (Bright at al. 2009), https://www.rspb.org.uk/Images/EnglishSensitivityMap_tcm9-237359.pdf).

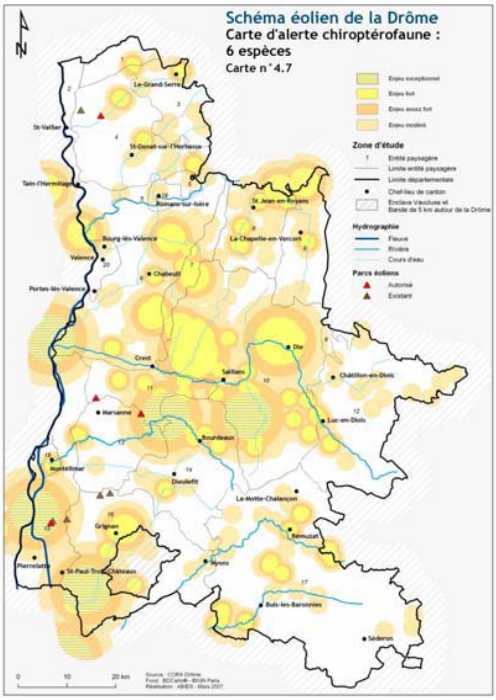
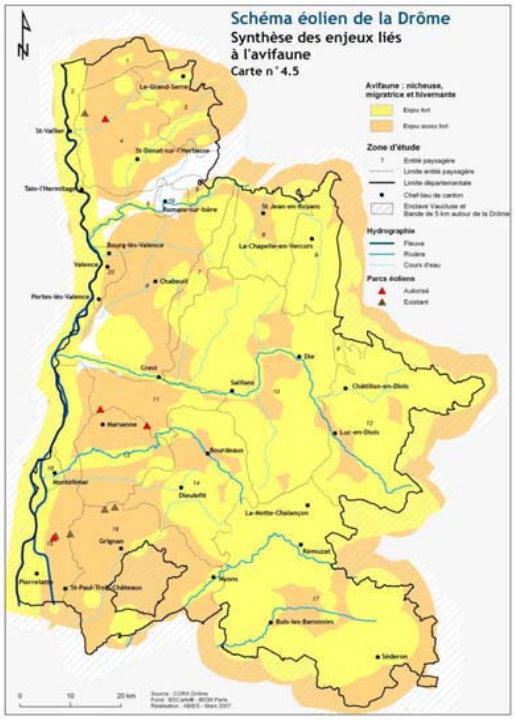
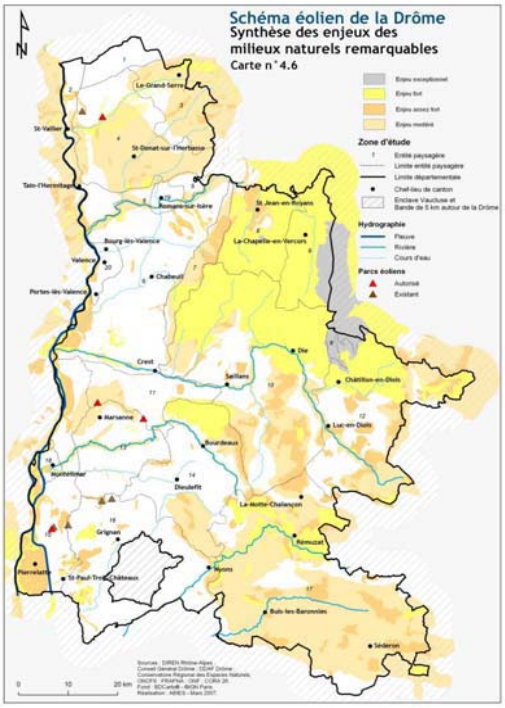
Regional spatial plan for wind energy development in Drôme Region, France



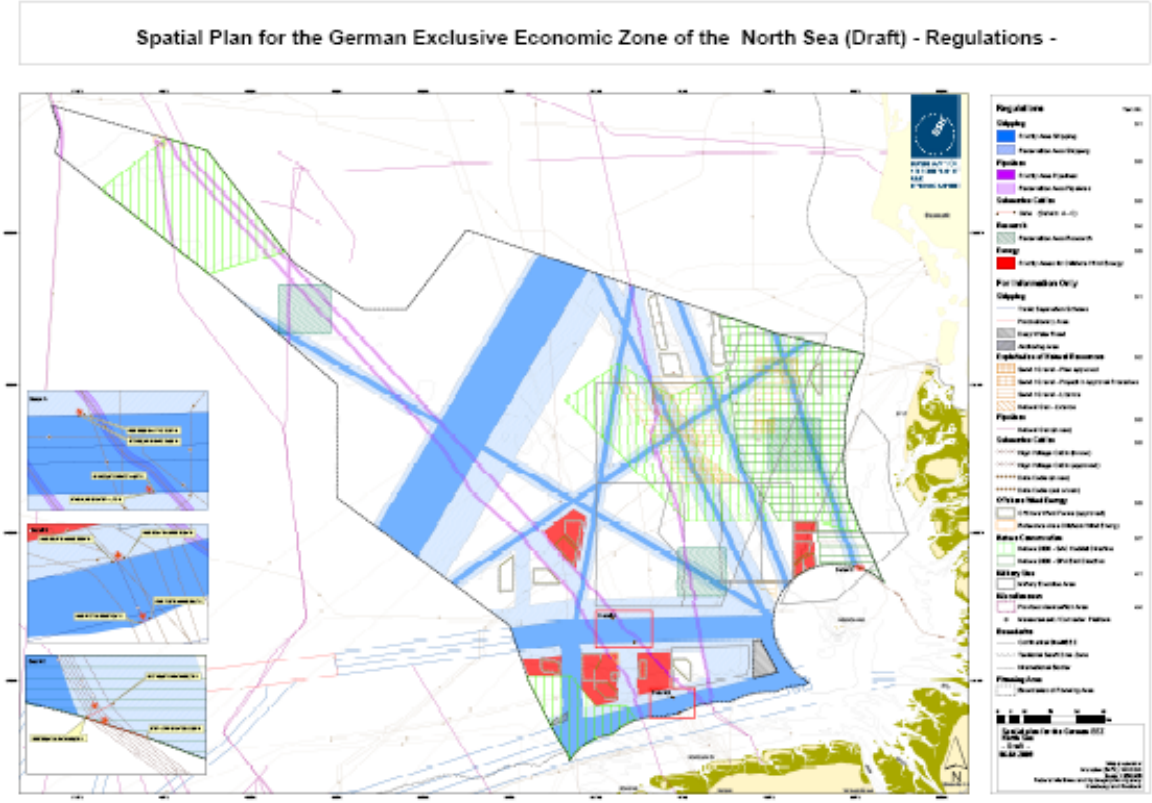
In 2005, the regional authorities of the Drome Region in France decided to develop a wind energy plan for the entire region. The aim was not only to analyse the potential benefits and constraints of wind development across the region but also to offer decision makers and wind farm developers a series of practical tools and important sources of information to help them prepare their development proposals in a way that is both cost effective and in keeping with the environment.



In this respect, detailed zonation maps were prepared in close consultation and dialogue with all interest groups. Each one identified different areas of high, medium or low potential in terms of wind resources, relevant public utilities and access to grid connections. A synthesis map was also prepared to demarcate areas of particular environmental sensitivity such as areas of importance for birds or bats or areas of high nature value. This synthesis map is based on, and accompanied by, more detailed wildlife sensitivity maps for certain species of particular conservation concern: bats, vulture and the golden eagle. These detailed maps are intended to provide an early warning system of potential conflicts with these important species so that wind farms can be planned in function of this knowledge.
More detailed information, including the complete report on the Drome wind energy plan is on: *http://www.drome.equipement.gouv.fr/rubrique.php3?id_rubrique=146* *Further french case studies and monitoring results on interactions between wind energy and biodiversity is available from* *http://www.eolien-biodiversite.com*



Synthesis map combining wind potential, public utilities, environmental concerns, heritage features and landscape. The zones are categorised as: areas deemed favourable for wind farm development (dark orange), areas moderately favourable but with some constraints (light orange), areas of low potential both for technical reasons and environmental reasons (yellow) and inappropriate areas eg poor wind capacity and high environmental constraints (grey areas).



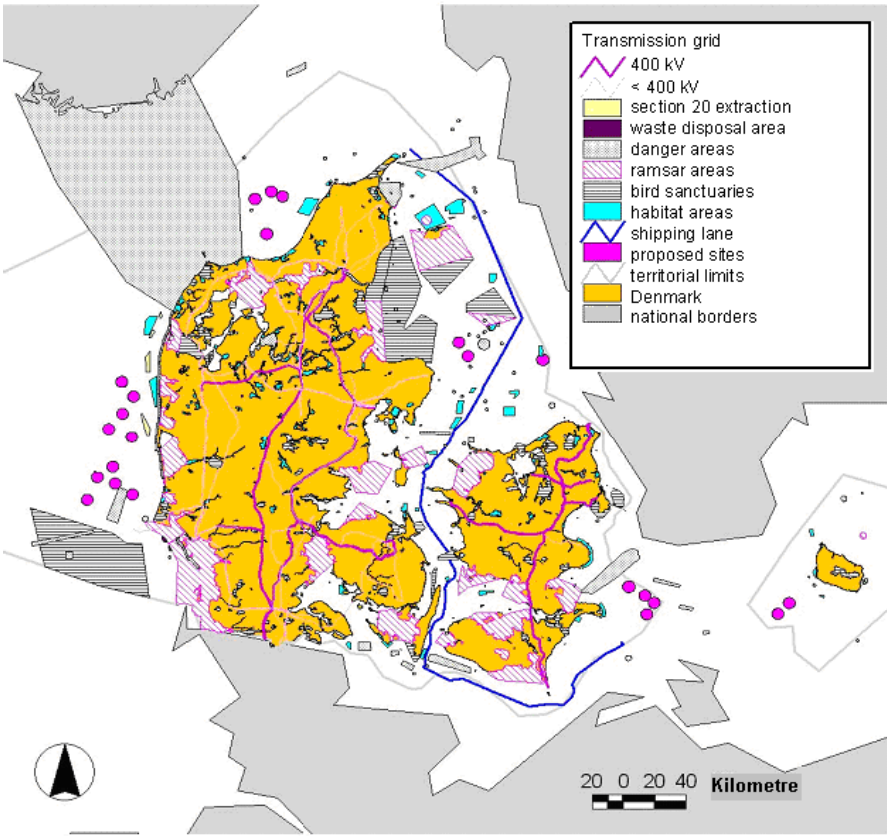
Map 1: alert map for vultures and golden eagle. May 2: alert map for bat species.
Map 3: synthesis map of areas of remarkable nature value.
Map 4: synthesis map of areas of importance for breeding, migrating and overwintering bird species

Spatial planning in the German EEZ of the North Sea.

The German EEZ of the North Sea attracts a lot of activities such as shipping, fishery, , exploitation of raw materials, energy production (especially wind energy) and marine scientific research; all of which take place within a geographically limited marine area which also harbour important bioresources and nature values.

After major efforts in terms of surveys and research to identify marine sites of high nature value and potential conflict areas with reference to other activities and developments, including wind farms, the German Cabinet approved Europe's first maritime spatial plan in September 2009. In this plan areas and zones for various activities and infrastructure have been identified, including sites designated for protection within the Natura 2000 network with reference to habitats, marine mammals and birds[117]*.*

A similar plan is in preparation for the German EEZ of the Baltic Sea.



[117] http://www.bsh.de/en/Marine_uses/Spatial_Planning_in_the_German_EEZ/index.jsp for further information about the work approach (with links to maps etc).

Locational mapping of offshore wind farms in Denmark

For Denmark, an offshore wind turbine action plan from 1997 was updated in 2007, within the framework of a long-term national energy policy with the goal to have a share of renewable energy covering at least 30% of the gross energy demand by 2025[118]. For wind energy, a proposal of 23 offshore wind farm locations (within 7 larger areas) with an installed capacity of 4,600 MW in total was proposed, corresponding to a total energy production of 18 TWh or just over 8% of the total energy consumption and 50% of the electricity consumption in Denmark.

Locations have been selected within the frame-work of strategic planning approach, taking into account, inter alia, wind conditions, nature values (incl. Natura 2000 designations), visibility, and grid connections. The map below illustrates the proposal of 23 wind farm locations in the Danish EEZ, taking into account various kinds of planning constraints (incl. bird sanctuaries, Ramsar areas and habitat areas) within a strategic planning approach[119].

[118] Future Offshore Wind Power Sites – 2025, submitted by The Committee for Future Offshore Wind Power Sites under The Danish Energy Authority, April 2007; http://www.ens.dk/graphics/Publikationer/Havvindmoeller/Fremtidens_%20havvindm_UKsummery_aug07.pdf.

5 . STEP-BY-STEP PROCEDURE FOR WIND FARM DEVELOPMENTS AFFECTING NATURA 2000 SITES

- *Paragraphs 3 and 4 of Article 6 of the Habitats Directive set out a series of procedural and substantive safeguards that must be applied to plans and projects that are likely to have a significant effect on a Natura 2000 site.*
- *The first step is to determine whether a plan or project should undergo an Appropriate Assesment (AA). If it cannot be excluded that there will be a significant effect upon a Natura 2000 site then an Appropriate Assessment must be undertaken.*
- *The purpose of the AA is to assess the implications of the plan or project in respect of the site's conservation objectives, individually or in combination with other plans or projects. The conclusions should enable the competent authorities to ascertain whether or not the plan or project would adversely affect the integrity of the site concerned.*
- *The Appropriate Assessment should focus on the species and habitats that have justified the site's designation as a Natura 2000 site and should also consider all the elements that are essential to the functioning and the structure of that site. The appraisal of effects must be based on objective information.*
- *The outcome of the AA is legally binding. If it cannot be ascertained that there will be no adverse effects on the integrity of the Natura 2000 sites, even after the introduction of mitigation measures or conditions in the development permit, then the plan or project cannot be approved unless the conditions of Article 6 (4) are met.*

5.1 Introduction

The previous chapter outlined the benefits of strategic and proactive planning as a means of avoiding potential impacts of wind farm developments on nature and wildlife at an early stage in the planning process, for instance through the appropriate siting of wind farm developments away from areas of potential conflict with wildlife and nature.

The present chapter looks specifically at what happens when Natura 2000 sites are likely to be affected either at the planning level or at the individual project level. It provides guidance on the procedures to follow in accordance with Article 6(3)-(4) of the Habitats Directive and offers practical advice on how to apply these requirements in the case of wind farm developments in particular.

The chapter is based largely on the guidance that already exists on article 6 of the Habitats Directive. It is strongly recommended that the following three guidance documents are read in conjunction with the present document[120]:

- Managing Natura 2000 sites: the provision of Article 6 of the 'Habitats' Directive 92/43/EEC
- Assessment of plans and projects significantly affecting Natura 2000 sites: methodological guidance on the provisions of Article 6(3) and (4) of the Habitats Directive 92/43/EEC.

[120] available at http://ec.europa.eu/environment/nature/natura2000/management/guidance_en.htm

- Guidance document on Article 6(4) of the Habitats Directive 92/43/EEC: clarification of the concepts of alternative solutions, imperative reasons of overriding public interest, compensatory measures, overall coherence, Opinion of the Commission.

Because Natura 2000 concerns Europe's most valuable and endangered habitat types and species, it is only logical that the procedures for approving such developments are sufficiently rigorous to avoid undermining the overall objectives of the Birds and Habitats Directives – that of safeguarding Europe's most vulnerable wildlife and nature.

Particular attention is therefore given to the need for decisions to be taken on the basis of sound scientific information and expertise. Delays during the decision making process are often caused by the lack of information or poor quality assessments that do not allow the competent authorities to make a clear judgement on the potential impacts of the proposed plan or project.

As explained in chapter 3, the assessments must cover not only the impacts related to the wind turbines but the whole wind farm development including associated infrastructures and installations such as access roads, site access (e.g. for maintenance works or during constuction), anemometer masts, construction compounds, concrete foundations, temporary contractors facilities, electrical cabling (e.g. overhead wires) for access to the grid, spoils, and/or possible a sub-station, control building etc.

5.2 Article 6 of the Habitats Directive : a step-by-step approach

Article 6 of the Habitats Directive is one of the most important articles in the Directive as it determines the relationship between conservation and land-use. Paragraphs (3) and (4) set out a series of procedural and substantive safeguards that must be applied to plans and projects that are likely to have a significant effect on a Natura 2000 site. The proposed development does not have to be located within the Natura 2000 site in order to trigger the need for an AA as plans and projects outwith the site may also carry the likelihood of adverse effects.

ARTICLE 6 (3) and (4) OF THE HABITATS DIRECTIVE

- *6(3). Any plan or project not directly connected with or necessary to the management of the site but likely to have a significant effect thereon, either individually or in combination with other plans or projects, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. In the light of the conclusions of the assessment of the implications for the site and subject to the provisions of paragraph 4, the competent national authorities shall agree to the plan or project only after having ascertained that it will not adversely affect the integrity of the site concerned and, if appropriate, after having obtained the opinion of the general public.*
- *6(4). If, in spite of a negative assessment of the implications for the site and in the absence of alternative solutions, a plan or project must nevertheless be carried out for imperative reasons of overriding public interest, including those of a social or economic nature, the Member State shall take all compensatory measures necessary to ensure that the overall coherence of Natura 2000 is protected. It shall inform the Commission of the compensatory measures adopted.*
- *Where the site concerned hosts a priority natural habitat type and/or a priority species, the only considerations which may be raised are those relating to human health or public safety, to beneficial consequences of primary importance for the environment or, further to an opinion from the Commission, to other imperative reasons of overriding public interest.*

This Article 6 procedure is designed to:

- Fully assess the impacts of plans or projects that are likely to have a significant negative effect on a Natura 2000 site by means of an Appropriate Assessment;
- Ascertain through the Appropriate Assessment, whether the impact will adversely affect the intergrity of the site and, if this is the case, whether the plan of project can still be approved if certain mitigation measures or planning conditions have been introduced that remove or minimise the adverse effects on the site to a non-significant level;
- Provide a mechanism for approving, in exceptional circumstances, plans or projects that have an adverse effect on a Natura 2000 site even after the introduction of mitigation measures when these plans or projects are considered to be of imperative overiding public interest but where no suitable alternative solutions exist (cf Art 6.4)

The procedures laid out in Article 6(3) and 6(4) is best carried out in stages. Every stage determines whether a further step in the process is required. For instance if, after stage one, it is concluded that there will be no significant effects on the Natura 2000 site, then the plan or project can be approved without the need for further assessment:

- **Stage one: Screening** – this initial evaluation is intended to determine whether a plan or project has to undergo an Appropriate Assessment. If it cannot be excluded, on the basis of objective information, that there will be significant negative effects upon a Natura 2000 site, then an Appropriate Assessment should be undertaken.

- **Stage two: Appropriate Assessment** – once it has been decided that an Appropriate Assessment is required, detailed information should be gathered on the site's ecological features and conservation objectives, and on the potential impacts of the plan or project on these conservation objectives. This will enable an assessment to be made on whether or not the plan or project, alone, or in combination with other plans or projects, will have an adverse impact on the integrity of the Natura 2000 site. The burden of proof is on demonstrating that there will be no adverse affects on the integrity of the site.

  In practice, the Appropriate Assessment is often an iterative process, allowing for improvements to the plan or project in order to avoid adverse effects on the integrity of the Natura 2000 site. Thus, depending on the assessment's findings, the authorities should consider if mitigation measures can be introduced or whether restrictions should be applied to the permit in order to avoid or reduce the effects to a non significant level.

  The authorities will also have to examine viable alternatives to the plan or project. But at the end of the day, the plan or project can only be authorised if it has been demonstrated that there is no adverse effect on the integrity of the site. If these cannot be ruled out, then the authorities must refuse its authorisation or apply the derogation test (Stage 3) under Article 6.4.

- **Stage three: derogation procedure in the absence of alternative solutions and for imperative reasons of overriding public interest:** If no alternative solutions exist and the adverse effects cannot be removed through mitigation, then, in exceptional cases, the authorities can decide if the plan or project should still be allowed to proceed on the grounds of imperative reasons of overriding public interest (IROPI). If so, then appropriate compensation measures must be identified and implemented to ensure that the overall coherence of Natura 2000 is protected.

The following flow chart (figure 11) demonstrates how these stages are applied and how decisions are reached on the authorisation or rejection of a plan or project.

Figure 11 :Flow chart of Article 6(3) and (4) procedure (based on Commission Art 6 methodological guide

It is clear from the above that this decision-making process is underpinned by the precautionary principle. The emphasis should be on objectively demonstrating, with reliable supporting evidence, that there will be no adverse effects on the Natura 2000 site. For this reason, the lack of scientific data or information on the potential risk or significance of impacts cannot be a reason to proceed with the plan or project.

Subsequent sections examine each of the stages in turn and provide advice on how they should be carried out in the context of wind farm developments in particular.

STAGE 1: SCREENING

5.3 When is an Appropriate Assessment needed ?

The first step is designed to determine whether or not an Appropriate Assessment is actually needed. If it can be determined with certainty that the plan or project is not likely to have a significant effect, either individually or in combination with other plans or projects, then the plan or project can be approved without further assessment.

If there is any doubt, then an Appropriate Assessment will need to be undertaken so that these potential effects are studied in full before a decision is taken on whether to approve the plan or project. It is ultimately for the competent authority to decide, in the light of screening, whether or not an AA is required.

Screening is required for :

- Both *plans* that serve as a framework for development consents and individual *projects*. This ensures that the potential impacts on Natura 2000 are taken into account at both the strategic planning level and at the level of each individual project[121].
- Plans or projects affecting sites classified under the *Birds Directive* and sites designated or proposed to be designated under the *Habitats Directive.* They are both part of the Natura 2000 network.[122]
- Plans or projects both *inside* and *outside* the Natura 2000 site if they are likely to have a significant effect on the Natura 2000 site. For instance, a wind farm development located outside a Natura 2000 site could still have a significant effect on certain species for which the site is designated (such as bats) because they cause the species to be displaced from their habitual breeding or foraging areas within the site.

[121] Case C-6/04: 20 October 2005

[122] **For Potential SPAs** (IBA) Article 6(3)-(4) is not applicable but Article 4(4) of the BD is applicable. Areas which have not been classified as SPAs but should have been so classified continue to fall under the regime governed by the first sentence of Article 4(4) of the Birds Directive. [Commission/France, Basses Corbières, C-374/98]

For potential pSCIs (eg marine sites): The MS are required to take protective measures that are appropriate, from the point of view of the Directive's conservation objective, for the purpose of safeguarding the relevant ecological interest which those sites have at national level. [Dragaggi, C-117/03. [Bund Naturschutz, C-244/05].

[122] Case C-98/03 paragraph 32: "…In its definition of measures to be subject to an assessment of the implications, the Directive does not distinguish between measures taken outside or inside a protected site."

[122] Case C-201/02 para.53: "….the decisions adopted by the competent authorities, whose effect is to permit the resumption of mining operations, comprise, as a whole, a 'development consent' within the meaning of Article 1(2) of that directive (85/337), so that the competent authorities are obliged, where appropriate, to carry out an assessment of the environmental effects of such operations…"

5.3.1 Gathering sufficient information

The screening exercise is carried out by the authority responsible for the adoption of the plans or approval/rejection of development applications. Most often they will seek the assistance of, and base their evaluation on, the information received from, the developers, environmental authorities or contracted experts.

The collaboration of other relevant authorities, especially those responsible for nature conservation, in the screening of plans and projects may also be crucial, as they can provide useful information which should be taken into account at this stage.

To carry out the screening exercise, sufficient information should be gathered on both the wind farm plan or project and on the Natura 2000 site(s) that might be affected. In the case of the plan or project, this information should include data on the location of the wind farm and associated infrastructures in relation to Natura 2000 site(s) in the area as well as details on the scale and design of the wind farms and its associated infrastructures. It should also include details of all activities that will be undertaken during each stage of the project's cycle – i.e. during the construction, operation and decommissioning /repowering phases.

As regards the Natura 2000 site, information should be gathered on the species and habitat types for which it has been designated, their conservation state and on the overall conservation objectives of the site. Part of this information can be found in the Natura 2000 Standard Data Forms or in the site designation or management plans where available.

It is worth recalling that the initial screening undertaken here is not the same as a full-scale Appropriate Assessment – it only requires sufficient information to be able to decide if there is likely to be a significant effect or not.

Natura 2000 Standard Data Form
The Standard Data Forms which have been compiled for each site contain information about the surface area, representativity and conservation status of the habitats present in the site, as well as the global assessment of the value of the site for the conservation of the natural habitat types concerned. For the species present in the site, information is provided on their populations, status (resident, breeding, wintering, migratory) and on the site's value for the species in question.

Conservation status of habitats and species
According to the provisions of Article 17 of the Habitat Directive, the EU 25 Member States (i.e. excluding Romania and Bulgaria) reported, in 2008, on the conservation status of all the species and habitats listed in the annexes of the Habitats Directive which occur in their territory. On the basis of this, the Commission produced a consolidated report on the conservation status of each species and habitat type at a biogeographical and EU level. These reports provide useful contextual information[123]

Natura 2000 Management plans
Some sites have a Natura 2000 management plan with important elements such as the conservation objectives for the site, the species and habitats, theirs status, threats, etc, which can be useful for the screening stage and for the Appropriate Assessment.

[123] *All reports are available at: http://biodiversity.eionet.europa.eu/article17 and http://ec.europa.eu/environment/nature/knowledge /rep_habitats/index_en.htm*

Pre-screening by developers: preparing the ground for a smoother decision making process

It is strongly recommended that developers already gather information on the Natura 2000 sites before starting to design their plan or project (i.e. even before the screening stage) so that they can be aware of the possible sensitivities regarding nature and wildlife and can take these into consideration during the preparation of their development proposal. This could, for instance, influence the choice of location for the wind farm as well as its actual design so that only the most appropriate sites are taken forward.

It is also very useful, at an early pre-screening stage, for developers to hold initial discussions with their planning authority and with the statutory nature conservation authorities to learn more about the potential environmental constraints the project might face and how these might be best avoided. This could also help to identify any potential issues to watch out for or any gaps in scientific knowledge that might need further investigation before the plan or project is approved. Experience has shown time and again that good research and consultation right from the start before work begins on the development proposal helps to avoid unnecessary time and expense on unsuitable sites later on.[124]

5.3.2 Determining if there is a 'significant effect'

Every plan or project that could potentially affect a Natura 2000 site(s) should initially be considered as a candidate for Appropriate Assessment. But an Appropriate Assessment will only be required for those that are '….*likely to have a significant effect ..'*.

When doing this initial evaluation it is important to recall that the emphasis is on there being a 'likelihood' of potentially significant effects – not a certitude. This shows the precautionary nature of this initial test. If there is any doubt over whether the effects are likely to be significant or not then an Appropriate Assessment must be undertaken to ensure that these potential effects can be studied in full.

The 'likelihood' of potentially significant effects should be considered in the light of the conservation objectives, the characteristics and the specific environmental conditions of the site. Plans or projects likely to undermine the site's conservation objectives must be considered likely to have a significant effect on that site.

Likely effects
Likely effects on the site should first be identified at this stage. The biodiversity elements liable to be affected (habitats, species, ecological processes) should be determined, taking into account their sensitivity in relation to the planned activities. Risks of effects must be identified using a precautionary approach. Where preliminary scientific evaluation indicates that there are reasonable grounds for concern as to the absence of significant effects, an appropriate assessment has to be carried out.

Significant effect
The significant nature of the effects on a site of a plan or project not directly connected with or necessary to the management of the site is linked to the site's conservation objectives. So, where such a plan or project has an effect on that site but is not likely to undermine its conservation objectives, it cannot be considered likely to have a significant effect on the site concerned. Conversely, where such a plan or project is likely to undermine the conservation objectives of the site concerned, it must necessarily be considered likely to have a significant effect on the site. In assessing the potential effects of a plan or project, their significance must be established in the light, inter alia, of the characteristics and specific environmental conditions of the site concerned by that plan or project (Case C-127/02 para. 46-48).

[124] European Best Practice Guidelines for wind energy development, EWEA 2002. Available from http://ec.europa.eu/energy/renewables/studies/wind_energy_en.htm

5.3.3 Looking at potential cumulative effects

The screening process also applies to plans or projects *in combination with other plans or projects*. It may be that one wind farm project alone might not have a significant effect but, if taken in combination with other plans or projects (wind farm or other developments) within the area, the cumulative effects may turn out to be significant.

Other plans or projects to be considered in this case include those that have already been completed, those that are approved by the planning authorities, or those that are currently undergoing planning approval.

The geographical scale over which these cumulative effects need to be considered will depend on the exact circumstances and scale of the plan or project being studied but should cover a sufficiently large area to capture any cumulative effects that may arise with the project under assessment, having the transboundary aspect in mind, when relevant. Again, the relevant nature conservation authorities will be able to help identify the possible plans or projects that need to be considered as part of the in-combination test.[125]

5.3.4 Recording the screening decision

Finally, as screening is a legal requirement, the reasons for the final decision as to whether or not to carry out an Appropriate Assessment should be recorded and sufficient information should be given to justify the conclusion. Given that the nature protection assessments often run in parallel with the EIA/SEA procedures, common information procedures to the public should be envisaged.

Key questions to be considered at the stage of screening:

- Identify the geographical scope of the plan or project, and its main characteristics
- Identify all Natura 2000 sites that might be affected by the plan or project.
- Identify the qualifying interests of the Natura 2000 sites concerned (i.e. the habitats and species for which the sites are designated) and the sites' conservation objectives.
- Determine which of those species and habitats could be significantly affected by the planned activities.
- Analyse other plans or projects which could, in-combination with the planned activities, give rise to a likely significant effect on Natura 2000 sites
- Analyse the possible interactions between the plan or project activities, either individually or in combination with other plans or projects, and the qualifying interests, the ecological functions and processes that support them.

[125] A possible (but still preliminary) approach to assessing the cumulative effect of onshore wind farms has been proposed by The Scottish Natural Heritage (SNH 2009b).

STAGE 2: CARRYING OUT THE APPROPRIATE ASSESSMENT

5.4. Purpose of Appropriate Assessment

The purpose of the Appropriate Assessment is to assess the implications of the plan or project in respect of the *site's conservation objectives*, individually or in combination with other plans or projects. The conclusions should enable the competent authorities to ascertain whether or not the plan or project would adversely affect the integrity of the site concerned.

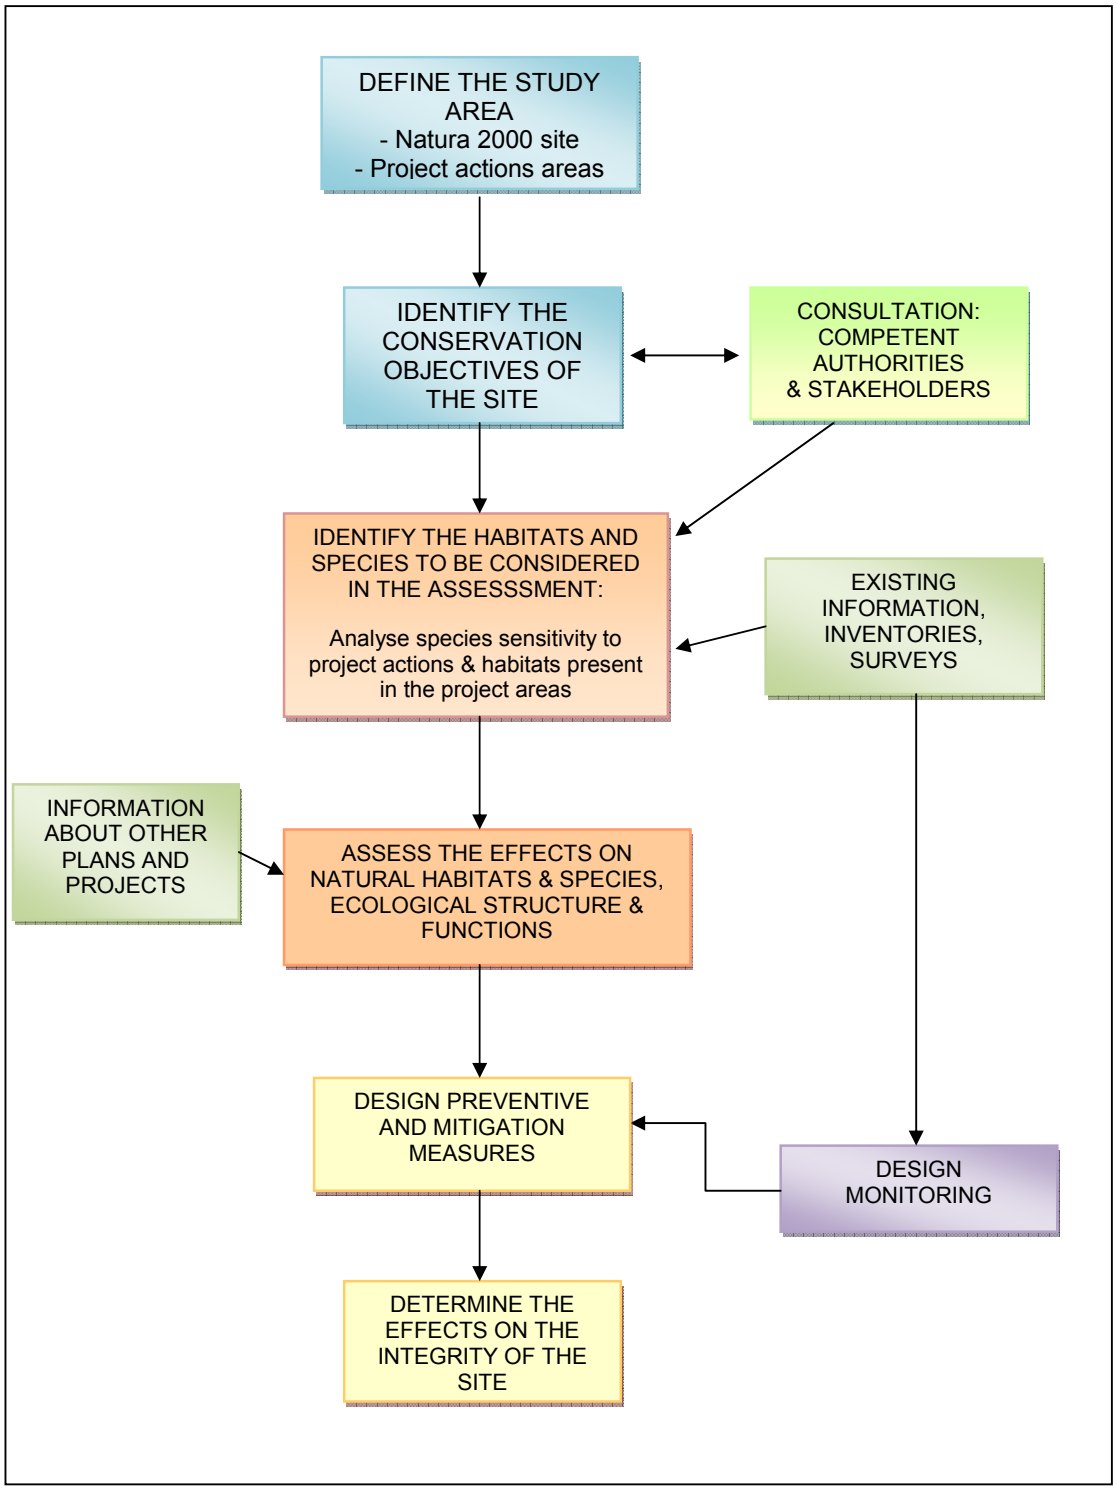
The Appropriate Assessment must be undertaken before the competent authority decides whether or not to undertake or authorise the plan or project. The EU Court of Justice has confirmed that as regards the concept of 'appropriate assessment' within the meaning of Article 6(3) of the Habitats Directive, the provision does not define any particular method for carrying out such an assessment. Nonetheless, according to the wording of that provision, an appropriate assessment of the implications for the site concerned of the plan or project must precede its approval [126].

In summary, the term 'appropriate' essentially means that the assessment needs to be appropriate to its purpose under the Habitats and Birds Directives – ie that of conserving rare and endangered species and habitat types of European interest. 'Appropriate' also means that the assessment has to be a *reasoned* decision. If the record of the assessment does not disclose the reasoned basis for the subsequent decision, then the assessment does not fulfil its purpose and cannot be considered 'appropriate'.

In this respect, it is important to recall that, in contrast to the EIA or SEA, the outcome of the Appropriate Assessment is legally binding for the competent authority and conditions its final decision[127]. Thus, if it cannot be ascertained that there will be no adverse effects on the integrity of the Natura 2000 site, even after the introduction of mitigation measures, then the plan or project cannot be approved, unless the conditions of Article 6(4) are met.

The lack of information or data cannot be used as a reason for approving a plan or project. The EU Court of Justice confirmed this position in the Waddensea case (C-127/02) where it stated that '*such an (appropriate) assessment of the implications implies that, prior to the approval of the plan or project, all the aspects of the plan or project which can, by themselves or in combination with other plans or projects, affect the site's conservation objectives must be identified in the light of the best scientific knowledge in the field.*'

5.5 Steps for an Appropriate Assessment of wind farm plans and projects



There are several basic steps to follow when carrying out an Appropriate Assessment. These are illustrated in the figure 12.

The focus of the Appropriate Assessment should be specifically on the species and/or habitat types for which the site is designated Natura 2000, and on the possible effects of the plan or project on them. This should also include any indirect effects on these species and/or habitat types, for instance on their supporting ecosystems and natural processes.

[126] C-127/02, paragraphs 52-53.

[127] See chapter 2 for details on the relationship between SEA, EIA and AA

Figure 12: Steps to be undertaken as part of the appropriate assessment

5.5.1. Setting the baseline and gathering further information

It is important to ensure that the Appropriate Assessment is well focussed and provides clear terms of reference for evaluating the potentially negative effects of the wind energy project on the Natura 2000 site(s). This means identifying more precisely what impacts the Appropriate Assessment should cover and to ensure that all necessary information is gathered to enable these impacts to be assessed correctly.

This builds on the information already gathered under the screening exercise but, this time, any gaps in knowledge should also be filled as far as possible so that the assessment can be made on sound scientific grounds. Sound baseline data is of vital importance as the Appropriate Assessment has to be able to ascertain with certainty that the proposal will not affect the integrity of the site concerned. **If there is some degree of doubt, the competent authorities may require further field work to be carried out or may refuse the project as it stands on the grounds of uncertainty over the impacts**.

At this stage it is also useful to define the study area bearing in mind that the potentially negative effects may be felt over a wider area than the immediate location of the wind turbines. It may for instance be useful to start with a 1km radius and then to adjust this to make the study area larger or smaller in function of the species and habitat types likely to be affected.

Information gathering during scoping

The **information about the plan or project** should contain details of all elements that are relevant for the assessment. They should include at least the folllowing:

- Detailed maps of precise location of the wind turbines and the associated infrastructures in relation to the Natura 2000 site(s) in the given area;
- The scale and design of the wind farm, e.g. the number and size of wind turbines, their layout and design, etc..
- Similar details for all associated infrastructures;
- Activities foreseen during construction works and their duration / timing;
- Activities foreseen during operation and management;
- Provisions for repowering and decommissioning;
- Details of any other plans or projects in the area that could, if taken in combination with this plan or project have a significant cumulative effect on the Natura 2000 site

The **information about the Natura 2000 site** should contain at least the following:

- Details on each species and habitat type for which the site is designated and ecological maps of their location within and around the site over time (eg over an annual lifecycle);
- Data on their overall usage of the site for activities such as foraging, breeding, resting, staging or hibernating;
- Data on their representativity and conservation status both within that site and within the area in general (including, inter alia, data on population size, degree of isolation; ecotype, genetic pool; age class structure..);
- Data on ecological structure and functioning of the site and its overall conservation state;
- Details of the conservation objectives of the site (incl any management plans etc);
- The role of the site within the biogeographical region[128] and the Natura 2000 network;
- Any other aspects of the site or its wildlife that is likely to have an influence on its conservation state and objectives (eg current management activities, other developments..)

[128] The lists of Sites of Community Importance (SCI) within the Natura 2000 network, are adopted by biogeographical region. For further information and links to maps go to http://ec.europa.eu/environment/nature/natura2000/db_gis/index_en.htm

Once again, in addition to requesting the developer to provide any relevant assessments, impact studies and surveys etc… that may be reasonably required of them, it is strongly recommended that the competent authorities also consult with, and seek the advice and guidance of, the relevant nature authorities, as early as possible during the scoping stage. They will be able to provide details about the Natura 2000 site and its conservation objectives. They can also provide scientific advice on the likely ecological effects that a wind energy project could have on the site.

Other bodies such as conservation NGOs, research institutions or local stakeholder groups can also be contacted to help provide further local knowledge and ecological information. Consulting these organisations already during the scoping exercise will help ensure that as complete a picture as possible is built up about the site, the species/habitats present and the potential impacts of the plan or project on these. It can also lead to a smoother decision making process if all interest groups are collaborating from the start in finding solutions that are acceptable to all.

Information gathering is necessarily an iterative process. If the first identification and analysis of effects reveals that there are important gaps in knowledge, then further surveys and monitoring work will need to be undertaken in order to complete the picture. This will ensure there is a sufficient basis of scientific knowledge to be able to make a reasoned decision.

Experience has shown that many of the delays or problems encountered during the Appropriate Assessment are caused by the fact that the information gathered for the Appropriate Assessment is incomplete or deficient. As a result, the authorities are unable to confirm that there be no adverse effects on the integrity of the site and the whole assessment process has to be put on hold whilst the missing information is being gathered.

Fictitious example of further information requirements identified during scoping.

Wind farm project with twelve turbines on edge of a woodland			
1. Possible likely significant effect	**Collision mortality**	**Disturbance and displacement**	**Habitat loss and degradation**
2. Information about species and habitats at the Natura 2000 site	Ecological data on the bat and bird species of European interest and at potential risk at the site.	Data on habitat requirements for species of European interest and at potential risk at the site.	Location of key habitats in or around the site.
3. Potential impacts to be assessed	Collision mortality rates during different parts of the species life cycle, e.g. during breeding or migration periods	Habitat usage across the site	Location of core roosting, breeding or foraging sites, and location of movement routes between these.
4. Data needed for these assessments	Field data over at least one annual cycle, for risk assessments, using modeling or sensitivity indices.	Field data on local dispersal patterns inside and around the site over at least one annual cycle.	

5.5.2. Assessing the impacts on the Natura 2000 site

The Appropriate Assessment itself involves looking at all the aspects of the plan or project that could cause a significant effect on the Natura 2000 site. In this context, each element of the project (wind turbines, other constructions etc..as well as effects during construction, maintenance and operation etc…) should be examined in turn and the potential effects of that element should be considered in relation to each of the species or habitat types of European interest for which the site has been designated Natura 2000 site. This is because each species has different conservation requirements. Also, the impacts on one species may vary from one site to another depending on its conservation state and the underlying ecological conditions of the site.

For example, a wind farm project proposes to locate 10 wind turbines in a degraded grassland away from any bird or bat interest within the Natura 2000 site but also proposes to construct an access road to the wind turbine site that will run across rare habitat types such as blanket bogs and natural forests. In such a case, the wind turbines themselves may be unlikely to cause any significant impact but the access road probably will, and so the effects of both operations should be examined in detail in light of the site's conservation objectives.

Thereafter, the effects of the different features within the plan or proposal should be looked at together, and in relation to each other, so that the interactions between them can be identified. For instance, it may be that the risk of collision mortality with the wind turbines alone is not likely to be significant but if it is taken in combination with the installation of overhead cables, which could also cause collision mortality, then the effects could become significant.

If there are several Natura 2000 sites that could be affected, as in the case of a development plan for instance, the impacts on each should also be studied seperately at first as they may have been designated for different species or habitat types and may have different conservation objectives.

Conservation objectives of Natura 2000 sites

The conservation objectives for a Natura 2000 site are determined at member state level.

The Natura 2000 Standard Data Forms (SDF), which have been compiled for each designated site, contain information about the habitats (e.g. surface area, representativity and conservation status) and the species (populations, status) and the value of the site for the habitats/species for which the site has been designated. The SDF therefore provides information regarding the qualifying interests of a Natura 2000 site and, in the absence of more detailed definition of conservation objectives for a atura 2000 site, they can be considered as such. Some countries have developed more detailed conservation objectives for their Natura 2000 sites either at a strategic level across a suite of sites, or at an individual site level. Some sites may also have management plans or management objectives that provide clear indications about the conservation objectives to be attained.

The Habitats Directive (Article 4.4) requires that once a site of Community importance (SCI) has been adopted, the Member State concerned shall designate that site as a Special Area of Conservation (SAC) as soon as possible and within six years at most and apply the necessary conservation measures for the maintenance or restoration of the habitat and species for which the site has been designed to a favourable conservation status. These measures should also be taken into account as part of the Appropriate Assessment as they show how the site's conservation objectives will be translated into practical actions.

Whilst the focus should be on the species and habitats of Community interest that have justified the site designation (the qualifying interests of the site), it should not be forgotten that these qualifying interests also interact with other species and habitats in complex ways. It is therefore important to consider all the elements that are essential to the functions and the structure of the site, its qualifying interests and its conservation objectives. Furthermore, other species can also be relevant for determining potential effects on protected habitats if they constitute typical species of the habitat in question.

The assessment should be based on the best available scientific knowledge of the following main elements as they relate to the qualifying interests of the site (EC 2007b):

- Structure and function, and the respective role of the site's ecological assets.
- Area, representativity and conservation status of priority and non-priority habitats in the site.
- Population size, degree of isolation, ecotype, genetic pool, age class structure, and conservation status of species under Annex II of the Habitats Directive, Annex I of the Birds Directive, and regularly occurring migratory species not listed in Annex I Birds Directive present in the site.
- Role of the site within the biogeographical region and in the coherence of the Natura 2000 network.Any other ecological assets and functions that are essential for meeting the site's conservation objectives.

The following boxes provide an overview of possible survey methods that have been used to identify and assess the likely effects of wind farms. These are based on a review of existing good practices and may therefore provide useful ideas and suggestions for future development proposals.

When field surveys are required a distinction should be made between those that are carried out before a decision is taken on the plan or project and those that involving longer term monitoring as a condition in the planning application – for instance to confirm the effects predicted in the AA/EIA or to monitor the effectiveness of the mitigation measures (which may be consideration so that adaptive mitigation can be applied). Baseline surverys which are necessary for the EIA/AA should be broader in scope in order to characterise the area for all species and habitats to enable a valid assessment to be made of the impacts and their significance.

Good practice methodologies for survey work on the likely effects of wind

The Appropriate Assessment will need to be based on sound scientific and objectively verifiable information. This can sometimes require additional survey work to be carred out before the plan or project is approved. The following section provides a series of possible methodologies for carrying out further surveys on the likely effects of wind farms on species of European interest. They are derived from a range of sources and are indicative of the kind of information that may need to be gathered for onshore or offshore wind farms.

There are no legal stipulations about the length or extent of the pre-construction surveys, this has to be decided case-by-case. However, some indications can be given on the basis of existing experience and knowledge. For onshore locations, a 2 year ornithological baseline survey for wind farm projects may be required[129] and for bats it should cover a full annual cycle (including maternity and hibernating seasons as well as spring and autumn migration[130]).

[129] In UK, cf DEFRA personal communication

[130] Rodrigues et al. (2008) for the elements to be included in a monitoring programme for bats.

For offshore wind farms, year around studies over a period of 1-2 years have been recommended for marine mammals[131] and a 2 year period is recommended for birds due to the general paucity of existing data in these environments.

Field surveys have also to be designed to provide data that can be used for reliable and robust statistical analyses for comparisons, for instance, between before and after construction, between sites, or between a wind farm site and a reference area with similar environmental characteristics as regards habitats or climate for instance

A non-exhaustive overview of the most common techniques used so far is given in the following table. They include a mixture of techniques based on direct visual observation (e.g. birds and bats), sampling methods (e.g. for marine fish and benthic fauna) and remote techniques such as radar and sonar. It has to be kept in mind, however, that as the understanding of the potential impacts improves, the recommended methodologies may change.

Visual observations are frequently used for studying bird abundance and distribution in zones around proposed wind farm locations in order to investigate potential displacement effects[132]. Recordings of flight movement, e.g. along frequently used migration corridors for birds or bats, is a common monitoring technique for collecting data needed for assessing collision risks and potential barrier effects. For studies of potential displacement effects by birds around onshore locations, traditional territory mapping and line transect counts are useful tools[133]. Offshore, ship-based surveys are generally better for species identification and behavioural observations, while aerial surveys have the advantage of enabling relatively rapid coverage of large sea areas.

Records of flight calls has been found to be a useful complement, both to visual observations and remote techniques, e.g. for species identification

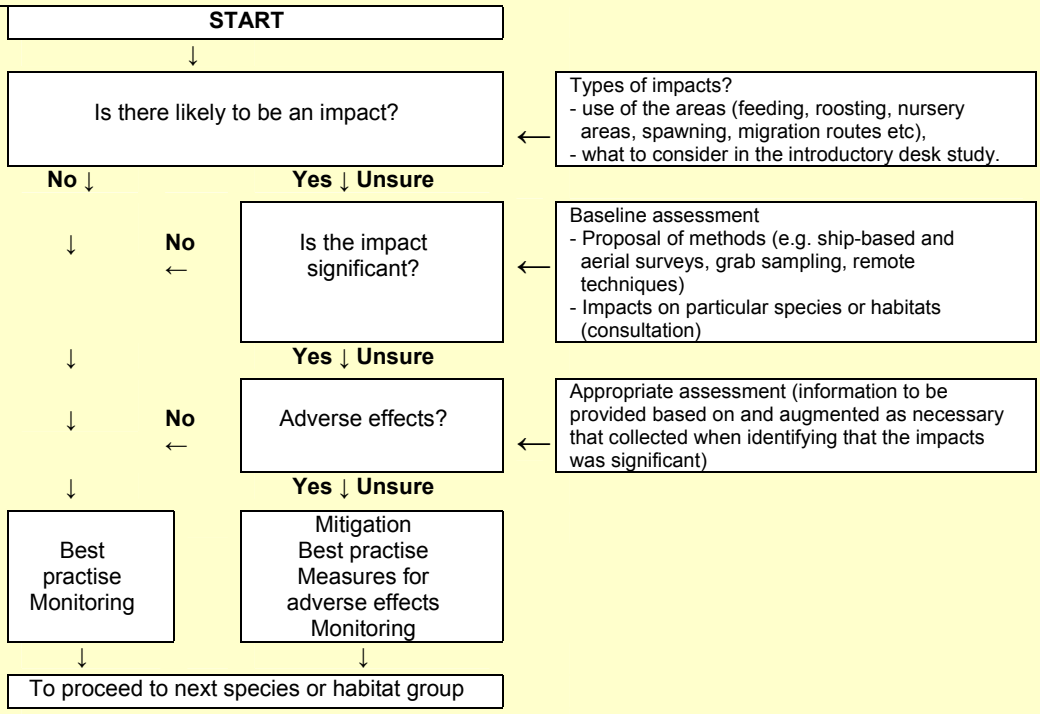
Carcass collection is included in many monitoring programmes for onshore locations. Although the method suffers from the obvious difficulty that carcasses can be overlooked or already removed by scavengers, it may still provide useful complementary and qualitative information about species killed by collision. Preferably, the search should be done in a standardised way that makes it possible to relate the number of findings to search effort, and (if needed) with correction factors for e.g. observer efficiency and scavenging rates[134]. For offshore locations, constructions of floating bunds and/or nets to retain corpses at wind farms have been considered but in most cases found to be impractical and not yielding reliable information[135].

Sampling of fish and marine fauna: Sampling methods such as trawling for fish and epifauna, and grab sampling for infauna are can be useful in combination with various remote techniques.

Remote techniques have been found to be very useful tools for collecting the data needed for impact assessments. Radar has a wide application and can be used to record movements (elevation as well direction) by birds and bats at night and in poor visibility. It is best used in combination with visual observations and/or records of flight calls to help with species identification etc. Thermal Animal Detection Systems (TADS) is a more recent, infra-red based technology with the potential to provide information about avoidance behaviour, flock size and flock altitude by birds and bats in close proximity to the rotor blades[136]. High Definition Video Surveys is an airplane-based technique for surveys of birds in marine environments, still under development[137]. Microphones for automatic registration of flight calls may also be a useful complement to species identification as well as quantitative estimates[138]. Hand-held or automatic bat detectors are necessary tools if the occurrence of bats is a key element in the surveillance programme.

[131] E.g. Diederichs et al. (2008) and primarily with reference to Harbour Porpoise (*Phocoena phocoena*).
[132] E.g Petersen et al. (2006), see also BSH (2007) and DEFRA (2005) for detailed descriptions.
[133] Useful references in SNH (2005b).
[134] E.g. Morrison et al. (2007).
[135] E.g. Desholm et al. (2006).
[136] E.g. Desholm et al. (2006) and Hüppop et al. (2006), and references in these publications. See also Kunz et al. (2007b) for an overview of various remote techniques for surveillance of nocturnally active birds and bats.
[137] E.g. Mellor & Maher (2008).
[138] E.g. Hüppop et al. (2006).

For marine environments, a large variety of techniques can be applied. For surveys of marine mammals, click detectors and towed hydrophones have been applied. "Passive Acoustic Monitoring" (PAM) systems, like T-Pods for surveys of whales and dolphins have been on the market for many years, and more advanced technologies, such as C-pods, are under development. Visual methods such as ship-based or aircraft surveys are useful complementary methods. – Remotely Operated Video (ROV) techniques are used for monitoring sediment characteristics and marine epifauna. For sediment processes hydro-acoustical techniques such as side scan sonar can be applied.



Study method	Disturbance & displacement - onshore	Disturbance & distancing - offshore	Collision	Barrier effect	Change in habitat structure

UK guidelines for assessing impacts on Natura 2000 sites of offshore wind farm development.

Guidelines and standards for EIAs and assessments of impacts on Natura 2000 sites, in accordance with Article 6 of the EU Habitats Directive, have been prepared by many Member States[139]. They differ in approach and degree of details, from outlines of the administrative procedures[140] to proposals of more detailed lines of action and appropriate methodology[141]. The approach proposed by the United Kingdom Department for Environment, Food and Rural Affairs[142] for assessments of impacts on marine Natura 2000 sites of offshore wind farm development has a wider application potential, also with reference to onshore locations and for other groups of species and habitats than the ones mentioned below.

The assessments are proposed to be done stepwise for various groups of species and habitats, e.g. as follows (flowchart below):
- Birds
- Marine mammals
- Fish and shellfish
- Subtidal benthos
- Intertidal benthos
- Terrestrial and coastal habitats
- Coastal and sedimentary processes

The guidance document includes proposals about relevant methodology for the various groups of species and habitats, with references to further studies and more detailed information. It is to be considered as a working document and it will be revised as the understanding of issues develops and new information becomes available.

[139] A selection of national guidelines are listed in Annex VI.
[140] E.g. the brief Swedish guidelines, "Vindkraft – tillståndsprocessen och kunskapsläget" (2007), edited by the Swedish Energy Agency.
[141] E.g. BSH (2007) for offshore wind farms in Germany, Scottish Natural Heritage (SNH 2005b) with reference to impacts birds of onshore wind farms and DEFRA (2005) for offshore wind farms in UK.
[142] DEFRA (2005).

Once all the information needed to make a reasoned assessment of impacts has been collated, the next stage of the Appropriate Assessment can begin in earnest: that of identifying the likely effects of the wind farm development proposal on the site's integrity in light of its conservation objectives.

This impact assessment has to be made in light of:
- the best scientific knowledge in the field (ECJ Waddensea ruling – see above)
- the Natura 2000 site's conservation objectives, as defined in the relevant national legislative framework and
  the potential impact on the site's integrity

Chapter 3 gives an overview of the kind of effects that are most frequently associated with wind farm developments and identifies the species or habitat types that have proven to be particularly vulnerable to this form of development. This provides a good starting point on what to look out for as it is based on current experiences and scientific studies.

But the effects of each project will be unique and must be evaluated on a case-by-case basis. According to the same ECJ Waddensea ruling (see above): *in assessing the potential effects of a plan or project, their significance must be established in the light, inter alia, of the characteristics and specific environmental conditions of the site concerned by that plan or project.*

Predicting the likely impacts can be difficult as one should have a good understanding of ecological processes and conservation requirements of particular species or habitat types types likely to be affected. It is therefore strongly recommended that the competent authorities secure the necessary expert advice and support in carrying out the impact assessment. As with all impact assessments, the Appropriate Assessment should be undertaken within a structured framework to ensure that the predictions can be made as objectively and accurately as possible.

For this purpose, impacts are often categorised into the following types:
- Direct and indirect effects;
- Short and long-term effects;
- Effects during different stages of the project (construction, operation, decommissioning..)
- Isolated and interactive effects
- Cumulative effects

For each effect identified, the *significance* of the impact will depend on:
- The magnitude of the impact
- The type of impact
- The extent
- Duration
- Intensity
- Timing
- Probability

Impacts should be predicted as precisely as possible, and the basis of these predictions should be made clear (this means also including some explanation of the degree of certainty in the prediction of effects). Wherever possible, predictions should be presented in such a way as to make them verifiable, as the outcomes of the tests can then be directly linked to a future monitoring programme (this may be one of the conditions placed in the planning permission – see below).

The impact assessment should also apply the best available techniques and methods to estimate the extent of the effects. Some of the techniques commonly used are listed in the following box.

Commonly used methods for predicting impacts:

- *Direct measurements*, for example of areas of habitat lost or affected, proportionate losses from species populations, habitats and communities.
- *Flow charts, networks and systems diagrams* to identify chains of impacts resulting from direct impacts; indirect impacts are termed secondary, tertiary, etc. impacts in line with how they are caused. Systems diagrams are more flexible than networks in illustrating interrelationships and process pathways.
- *Quantitative predictive models* to provide mathematically derived predictions based on data and assumptions about the force and direction of impacts. Models may extrapolate predictions that are consistent with past and present data (trend analysis, scenarios, analogies which transfer information from other relevant locations) and intuitive forecasting. Normative approaches to modelling work backwards from a desired outcome to assess whether the proposed project will achieve these aims.
- Population level studies: are potentially beneficial for determining population level effects of impacts to bird or bat or marine mammal species, for instance.
- *Geographical information systems (GIS)* used to produce models of spatial relationships, such as constraint overlays, or to map sensitive areas and locations of habitat loss. GIS are a combination of computerised cartography, storing map data, and a database-management system storing attributes such as land use or slope. GIS enable the variables stored to be displayed, combined, and analysed speedily.
- *Information from previous similar projects* may be useful, especially if quantitative predictions were made and have been monitored in operation.
- *Expert opinion and judgment* derived from previous experience and consultations on similar wind farms.
- *Description and correlation*: physical factors (water regime, noise) may be directly related to distribution and abundance of species. If future physical conditions can be predicted then it may be possible to predict future abundance on this basis.
- *Carrying capacity analysis* involves identifying the threshold of stress below which populations and ecosystem functions can be sustained. Carrying capacity analysis involves the identification of potentially limiting factors, and mathematical equations are developed to describe the capacity of the resource or system in terms of the threshold imposed by each limiting factor.
- *Ecosystem analysis* This approach aims to provide a broad regional perspective with a holistic framework. Three basic principles of ecosystem analysis are (i) taking the 'landscape level' view of ecosystems, (ii) use a suite of indicators including community level and ecosystem-level indices and (iii) taking into account the many interactions amongst ecological components which are involved in maintaining ecosystem function.

Adapted from: Assessment of plans and projects significantly affecting Natura 2000 sites. Methodological guidance on the provisions of Article 6(3) and (4) of the Habitats Directive 92/43/EEC; http://ec.europa.eu/environment/nature/natura2000/management/docs/art6/natura_2000_assess_en.pdf.

5.5.3. Assessing whether there are no adverse effects on site integrity

Once the potential effects of the plan or project have been predicted as accurately as possible, the Appropriate Assessment can move onto the next stage which is to determinine whether the impacts will adversely affect the integrity of the Natura 2000 site, either alone or in combination with other plans or projects.

Again, it is important to bear in mind that **the focus of the assessment should be on objectively demonstrating, with supporting evidence, that there will be no adverse effects on the integrity of the Natura 2000 site,** in light of its conservation objectives. Thus, the competent authority has to be sure that there is no reasonable scientific doubt. If the adverse effects cannot be ruled out or if there is too much scientific doubt, the adverse effects have to be assumed.

It is clear from the purpose of the Directive that the 'integrity of the site' relates directly to the site's conservation objectives. Determining whether the integrity of the site is affected means determining whether the plan or project will adversely affect the:

- the coherence of the site's ecological structure and function, across its entire area, or
- the habitats, complex of habitats and/or
- populations of species for which the site is designated.

The focus is also on the specific site. Thus, it is not possible to accept a plan or project with significant adverse effects on the grounds that the conservation status of the habitat types and species it hosts will anyway remain favourable within the Member State or the EU as a whole.

Integrity of the site

Biological integrity can be defined as all those factors that contribute to the maintenance of the ecosystem, including structural and functional assets. In the framework of the Habitats Directive, the "integrity"' of the site is linked to the conservation objectives for which the site was designated as part of the Natura 2000 Network (EC 2007b). It has been usually defined as "the coherence of the site's ecological structure and function, across its whole area, that enables it to sustain the habitat, complex of habitats and/or populations of species for which the site is classified" [143] *(EC 2000b, ODPM 2005). As regards the meaning of 'integrity', this can be considered as a quality or condition of being whole or complete. In a dynamic ecological context, it can also be considered as having the sense of resilience and ability to evolve in ways that are favourable to conservation. (EC 2000b).*

A site can be described as having a high degree of integrity where the inherent potential for meeting site conservation objectives is realised, the capacity of self-repair and self-renewal under dynamic conditions is maintained, and a minimum of external management is required. When looking at the "integrity of the site", it is therefore important to take into account a range of factors, including the possibility of effects manifesting themselves in the short, medium and long-term (EC 2000b).

Authorisation of a plan or project granted in accordance with Article 6(3) of the Habitats Directive necessarily assumes that it is considered not likely to adversely affect the integrity of the site concerned and, consequently, not likely to give rise to deterioration or significant disturbances within the meaning of Article 6(2) (ECJ ruling on case C-127/02 para. 36).

[143] PPG 9, UK Department of the Environment, October 1994 quoted on page 39 of the Commission's article 6 guide on "Managing Natura 2000 sites". The concept of 'integrity of the site' is further elaborated on page 79.

To sum up, there are two possible conclusions that can be drawn from this first impact assessment:
- there is no adverse effect and the project or plan can be approved as it stands;
- there will be adverse effects or adverse effects cannot be ruled out.

The latter does not necessarily mean that the plan or project is automatically refused. The competent authority could ask the developer to redesign or relocate the wind farm or introduce mitigation measures that would avoid or eliminate the predicted adverse effects. This would then normally imply a second evaluation round in the Appropriate Assessment to ensure that the mitigation measures/safegaurds are indeed sufficient. This is discussed further in the next section.

5.5.4. Considering how to mitigate adverse effects on the Natura 2000 site

For a wind energy project, the AA is the key tool for ensuring that adverse effects on the integrity of the sites concerned are prevented or mitigated during design of the project. Mitigation involves introducing measures into the plan or project to eliminate the potential negative effects on the conservation objectives of the Natura 2000 site, or to reduce them to a level where they will no longer adversely affect the integrity of the site. As such, they should be directly linked to the likely negative effects which have been identified during the impact assessment described above. The competent authority, upon the advice of its ecological experts or the relevant nature authorities, should determine the level of mitigation required.

It can then ask the developer/planner to propose suitable mitigation measures (e.g. changes to the siting, design, scale of the wind farm and its associated instrastructures) or it can set certain conditions or restrictions in the development permit as a pre-condition for approving the plan or project (eg as regards the timing of the construction works or restrictions on the operation of the wind turbines, for instance during peak dispersal and migraiton periods).

Either way each mitigation measure should be based on sound scientific principles that will ensure they will be effective. As such they should contain:
- details of the measure proposed and an explanation of how it will avoid or reduce the adverse impacts which have been identified;
- evidence of how they will be implemented and by whom;
- a timetable for implementation relative to the plan or project (some may need to be put in place before the development can proceed);
- details of how the measure will be monitored and how the results will be fed back into the day to day operation of the wind farm (adaptive management – see below).

This will enable the competent authority to evaluate the mitigation measures as part of the Appropriate Assessment (second round) and determine whether or not they are sufficient or suitable for eliminating or removing the adverse effects which have been identified (and do not inadvertently cause other adverse effects on the species and habitat types in question). If the mitigation measures are deemed sufficient, they will become an integral part of the specification of the plan or project.

In the case of wind farm plans or projects, the most obvious mitigation measure is to adjust the location of wind farm away from areas where it can cause conflicts with the species and habitat types for which the site has been designated (e.g. foraging paths, flyways, migration routes, vulnerable areas such as breeding sites or foraging area). Evidence to date shows that the inappropropriate siting of wind farms and their associated structures is one of the most frequent and common causes of impact.

But mitigation measures can also involve modifications to the size, design and the configuration of wind farms and to the construction of turbines and associated infrastructures. Or they can introduce temporal adjustments of activities during construction and operation.

The following box provides an overview of some of the mitigations that have been used in the case of wind farm developments in particular and which may provide useful ideas or suggestions for future developments.

Possible mitigation measures that have been used or proposed for wind farms so far

The list below provides an overview of possible mitigation measures that have been proposed or applied with reference to wind farms:

***Configuration of wind farms**:*
Wind farms should be carefully planned having regard to the flight paths of birds and bats in particular. It has been proposed that grouping turbines in rows that run parallel – instead of perpendicular - to the main flight direction of certain birds can be an effective mitigation measure.[144] In addition, locating turbines in blocks to create corridors can create safety zones through which birds can pass. Adjustments of the configuration of wind farms may also be considered when old turbines are replaced by new and larger ones.

***Construction of turbines and associated infrastructures**:*
A variety of technical adjustments to wind turbines have been proposed to reduce the collision risk. This concerns in particular the turbine's height and the rotor-sweep[145].

- Resting and perching places: In the past, wind turbines sometimes provided attractive perching sites for birds. Modern turbines should be designed to remove any possible perches. If this is not possible then various kinds of anti-perching devises should be introduced, such as enclosing the nacelles, avoiding lattice constructions and eliminating guy wires to support the turbines[146]. The junction between nacelle and tower should also be well sealed, and the nacelle closed, in order to avoid offering a roost for bats.
- Design of rotor blades: On the basis of theoretical modelling of collision risks among birds, it has been proposed that fewer rotor blades and low tip speed can lower collision risk[147], but there is some conflicting evidence whether turbines with a larger rotor-swept area may have similar or even smaller avian fatality than turbines with smaller rotor-swept areas.
- Increasing rotor visibility: Birds may be unable to see rotors when they get close (motion smear) and this phenomenon may at least partly explain collision even in times of good visibility[148]. Various tests whether increasing the visibility of rotors by painting high-contrast patterns (e.g. black and white bands) may help to reduce the collision risk have so far yielded mixed results, and the same applies for on-going test with UV-painted rotor blades[149].
- Using fewer but larger turbines: There are increasing evidence that fewer but larger and more power-efficent turbines may produce fewer collision risks for large-sized birds, while there is more concern with reference to bats[150].

[144] E.g. Drewitt & Langston (2006, 2008).
[145] But the evidence for this is still anecdotal and lacks adequate data, e.g. Johnson et al. (2007), Drewitt & Langston (2008).
[146] E.g. Johnson et al. (2007).
[147] Tucker (1996a, 1996b).
[148] E.g. Drewitt & Langston (2008) and references therein.
[149] E.g. Drewitt & Langston (2006). In addition, painting rotor-blades or turbines might be questionable due to landscape and visual effects.
[150] E.g. Hötker (2006), Barclay at al. (2007), Smallwood & Karas (2009).

Associated infrastructure

- Inter-array cable installations and grid infrastructure: Where possible, inter-array cables (e.g. between turbines and substations) should be buried underground while taking into account relevant considerations e.g. to habitat sensitivity.
- Lighting of wind farms: There is broad consensus that lighting of turbines is to be avoided to reduce the risk of fatalities, for onshore as well as offshore locations. If lighting cannot be avoided, e.g. for safety or navigation purposes, flashing white strobe light has been proposed to be less attractive for birds than e.g. solid or pulsating red light[151]. But these must still be in compliance with national and international regulations on health and aviation/shipping safety.
- Reduction of the electro-magnetic fields around cables from offshore turbines: Impact recommended to be reduced by choice of cable type, burial of at least 1 m and/or conversion to higher voltage[152].
- Appropriate choice of foundations for offshore locations[153]; to the extent possible as the choice of foundation is primarily related to the geological conditions.

Measures in order to reduce risks during construction period

- Timing of construction work: Certain risks are concentrated at critical times of the year, such as reproductive or moulting periods of marine mammals and breeding or migration periods for sensitive bird species. The first option for mitigation would be to avoid these sensitive periods altogether, and plan the construction to take place at other times of the year (eg in winter for hibernating bats). Appropriate seasons (time windows) should be identified in order to reduce disturbance at potentially sensitive life stages of species.

  This may not always be possible in particular for offshore projects where time windows for construction can already be quite limited for practical/safety reasons and therefore this needs to be analysed on a case-by-case basis. Many of these issues will be site-specific. The time periods in which construction work is recommended to be avoided depends on the affected species' main periods of foraging, resting and breeding. If this is not feasible then restrictions in construction work like temporary and short-term breaks, in order to reduce the reduced risk of collision fatalities or disturbance may need to be considered.
- Noise and vibration during construction work: In respect to offshore wind farms, and in order to minimise impact from noise and vibration on both fish and mammals, it is recommended to start pile driving gently to allow individuals to move away from the noise source (i.e. soft-start). This may be combined with the use of passive acoustic monitoring and marine mammal observers to minimise the risk of animals being in the area when piling commences. Other proposed methods, including specifically engineered solutions such as bubble curtains and piling cushions, are under development. "Scrammers" and "pingers" may provide additional deterrence to marine mammals entering the construction area.

Measures in order to avoid risks during operation

Similar considerations may also be required during the operation phase and on a more long-term basis to avoid risks during critical times of the year. For bats, many of the above proposed technical modifications may be inadequate, and shutting down turbines during critical periods of limited duration is so far a primary mitigation measure to reduce the risk fatalities, e.g. during migration periods in spring and autumn (especially August-October) or during periods of calm weather when insect prey are concentrated around turbines (and energy producing capacity might be low in any case)[154].

Temporary halting of the operation or reducing rotor speed may also be considered in order to avoid fatalities e.g. during peak migration periods or main display periods by birds, or disturbance during or spawning seasons by fish.

[151] E.g. Johnson et al. (2007).

[152] A conversation from 33 kV to 135 kV reduces the induced field by a factor of 4 (but may turn out to be unpractical in many cases; DEFRA 2005).

[153] E.g. Hammar et al. (2008) for comparisons between different types of foundations.

[154] E.g. Rodrigues et al. (2008), Ahlén et al. (2007), Baerwald et al. (2009).

5.5.5. Recording the results of the Appropriate Assessment

Once these mitigation measures and possible safeguards/conditions have been identified and assessed, the competent authority will finally be in a position to determine conclusively whether the plan or project can be approved or not, and if any conditions apply. Whatever the results, they should be clearly recorded. In this respect, the Appropriate Assessment report should be sufficiently detailed to demonstrate how the final decision was reached, and on what scientific grounds the decision was made.

This is confirmed by an ECJ ruling: *The appropriate assessment should contain complete, precise and definitive conclusions capable of removing all reasonable scientific doubt as to the effects of the works proposed on the site concerned*. (Commission/Italy, C-304/05).

The report should:

- describe the project or plan in sufficient detail for members of the public to understand its size, scale and objectives;
- describe the baseline conditions and conservation objectives of the Natura 2000 site;
- identify the adverse effects of the project or plan on the Natura 2000 site;
- explain how those effects will be avoided through mitigation;
- set out a timescale and identify the mechanisms through which the mitigation measures will be secured, implemented and monitored.

Following the Appropriate Assessment, and despite the application of mitigation measures, if the competent authority considers that adverse effects remain, then the project or plan may not proceed until the derogation test under Article 6.4 has been successfully completed and it has been objectively concluded that there is an absence of alternative solutions.

STAGE 3: DEROGATION PROCEDURE: ARTICLE 6.4

5.6 The derogation procedure of Article 6.4 of the Habitats Directive

5.6.1 The scheme of Article 6.4

If, on the basis of the Appropriate Assessment, it cannot be ascertained that a plan or project will not adversely affect the integrity of the site concerned, the plan/project should either be refused as it stands or the provisions of Art. 6(4) of the Habitats Directive should be applied. Article 6(4) is only applicable under the strict conditions and will only be passed in exceptional circumstances.

The requirements of Article 6(4) of the Habitats Directive establish a set of conditions, which must be met for the competent authority to authorise the plan or project where the AA shows that the integrity of a Natura 2000 site will be adversely affected by it. Being an exception to Article 6(3), the fulfilment of the conditions under which it may be applied is subject to strict interpretation.

It falls on whoever wants to make use of Article 6(4) to prove, as a prerequisite, that the following conditions do indeed exist:

- The alternative put forward for approval is the least damaging for the integrity of the Natura 2000 site in terms of its qualifying interests, and no other feasible alternative exists that would not adversely affect the integrity of any Natura 2000 site;

- There are imperative reasons of overriding public interest (IROPI);
- All necessary compensatory measures have been adopted .

The European Commission has published a Guidance Document on Article 6(4) of the Habitats Directive which provides clarification of the concepts of alternative solutions, imperative reasons of overriding pubic interest, compensatory measures, overall coherence and the opinion of the Commission required in some cases[155].

5.6.2 The absence of alternative solutions

The search for alternatives can be quite broad and should be linked to the public interest objectives of the plan or project. It could involve alternative locations, different scales or designs of development, or alternative processes. If the intention is to increase the renewable energy capacity by a certain amount, the question is then: can this be achieved in a less damaging way, for instance, by selecting a more appropriate site for wind farm development elsewhere or by resizing or scaling down the plan or project.

In practice, alternative solutions should normally already have been identified within the framework of the initial assesment under Article 6(3). They are part of the iterative process seeking to improve the siting and design of a plan or project at the earliest stages.

To fulfil the requirements of Article 6(4), the competent authority must be the ones to assess alternative solutions, once the appropriate assessment stage has concluded that it cannot be ascertained that the plan or project will not have adverse effects on the integrity of the site concerned, even after mitigation measures have been introduced. The competent authorities have also to analyse and demonstrate first the need of the plan or project concerned. Thus, the zero option should also be considered at this stage[156].

They should also make comparisons between various possible alternatives but It should be stressed that the reference parameters for such comparisons deal with aspects concerning the conservation and the maintenance of the integrity of the site and of its ecological functions. This means that the conservation objectives and status of the Natura 2000 should be weighted against any consideration of costs, delays or aspects of an alternative solution, following the procedures prescribed in Article 6(4).

The alternative solutions chosen should also in principle undergo the same screening exercise as the original plan or project and could be subject to a new Appropriate Assessment for, although the alternative is less damaging, it could still have an adverse effect on the integrity of the same or another Natura 2000 site. Usually, if the alternative is

similar to the original proposal, the Appropriate Assessment may be able to draw a lot of the information needed from the first Appropriate Assessment.

Figure 13 . Flow chart of the Article 6(4) conditions

5.6.3. Imperative reasons of overriding public interest (IROPI)

It is clear from the wording of Article 6(4) that only public interests, irrespective of whether they are promoted either by public or private bodies, can be balanced against the conservation aims of the Directive. Thus, projects developed by private bodies can only be

considered to meet this condition of Article 6(4) where such public interests are served and demonstrated[157].

Such public interests may include human health, public safety, beneficial consequences of primary importance for the environment, and other interests of a social (e.g. employment) or economic nature.

To fulfil the requirements of Article 6(4) of the Habitats Directive, the competent national authorities have to make their approval of the plans and projects in question subject to the condition that the balance of interests between the conservation objectives of the Natura site(s) affected by those initiatives and the above-mentioned imperative reasons weighs in favour of the latter. This should be determined according to the following considerations:

a) The public interest must be **overriding**: it is therefore clear that not every kind of public interest of a social or economic nature is sufficient, in particular when seen against the particular weight of the interests protected by the Directive (see e.g. its 4th recital stating *"Community's natural heritage"*).

b) In this context, it seems also reasonable to assume that the public interest can only be overriding if it is a long-term interest; short term economic interests or other interests which would only yield short-term benefits for the society would not appear to be sufficient to outweigh the long-term conservation interests protected by the Directive. Overriding interests, as long-term, fundamental social interests, may be properly identified beforehand by published policies, and land-use and other plans.

It is reasonable to consider that the "*imperative reasons of overriding public interest, including those of social and economic nature*" refer to situations where plans or projects envisaged prove to be indispensable:
- within the framework of actions or policies aiming to protect fundamental values for the citizens' life (health, safety, environment);
- within the framework of fundamental policies for the State and the Society;
- within the framework of carrying out activities of economic or social nature, fulfilling specific obligations of public service.

It should be noted that the conditions of overriding public interest are even stricter when it comes to the realisation of a plan or project likely to adversely affect the integrity of a Natura 2000 site that hosts qualifying *priority* habitats and/or species, where those habitats and/or species are affected.

These can only be justified if the imperative reasons of overriding public interest concern
- human health and public safety or
- overriding beneficial consequences for the environment, or,
- for other imperative reasons if, before granting approval to the plan or project, the opinion of the Commission has been given (EC 2007b).

[157] Guidance document on article 6(4) of the 'Habitats Directive'92/43/EEC. Clarification of the concepts of: alternative solutions, imperative reasons of overriding public interest, compensatory measures, overall coherence, opinion of the Commission;
http://ec.europa.eu/environment/nature/natura2000/management/docs/art6/guidance_art6_4_en.pdf

5.6.4. The adoption of all necessary compensatory measures

Compensatory measures, as described in Article 6(4) of the Habitats Directive, constitute the "last resort" and are used only when the decision has been taken to proceed with a plan or project having an adverse effect on the integrity of the Natura 2000 site because no alternative solutions exist and the project has been judged to be of overriding public interest under the conditions described above.

The compensatory measures constitute measures specific to the unavoidable adverse effects of a project or plan. They aim to ensure that the overall coherence of Natura 2000 is protected, and should provide compensation corresponding precisely to the negative effects on the species or habitat concerned. There is little experience with the implementation of compensation measures under Article 6(4) of the Habitats Directive in the context of wind energy projects.

To ensure that the overall coherence of Natura 2000 is protected, the compensatory measures proposed for a plan or project should:

a) contribute to the conservation of natural habitats and species of Community Interest "within the biogeographical region concerned", in order to ensure the maintenance of the overall coherence of the Natura 2000 Network (for sites designated under the Habitats Directive), or within the same range, migration route or wintering area for bird species (i.e. sites designated under the Birds Directive) in the Member State concerned.

b) address, in comparable proportions, the habitats and species of Community Interest negatively affected;

c) provide functions comparable to those which had justified the selection of the original site, particularly regarding the adequate geographical distribution

It is considered good practice to take compensatory measures as close as possible to the affected area in order to maximise chances of protecting the overall coherence of the Natura 2000 network. Therefore, locating compensation within or nearby the Natura 2000 site concerned in a location showing suitable conditions for the measures to be successful is the most preferred option. However, this is not always possible and it is necessary to set a range of priorities to be applied when searching locations that meet the requirements of the Habitats Directive.

As a general principle, the compensatory measures should be in place and working before the work on the plan or project has begun. This is to help buffer the damaging effects of the project on the species and habitats by offering them suitable alternative locations in the compensation area.

If this is not fully achievable, the competent authorities should require extra compensation for the interim losses that would occur in the meantime. Member States should pay particular attention when the negative effects of a plan or project are produced in rare natural habitats or in natural habitats that need a long period of time to provide the same ecological functionality (EC 2007b). Under these circumstances, the likelihood of long-term success is best evaluated by peer-reviewed scientific studies of trends.

The information on the compensatory measures should be submitted to the Commission before they are implemented and indeed before the realisation of the plan or project concerned. It is therefore advised that compensatory measures should be submitted to the

Commission as soon as they have been adopted in the planning process in order to allow the Commission, within its competence of guardian of the treaty, to assess whether the provisions of the Directive are being correctly applied (EC 2007b).

The Commission will deliver an opinion when priority habitats and/or species might be adversely affected. In delivering its opinion, the Commission will check the balance between the ecological values affected and the invoked imperative reasons, and evaluate the compensation measures. The opinion is not binding but in case of non-conformity with Community law, legal action may be taken.

According to existing EC guidance[158], compensatory measures under Article 6(4) can consist of one or more of the following:

- **Restoration or enhancement** within existing Natura 2000 sites: restoring the habitat to ensure the maintenance of its conservation value and compliance with the conservation objectives of the site or improving the remaining habitat in proportion to the loss due to the plan or project on a Natura 2000 site;

- **Habitat Recreation**: recreating a habitat on a new or enlarged site, to be incorporated into Natura 2000;

- **Designation of new sites** under the Birds and Habitats Directive, in association with other works, as described above. As regards compensatory measures for designated sites under the Birds Directive (SPA), any new habitat created as compensation for damage to an SPA should be designated as an SPA once it meets its objectives in order to maintain the overall coherence of the network.

Key issues to address in designing compensatory measures include:

- Targeted objectives to address the unavoidable adverse effects and to ensure that the overall coherence of Natura 2000 is protected
- Ensuring the compensation is feasible and effective i.e. level of risk of failure;
- Assessment of technical feasibility;
- Extent of compensatory measures;
- Location in relation to damage;
- Timing in relation to damage;
- Long-term implementation.

ANNEX I:

Recommendations and resolutions adopted by international conventions on the potential impact of wind farms on wildlife and habitats

Different international biodiversity Conventions and Agreements have adopted measures that relate to wind farm developments.

Bern Convention on the Conservation of European Wildlife and Natural Habitats.
On behalf of the Bern Convention, BirdLife International presented in 2003 an analysis of effects on birds and guidance on environmental assessment criteria and site selection issues, based on a literature overview[159]. This initiative was followed up with a resolution "on minimising adverse effects of wind power generation on wildlife", adopted by the Convention Standing Committee in December 2004[160] . The Contracting Parties are recommended to take appropriate measures to minimise the potential adverse effects of wind turbines on wildlife, to involve the industry sector and to ensure adequate monitoring and surveillance to improve the understanding of the impact of wind farms.

Bonn Convention on the Conservation of Migratory Species of Wild Animals (CMS)
The Conference of the Parties of the Bonn Convention adopted a resolution on wind turbines and migratory species in 2002[161]. The resolution calls upon the Parties, *inter alia* to identify areas where migratory species are vulnerable to wind turbines and where wind turbines should be evaluated to protect migratory species. They should also apply and strengthen comprehensive strategic environmental impact assessments where major developments of wind turbines are planned, and take full account of the precautionary principle.

The Agreement of the Conservation of Populations of European Bats (EUROBATS)
As a follow up to the above mentioned resolution the Bonn Convention adopted a resolution on the potential impact of wind farms on bats in 2003[162]. This includes a request to the Advisory Committee to assess the evidence of the impacts, and if appropriate, to develop guidelines for assessing potential impacts. These guidelines were published in 2008[163].

The Agreement of the Conservation of Small Cetaceans of the Baltic and North Sea (ASCOBANS)
Also as part of the agreement under the Bonn Convention (CMS), a resolution was adopted on "adverse effects of sound, vessels and other forms of disturbance on small cetaceans" in 2006[164]. Parties and Range States are invited to conduct further research into the effects on small cetaceans of e.g. "extractive and other industrial industries, including windfarms", and to include physical and behavioural effects both at the individual and population levels. Parties and Range States are also invited to develop appropriate management measures, guidelines and technological adaptations to minimise adverse effects on small cetaceans; and to implement procedures to assess the effectiveness of any guidelines and management measures. A workshop on impacts and methodologies for assessing impacts of offshore wind farms on marine mammals took place in 2007

[192] In addition, 'Microchiroptera, all species' are listed in Annex IV(a) of the 'Habitats Directive', i.e. in practise that obligations following from Article 12 of the directive apply for all European bat species.

[193] No information on *Rousettus aegiptiacus* is given by Rodrigues et al. (2008).

ANNEX IV:

Aquatic species listed in Annexes II and/or IV(a) of the 'Habitats Directive' and recommended to be especially considered with reference to adverse impact from wind farms (list is non-exhaustive[194]).

Species, species group	Annex	Reason for consideration
Seals (Phocidae)		
Halichoerus grypus	II	• Disturbance (noise etc) from offshore wind farms, primarily during construction.
Monachus monachus	II (priority), IV(a)	• Although no information about impacts has been found, risk for disturbance (noise etc) from offshore wind farms during construction phase should nevertheless by considered, in analogy with findings for other marine mammals and concern for the overall unfavourable conservation status of this species.
Phoca hispida bottnica	II	• Although not studies with reference to potential impact from wind farms, risk for disturbance (noise etc) from offshore wind farms during construction phase should nevertheless by considered, in analogy with findings for other marine mammals and concern for the conservation status of this subspecies, endemic to the Baltic Sea.
Phoca vitulina	II	• Disturbance (noise etc) from offshore wind farms, primarily during construction.
Whales, dolphins and porpoises (Cetacea)		
All species	IV(a)	• Disturbance (noise etc) from offshore wind farms, primarily during construction, and possibly also during operation, in analogy with findings for *Phocoena phocoena.*
Phocoena phocoena	II	• Disturbance (noise etc) from offshore wind farms, primarily during construction, but also conflicting evidence on impact during operation.
Tursiops truncatus	II	• Disturbance (noise etc) from offshore wind farms, primarily during construction, and possibly also during operation, in analogy with findings for *Phocoena phocoena.*
Terrestrial mammals[195]:		
Lutra lutra	II, IV(a)	• Perceived indirect impact of changes in hydrology etc related to wind farm developments in upstream located wetlands (incl. peatlands).
Fish:		
Salmo salar	II	• Perceived indirect impact of changes in hydrology etc related to wind farm developments in upstream located wetlands (incl. peatlands).
Molluscs:		
Margaritifera margaritifera	II	• Perceived indirect impact of changes in hydrology etc related to wind farm developments in upstream located wetlands (incl. peatlands).

[194] Primarily based on information from Hötker et al. (2005, 2006), Lucke at al. (2006), Rodrigues et al. (2008) and Thomsen et al. (2006) with reference to bats and marine mammals.

[195] Ref. comments from Scottish and Irish *ad hoc* group members (August 2008).

ANNEX V

Some examples of proposed or confirmed impacts of wind farm development on species and species groups

Kind of impact	Onshore	Offshore
Disturbance and displacement, birds	• For staging and wintering waterfowl there is evidence of disturbance, with ranges from zero up to around 800 m and with 600 m from the development as an often accepted 'rule of thumb'[196], but also that staging waterfowl may habituate over time[197]. • Studies in wintering farmland birds in UK indicate only minimal effects[198]. • Breeding birds may been proposed to be more tolerant than staging and wintering birds[199], but this assumption needs to be further verified on the basis of long-term studies. For single bird species, however, there is evidence of displacement effects during the breeding periods[200]. • This was further confirmed in a study in upland habitats in northern UK, where breeding densities were reduced by 15-53% within a zone 500m around the wind turbines for 7 of 12 species[201].	• Danish studies at offshore developments, 1999-2007, indicated displacement as well as recovery of single bird species using waters around wind farms for staging or wintering[202]. Initial indications of avoidance of areas up to at least 2 km were reported for e.g. Red-throated Diver (*Gavia stellata*), Common Scoter (*Melanitta nigra*) and auks (*Uria aalge* and *Alca torda*). A clear recovery was reported 3-5 years after construction for Common Scoter, while still to clarify if this was related to change in food supply or habituation. For Red-throated Diver, no indications of recovery were recorded still 5-6 years after construction works.
Disturbance and displacement, marine mammals and fish	N.A.	• For marine mammals (seals, dolphins, whales) and fish impact of noise has been a main issue for study. • Construction work, especially pile-driving, may result in short-term but long-ranged impacts[203], with audibility extending 80 km for

[203] E.g. Nedwall et al. (2007), Diederichs et al. (2008).

		Harbour Porpoise (*Phocoena phocoena*) and Harbour Seal (*Phoca vitulina*), and potential behavioural responses up to 15-20 km. In immediate vicinity, severe injuries of ramming activities cannot be excluded[204]. • Impact during construction has been shown to more evident for porpoises than on seals. Detailed studies of the Harbour Seal populations at the Nysted and Horns Rev offshore wind farms indicated a drecrease in numbers during pile driving but no overall change in abundance during the construction phase[205]. For Harbour Porpoise, a substantial but short-lived effect of pile-driving was observed. At Horns Rev, a slight decrease in abundance occurred during the construction, but no effect under operation. At Nysted, there was a clear decrease during construction, and this effect persisted also after two years of operation, although with indications of a slow, gradual recovery [206]. • Noise during operation is generally low and mostly not exceeding variations which may be encountered during the animals' normal course of activity. Impact (if any) is local but long-lasting[207], but may differ between sites[208]. • Electro-magnetic fields induced in the vicinity of under-water cables have been an issue of concern with reference to interference with electric fields used by some fish species for prey detection, spatial orientation etc, and magnetic fields used for navigation; especially

[210] E.g. Meissner & Sordyl (2006).
[211] Bochert & Zettler (2006).
[212] E.g. Keller et al. (2006), Thomsen et al. (2006).
[213] E.g. Wilhelmsson et al. (2006).
[214] E.g. Fiskeriverket (2007).

		with reference to sharks, rays and lampreys[209], although information available is not conclusive with reference to any major effects[210]. • For marine benthic animals, the static magnetic fields of sub-marine cables did not seem to have any clear influence on orientation, movement and physiology, when tested during artificial conditions, although further studies are needed to focus on a long-term perspective[211]. • For some fish species, including cod and herring, operational noise may be detectable up to 4 km distance, and up to around 1 km for some other species; with a risk of masking intraspecific communication. Behavioural and physiological stress is expected to be restricted to very close surroundings[212]. • Offshore wind farms may function as combined artificial reefs and fish aggregations devices[213], and restrictions in fishery in the immediate surroundings may have an additional positive impact on the fish stocks[214].
Collision fatalities, birds	• Collision rates are overall very low, but with the noteworthy exception of high frequency of fatalities involving raptors. Special concern has to be raised for e.g. Eurasian Griffon Vulture (*Gyps fulvus*), Egyptian Vulture (*Neophron percnopterus*), White-tailed Eagle (*Haliaeetus albicilla*), Golden Eagle (*Aquila chrysaetos*), Red Kite (*Milvus milvus*) and Common Kestrel (*Falco tinnunculus*)[215]. • Single cases with high number of fatalities at various locations in e.g. California, Spain and Norway have attracted wide-spread publicity, but risks are highly site-specific[216]. • Birds making regular foraging flights between nesting and feeding areas may face enhanced risks[217].	• For offshore locations information about collision fatalities are still limited, but direct observations and radar studies as well as modelling indicate very low risks, as has been shown e.g. for Eider (*Somateria mollissima*)[218].

[215] E.g. Barrios & Rodrígues (2004, 2007), Hötker at al. (2005, 2006), Lekuona & Ursúa (2007), Follestad et al. (2007), Thelander & Smallwood (2007) and Carrete et al. (2009).
[216] Drewitt and Langston (2008), and references therein.
[217] E.g. Everaert & Stienen (2007), with reference to a study of three species of breeding terns at coastal breeding site.
[218] E.g. Pettersson (2005), Petersen et al. (2006).

Collision fatalities, bats	• Higher mortality risks than for birds, primarily for migrating species (short and long distance) at both onshore and offshore locations[219]. • In a one-year study of operational impacts on bats in the Freiburg region in southern Germany, including standardsied seach of carcasses at 16 turbines, 50 dead bats were found, with a dominance of *Pipistrellus pipistrellus* and *Nyctalus leisleri,* while only 9 birds (of 5 species) were recorded. Most bats were found in late summer, and most fatalities were recorded in forests and none in open areas. At 2 turbines where acitvity was studied, using a thermal imaging camera, and around 25% of the bats showed evasive behaviour when approaching a rotor[220].	• Higher mortality risks than for birds, primarily for migrating species at both onshore and offshore locations[221].
Barrier effects	• From literature overviews it can be concluded that avoidance behaviour is a relatively common but still poorly understood phenomenon. E.g. most information refers to day-time observations while there is lack of data with reference to night-time, when much migration takes place[222].	• At an offshore wind farm (7 turbines) located at a frequently used flyway at Kalmarsund, SE Sweden, avoidance behaviour at a distance of 1-2 km was recorded among migrating waterbirds (primarily Eider, *Somateria mollissima*). In spring migration (but not autumn), the flight corridor was adjusted to a more easterly location. The total length of migration, and thus the energy expenditure was assessed to increase by 0.2-0.5%[223]. • Good evidence on avoidance behaviour among various species of waterbirds (incl. Eider) exists also from Danish offshore wind farms, with most bird flocks heading for the wind farm at 1.5-2 km distance, although responses were highly species-specific[224]. • No evidence of barrier effect among fish and marine mammals has been found[225]

ANNEX VI:

European and national guidance documents of relevance for impact assessments with reference to wind farms

This list of already existing EC and national guidance that might be of relevance with reference to impact assessments of wind farms plans and projects is non-exhaustive. For the national documents, it is primarily based on information provided by the *ad hoc* group members. The list also includes a few guidance documents prepared by NGOs.

Europe

The documents listed below have been developed by the EC. They provide detailed guidance on how to apply the EU nature legislation.

European Commission (2000) Managing Natura 2000 sites: the provisions of Articles 6 of the habitats directive 92/43/EEC. Luxembourg: Office for official publications of the European Communities;
http://ec.europa.eu/environment/nature/natura2000/management/docs/art6/provision_of_art6_en.pdf

European Commission (2002) Assessment of plans and projects significantly affecting Natura 2000 sites. Methodological guidance on the provisions of articles 6(3) and (4) of the Habitats Directive 92/43/EEC. Luxembourg: Office for official publications of the European Communities;
http://ec.europa.eu/environment/nature/natura2000/management/docs/art6/natura_2000_assess_en.pdf

European Commission (2003) Implementation of Directive 2001/42 on the assessment of the effects of certain plans and programmes on the environment;
http://ec.europa.eu/environment/eia/pdf/030923_sea_guidance.pdf

European Commission (2007) Guidance document on article 6(4) of the 'Habitats Directive'92/43/EEC. Clarification of the concepts of: alternative solutions, imperative reasons of overriding public interest, compensatory measures, overall coherence, opinion of the Commission;
http://ec.europa.eu/environment/nature/natura2000/management/docs/art6/guidance_art6_4_en.pdf

European Commission (2007) Guidance document on the strict protection of animal species of Community interest under the 'Habitats Directive'92/43/EEC. Final version, February 2007.
http://ec.europa.eu/environment/nature/conservation/species/guidance/index_en.htm

Other guidance documents relevant on the supra-national level (selection)

Diederichs, A., Nehlds, G., Dähne, M., Adler, S, Koschinski, S. & Verfuss, U. (2008) Methodologies for measuring and assessing potential changes in marine mammal behaviour, abundance or distribution arising from the construction, operation and decommissioning of offshore windfarms. – Commissioned by COWRIE Ltd.;

Annex II: List of animal species covered by Annex II, IV and V 69
Annex III: Example of a species dossier for *Triturus cristatus* 87

FOREWORD

Why a guidance document on the protection of animal species?

Up until now, most of the attention regarding the implementation of the Habitats Directive[1] has focused on the establishment of the Natura 2000 network (of protected areas). This "1st pillar" of the Directive refers to the conservation of natural habitats and the habitats of species. However, the Directive also has a "2nd pillar", covering the protection of species. In particular, Articles 12 and 16 aim to establish and implement a strict protection regime for species within the whole territory of Member States. It has become evident that the precise content of the type of measures needed to ensure a "system of strict protection" as well as the correct application of the derogation provisions pose problems. In addition, certain technical terms used in the articles need better definition. Clearly, therefore, guidance is needed on the provisions for species protection and the specific terms used.

Purpose of the guidance document

The essential focus of this document is on the main obligations under Articles 12 and 16 of Directive 92/43/EEC, which establish a system of strict protection for the animal species listed in Annex IV(a), but allow for derogation from these provisions under defined conditions. Particular consideration is given to the definition of a "system of strict protection" specified in Article 12(1), examining it in the context of the overall objectives of the Directive. The document is mainly based on relevant Court judgments (see Annex 1), opinions given by the Commission's Legal Service on some specific questions, and input from the Working Group on Article 12. This Working Group, an ad hoc working group formed under the Habitats Committee, met eight times from June 2002 to February 2005. The Group's final report can be viewed on the Commission's website (http://ec.europa.eu/environment/nature/home.htm).

This document is intended to ensure a common understanding of the relevant provisions among national and regional authorities, conservation bodies and other structures responsible for or involved in the implementation of the Habitats Directive. It aims to assist in devising pragmatic and flexible ways of applying the provisions and making them effective and practical, while fully respecting the legal framework.

Limitations of the guidance document

This guide has been drafted by the Environment Directorate-General of the European Commission. It is intended to be bound by, and faithful to, the text of the Directive and the wider principles underpinning Community environmental law. It is not legislative in character (not making new rules but providing guidance on the application of those that exist). As such, the document reflects only the views of the Commission services and is not of a binding nature. Member States have been consulted on various drafts of this guidance document and were invited to comment on it. There are some parts of the guidance in which some Member States hold differing views on the interpretation of Article 12 and Article 16.

It should be stressed that it rests with the European Court of Justice to provide a definitive interpretation of a Directive. Therefore, the guidance provided will need to evolve in line with any emerging jurisprudence on this subject, and also with experience arising from the implementation of Articles 12 and 16 in the Member States.

---

[1] Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora (OJ L 206, 22 July 1992, p. 7).

Also, as with any directive, the interpretation needs to consider the different language versions of the texts, all of which are valid. On this specific issue, we note that some phrases in the different language versions merit careful attention. It is important when looking at the different language versions to elicit a meaning that best reflects the purpose and context of the terms under examination.

Structure of the document

The document is presented in three main chapters. The first chapter reviews species protection within the EC under the Directive and international framework. The second chapter takes a more in-depth look at the relevant legal provisions of Article 12 of the Directive, while the third chapter examines the derogation possibilities under Article 16 of the Directive.

The key points arising from the analyses are summarised (in italics) at the end of each section, in order to highlight the relevant conclusions. Full references for the Court cases quoted throughout the text are provided in an annex at the end of the document.

I. CONTEXT

I.1 Species conservation within a wider political and legal context

I.1.1 Political context

(1) Preserving, protecting and improving the environment, including biodiversity, are essential objectives of general interest pursued by the European Community, as provided for in Article 174 of the Treaty.

(2) In 2001, the EU Heads of State and Government made a commitment at the Spring Summit in Göteborg to *'halt the decline of biodiversity by 2010'*[2]. The same Göteborg Council adopted the EU Sustainable Development Strategy, which again stressed the need *'to protect and restore habitats and natural systems and halt the loss of biodiversity by 2010'.* The Sixth Environmental Action Programme (6th EAP)[3], which constitutes the EU's "environmental work plan" from 2002 to 2012 was adopted in 2002. The issue of nature and biodiversity conservation is one of the four priorities in the 6th EAP, with the focus on *'protecting, conserving, restoring and developing the functioning of natural ecosystems, natural habitats, wild flora and fauna with the aim of halting … the loss of biodiversity, including diversity of genetic resources, both in the European Union and at the global scale*' with a particular view to *'halting biodiversity decline with the aim to reach this objective by 2010'*.

(3) These EU efforts go hand in hand with the EC Biodiversity Conservation Strategy adopted in 1998, which was developed to meet the EC's obligations as a Party to the Convention on Biological Diversity (1992). Under this Strategy, four Biodiversity Action Plans were adopted in 2001 in various policy areas (natural resources, fisheries, agriculture, economic and development cooperation). With the latest Communication of May 2006 on halting the loss of Biodiversity by 2010[4], the Commission launches a new effort to pull together EU actors to meet the 2010 target and foster recovery of biodiversity.

(4) Within all these initiatives, the issue of species protection is at the forefront of debate and has an indicator role in judging the health of ecosystems. Our ability to ensure that species survive over the long term as part of our European natural heritage will show the extent to which our conservation and biodiversity policies are truly effective. The 'target date' of 2010 is very likely to accelerate progress. Accordingly, the full and proper implementation of both the Birds[5] Directive and the Habitats Directive, which seeks to *'… maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora of Community interest'*, is of major importance and a test case as to how far our commitments can be achieved in practice.

---

2 'The European Council agrees that biodiversity decline should be halted with the aim of reaching this objective by 2010 as set out in the Sixth Environmental Action Programme.' Presidency Conclusions, Göteborg Council, 15 and 16 June 2001. SN/200/1/01 REV1, page 8. http://ue.eu.int/newsroom/newmain.asp?lang=1.

3 Decision No 1600/2002/EC of the European Parliament and of the Council of 22 July 2002 laying down the Sixth Community Environment Action Programme, OJ L 242 of 10/9/2002.

4 Communication from the Commission: Halting the loss of Biodiversity by 2010 – and beyond ; Sustaining ecosystem services for human well-being; 22 May 2006, COM (2006) 216 final

5 Council Directive 79/409/EEC of 2 April 1979 on the conservation of wild birds (OJ L 103, 5 April 1979, p. 1).

Summary: There are a wide range of political commitments within the EU aiming to protect nature and biodiversity, with species conservation at the forefront. With a view to meeting the objective of halting the decline of biodiversity by 2010, the full and proper implementation of both the Birds Directive and the Habitats Directive is a test case as to how far EU conservation policies are truly effective.

I.1.2 Legal context

(5) The Habitats Directive and its provisions for species protection should however be seen not only in a political context but also in the context of international conventions and other EC legal instruments.

(6) The legal instrument most closely related to the Habitats Directive is the **Birds Directive** of 1979, which shares not only common objectives (for birds in this case) and a similar conceptual structure, but also common provisions in relation to the network of protected sites (Natura 2000). Furthermore, Articles 5 to 9 of the Birds Directive contain similar provisions regarding species protection. In addition, the ECJ case law on these provisions is already quite extensive. The reasoning behind the judgments arising from the implementation of the Birds Directive is thus of great importance and can often be applied as well to Articles 12 and 16 of the Habitats Directive[6].

(7) Seen in an international context, the species protection provisions of the Habitats Directive help achieve the aims of relevant international nature conservation conventions such as the Convention on International Trade in Endangered Species of Wild Fauna and Flora[7], the Bern Convention[8], the Bonn Convention[9] and the Convention on Biological Diversity[10].

(8) Of particular relevance here is the **Bern Convention**. The Bern Convention (signed in 1979) pre-dates the Habitats Directive and had an important influence on both its conception and drafting. The parallels between Article 6 of the Convention[11] and Article 12 of Directive 92/43/EEC are obvious. However, despite the equivalence of objectives and the similarities in wording, Directive 92/43/EEC creates a more detailed framework for site

---

[6] For example, in its judgment of 20 October 2005 (Commission v UK, Case C-6/04, ECR p.9017), the Court used the case law for the Birds Directive.

[7] Council Regulation (EC) No 338/97 of 9 December 1996 on the protection of species of wild fauna and flora by regulating trade therein (OJ L 61, 3.3.1997, p. 1).

[8] Council Decision 82/72/EEC of 3 December 1981 concerning the conclusion of the Convention on the conservation of European wildlife and natural habitats (OJ L 38, 10.2.1982, p. 1).

[9] 82/461/EEC, Council Decision of 24 June 1982 on the conclusion of the Convention on the conservation of migratory species of wild animals (OJ L 210, 19/07/1982, p. 10).

[10] 93/626/EEC, Council Decision of 25 October 1993 concerning the conclusion of the Convention on Biological Diversity (OJ L 309, 13/12/1993 p. 1).

[11] Article 6 of the Convention provides that *"each Contracting Party shall take appropriate and necessary legislative and administrative measures to ensure the special protection of the wild fauna species specified in Appendix II. The following will in particular be prohibited for these species:*

(a) all forms of deliberate capture and keeping and deliberate killing;

(b) the deliberate damage to or destruction of breeding or resting sites;

(c) the deliberate disturbance of wild fauna particularly during the period of breeding, rearing and hibernation, in so far as disturbance would be significant in relation to the objectives of this Convention;

(d) the deliberate destruction or taking of eggs from the wild or keeping these eggs even if empty;

(e) the possession of and internal trade in these animals, alive or dead, including stuffed animals and any readily recognisable part or derivative thereof, where this would contribute to the effectiveness of the provisions of this Article."

conservation and protection than does the Convention[12]. The differences between the two texts were confirmed by the Court in case C-75/01, relating to the transposition of Directive 92/43/EEC in Luxembourg. The Court considered that the national measures for transposing Article 12(1)(c) of the Directive, including a law approving the Bern Convention, were insufficient to ensure complete transposition due to the disparities between Annex II of the Bern convention and Annex IV(a) of Directive 92/43/EEC[13]. It follows that even if the Bern Convention and Directive 92/43/EEC have substantially similar objectives, this does not affect the autonomous character of the obligations under the Habitats Directive.

Summary: The species protection provisions of the Habitats Directive have to be seen in the context of international conventions and other EC legal instruments, the most closely related being the Bern Convention and the Birds Directive.

I.2 Species conservation within the overall scheme of Directive 92/43/EEC

(9) The maintenance or restoration, at favourable conservation status, of the natural habitats and species of wild fauna and flora of Community interest is the primary objective of Directive 92/43/EEC. In order to attain this objective the Directive establishes different conservation instruments. Articles 12-16 thus form part of a general framework that aims to meet, along with other provisions, the broad objective of the Directive as set out in Article 2.

I.2.1. Primary aim of the Directive: the role of Article 2

(10) The aim of the Directive is laid down in Article 2. This provision does not in itself create obligations for the Member States, but it is relevant when considering the interpretation of other provisions of the Directive.

Article 2 (Directive 92/43/EEC)

1. The aim of this Directive shall be to contribute towards ensuring bio-diversity through the conservation of natural habitats and of wild fauna and flora in the European territory of the Member States to which the Treaty applies.

2. Measures taken pursuant to this Directive shall be designed to maintain or restore, at favourable conservation status, natural habitats and species of wild fauna and flora of Community interest.

3. Measures taken pursuant to this Directive shall take account of economic, social and cultural requirements and regional and local characteristics.

(11) It should be noted that the Court has recognised the need for any interpretation of Community legislation to take into account the aims of that legislation. According to Article 2(1) of Directive 92/43/EEC, the main aim of the Directive is to contribute towards ensuring biodiversity conservation through the conservation[14] of natural habitats and of wild fauna

[12] Two important differences should be stressed. Firstly, the Convention has a greater species coverage, since its Appendix II contains a larger number of species than Annex IV(a) of the Directive (partly due to the larger geographic area covered by the Convention). Secondly, the word "deliberate" figures in Article 6(b) but is absent from Article 12(1) (d).

[13] See the judgment of 13 February 2003, Commission v Luxembourg, Case C-75/01, ECR p.1585, paragraphs 55-58.

[14] According to Article 1(a) of the Directive, "conservation means a series of measures required to maintain or restore the natural habitats and the populations of species of wild fauna and flora at a favourable status."

and flora in the European territory of the Member States. Following Article 2(2), measures taken by Member States must aim to maintain or restore, at favourable conservation status, the natural habitats and species of wild fauna and flora of Community interest[15]. Consequently, the strict protection obligations set out in Article 12 are important instruments for the achievement and effective implementation of the main aim of the Directive.

(12) In parallel, the economic, social and cultural requirements and regional and local characteristics referred to in Article 2(3) of the Directive should not be neglected when interpreting the species protection provisions. As set out further below, Article 2(3) is applicable to various implementation aspects of Article 12 and 16 (e.g. when defining the requisite measures, especially in the case of ongoing activities, when drafting codes of conduct, when producing species conservation plans, and of course when making use of the derogations system).

(13) Since Article 2(3) requires the protection of natural habitats and species to be balanced against other requirements, one may ask if this provision comprises an independent derogation from the general requirements of the Directive. For Directive 79/409/EEC, the Court has clearly confirmed that it does not[16]. *Mutatis mutandis*, it follows that Article 2(3) of Directive 92/43/EEC does not provide an independent derogation from the obligations and requirements of the Directive. Nonetheless, the Court's pronouncements show that Article 2 is not without relevance and weight when considering the interpretation of other provisions of the Directive. In this regard, the provisions of Article 2 have value as a general orientation guide as to what the Directive requires and allows.

Summary: The strict protection obligations under Article 12 must be interpreted in terms of the overall aim of the Directive described in Article 2, to which they contribute. Article 2(3) cannot be regarded here as providing an independent derogation from the general requirements of the Directive.

I.2.2. Favourable conservation status

(14) The maintenance or restoration of "favourable conservation status" (FCS) is the overall objective for all habitat types and species of Community interest. Such species are listed in Annexes II, IV and V to the Directive. In simple terms, FCS could be described as a situation where a habitat type or species is doing sufficiently well in terms of quality and quantity and has good prospects of continuing to do so in future. The fact that a habitat or species is not threatened (i.e. not faced by any direct extinction risk) does not necessarily mean that it has favourable conservation status. The target of the Directive is defined in a positive way, as a 'favourable' situation to be reached and maintained, which needs to be defined based on the best available knowledge. Therefore, the obligation of a Member State

[15] Such species are listed or may be listed in Annex II, IV and V of the Habitats Directive.

[16] See judgment of 8 July 1987, Commission v Belgium, Case 247/85, ECR p.3029, paragraph 8. The Court noted: "In this context it is necessary to refer to Article 2 of the Directive, which requires Member States to take the requisite measures to maintain the population of all bird species at a level, or to adapt it to a level, which corresponds in particular to ecological, scientific and cultural requirements, while taking account of economic and recreational requirements, and from which it is therefore clear that the protection of birds must be balanced against other requirements, such as those of an economic nature. Therefore, although Article 2 does not constitute an autonomous derogation from the general system of protection, it none the less shows that the Directive takes into consideration, on the one hand, the necessity for effective protection of birds and, on the other hand, the requirements of public health and safety, the economy, ecology, science, farming and recreation." In Case C-262/85 (judgment of 8 July 1987, Commission v Italy, ECR p.3073) the Court rejected arguments by the Italian government that departures from the requirements of Article 7(4) could be based directly on Article 2.

is more than just avoiding extinction. All measures taken under the Directive must aim to reach or maintain a favourable conservation status.

(15) FCS for species is defined in general terms in Article 1(i) of the Habitats Directive.

"conservation status of a species means the sum of the influences acting on the species concerned that may affect the long-term distribution and abundance of its populations within the territory referred to in Article 2. The conservation status will be taken as 'favourable' when:

- population dynamics data on the species concerned indicate that it is maintaining itself on a long-term basis as a viable component of its natural habitats, and

- the natural range of the species is neither being reduced nor is likely to be reduced for the foreseeable future, and

- there is, and will probably continue to be, a sufficiently large habitat to maintain its populations on a long-term basis."

(16) This definition contains the main parameters (population[17] dynamics, range, sufficient habitat, prospects of long-term viability) for defining and assessing both the current and target conservation status. It also provides a framework for more specific definitions on a species-by-species basis. All these parameters therefore need to be considered thoroughly when designing measures for a certain species. It is important to note that the assessment of conservation status not only includes an element of 'diagnosis' based on current conditions, but also an important element of 'prognosis' (foreseeable future) based on influences. Such foreseeable future influences could be specific or general threats, positive or negative, medium- to long-term impacts, etc.

(17) The concept of FCS is not limited to the Natura 2000 network or to the species protected by this network (i.e. Annex II species). It applies to the *overall situation* of all species of Community interest (Annexes II, IV and V), which needs to be assessed and surveyed[18] in order to judge whether it is favourable or not. Assessing and evaluating the conservation status of habitats and species *within* the Natura 2000 network is therefore not always enough, especially when the occurrences of habitats or species are only partly covered by the network, maybe even in some cases only to a relatively small extent.

(18) In April 2005 the Habitats Committee agreed on a harmonised framework for evaluating the conservation status of habitats and species (see document DocHab-04-03/03 rev.3 "Assessment, monitoring and reporting of conservation status – Preparing the 2001-2007 report under Article 17 of the Habitats Directive"[19]). Member States agreed to assess conservation status according to a common 3-grade assessment matrix within each of the biogeographic regions in their territory. The three grades are favourable = green, unfavourable/inadequate = amber and unfavourable/bad = red *("traffic light system")*.

(19) For assessing favourable conservation status, the meaning of the term "natural range" as used in the Habitats Directive was defined as follows:

[17] "Population" is defined here as a group of individuals of the same species living in a geographic area at the same time that are (potentially) interbreeding (i.e. sharing a common gene pool).

[18] Article 11 of the Directive requires surveillance of the conservation status of the natural habitats and species referred to in Article 2, with particular regard to priority natural habitat types and priority species.

[19] See http://forum.europa.eu.int/Public/irc/env/monnat/home (public site, no "sign in" needed) for all relevant documents

The natural range of species and habitats — a dynamic concept

The natural range describes roughly the spatial limits within which the habitat or species occurs. It is not identical to the precise localities (the area actually occupied) or territory where a habitat, species or sub-species permanently occurs. Such actual localities or territories might be patchy or disjointed for many habitats and species (i.e. habitats and species might not be evenly spread) within their natural range. If the reason for disjunction proves to be natural, i.e. caused by ecological factors, the isolated localities should not be interpreted as a continuous natural range. For example, for an alpine species the range may be the Alps and the Pyrenees, but not the lowlands between them. However, the natural range includes areas that are not permanently used: for example for migratory species, their "range" includes all the areas of land or water that a migratory species inhabits, stays in temporarily, crosses or overflies at any time during its normal migration[20].

A natural range as defined here is not static but dynamic: it can decrease and expand. A natural range can constitute one aspect for the assessment of (un)favourable conditions for a habitat or species. If the natural range is insufficient in size to allow for the long-term existence of that habitat or species, Member States are asked to define a reference value for a range that would allow for favourable conditions and work towards this, for instance by fostering expansion of the current range.

When a species or habitat spreads on its own to a new area/territory or when a species has been re-introduced into its former natural range (in accordance with the rules in Article 22 of the Habitats Directive), this territory has to be considered part of the natural range. Similarly, the restoration/re-creation or management of habitat areas, as well as certain agricultural and forestry practices, can contribute to the expansion of a habitat or a species and hence its range. However, individuals or feral populations of an animal species introduced deliberately or accidentally by man to locations where they have never occurred naturally, or where they would not have spread to naturally in the foreseeable future, should be considered to be outside their natural range and consequently not covered by the Directive. Vagrant or occasional occurrences would also not be considered as part of the natural range.

Summary: The main parameters for defining the favourable conservation status of a species are given in Article 1(i) of the Habitats Directive. Roughly speaking, this status is a situation where species populations are doing well with good prospects for the future. Member States have agreed on a harmonised framework for evaluating *conservation status in the report required by Article 17 under the Directive.*

I.2.3. Species conservation instruments

(20) The Directive lays down a set of obligations and procedures that aim to meet the broad objective set out in Article 2. Two main concepts or "pillars" can be distinguished: the conservation of natural habitats and the habitats of species through the establishment of the Natura 2000 network (Articles 3 to 10) and the protection of animal and plant species (Articles 12 to 16).

[20] See also Article 1 of the Bonn Convention.

(21) The **1st pillar,** in relation to species[21], targets the conservation of the habitats of species[22], focusing on the maintenance (including positive management measures) and restoration of these habitats by establishing protected sites. The species for which this network of protected sites (Natura 2000) is established are listed in Annex II to the Directive.

(22) Article 6 is the central provision covering positive management (Article 6(1)) and avoidance of negative influences to the network (Article 6(2)); it also deals with plans or projects likely to have a significant negative impact on certain sites (Article 6(3)-(4)). The Commission services have produced two guidance documents explaining in detail the provisions of this Article:

1. "Managing Natura 2000 sites: The provisions of Article 6 of the Habitats Directive 92/43/EEC", European Commission, 2000, ISBN 92-828-9048-1

2. "Assessment of Plans and Projects Significantly Affecting Natura 2000 sites - Methodological guidance on the provisions of Article 6(3) and (4) of the Habitats Directive 92/43/EEC", European Commission, 2002, ISBN 92-828-1818-7

(23) While the first document deals with the management of Natura 2000 sites in general, the second document focuses on the procedures for the nature impact assessment and its consequences under Article 6(3) and 6(4). Both documents are available at http://www.europa.eu.int/comm/environment/nature/home.htm.

(24) To enhance the effectiveness of the network, the provisions of Article 10 target the ecological coherence of the network by suggesting integrated land-use planning and the management of certain landscape features.

(25) The **2nd pillar** deals with direct influences on the species themselves as well as (in the case of animal species) their eggs, breeding sites and resting places. Provisions under this section are not restricted in geographical terms. They apply to the whole of the territory to which the Directive applies, albeit subject to very few specific geographical restrictions indicated in the annexes[23]. In contrast, the protection afforded by Article 6 is limited to the Natura 2000 network.

(26) A distinction can be made under this pillar between those provisions calling for a "system of strict protection" for Annex IV species (Articles 12 & 13) and measures to control the exploitation of species listed in Annex V (Articles 14 & 15[24]). While the "system of strict protection", as the name suggests, provides a stringent protection regime, species covered by Annex V can be exploited, although such exploitation should not jeopardise the objective of maintaining their favourable conservation status in any way.

(27) Both pillars allow for exceptions from the protection regimes. The system of protection envisaged under Articles 12-15 is qualified by the possibility of derogations under Article 16 of the Directive. Article 6(4) of the Directive addresses specific exceptions (i.e. from the protection granted by the Natura 2000 network) to the general rule of Article 6(3) that authorisation can only be granted to plans or projects not adversely affecting the

[21] The 1st pillar also deals with habitats and their typical species as listed in Annex I to the Directive.

[22] Article 1(f) states that the "*habitat of a species means an environment defined by specific abiotic and biotic factors, in which the species lives at any stage of its biological cycle*".

[23] For example for *Vipera seoanni*, there is a geographical restriction which excludes the Spanish population from Annex IV and consequently from the provisions of Article 12.

[24] Article 15 contains elements that also relate to Annex IV(a) species in cases when derogations are applied.

integrity of the sites concerned. The application of Article 6(4) has to respect the various steps and the sequential order established in the Directive.

(28) So while there are certain similarities between both pillars, it should be stressed that the 1st pillar requires not only active maintenance but also restoration and improvement actions on sites, while the 2nd pillar has a more preventive character, requiring Member States to avoid and prevent a number of situations that could negatively impact a species.

(29) In consequence, it can be said that the two pillars are closely interlinked and are complementary in their approach, as their joint aim is the favourable conservation status of all habitats and species of Community interest[25].

Summary: In order to achieve its objectives, the Habitats Directive provides for two main instruments: the Natura 2000 network of protected sites and the species protection provisions. The provisions for species protection apply to the whole of a Member State's territory and concern the physical protection of specimens as well as their breeding sites and resting places. Both regimes allow for exceptions under certain conditions. Both instruments are complementary and jointly aim to ensure a favourable conservation status for all species of Community interest.

I.2.3.a) The Annexes

(30) Which "pillar" applies to which species is specified by the annexes to the Directive. The fact that a species is frequently listed in more than one annex demonstrates the close interaction between the two pillars, which share the same objective.

Purpose of Annex and number of references[26] listed (EU25)

Annex II	Animal and plant species of Community interest whose conservation requires the designation of special areas of conservation ("Natura 2000" sites"). Annex II lists a total of 869 references, of which 297 are animal and 572 plant species.
Annex IV	Animal and plant species of Community interest in need of strict protection. Annex IV lists a total of 922 references, of which 323 are animal and 599 plant species.
Annex V	Animal and plant species of Community interest whose taking in the wild and exploitation may be subject to management measures. Annex V lists a total of 77 references, of which 45 are animal and 32 plant species.

(31) In total, the Directive lists 447 animal and 695 plant species. Although different species are listed in different annexes and therefore fall under different kinds of protection measures, many species are actually listed in more than one annex. For example, plant species listed in Annex II (except bryophytes) are automatically listed in Annex IV(b) as

[25] It should be noted that Articles 12 and 16 are applicable from the date on which Directive 92/43/EEC came into force, i.e. 10 June 1994. The Member States that joined the EU after 1994 were to comply with these provisions from the date of accession.

[26] "References" mostly refers to species but also includes some grouped taxa (e.g. *Alosa spp.*) and sub-species. Refers to annexes valid for the EU-25.

well, so are covered by the habitat protection provisions *and* the strict protection system of Article 13. On the other hand, a group of other plants is listed only in Annex IV. For animal species, such an 'automatic' parallel listing does not exist. The situation with animal species is therefore more complex:

Overlap between Annexes – Animal species (EU25)

Annex	II & IV	II & V	only II	only IV	only V
% of the 447 animal references	45%	5%	17%	28%	5%

(32) How can this situation be explained? At the time of adoption, the legislator considered the level and type of threats to species as well as the best way to counteract threats based on the scientific information available at the time. While site designation and habitat management would be the appropriate approach for certain species, others might need a different regime of protection going beyond protected sites. The development of the annexes to the Habitats Directive follows the logic described below.

(33) A listing in Annex II was chosen for species for which the conservation of their (often quite specific) habitat is the principal factor determining their survival and well-being. The protection and management of sites were selected here as the appropriate instrument, which includes not only the maintenance of species habitats but also, where appropriate, their restoration. The group of species listed in Annex IV may be less suited to conservation by establishing protected areas, but instead needs "physical" protection of the actual species as well as protection of the most important parts of their habitat (i.e. their breeding sites and resting places) throughout the territory of a Member State. This is because of the specific threats they face, the measures needed to counteract them, the species' pattern of occurrence (e.g. scattered) or the type or specific character of their habitat. For the third group of species listed in Annex V, which may be exploited by human beings, this exploitation must be managed — if necessary — in order to ensure a favourable conservation status. Under Article 14 of the Directive, if Member States deem it necessary in the light of the surveillance provided for in Article 11, they have to take measures to ensure that the exploitation or taking in the wild of specimens of the species listed in Annex V is compatible with maintaining their favourable conservation status.

(34) Quite often, however, animal species do not perfectly fit into one of these groups. Usually species are subject to a combination of threats and should consequently be the target of a range of measures. This explains why most species of Community interest are actually listed in more than one annex. The most frequent combination is a listing in both Annex II and IV (see also the next chapter), which maximises the conservation effort by requiring management (maintenance and restoration) of the general habitats in protected sites (which should cover the most important populations) and the protection of the breeding sites and resting places as well as the species itself over the whole territory of a Member State.

(35) Since the development of these annexes, however, research and monitoring have developed further and the conservation status of a number of species may have changed, so that the picture today might be different from the one in the late 1980s/early 1990s when the Directive was prepared. As explained in chapter *I.2.4.b) "Appropriate and effective*

character of measures taken", several reactions are possible. If it is found, for example, that a species in need of habitat restoration or active habitat management is listed only in Annex IV but would effectively need to be listed under Annex II, Member States may voluntarily take additional measures. Alternatively, based on good scientific evidence, the annexes could be amended to include the species in Annex II. On the other hand, the surveillance under Article 11, once collated and analysed at European level, might show that a species should be deleted from one or all the annexes it is listed in because it no longer fulfils the criteria for Community interest (as defined in Article 1(g) of the Directive).

(36) The efficient use of the different species conservation instruments requires **a species-by-species approach**[27]. Such an approach looks at the conservation needs of each species as well as the instruments available for its conservation and formulates on this basis the adequate measures to be implemented. Such an approach ensures flexible implementation of the Directive while at the same time optimum achievement of its objectives. The target of favourable conservation status should always be the guiding principle for all conservation efforts by the Member States and should be addressed by all appropriate means available (see also chapter I.2.4.b).

Summary: The different annexes determine which instruments are available for which species. Most species are covered by more than one annex and therefore are subject to a combination of instruments, i.e. a combination of conservation approaches and measures. How these instruments are finally implemented should be considered on a species-by-species basis, taking account of the specific needs of each species.

I.2.3.b) The protection of animal species listed under both Annexes II and IV in Natura 2000 sites

(37) Since a large proportion (45%) of the animal taxa are listed in both Annex II and Annex IV, it is worth looking at which regime and which procedures apply to an Annex IV species within a Natura 2000 site. The Commission services consider that, within Natura 2000 sites, **a twofold regime applies** to Annex II/IV species. These species should benefit from both approaches: protection under the section on "Conservation of natural habitats and habitats of species", in particular the measures envisaged under Article 6, and the strict protection system envisaged under Article 12.

(38) This view is first of all justified by the different — and complementary — approaches followed by the two systems. Article 6 is concerned with site and habitat conservation and protection, whereas Article 12 is concerned with protecting the individuals of the listed species and their breeding sites and resting places. Furthermore, such an approach is in line with the general objective of the Habitats Directive, i.e. to contribute towards ensuring biodiversity through the maintenance or restoration, at favourable conservation status, of natural habitats and species of Community interest.

(39) It should be observed in this regard that for all Annex II species a coherent and complete network, based on an exhaustive list of sites, has to be established in accordance with the procedure and criteria set out in Annex III of the Directive. Based on a biogeographic approach, the network is established taking into account the threat status, ecology and distribution of a species. Depending on these and other scientific factors, a

[27] There might of course be cases where a whole group of species faces similar situations and has similar needs and can be treated together.

more or less complete coverage of habitats is agreed for inclusion in the network[28]. It therefore is all the more important that for species (listed in Annexes II and IV) not largely covered by the network, measures are also taken outside the network to maintain or restore their favourable conservation status. However, the fact that an Annex IV species is well covered in the Natura 2000 network does not replace the obligation to establish and effectively implement a strict protection system. It follows that, for animal species listed in Annex II and IV(a), within a site belonging to the Natura 2000 network, the simultaneous application of Articles 6 and 12 to 16 needs to be ensured.

(40) Given that these provisions contain similar elements, their simultaneous application may lead to situations where overlaps occur. This is for example the case with the protection of Natura 2000 sites under Article 6(1) and (2) and the protection of breeding sites and resting places under Article 12(1)(d). Both provisions deal with the protection of habitats of species. Breeding sites and resting places are central parts of the total habitat of a species, which has to be protected (maintained and restored) in its entirety in the Natura 2000 site. Natura 2000 therefore has a much more intensive and broader task, namely to maintain (and where needed restore) the entire habitat of a species at certain sites, while the provisions of Article 12 concentrate on preventing negative effects on the most central parts of such habitats, namely those that are essential in order to guarantee successful breeding and resting.

(41) It would be logical for measures taken under Article 6(1) (e.g. management plans) to make special reference to the protection requirements of Annex II & IV species occurring at the site. Also, where, for example, special measures are taken to avoid the deterioration of habitats or disturbance of species (Article 6(2)), these should logically respond to the requirements spelled out under Article 12(1)(a)-(d).

(42) With regard to the **simultaneous application of derogations** under Articles 6(3)-(4) and 16 to animal species listed in both Annexes II and IV, the Commission services consider that their simultaneous or parallel application is feasible in practical terms and meaningful in conservation terms.

(43) Without envisaging all possible scenarios, the Commission services consider that, if for example a project would be likely to destroy or damage the central parts of habitats within a Natura 2000 site, it can be assumed that both Article 6(3) and Article 16 come into play at the same time. It can be further assumed that the impact assessment thus triggered will cover both provisions — as they simultaneously have the same objective (although Article 12(1)(d) is more limited), i.e. the assessment under Article 16 will form part of the presumably broader (because covering the entire habitat) assessment undertaken under Article 6(3). Such a procedure should avoid any double assessment or incoherence in applying the provisions. It has to be ensured in such cases that the outcome of the impact assessment does not go against the species protection provisions. Of course, the decisions taken after the assessment will then have to take into account the requirements under both articles. Should, for example, a harmful project be allowed due to overriding public interest, compensation measures will have to be taken and reported under Article 6(4) and the project also has to be included in the Article 16 (derogation) reports.

(44) On the other hand, it may well be possible that a derogation is required under Article 16 for an activity in a Natura 2000 site even where no impact assessment under Article 6(3) is needed. This might for example be the case when a few specimens or eggs of an Annex

[28] Even where Community lists have been approved, the network still needs improvement for certain habitat types and species: so-called 'reserves' had to be included in the first Community lists of sites of Community interest to allow for completion later on.

II/IV species are to be taken for research purposes although this is unlikely to have any negative effect on the site and its population, or on the contrary will have a positive effect.

Summary: Species listed in Annex II and IV benefit from complementary, twofold protection within Natura 2000 sites. Certain overlaps in the protection of habitats (entire habitat in the Natura 2000 site, including breeding and resting sites under Article 12) exist but can and should be dealt with in a coherent manner.

I.2.4 Basic principles of species conservation

I.2.4.a) Good knowledge and surveillance of conservation status

(45) Recital 19 of the Directive states that "the improvement of scientific and technical knowledge is essential for the implementation of this Directive", while Article 18 of the Directive stresses the necessity for research. Indeed, in order to implement meaningful species conservation measures under the Directive, a good knowledge of each species (range, occurrences, biology, ecology, threats & sensitivity, conservation needs, etc.) is a *conditio sine qua non*. Member States therefore need to collect and use the best available information from all reliable sources (e.g. conservation agencies, universities, conservation NGOs, etc.) when designing their conservation strategies. In addition, as the Directive's aims are framed in an EU and not a national context, it may often be important to look for information beyond regional and national borders in order to cooperate and coordinate with other regions/Member States (this may — among other things — take place in committees and working groups at EU level or through EC co-funded projects). Harmonised, transboundary approaches are valuable for the implementation of the Directive when for example two Member States share one population of a certain species and can only assess the full situation (and consequently define effective measures) when taking the situation 'on the other side of the border' into account.

(46) Besides the factual knowledge on a species, surveillance (or monitoring[29]), meaning long-term systematic observation, is required by the Directive to track trends in conservation status. The establishment of an appropriate surveillance system to monitor the conservation status of a species of Community interest (as listed in Annex II, IV and V) is an obligation arising from Article 11 of the Directive. According to the Court, *"the surveillance obligation is fundamental to the effectiveness of the Habitats Directive and it must be transposed in a detailed, clear and precise manner"*[30]. Thus, domestic law should set out the statutory duties of the national authorities to undertake surveillance of the conservation status of natural habitats and species, in order to guarantee that this surveillance is undertaken systematically and on a permanent basis[31].

[29] Article 11 of the Directive refers to the surveillance of the conservation status of natural habitats and species. The Commission services consider that the interpretation of the term "surveillance" and its scope should take into account the relevant definitions of Article 1(e) and (i).

[30] See the judgment of 20 October 2005, Commission v UK, Case C-6/04, ECR p.9017, paragraphs 26 and 65.

[31] In its judgment of 20 October 2005, the Court found that *"inasmuch as it is common ground that United Kingdom domestic law does not contain any statutory duty requiring the national authorities to undertake surveillance of the conservation status of natural habitats and species, that domestic law involves an element of legal uncertainty. Hence, it is not guaranteed that surveillance of their conservation status is undertaken systematically and on a permanent basis"* (Case C-6/04, paragraph 68).

Article 11 (Directive 92/43/EEC)

Member States shall undertake surveillance of the conservation status of the natural habitats and species referred to in Article 2 with particular regard to priority natural habitat types and priority species.

(47) The scope of Article 11 is not restricted to Natura 2000 sites, but requires monitoring of the conservation status of habitats and species of Community interest, as defined in Article 1 of the Directive, throughout the territories of all Member States.

(48) The position of Article 11, which comes at the end of the section on "conservation of habitats and habitats of species", could give rise to some ambiguity. However, the Commission services consider that this provision applies to the species covered by the 2nd pillar as well. This conclusion is based on several grounds. First of all, the text of Article 11 expressly refers to the surveillance of "the conservation status of the natural habitats and species referred to in Article 2", i.e. the natural habitats and species of wild fauna and flora of Community interest. Additionally, Article 14 of the Directive, which is in the 'protection of species' section, includes a reference to the "surveillance provided for in Article 11". This clearly illustrates that the compartmentalisation between these two sections of the Directive is not absolute. Furthermore, the recitals of the Directive refer to the need to set up a system "for surveillance of the conservation status of the natural habitats and species covered by this Directive" for the implementation of the Directive.

(49) A common framework for evaluating conservation status (in three grades) and reporting on this under Article 17 of the Directive was approved by the Habitats Committee in April 2005[32]. This framework defines what information is to be reported (and consequently collected) and gives rough guidelines on how to assess conservation status, so that conclusions at European level can be drawn from the national reports. Important elements of the agreement are that the 2007 report should include a first assessment of conservation status for each species and habitat of Community interest, based on the best available information. Reports thereafter (every 6 years) should be based on the surveillance systems put in place[33]. In order to know when a species or habitat has a favourable status, this favourable situation first needs to be defined. Member States are therefore encouraged to define "favourable reference values", to be used as benchmarks in the assessment process.

(50) The status of species should be determined at biogeographical level in Member States (for overviews, national/regional strategies, targets and reporting purposes) and at population level[34] where appropriate (for defining requisite measures, management and derogations). In the case of transboundary populations and species that migrate across the frontiers of the EU, their overall natural range, including migration zones outside the EU, should be considered as well where this is feasible. Repeated or regular monitoring will give an indication as to the appropriateness and effectiveness of the conservation measures chosen.

---

[32] DocHab-04-03/03 rev.3 "Assessment, monitoring and reporting of conservation status – Preparing the 2001-2007 report under Article 17 of the Habitats Directive".

[33] Member States are free to choose their means and methods of gathering data and to adapt monitoring methods to regional differences; however, a certain – voluntary – harmonisation over the medium to long term should be sought.

[34] Regarding the definition of 'population', a group of spatially separated populations of the same species which interact at some level (meta-populations) might be used as a biologically meaningful reference unit. This approach needs to be adapted to the species in question, taking account of its biology/ecology.

(51) Surveillance of the conservation status of animal species should provide valuable information and contribute to effective implementation of the Directive. Such information is also necessary for appropriately applying derogations under Article 16: in order to determine whether any actions would be detrimental to maintaining that species at a favourable conservation status, national authorities must have sufficient information available to assess the conservation status of the species, and to predict the likely effects of any proposed derogation.

(52) In addition to the surveillance of conservation status, there is an explicit obligation under Article 12(4) to establish a system to monitor the incidental capture and killing of Annex IV(a) species and, in the light of the information gathered, to take further research or conservation measures if required. Findings under this system should be incorporated in the overall lessons drawn from the surveillance of conservation status.

Summary: Good knowledge of a species (range/distribution, occurrence, biology, ecology, threats & sensitivity, conservation needs, etc.) and regular surveillance of its conservation status over time (as required in Article 11) are essential preconditions for any meaningful conservation strategy. Cooperation at EU level and transboundary cooperation might be essential for certain species. An EU framework for assessing conservation status was agreed by Member States in April 2005.

I.2.4.b) Appropriate and effective character of measures taken

(53) The Directive does not define in detail the concrete measures needed to fulfil the obligations arising from its various provisions and allows the Member States a certain margin of manoeuvre, or flexibility. The definition, adoption and implementation of such measures fall within the competence of national authorities. The Habitats Directive thus enables the Member States to implement its provisions in a **proportionate and appropriate** manner, an approach that underlies all the provisions of the Habitats Directive, including Articles 12 and 16. However, the discretionary power of Member States should respect some basic requirements.

(54) When it comes to interpreting provisions of a Directive, special attention must be given to the guiding principle laid down in Article 10 of the EC Treaty, which states that *"Member States shall take all appropriate measures, whether general or particular, to ensure fulfilment of the obligations arising out of this Treaty or resulting from action taken by the institutions of the Community. They shall facilitate the achievement of the Community's tasks."*

(55) Consequently, the maintenance or restoration of favourable conservation status has to be taken into consideration when establishing adequate measures for species protection and habitat conservation. Good scientific knowledge and surveillance of a species are preconditions for doing so. The circle is closed when the results of the surveillance of conservation status show that the measures chosen are actually appropriate and **effective** in the field.

(56) The measures taken by the Member States should adequately address the objective pursued, i.e. maintaining and restoring favourable conservation status, while also taking account of economic, social and cultural requirements and regional and local characteristics (Article 2(3)). Such measures will be proportionate where they enable the desired aim to be attained, are necessary for attainment of that aim and are appropriate in terms of the means used.

(57) In addition, it should be underlined that **a species-by-species approach** also needs to be adopted. The concrete targets to be achieved may differ significantly for each species, and can also evolve (e.g. due to better scientific knowledge). Member States should therefore always consider their implementation actions in the light of the intended objective, the species concerned and the circumstances of each case. Thus, a proportionate approach is not a static concept and becomes an important factor for the flexible implementation of species conservation. However, taking no measures at all on account of a species being in a good conservation status is not an option (see also chapter II.2.3).

(58) Flexibility and proportionality should thus not be misunderstood as concepts that reduce the obligations on Member States to act in an effective way, but need to be seen as providing room for authorities to adapt their way of implementation to the specific circumstances of each case (in conservation status terms, but also in social, economic and cultural terms). The implementation of a flexible and proportionate approach calls for the Member States to act within a clear framework of coordinated and effective measures, applied in a coherent[35] way with sufficient safeguards. According to the Court, *"Articles 12, 13 and 16 of the Habitats Directive form a coherent body of provisions intended to protect the populations of the species concerned"*[36]. Thus, such approaches need to respect the overall objective of the Directive, namely to ensure biodiversity and to maintain or restore, at a favourable status, natural habitats and species of Community interest[37].

(59) The following paragraphs are intended to explain the link between conservation status, the use of different instruments and their appropriateness and effectiveness.

(60) In general terms, surveillance or an initial assessment of conservation status can conclude that the status of a species is either favourable or unfavourable (classified in different grades). Based on the best available information, the Member States should then define — in accordance with the provisions of the Directive — the specific conservation measures needed to maintain (a favourable) or restore (an unfavourable) conservation status for each species.

(61) At this stage, the question as to **what types of measures are obligatory** under the Directive arises depending on the annex in which a species is listed. Chapter II will deal in more detail with the concept of 'requisite measures to establish a system of strict protection' under Article 12. At this point, it will only be noted that certain measures, though important or appropriate for a species, might not be required under the provisions of the Directive depending on the annex in which a species is listed in. In relation to the species protection section, it is important to recognise that proactive habitat management measures (such as restoration of habitats/populations, improvement of habitats) are not an obligation under Article 12, even though they might well be under Article 6. For example, if proactive biotope restoration is needed for a butterfly species listed only in Annex IV(a) because its habitat has nearly disappeared and only a larger habitat would ensure long-term survival, such a measure would not be covered by Article 12. Such situations could be avoided or corrected in the medium to long term by revision of the annexes or the Directive itself.

---

[35] Coherence in this context means that flexibility and proportionality cannot be applied only when this seems convenient (for example only when granting derogations) but must at the same time be applied to the requisite measures for the effective protection of species under the strict protection system, so that overall implementation is in line with the objectives of the Directive.

[36] Judgment of 20 October 2005, Commission v UK, Case C-6/04, ECR p.9017, paragraph 112, and judgment of 10 January 2006, Commission v Germany, Case C-98/03, ECR p.53, paragraph 66.

[37] If the Commission considers that such an approach does not comply with the Directive, it needs to prove that this is the case (see, for example, the judgment of 6 November 2003, Commission v UK, Case C-434/01, ECR p.13239, paragraph 21).

(62) Overall, the following main scenarios can be distinguished:

1. If the measures required for a specific species are obligatory under the Directive, there are two possible scenarios:

   - The Member State implements sufficient and verifiable measures to maintain or restore FCS, which is confirmed by the surveillance results; in that case, the measures and surveillance should be continued;

   - The Member State does not implement sufficient and verifiable measures to maintain or restore FCS. This means that it is not complying with its obligations, which normally constitutes an infringement of the Directive.

2. If the measures required for a species (or parts of it) are not obligatory under the Directive (e.g. active biotope restoration or reintroduction for a species exclusively listed in Annex IV), there are two possibilities:

   - The Member State implements voluntarily sufficient and verifiable measures to maintain or restore FCS, which is confirmed by the surveillance results; in that case, the measures and surveillance should be continued;

   - The Member State does not implement sufficient and verifiable measures to maintain or reach FCS. In such a case, the need for further action needs to be assessed, which might include modification of the annexes to the Directive if this is the appropriate way of ensuring FCS for a species. Modification of the annexes could involve adding a species listed only in Annex IV to Annex II or upgrading a species to priority status. If modification of the annexes is not likely to bring results, more far-reaching adaptations or additional instruments might be considered[38].

(63) This demonstrates the importance of designing appropriate and effective measures in combination with a surveillance system to monitor the conservation status of species.

Summary: Measures taken by the Member States when implementing the provisions under the Directive should always be proportionate and appropriate to the objective pursued, i.e. maintaining and restoring favourable conservation status. The measures must be appropriate and effective on the ground. There might be some cases where appropriate measures are not obligatory under the Directive. Voluntary measures or adaptation of the Directive and its annexes may be envisaged in such cases.

[38] Annexes could also be modified to remove a species as well, since surveillance could reveal a species to be widely abundant.

APPROPRIATENESS AND EFFECTIVENESS OF MEASURES TAKEN

* Where monitoring shows that a species is in a favourable status with no need for measures to maintain this situation, and consequently no longer fulfils the criteria for Community interest, modification of the annexes (in this case, removal of the species) should be envisaged.

** This refers to the situation described in chapter 1.2.4.b.

II. ARTICLE 12

Text of Article 12
1. Member States shall take the requisite measures to establish a system of strict protection for the animal species listed in Annex IV (a) in their natural range, prohibiting: *(a) all forms of deliberate capture or killing of specimens of these species in the wild;* *(b) deliberate disturbance of these species, particularly during the period of breeding, rearing, hibernation and migration;* *(c) deliberate destruction or taking of eggs from the wild;* *(d) deterioration or destruction of breeding sites or resting places.* *2. For these species, Member States shall prohibit the keeping, transport and sale or exchange, and offering for sale or exchange, of specimens taken from the wild, except for those taken legally before this Directive is implemented.* *3. The prohibition referred to in paragraph 1 (a) and (b) and paragraph 2 shall apply to all stages of life of the animals to which this Article applies.* *4. Member States shall establish a system to monitor the incidental capture and killing of the animal species listed in Annex IV (a). In the light of the information gathered, Member States shall take further research or conservation measures as required to ensure that incidental capture and killing does not have a significant negative impact on the species concerned.*

(1) As a part of the second pillar of Directive 92/43/EEC, Article 12 tackles the more specific question of the protection of Annex IV(a) species. Consequently, Article 12 places the emphasis on the direct threats faced by animal species listed in Annex IV(a) rather than the broader question of the conservation of their habitats — with the exception of 12(1)(d).

(2) Annex IV(a) encompasses a wide variety of species, from large, wide-ranging vertebrates to small invertebrates with very small home ranges. Some of these animal species benefit from the provisions of the section on 'habitat conservation' but others do not. In the case of species listed only in Annex IV, Article 12 is the main provision for achieving the conservation aim in Article 2.

(3) Before addressing the provisions of Article 12 in detail, it is worth recalling some general legal considerations that have previously been developed by the ECJ.

II.1. General legal considerations

(4) Effective implementation of Article 12 of Directive 92/43/EEC requires full, clear and precise transposition by Member States. According to established case law, "*the provisions of Directives must be implemented with unquestionable binding force and with the*

specificity, precision and clarity necessary to satisfy the requirements of legal certainty"[39]. For instance, a prohibition on using pesticides where this is likely to have seriously harmful effects on the balance of nature is not as clear, precise and strict as the prohibition of the deterioration of the breeding sites or resting places of protected animals as laid down in Article 12(1)(d)[40].

(5) According to the Court, the transposition of a Directive into domestic law does not necessarily require that its provisions be incorporated formally and verbatim in express, specific legislation; a general legal context may, depending on the content of the Directive, be adequate for the purpose, provided that it does indeed guarantee the full application of the Directive with sufficient clarity and precision[41]. Any provisions setting up a strict protection framework should specifically address the issue of Annex IV(a) species protection and meet the requirements laid down by Article 12. It should be observed that the Court[42] emphasised the importance of this question in the *Caretta caretta* case. When asked by the Court to identify, and submit the wording of, the specific provisions in force in their legal system which it believed met the requirements laid down by Article 12, "*the Greek Government merely listed a series of laws, regulations and administrative measures without referring to any specific provisions capable of meeting those requirements.*" In consequence, given the specific character of Article 12, legislative or administrative provisions of a general character, e.g. a mere repetition of the wording of Article 12 in national legislation, may not always satisfy the requirements of species protection and guarantee the effective implementation of Article 12. The formal transposition of Article 12 into national legislation may not always guarantee its effectiveness and may need to be complemented by further implementing provisions to ensure strict protection based on the particularities, specific problems and threats faced by species or groups of species.

(6) When transposing the Directive, Member States must respect the meaning of terms and concepts used by the Directive so as to ensure uniformity in its interpretation and application[43]. This also implies that national transposition measures should guarantee the full application of the Directive without modifying its terms, selectively applying its provisions or adding supplementary conditions or derogations not provided for in the Directive[44]. As the Court has observed, *"faithful transposition becomes particularly important in an instance such as the present one, where management of the common heritage is entrusted to the Member States in their respective territories… It follows that, in the context of the Habitats Directive, which lays down complex and technical rules in the field of environmental law, the Member States are under a particular duty to ensure that their legislation intended to transpose that directive is clear and precise"*[45].

(7) For instance, the transposition of Article 12(1)(d) prohibiting the deterioration or destruction of breeding sites and resting places that are "*clearly perceptible*" or "perfectly *known and identified as such*" or prohibiting only the deliberate deterioration or destruction

---

[39] See in particular the judgment of 20 October 2005 (Commission v UK, Case C-6/04, ECR p.9017, paragraph 27), but also the following judgments: 30 May 1991, Commission v Germany, Case C-59/89, ECR p.2607, paragraphs 18 and 24; 19 May 1999, Commission v France, Case C-225/97, ECR p.3011, paragraph 37; 17 May 2001, Commission v Italy, Case C-159/99, ECR p.4007, paragraph 32.

[40] See the judgment of 10 January 2006, Commission v Germany, Case C-98/03, ECR p.53, paragraphs 67-68.

[41] For instance: judgment of 20 October 2005, Commission v UK, Case C-6/04, ECR p.9017, paragraph 21.

[42] See paragraph 29 of the judgment in Case C-103/00.

[43] For instance: judgment of 28 March 1990, Criminal proceedings against G. Vessoso and G. Zanetti, joined cases C-206 and 207/88, ECR p.1461.

[44] Judgment of 13 February 2003, Commission v Luxembourg, Case C-75/01, ECR p.1585, paragraph 28.

[45] See for instance the judgment of 20 October 2005, Commission v UK, Case C-6/04, ECR p.9017, paragraphs 25-26 and the judgment of 10 January 2006, Commission v Germany, Case C-98/03, ECR p.53, paragraphs 59-60.

of breeding sites or resting places[46] modifies the substance of Article 12(1)(d) and limits its scope of application. The same goes for the exemption of lawful acts from the application of Article 12(1)(d). This kind of transposition is therefore incompatible with Article 12(1)(d).

(8) In addition, "*mere administrative practices, which by their nature may be changed at will by the authorities, cannot be regarded as constituting proper compliance with the obligation on Member States to which a Directive is addressed, pursuant to Article 189 of the Treaty*"[47]. It has to be stressed that the existence of national case law alone, with no specific legal provision, cannot be considered as properly complying with the obligation to fully transpose a Directive.

Summary: Effective implementation of Article 12 requires full, clear and precise transposition by Member States. The provisions in their laws must be specific enough to be capable of meeting the requirements of the Directive.

The *Caretta caretta* Judgment

The judgment of 30 January 2002 in the *Caretta caretta* case (Commission versus Greece, Case C-103/00) was the first judgment on the application of Article 12 of the Habitats Directive (Directive 92/43/EEC) for a specific species. The Court had never given an interpretation on its application and scope prior to this judgment.

The loggerhead sea turtle (*Caretta caretta*) is listed in Annexes II and IV to Directive 92/43/EEC as a species of Community interest in need of strict protection. Laganas Bay on the island of Zakynthos is the most important breeding site for this turtle in the Mediterranean and has also been proposed as a Site of Community Importance for the Natura 2000 network.

In 1998, a number of non-governmental organisations exposed the deterioration in the conditions for this species of sea turtle on Zakynthos. The main problems were uncontrolled use of the island's beaches and the surrounding sea for tourism-related activities, including, among other things, the erection of illegal buildings, the use of mopeds on beaches and other activities with potential negative impacts on these turtles. The Commission called on the Greek authorities to provide information on the measures taken to protect the species on this island. Based on this information and the findings of Commission officials on missions, an infringement procedure under Article 226 of the Treaty was initiated on the grounds that Greece had failed to fulfil its obligations under Article 12(1)(b) and (d) of the Habitats Directive. In the course of the pre-litigation procedure, the Greek authorities maintained that all the appropriate measures to ensure the protection of the turtle had been taken or were in the process of being adopted and implemented.

After an updated assessment of the situation by the Commission services in 1999, it was still found to be inadequate and the case was referred to the Court of Justice. More specifically, the Commission alleged that Greece had contravened this Article, firstly by not adopting a legal framework designed to ensure the strict protection of *Caretta caretta* against any deliberate disturbance during its breeding period and against any deterioration in, or destruction of, its breeding sites and secondly by not taking any concrete, effective measures on the ground to avoid such problems.

[46] See also the Court judgment of 20 October 2005, Commission v UK, Case C-6/04, ECR p.9017, paragraph 79.

[47] For example: judgment of 23 February 1988, Commission v Italy, Case 429/85, ECR p.843, paragraph 12; judgment of 11 November 1999, Commission v Italy, Case C-315/98, ECR p.8001, paragraph 10; judgment of 13 February 2003, Commission v Luxembourg, Case C-75/01, ECR p.1585, paragraph 28.

On 30 January 2002, the Court accepted the Commission's arguments and condemned Greece for its failure to establish and implement an effective system of strict protection for the sea turtle *Caretta caretta* on Zakynthos. In particular, the Greek authorities had not taken the requisite measures to avoid disturbance of the species during its breeding period and activities that may bring about deterioration or destruction of its breeding sites.

II.2. Requisite measures for a system of strict protection

(9) Article 12 of Directive 92/43/EEC obliges Member States to take requisite measures to "establish and implement an effective system of strict protection"[48] for the animal species listed in Annex IV(a) in their natural range. This wording leads to several questions as regards the definition of certain terms.

(10) The Directive, while clearly setting out the prohibitions, does not define in detail the "requisite" measures for their implementation and for the establishment of a "system" of strict protection for each of the species concerned. The interpretation and implementation of Article 12(1)(a) to (d) should take into account the aim of the Directive as laid down in Article 2. Article 12 should not be interpreted as requiring the adoption of pro-active habitat management measures, such as for example the restoration or improvement of habitats for certain species. Thus, the Directive gives a certain margin of manoeuvre to the Member States, which are responsible for defining, adopting and implementing the requisite measures establishing a "system" of strict protection for each of the animal species listed in Annex IV(a). However, the discretionary power of Member States is subject to some limitations and should respect some basic requirements.

II.2.1. Measures to establish and effectively implement a system of strict protection

(11) The Commission considers that the full and effective application of Article 12 requires, on the one hand, the establishment of a coherent legal framework, i.e. the adoption of specific laws, regulations or administrative measures to effectively prohibit the activities indicated in Article 12(1), and, on the other hand, the application of concrete measures to enforce these provisions on the ground for the protection of Annex IV(a) species.

(12) The Court also adopted this approach in Cases C-103/00 (concerning the protection of *Caretta caretta* in Zakynthos[49]), C-518/04 (concerning the protection of *Vipera schweizeri* in Milos[50]) and C-183/05 (concerning the protection of several Annex IV species in Ireland[51]). In particular, in Case C-103/00, the Advocate General provided a detailed analysis of the significance and scope of the concept of "system of strict protection".

(13) This concept is fundamental for the application of Article 12. In the *Caretta caretta* case, the Court declared that Greece had failed to fulfil its obligations under 12(1) of Directive 92/43/EEC, since it had failed to take "*the requisite measures to establish and implement an effective system of strict protection for the sea turtle Caretta caretta on Zakynthos to avoid disturbing the species during its breeding period and to avoid activities which may deteriorate or destroy its breeding sites*." Thus, full application of Article 12

[48] See the judgment of 30 January 2002, Commission v Greece, Case C-103/00, ECR p.1147.

[49] Judgment of 30 January 2002, Commission v Greece, Case C-103/00, ECR p.1147. See also the judgment of 17 January 1991, Commission v Italy, C-157/89, ECR p.57 (in particular paragraph 14), which concerns Article 7 of Directive 79/409/EEC.

[50] Judgment of 16 March 2006, Commission v Greece, Case C-518/04, ECR p.42.

[51] Judgement of 11 January 2007, Commission v Ireland, Case C-183/05, not yet published in the ECR.

requires the establishment and implementation of a system of strict protection which effectively prohibits the activities indicated in Article 12(1).

(14) To summarise the above, an adequate system of strict protection for Annex IV(a) species consists in **a set of coherent and coordinated measures of a preventive nature**. This results directly from the term "system" and also takes account of the need to establish a link between the adopted measures and the objectives of Article 12 and the Directive in general. These measures must contribute to the aim of maintaining the species in the long term or restoring its population in its habitat and must be **effectively enforced**.

(15) Moreover, this interpretation is borne out by recitals 3[52] and 15[53] of the Directive, which refer to the encouragement of human activities and to management measures with a view to maintaining or restoring species at a favourable conservation status. Of course, the recitals themselves do not have any binding legal effect and can never override the substantive provisions of the Directive. The Court does not use the preamble to directly ground a judgment. However, the preamble is often used as an aid in interpreting the substantive provisions of secondary legislation[54].

(16) The need for coherent and coordinated measures of a preventive nature in order to implement the requirement for the strict protection of Annex IV(a) species does not necessarily imply the establishment of new structures or authorisation procedures at national level. Regarding projects that may affect an Annex IV species, **Member States can adapt existing planning procedures to meet the requirements of Article 12.** This means that assessment of the impact on species can be built into the appraisals that form part of existing decision-making processes at various levels in a Member State, including e.g. land-use planning decisions. With regard to ongoing activities, all Member States will most likely employ planning procedures, regulations or best practice codes, which could then be used as tools to implement Article 12 provisions.

Summary: The full and effective application of Article 12 requires, on the one hand, the establishment of a legal framework of coherent and coordinated measures and, on the other, the application of concrete, coherent and coordinated measures to enforce these provisions on the ground effectively.

II.2.2. Measures to ensure favourable conservation status

(17) The interpretation of Article 12 has to take into consideration the objective of Directive 92/43/EEC[55] set out in Article 2, which applies, without distinction, to all Annexes. Consequently, strict protection measures adopted under Article 12 should aim to fulfil the main objective of the Directive by contributing to the maintenance or restoration, at favourable conservation status, of Annex IV(a) species of Community interest, while taking into account economic, social and cultural requirements and regional and local characteristics.

---

52 "Whereas the maintenance of such biodiversity may in certain cases require the maintenance, or indeed the encouragement, of human activities."

53 "Whereas a general system of protection is required for certain species of flora and fauna to complement Directive 79/409/EEC; whereas provision should be made for management measures for certain species, if their conservation status so warrants, including the prohibition of certain means of capture or killing, whilst providing for the possibility of derogations on certain conditions".

54 For example, judgment 28 February 1991, Commission v Germany, Case C-57/89, ECR p.883.

55 See chapter I.2.1.

(18) Furthermore, Article 12 has to be interpreted in the light of Article 1(i), which defines the favourable conservation status of a species. In addition, the measures taken by the Member States should be appropriate with a view to attaining the objective of maintaining or restoring the conservation status of a species. This implies that the measures to be taken must be decided depending on the particular circumstances of each situation and taking into account the specificity of each species. For instance, the characteristics of a species, such as its conservation status, may justify more specific or intense protection measures.

Summary: Strict protection measures adopted under Article 12 must contribute to fulfilling the main objective of the Directive, namely maintaining or restoring a favourable conservation status.

II.2.3. Measures regarding the situations described in Article 12

(19) The scope and type of measures taken to establish a system of strict protection are circumscribed by the content of the prohibitions and other obligations in Article 12 (see also chapter II.3). Consequently, the measures taken must relate to actions that threaten the species (12(1)(a)-(c), 12(2), 12(4)) or defined elements of their habitats (Article 12(1)(d)). Article 12 does not, in itself or in conjunction with Article 2, oblige Member States to take proactive habitat management measures. What is required are measures to effectively implement the prohibitions of Article 12.

(20) It is obvious that different types of measures may be required to address each specific species listed in Annex IV and each specific situation. In addition, as already stated in chapter II.1, mere repetition of the wording of Article 12 in national legislation may not always satisfy the requirements of species protection. The transposition of Article 12 into national legislation should guarantee its effective implementation. Based on the particularities, specific problems and threats faced by species or groups of species, Member States should adopt provisions specifically for their protection. It is the responsibility of national authorities to define the measures necessary to implement the prohibitions of Article 12 and to ensure the strict protection of animal species. The nature of these measures will depend on each national system.

(21) However, for some species and in some situations, the adoption and implementation of purely prohibitive measures may not be sufficient, and may not guarantee effective implementation of Article 12. In such cases, Article 12 requires the adoption and implementation of preventive measures. It is also evident from the wording of Articles 12 and 1(i), and from the objective of "maintaining" a favourable conservation status, that Member States are bound by their obligations under Article 12 even before any reduction in numbers of the species has been confirmed or the risk of this protected species disappearing has become a reality[56]. Even if a species has a favourable conservation status and is likely to have this in the foreseeable future, Member States should take preventive measures to protect the species by effectively prohibiting the activities indicated in Article 12.

(22) This view was supported in Cases C-103/00, C-518/04 and C-183/05, where the Court stressed the importance of the preventive character of the measures taken[57]. The Court rejected the Greek Government's argument that a decrease in the number of nests needed to be proved in order to demonstrate the absence of strict protection for *Caretta*

[56] See in particular paragraph 43 of the Advocate General's opinion and paragraph 31 of the *Caretta caretta* judgment, as well as paragraph 21 of the *Vipera schweizeri* judgment.

[57] This solution had already been applied in the Santoña case (judgment of 2 August 1993, Commission/Spain, Case C-355/90, ECR, p.4221, paragraph 15).

caretta. According to the Court *"the fact that it does not appear that the number of nests of that species has decreased over the last 15 years does not, of itself, call this finding into question"*, i.e. the absence of a system of strict protection for *Caretta caretta*. The same goes for arguments such as the good state of the environment or the stability of a species population. It clearly follows that the measures to be taken under Article 12 should not be purely prohibitive but should also be of a preventive nature.

(23) Such an approach is also founded on Article 174 of the EC Treaty, according to which "*Community policy on the environment shall aim at a high level of protection*", and is based on the precautionary principle and on the principle that preventive action should be taken. Preventive measures anticipate the threats and risks a species may face and are particularly important in preventing deterioration or destruction of breeding sites or resting places of Annex IV(a) species (Article 12(1)(d)). Preventive measures that at the same time ensure effective implementation of the prohibitions in Article 12 "on the ground" could include for example:

- information campaigns to raise awareness among a general or targeted public (e.g. landowners, etc.) of the protection requirements for certain species;
- action to have species protection considerations taken into account by relevant economic sectors interfering with Annex IV species (e.g. agriculture, forestry) to avoid the negative impacts of certain land-use practices. This could include training, codes of conduct, guidance documents, or the adaptation of forestry or agricultural plans and best practice or administrative procedures.
- active prevention of likely disturbances (e.g. restricting access to bat caves during sensitive periods to avoid disturbance or vandalism)
- inspections
- preparation of national conservation plans, which could set out in detail the measures mentioned above and provide practical guidance to local/regional authorities, affected interest groups, etc. in effectively implementing provisions for specific species

National Species Action Plans in Sweden

Sweden has put forward about 120 National Action Plans for threatened species that will be developed and initiated in the period 2003 – 2006. A National Action Plan (NAP) is not a legal document, but serves as guidance for authorities, organisations and landowners on important actions needed to conserve species and to review their ecology and present-day status. The NAP normally sets out the division of responsibility among relevant bodies.

The establishment of an NAP is coordinated by one of the 21 County Administration Boards. They normally do not write the plan themselves, but contract an expert (there is a guidance document on how to write NAPs and on the adoption procedure). When the Administration Board and the Swedish Environmental Protection Agency (SEPA) agree that there is a good draft available, the plan is circulated for consideration by relevant bodies and experts. Based on comments received, the plan is modified and finally adopted by the SEPA. The NAP normally includes a draft budget, provided by the SEPA and other bodies. SEPA's present annual budget (2005) for producing and implementing plans is about 6.5 million euros.

Main elements of a Swedish NAP:

- Formal decision by the Swedish EPA to adopt the NAP
- Time period, follow-up and review of the Plan
- Brief description of the species, their ecology and biology, and genetic aspects (if relevant)

- Distribution and conservation status
- Status in relation to national and international legislation and commitments
- Reasons for decline and identified threats
- Experiences from previous actions (if any)
- Vision for the future and gap analyses
- Short-term and long-term NAP objectives
- Priority measures to be taken
- Recommendations targeting municipalities, landowners and others
- Description of consequences to other species/habitats and conflicts of interests
- References
- Appendices (maps, diagrams, and a table with an overview of all agreed actions, actors, priorities, costs and finance)
- Summaries in Swedish and English

The plans, which usually cover a period of several years, are supported by yearly plans dealing with the concrete action to be undertaken. Approximately 40 NAPs have so far been established, e.g. for *Hyla arborea, Bombina bombina, Osmoderma eremita, Margaritifera margaritifera, Ursus arctos* and many others. The programme is ongoing, will probably gain a larger budget in the coming years, and is coupled with environmental objectives approved by the Swedish parliament.

Consequently, for some species, preventive measures would also form part of the "requisite measures" for the system of strict protection. They are not the same as proactive biotope management measures such as restoration or habitat improvement.

Summary: Measures to be taken under Article 12 are circumscribed by the content of the prohibitions and other obligations in Article 12. However, as national legislation should guarantee the effectiveness of Article 12, the formal transposition of Article 12 prohibitions may not be sufficient and Member States should define the measures necessary to implement the prohibitions of Article 12 and ensure the strict protection of species. In addition, for some species and in some situations, the adoption and implementation of preventive measures may be required. Preventive measures anticipate the threats and risks a species may face and are particularly important in preventing deterioration or destruction of the breeding sites or resting places of Annex IV(a) species.

II.2.4. Provisions of Article 12(1) (a)-(d) in relation to ongoing activities

(24) While the application of protection provisions can be clearly linked to development permitting procedures, for e.g. construction projects and infrastructure, ongoing activities such as **agriculture and forestry**[58], for example, pose a more complex set of issues. The majority of activities and practices in these sectors are not subject to prior approval or consent and it would be disproportionate to impose a comprehensive set of controls along these lines. It is also important to recognise the positive contribution that many traditional farming and forestry practices make to the creation and maintenance of some of Europe's most valued habitats (e.g. semi-natural grasslands such as hay meadows or species-rich *Nardus* grassland). The Directive does nevertheless apply to these sectors and Member States do therefore have to meet their obligations to protect the species concerned. This

[58] As very widespread activities, agriculture and forestry are looked at in detail in this chapter. However, while the level of statutory control over ongoing activities may vary, the principles set out in this chapter should be seen as generally applying to other ongoing activities as well (e.g. fisheries, tourism, maintenance activities, etc.)

does not necessarily mean that new structures or authorisation procedures should be introduced at national level. All Member States will most likely have planning procedures, regulations or best practice codes in place, and these tools could be adapted in order to apply Article 12 to ongoing activities. **Independently of the option chosen to apply Article 12 to ongoing activities (creation of a new mechanism or adaptation of existing mechanisms), Member States have to ensure that the strict protection requirements are adequately met.** As agriculture and forestry differ significantly on this point, they are discussed separately.

(25) As regards **agriculture**[59], a number of Member States opt for preventive measures to ensure Article 12 compliance, in part by developing **guidance and codes of conduct**. It is important to note that basic farming practice rules will include the protection of features — such as hedges, ponds, etc. — which are most likely to be the habitat of the species concerned. This approach is seen to be appropriate and effective in contributing to the protection of these species, providing a high chance of success. The range of species concerned is very wide, however, and in some cases Member States have thought it appropriate to produce more detailed species-specific guidance. The Directive nevertheless requires that such approaches and tools complement rather than replace formal legal protection, i.e. if these tools (e.g. codes of conduct, best practices) are ignored, there must be legal procedures in place in order to ensure an effective system of strict protection for animal species.

(26) In this context, it should be stressed that the occurrence of protected species in e.g. agricultural land is often the result of traditional land-use and farming practices, usually of an extensive nature. Where land-use practices are clearly supportive of the conservation status of a species under consideration, it is obvious that the continuation of such practices should be encouraged. Accidental disturbance or killing of individuals of the species concerned by such practices needs to be accepted in the interest of the population as a whole (applying proportionality to achieve the overall objective). Where however an ongoing land use (due to changes of practices, intensification, etc.) is clearly damaging to a species, leading to decreases in its population in the area, a Member State is required to find ways to avoid this.

The UK approach of integrating species protection in ongoing activities

In the UK, there are two "layers" for protecting species during ongoing activities: the first is legislative, the second comprises a range of good practice guidance available to farmers, foresters, building professionals, etc. By following good practice guidance, land managers should be able to continue their normal activities and at the same time avoid the deterioration or destruction of the breeding sites / resting places of Annex IV species. Maintaining or restoring optimum habitats for populations is seen as more important than the unintentional loss or disturbance of individuals that might occur as result of ongoing activities. By raising awareness of the possible presence of such species and by giving advice on action that land managers can take, the chances of offences against species are minimised.

[59] With respect to the relationship between agriculture and environment protection, the 2003 reform of the Common Agricultural Policy is significant in two key respects. Firstly, it has broken the link between Community subsidies and the productivity of farmland. The majority of farmers will now receive a Single Farm Payment no longer related to their productivity. The incentive for farmers to increase productivity will in future be solely determined by economic considerations set by market prices. Secondly, a condition for receiving Single Farm Payments and any other support from the CAP will be compliance with a number of environmental standards established in Community environment legislation (known as cross-compliance) and thus observance of a set of basic farming practice rules.

Government agencies in the UK consequently provide a range of practical guidance on protected species aimed at informing property managers. This ranges from simple general guidance (e.g. on newts on farmland) to comprehensive conservation handbooks (e.g. for the dormouse *Muscardinus avellarnarius*). It is disseminated via the internet or as leaflets to people managing farms, forests or even buildings that host protected species, for example information brochures such as 'Great crested newts on your farm', 'Woodland management for bats' and 'Bats in buildings'.

The guidance provides land-owners with

1. information on how to know if a listed species inhabits the property
2. a simple description of the species concerned, supported by illustrations
3. information on the biology and ecological requirements of the species
4. a simple description of the annual life cycle and relationship with the annual management practices of interest to land managers
5. advice on how to prevent damage to species and their habitats and how ongoing activities might be adjusted to favour species protection
6. information on the need for some management operations to have a licence and where to apply for it
7. examples of concrete activities that are damaging to species
8. information on the legal protection status and possible legal consequences in cases where the law might be breached
9. essential contact information on who can help and give advice
10. information on grant schemes available (Environmental Stewardship)

(27) Applying Article 12 to **forestry** is, in some respects, more complex in that it is more likely that the trees to be harvested are themselves the habitat (breeding site/resting place) of some of the species concerned. The specific characteristics of the sector, i.e. the long production cycles and consequently the need for long-term planning add to the special challenges of species conservation. In the search for sustainable forest-management practices, which are consistent with conservation requirements, a variety of approaches have been developed in different Member States to address the issue. Existing approaches vary from detailed forestry planning and prior approval of forest management plans, or general codes of practice, to the pre-notification (see Finnish example below) of felling proposals to permit environmental authorities to intervene where known populations of protected species may be involved. As in the case of agricultural practices, these preventive approaches can ensure the protection of the species concerned, provided that they are communicated effectively and are implemented with good will and sufficient resources. A particular economic incentive to follow such approaches is in fact provided by the growing prevalence of forest certification schemes, which require compliance with environmental protection requirements including biodiversity and species protection (the approaches may of course need to be adapted to conform to the protection requirements of Annex IV species). However, such approaches do not provide an absolute guarantee, except where full prior approval of forest management plans is required, and must (as indicated above) be supported by a legal protection regime as required by the Directive.

Species protection in ongoing forestry management in France

In France, ongoing forestry practices are regulated in both public and private forests. A law adopted in 2001 provides that the management of forests must be sustainable and must guarantee the preservation of biodiversity. The implementation of this law is supported by different types of management plans and codes of good practice depending on whether a

forest is private or public and depending on its size. These documents are approved by the administrative authorities and take full account of protected habitats and species. However, these documents do not stand alone: they are accompanied by awareness-raising, information and training of forest owners and managers so that they can make an active contribution to the implementation of Article 12. Coherent cooperation between the different levels (national, regional, local) is also ensured by planning, information and guidance instruments.

The French forestry plans go beyond the protection of current species occurrences and habitats: they also target the long-term viability of species populations, taking into account their conservation needs over time as well as space. Two examples illustrate this:

Certain bat species need large areas of forest to survive in the long term. A bat-sensitive forest management therefore needs to provide — over a longer-term perspective — the structures needed and other requirements for a sufficiently large habitat, while at the same time allowing for the use and renewal of the forest. Consequently, local, mostly unavoidable deterioration or destruction of bat habitats during the exploitation of single parcels of forests will — due to the overall planning, codes of good practice and safeguards applying on a broader scale to the woodland as a whole — not have any influence on the conservation status of the species in the woodland as such. This situation was confirmed in a special study carried out in the "Rambouillet" forest near Paris.

Another example is the wood-boring beetle *Rosalia alpina*, which inhabits mature broadleaf trees in mountainous forests. During its larval development, it is virtually impossible to detect the presence of the insect in a tree. It is therefore more or less unavoidable that breeding sites and resting places of the beetle will be destroyed during forest exploitation. The management of this species, as laid down in the management plan, therefore targets the long-term preservation of a network of islands with trees likely to be used by the beetle in order to guarantee the conservation status of the species.

(28) The conclusion that can be drawn is that ongoing activities should best be guided so as to avoid conflicts with the species protection provisions in the first place. Tools such as planning instruments, systems of prior consent, codes of conduct and concrete information or guidance are options here. Such measures should:

a) form part of the "requisite measures" needed under Article 12 to "establish and implement an effective system of strict protection",
b) incorporate the strict protection requirements,
c) offer flexibility, i.e. while recognising that absolute protection for all individuals of a species cannot be guaranteed, ensure that any harmful action takes full account of the conservation needs of the species/population concerned,
d) have the advantage that they potentially protect the person engaging in an activity (i.e. from prosecution) as long as the person adheres to these measures.
e) be accompanied by a legal framework for strict protection which ensures adequate enforcement by the regulatory authorities in the case of non-compliance (legal certainty aspects are met)
f) help define appropriate levels of surveillance (required under Article 11 of the Directive) and determine how these should be funded,
g) be in line with Article 2(3) by taking account of economic, social and cultural requirements.

Integrating flying squirrel protection in Finnish forestry

In June 2004 a new legislative protection system was established in Finland to enhance the protection of the breeding sites and resting places of the flying squirrel *(Pteromys volans)*. Under the Forestry Act, a forest owner must notify the regional forest authorities before cuttings take place. The notification must include a map and a short description of planned cuttings. All known breeding and resting places of the squirrel are stored in a database. If a planned cutting site matches information in the database, a formal decision is taken by the environmental authorities. The landowner, the forest company concerned and the regional forest authority are informed. The decision includes a detailed description of the site and a map indicating the location of the breeding sites and resting places. It also lays down what measures, if any, are allowed.

The experience so far shows that there are some problems, such as time-consuming procedures, diverse technical problems, and scientific problems especially in identifying the breeding and resting places, and that the system needs to be improved. On the other hand, it is already evident that the system has improved cooperation and the exchange of information and data between the forest authorities and environment authorities and that it provides landowners with more accurate and updated information on the species they have an obligation to protect. The ecological and economic effects of the system need to be assessed in the near future.

A lot of Member States have used voluntary measures, such as agro/forestry environmental measures under rural development regulation, to support the implementation of Article 12. Such measures have the potential to successfully combine the preventive approach with (voluntary) proactive habitat management.

Developing measures for species protection under rural development regulation & LIFE-nature

The occurrence of large predators protected by the Habitats Directive can sometimes lead to conflicts with farmers and foresters. A characteristic of these large predators is their mobility within very large territories, usually beyond specific Natura 2000 sites designated for them. Large predators may have an impact on ongoing activities, mainly livestock farming (e.g. sheep herding), due to predation. These protected species are widely known by farmers and the need to protect them due to their continuously decreasing numbers is also well communicated and documented. Actions to mitigate the impacts of these species on ongoing activities have been examined for many years. Several measures have been tested with support from the LIFE-nature programme[60] and put in place with support from agri-environmental projects to prevent damage, such as the installation of electric fences, the provision of sheepdogs to watch over herds, the provision of natural prey, improvement of the habitat and feeding possibilities within this habitat, etc., and/or to provide compensation for damage encountered.

Measures of this type have been included in the rural development plans of some Member States. For example, Greece's rural development plan includes the following measures:
1. acquiring and using sheep dogs in areas where wolf and bear are present;
2. installing and maintaining electric fences to protect crops and hives in areas with bears;

[60] For details on LIFE-nature and the projects funded by this programme, please go to http://ec.europa.eu/environment/life/life/nature.htm

3. cultivation of special plots of cereals or fruit trees by farmers to provide food resources for (among others) bears.
These voluntary measures aim at preventing damage from large carnivores, complementing national legislation that prohibits all kinds of actions that have a negative effect on the species, like killing, trapping, baits, etc. Similar measures are included in the rural development programmes of various French regions with populations of large predators.

These positive examples of practices that contribute to species management and protection can in some cases also entail some negative impacts for other protected species in Annex IV, which might be locally disturbed. However, looking at the overall picture, such measures contribute to the protection of Annex IV species and also to good pastoral management.

Summary: For ongoing activities, such as agriculture or forestry, the challenge is to apply the species protection provisions of Article 12 using appropriate means in order to avoid conflicts in first place. The use of tools such as planning instruments, codes of conduct and concrete information/guidance are options here and potentially can satisfy the specific conservation needs while taking into account economic, social and cultural requirements. However, these tools need to be accompanied by a legal framework for strict protection which ensures adequate enforcement by the regulatory authorities in cases of non-compliance.

II.3. The specific protection provisions under Article 12

II.3.1. Deliberate capture or killing of specimens of Annex IV(a) species

(29) Article 12(1)(a) prohibits all forms of deliberate capture or killing[61] of specimens of these species in the wild. In accordance with Article 12(3), this prohibition applies to all stages of life of the animals. According to Article 1(m), *"specimen means any animal or plant, whether alive or dead, of the species listed in Annex IV and Annex V, any part or derivative thereof, as well as any other goods which appear, from an accompanying document, the packaging or a mark or label, or from any other circumstances, to be parts or derivatives of animals or plants of those species."*

(30) This prohibition is important as it is linked with the population of a species (its size, dynamics, etc.), which constitutes one of the criteria under Article 1(i) for assessing the conservation status of a species. Killing or capture may lead to an immediate, direct (quantitative) decline in a population, or could have other more indirect (qualitative) negative effects. The prohibition covers deliberate capture or killing, not incidental capture or killing, which falls under Article 12(4).

(31) In Case C-103/00, the Court referred to the element of "intent", observing that: "*the use of mopeds on the breeding beaches was prohibited and notices indicating the presence of turtle nests on the beaches had been erected. As regards the sea area around Gerakas and Dafni, it had been classified as an absolute protection area and special notices had been erected there.*" Despite the information available to the public on the need to protect these

[61] In its judgment of 18 May 2006 (Commission v Spain, case C-221/04, ECR p.4515, paragraph 69) the Court clarified that it is clear from a reading of the different language versions that "deliberate" refers to both the capture and killing of protected animal species.

areas, the persons on the beach committed the infringements[62]. This constituted a failure of enforcement. Thus, the Court "*seems to interpret the term 'deliberate' in the sense of conscious acceptance of consequences*"[63].

(32) In Case C-221/04[64], the reasoning of the Court was more specific. In that case, the Commission brought an action before the Court because, due to the authorisation by the authorities in Castilla y León of snares in several private hunting areas, Spain had failed to comply with Article 12(1)(a) as regards the protection of the otter (*Lutra lutra*). The Court recalled the findings of the *Caretta caretta* case and stated that ***"for the condition as to 'deliberate' action in Article 12(1)(a) of the directive to be met, it must be proven that the author of the act intended the capture or killing of a specimen belonging to a protected animal species or, at the very least, accepted the possibility of such capture or killing"***[65]. This is used as a "requisite criterion" by the Court, which in the present case found that the contested permit related to fox hunting and accordingly was not in itself intended to allow the capture of otters. In addition, the Court stressed that the presence of otters in the area concerned had not been formally proven, so that it had also not been established that the Spanish authorities knew that they risked endangering otters by issuing the contested permit for fox hunting. Thus, the Court concluded that the requisite criteria for determining that the capture or killing of a specimen belonging to a protected animal species was deliberate had not been met[66].

(33) On the basis of the approach taken by the Court in cases C-103/00 and C-221/04, the following definition could be proposed: **"Deliberate" actions are to be understood as actions by a person who knows, in light of the relevant legislation that applies to the species involved, and the general information delivered to the public, that his action will most likely lead to an offence against a species, but intends this offence or, if not, consciously accepts the foreseeable results of his action.** In other words, not only a person who fully intends to capture or kill a specimen of an animal commits an offence: an offence is also committed by a person who might not intend to capture or kill a specimen but is sufficiently informed and aware of the consequences his action will most likely have and nevertheless performs the action, leading to the capturing or killing of specimens (e.g. as an unwanted but accepted side-effect), with reckless disregard of the known prohibitions (conditional intent). It goes without saying that negligence is not included in the meaning of "deliberate".

(34) Therefore, it would seem appropriate to alert the public, or other more limited categories of people (e.g. certain categories of land users) who are likely to interfere with a species in Annex IV(a), to the prohibitions that apply to listed species using appropriate means. The public relations work of the Scottish Natural Heritage in relation to bats is an example of this (see http://www.snh.org.uk, publications on bats). The beach notices in the *Caretta caretta* case constitute another.

---

62 In Case C-103/00, the Court emphasised the fact that both the driving of mopeds and the presence of small craft were not isolated occurrences. In practical terms, it seems that, in the case of *Caretta caretta*, the repeated character of the violations was decisive in proving the existence of deliberate disturbance.

63 See paragraph 118 of the Advocate General's Opinion in Case C-6/04.

64 Judgment of the Court of 18 May 2006, Commission v Spain, Case C-221/04, ECR p.4515.

65 See paragraph 71 of the judgment.

66 See paragraphs 72-74 of the judgment.

Summary: Article 12(1)(a) prohibits all forms of deliberate capture or killing of specimens of Annex IV(a) species in the wild. The term "deliberate" has to be interpreted as going beyond "direct intention". A person who is reasonably expected to know that his action will most likely lead to an offence against a species, but intends the offence or, if not, at least accepts the results of his action, commits an offence. Good information and guidance by the competent authorities seem an appropriate way of implementing these provisions.

II.3.2. Deliberate disturbance of Annex IV(a) species, particularly during periods of breeding, rearing, hibernation and migration

(35) Article 12(1)(b) prohibits the deliberate disturbance of Annex IV species especially during periods of breeding, rearing, hibernation and migration, where the species are more vulnerable[67]. Under Article 12(3), moreover, this prohibition applies to all stages of life of the animal species concerned.

II.3.2.a) Disturbance

(36) Neither Article 12 nor Article 1 of Directive 92/43/EEC contains a definition of the term "disturbance". Article 6 guidelines[68] contain some useful information on the term in relation to habitats. If we apply the Commission services' guidelines to Article 12, we may observe the following:

(37) Disturbance (e.g. by noise, source of light) does not necessarily directly affect the physical integrity of a species but can nevertheless have an indirect negative effect on the species (e.g. by forcing them to use lots of energy to flee; bats, for example, when disturbed during hibernation, heat up as a consequence and take flight, so are less likely to survive the winter due to high loss of energy resources). The intensity, duration and frequency of repetition of disturbances are important parameters when assessing their impact on a species. Different species will have different sensitivities or reactions to the same type of disturbance, which has to be taken into account in any meaningful protection system. Factors causing disturbance for one species might not create disturbance for another. Also, the sensitivity of a single species might be different depending on the season or on certain periods in its life cycle (e.g. breeding period). Article 12(1)(b) takes into account this possibility by stressing that disturbances should be prohibited particularly during the sensitive periods of breeding, rearing, hibernation and migration. Again, a species-by-species approach is needed to determine in detail the meaning of "disturbance".

(38) The disturbance under Article 12(1)(b) must be deliberate (see chapter II.3.1) and not accidental. On the other hand, while "disturbance" under Article 6(2) must be significant, this is not the case in Article 12(1), where the legislator did not explicitly add this qualification. This does not exclude, however, some room for manoeuvre in determining what can be described as disturbance. It would also seem logical that for disturbance of a protected species to occur a certain negative impact likely to be detrimental must be involved.

---

[67] In Case C-75/01 (judgment of 13 February 2003, Commission v Luxembourg, Case C-75/01, ECR p.1585, paragraphs 53-54), the Court declared that Luxembourg had failed to ensure the full and complete transposition of Article 12(1)(b), since deliberate disturbance of species was not prohibited during the period of migration.

[68] "Managing Natura 2000 sites - the provisions of Article 6 of the Habitats Directive 92/43/EEC"; see, in particular, points 3.4, 3.5 and 3.6.2.

(39) In order to assess a disturbance, consideration must be given to its effect on the conservation status of the species at population level and biogeographic level in a Member State (see also chapter III.2.3.a on "Scale of assessment"). For instance, any disturbing activity that affects the survival chances, the breeding success or the reproductive ability of a protected species or leads to a reduction in the occupied area should be regarded as a "disturbance" in terms of Article 12. On the other hand, sporadic disturbances without any likely negative impact on the species, such as for example scaring away a wolf from entering a sheep enclosure in order to prevent damage, should not be considered as disturbance under Article 12. Once again, it has to be stressed that the case-by-case approach means that the competent authorities will have to reflect carefully on the level of disturbance to be considered harmful, taking into account the specific characteristics of the species concerned and the situation, as explained above.

(40) On the question of deliberate disturbance of a species during the breeding period, concerning *Caretta caretta* in Zakynthos, the Court analysed, on a case-by-case basis, the various activities on the breeding beaches with a view to establishing the causal link between these activities and the disturbance of the species. It found, first of all, that driving mopeds on a breeding beach of *Caretta caretta* was likely to disturb this species, mainly because of the noise nuisance, particularly during the egg-laying, incubation and hatching period and when the young turtles were making their way out to sea. Lastly, according to the judges, it was clear that the presence of small craft close to the breeding beaches constituted a threat to their lives and well-being.

Summary: Disturbance need not directly affect the physical integrity of a species but can nevertheless have a direct negative effect. Disturbance is detrimental for a protected species e.g. by reducing survival chances, breeding success or reproductive ability. A species-by-species approach needs to be taken as different species will react differently to potentially disturbing activities.

II.3.2.b) Periods of breeding, rearing, hibernation and migration

(41) The periods of breeding, rearing, hibernation and migration are considered as especially sensitive periods in relation to disturbance. There is, however, no definition of these terms in the Habitats Directive. Nevertheless, similar terms (e.g. "period of reproduction", "return to the breeding areas"[69]) are used in the Birds Directive, where they are defined in the context of birds. As Annex IV(a) includes a much wider range of species, which are very different ecologically, biologically and behaviourally, it is necessary to use, once more, a "species-by-species" approach when defining periods of breeding, rearing, hibernation and migration (where those periods apply at all).

(42) Period of breeding and rearing:

This period may include (where applicable) the period of courtship, mating, nest construction or selection of egg-laying or parturition[70] site, parturition or egg laying, or production of offspring where reproduction is asexual, egg development and egg hatching, and rearing of young.

(43) Period of hibernation:

[69] 'Guidance document on hunting under Council Directive 79/409/EEC on the conservation of wild birds' (to be found under http://www.europa.eu.int/comm/environment/nature/home.htm).

[70] Parturition – act of giving birth.

Hibernation is a period of time when an animal becomes inactive and remains in a state of sleep, a torpid or resting state, usually during winter. Usually such a state is accompanied by a lowered body temperature and slowed heartbeat and breathing. Hibernation allows an animal to survive harsh conditions by using less energy than if it were active (for example some bats, rodents, amphibians or reptiles)

(44) Period of migration:

Migration is the periodic movement of animals from one area to another as a natural part of their life cycle, usually in response to seasonal changes or changes in the food supply.

Summary: The periods of breeding, rearing, hibernation and migration are considered as especially sensitive periods in relation to disturbance. These periods can be defined only using a species-by-species approach, due to ecological, biological and behavioural differences between species.

II.3.3. Deliberate destruction or taking of eggs from the wild

(45) Under Article 12(1)(c), deliberate destruction or taking of eggs from the wild is proscribed. As it protects the eggs of species, this provision protects the species population and its viability in the long-term.

II.3.4. Deterioration or destruction of breeding sites or resting places

(46) Article 12(1)(d) is a stand-alone provision. Contrary to the other prohibitions of Article 12, it does not concern directly the species but protects important parts of their habitats, as it prohibits deterioration or destruction of breeding sites or resting places. In addition, while points (a), (b) and (c) of Article 12(1) use the term "deliberate", this is not the case as far as point (d) is concerned. This prohibition presents a number of issues that need further clarification.

II.3.4.a) Consequences of the word "deliberate" not being included in Article 12(1)(d)

(47) Under points (a), (b) and (c) of Article 12(1) only deliberate acts are prohibited and have to be avoided, whereas under point (d) a deliberate act is not required as a necessary precondition[71]. Article 12(1)(d) requires all acts resulting in deterioration or destruction of breeding sites or resting places to be prohibited irrespective of whether they are deliberate or not[72]. Apparently, the Community legislator has focused on the two important areas of breeding sites and resting places and decided that stricter measures are needed. The Court confirmed that "*by not limiting the prohibition laid down in Article 12(1)(d) of the Directive to deliberate acts, which it has done in respect of acts referred to in Article 12(1)(a) to (c), the Community legislature has demonstrated its intention to give breeding sites or resting*

[71] It is worth mentioning that this point constitutes one of the differences between Directive 92/43/EEC and the Bern Convention. While this specific part of Article 12 lacks the word "deliberate", the term appears in the comparable wording of Article 6 of the Bern Convention.

[72] In its judgment of 20 October 2005 (Commission v UK, Case C-6/04, ECR p.9017, paragraph 79), the Court observed that *"by prohibiting only the deliberate damaging or destruction of breeding sites or resting places of the species concerned, the legislation applicable in Gibraltar does not satisfy the requirements of Article 12(1)(d)".* The Court followed the same approach in its judgement of 11 January 2007 (Commission v Ireland, Case C-183/05, not yet published in the ECR, paragraph 47): *"by providing that acts which unintentionally interfere with or destroy breeding sites or resting places of wild species do not constitute an offence, section 23(7)(b) of the Wildlife Act does not satisfy the requirements of Article 12(1)(d) of Directive 92/43, which prohibits such acts, whether they are intentional or not*".

places increased protection against acts causing their deterioration or destruction. Given the importance of the objectives of protecting biodiversity which the Directive aims to achieve, it is by no means disproportionate that the prohibition laid down in Article 12(1)(d) is not limited to deliberate acts"[73].

(48) In criminal law, a distinction is made between intentional/deliberate and unintentional acts. "Deliberate" also covers situations where the result is not directly intended but the person ought to have taken into account the consequences that could follow from his action. This clearly indicates that, when leaving out the word "deliberate" from subparagraph (d), the intention was to include non-deliberate acts leading to deterioration or destruction in the provision as well. This introduces a special quality to this provision: all deterioration or destruction of breeding sites or resting places is to be effectively prohibited, i.e. avoided.

(49) However, this does not mean that proactive habitat management measures are required under Article 12(1)(d) of the Directive (e.g. to actively manage a meadow for butterflies). Nonetheless, in order to protect breeding sites or resting places from deterioration, a simple prohibition in a legal text is not sufficient and must be supported by an adequate enforcement mechanism, including preventive measures. The lack of the word 'deliberate' underlines the importance of preventive action. Under a strict protection system, Member States should anticipate the threats sites may face from human action and take measures to ensure that those likely to commit an offence (intentionally or not) are aware of the prohibition in force and act accordingly.

(50) However, the deterioration of natural habitats may take place naturally (including through natural succession after cessation of a certain land use like agriculture) or be caused by unforeseeable events, so that the habitat is no longer a suitable breeding site or resting place for certain species. In this case, where no act has been committed to provoke deterioration/destruction of breeding sites or resting places but, where this has arisen through natural causes, Article 12(1)(d) cannot be applied[74].

(51) It should be stressed that, in the *Caretta caretta* case, the Court declared that the presence of buildings on a beach used by the species for breeding was liable to lead to the deterioration or destruction of the breeding site within the meaning of Article 12(1)(d) of the Directive[75]. Significantly, the Court did not use the Commission's wording, which referred to "illegal" buildings. The mere fact that buildings had been built there and were liable to cause deterioration and destruction was the overriding argument for the Court. Therefore, the construction of buildings on a beach classified as "an absolute protection area" and where "special notices had been erected" is sufficient to constitute an infringement of Article 12(1)(d).

---

[73] See the judgment of 10 January 2006, Commission v Germany, Case C-98/03, ECR p.53, paragraph 55.

[74] The appropriate instrument for dealing with deterioration due to natural causes or unforeseeable events is Article 6(2) of the Habitats Directive. In its judgment of 20 October 2005 (Commission v UK, Case C-6/04, ECR p.9017, paragraph 34), the Court stated that *"in implementing Article 6(2) of the Habitats Directive, it may be necessary to adopt both measures intended to avoid external man-caused impairment and disturbance and measures to prevent natural developments that may cause the conservation status of species and habitats in SACs to deteriorate."*

[75] According to paragraph 38 of the judgment, "there is no doubt that the presence of buildings on a breeding beach such as the one at Dafni is liable to lead to the deterioration or destruction of the breeding site within the meaning of Article 12(1)(d) of the Directive".

Summary: The word "deliberate" covers not only situations where a certain result is directly intended but also situations were the person committing an offence knows the consequences of his action but accepts them, even if not directly intended. The fact that the word "deliberate" is not used in Article 12(1)(d) underlines the importance of preventive action by Member States to avoid all likely deterioration or destruction caused by humans. Cases of deterioration or destruction resulting from natural causes (i.e. not directly the consequence of human activities, e.g. natural disasters) or caused by unforeseeable events, do not fall within the scope of Article 12(1)(d).

II.3.4.b) Identification of "breeding sites and resting places"

(52) Although Article 12(1)(d) explicitly refers to the protection of "breeding sites" and "resting places" of species listed in Annex IV(a), neither Article 12(1)(d) nor Article 1 of the Directive provide any specific definitions.

(53) In the light of the objectives of the Directive, however, breeding sites and resting places may be considered to require strict protection because they are crucial to the life cycle of animals and are very important parts of a species' entire habitat[76], needed to ensure its survival. Their protection is directly connected with the conservation status of a species. The provision in Article 12(1)(d) should therefore be understood as **aiming to safeguard the ecological functionality** of breeding sites and resting places. Thus, Article 12(1)(d) ensures that such sites and places are not damaged or destroyed by human activities so that they can continue to provide all that is required for a specific animal to rest or to breed successfully.

(54) It thus follows from Article 12(1)(d) that such breeding sites and resting places also need to be protected when they are not being used, but where there is a reasonably high probability that the species concerned will return to these sites and places. If for example a certain cave is used every year by a number of bats for hibernation (because the species has the habit of returning to the same winter roost every year), the functionality of this cave as a hibernating site should be protected in summer as well so that the bats can re-use it in winter. On the other hand, if a certain cave is used only occasionally for breeding or resting purposes, it is very likely that the site does not qualify as a breeding site or resting place.

(55) The identification of general criteria for breeding sites and resting places is difficult, because Annex IV(a) lists species from many taxa with many different life history strategies. It is not possible to provide a rigid definition of "breeding site" and "resting places" that will apply to all taxa. Any interpretation of the terms "breeding sites" and "resting places" must therefore take into account this variety and reflect different prevailing conditions. The following general definitions aim to provide guidance that will allow species-specific definitions to be prepared in the form of individual dossiers for each of the species listed under Annex IV(a) of the Directive. The definitions are based on the assumption that the sites in question can be identified and reasonably delimited. They are intended to be used as a checklist of elements to be considered when preparing individual species dossiers; meaning that not all these elements will be applicable to all species (e.g. *Canis lupus* has no clearly definable mating site). Knowledge gaps for species can be identified here. For example, the current information on *Caretta caretta* permits only breeding sites (i.e. the beaches) to be well defined, with resting places (in marine areas) not yet determined.

[76] Article 1(f) defines the "habitat of a species" only as "an environment defined by specific abiotic and biotic factors, in which the species lives at any stage of its biological cycle".

However, with improved knowledge and increased research, resting sites may be delimited in future.

(56) The two definitions below are detailed in separate sections, though in practice they will often interlink and overlap and so could be considered together.

(57) ***Breeding sites: a definition***

Breeding is defined here as: mating, giving birth to young (including egg laying) or production of offspring where reproduction is asexual. A breeding site is defined here as the areas needed to mate and to give birth in and covers also the vicinity of the nest or parturition site, where offspring are dependent on such sites. For some species, a breeding site will also include associated structures needed for territorial definition and defence. For species that reproduce asexually, a breeding site is defined as the area needed to produce offspring. Breeding sites that are used regularly, either within or between years, must be protected even when not occupied.

(58) The breeding site may thus include areas required for:

1. courtship;
2. mating;
3. nest construction or selection of egg-laying or parturition[77] site;
4. place used for the purpose of parturition or egg laying or production of offspring where reproduction is asexual;
5. place of egg development and egg hatching;
6. nest or parturition site when occupied by young dependent on that site;

(59) ***Resting places: a definition***

Resting places are defined here as the areas essential to sustain an animal or group of animals when they are not active. For species that have a sessile stage, a resting place is defined as the site of attachment. Resting places will include structures created by animals to function as resting places. Resting places that are used regularly, either within or between years, must be protected even when not occupied.

(60) Resting places essential for survival may include one or more structures and habitat features required for:

1. thermoregulatory behaviour, e.g. *Lacerta agilis*;
2. resting, sleeping or recuperation, e.g. *Nyctalus leisleri* roosts;
3. hiding, protection or refuge e.g. *Macrothele calpeiana* burrows;
4. hibernation, e.g. bat dormitories; *Muscardinus avellanarius* hides.

Examples of breeding sites and resting places

	Breeding site	**Resting place**
Triturus cristatus *(see also*	All points of the definition apply to *T. cristatus*. The pond used for mating has individual male territories within which	During the terrestrial phase of its life, *T. cristatus* makes use of refuges such as stones and logs to hide under during the day. Similar refuges are used for periods of hibernation (in cold regions) or

[77] parturition – act of giving birth

dossier in Annex III)	courtship and mating take place. Eggs are laid singly on emergent plants and mature over a period of 12 – 18 days. Young larvae emerge and swim freely. The pond is therefore the breeding site.	summer dormancy (in hot regions). During the aquatic phase of their life, adults and larvae make use of submerged and emergent vegetation as a place of refuge. *T. cristatus* does not migrate but does disperse to adjacent pools. Healthy populations of *T. cristatus* utilise a series of pools and move between them, dispersing over a suitable interconnecting terrestrial habitat. Individuals may move approx. 1 km from their natal pool. The resting places for *T. cristatus* are thus the ponds they inhabit and the adjacent terrestrial habitat that supports them during the terrestrial part of their life cycle.
Nyctalus Leisleri	Males establish mating territories in tree holes in the autumn. Mating takes place in late autumn and females delay fertilisation until the spring. Young are born in a maternity roost and are dependent on their mother until they are weaned in the summer. Male territories and maternity roosts are therefore breeding sites. This strict application of the definition omits winter hibernation roosts, which are covered by "resting places" in Article 12(1)(d)	Hibernation *N. leisleri* is principally a tree-dwelling bat that hibernates over winter. In the winter they roost in tree-holes, buildings and occasionally caves and tunnels that provide a suitable microclimate. They will also utilise artificial roost boxes. Tree roosts have been found in parkland and urban areas as well as deciduous and coniferous woodland. These roosts must be in a relatively undisturbed position as bats roused from their torpor expend valuable energy reserves that cannot be replaced in winter. Day roosts during their active period (in spring) are also essential to all bat species, requiring a relatively undisturbed site during daylight hours, again in the cracks and crevasses of old trees and buildings. Depending on their location, a colony may use several summer roosts in turn, the larger of which may be used as maternity roosts, while males will become solitary or live in small groups. Migration *N. leisleri* is known to migrate in some parts of its European range: individuals ringed in Germany have been found to winter in France and Switzerland (National report 2003). Exact migration patterns are not known. However, other populations appear more sedentary with both maternity and winter roosts located in the same location. Roosts used by *N. leisleri* to rest during the day and to hibernate in are resting

		places.
Osmoderma eremita	All points of the definition apply to *O. eremita* This saproxylic species lives for the majority of its life within the rot-filled cavities of mature deciduous trees, usually of the *Quercus* species. A high proportion of individuals do not leave the natal tree. Mating takes place inside the substrate, and eggs are deposited deep within the substrate. The development from egg to beetle takes several years. Pupae develop in the autumn; adults emerge in the late spring / early summer. A series of mature and substantially hollow deciduous trees, usually *Quercus* sp. with heart rot, being used by the species is the breeding site for *O. eremita*.	Resting place and breeding site are in effect synonymous for *O. eremita*. This saproxylic species lives for the majority of its life within the rot-filled cavities of mature deciduous trees, usually of the *Quercus* species. A high proportion of individuals do not leave the natal tree. Mating takes place inside the substrate, and eggs are deposited deep within the substrate. The development from egg to beetle takes several years. Pupae develop in the autumn; adults emerge in the late spring / early summer. A series of mature and substantially hollow deciduous trees, usually *Quercus sp*. with heart rot, being used by the species is the resting place for *O. eremita*.
Maculinia arion	Points 1 to 5 of the definition apply to *M. arion*. *M. arion* requires a site with its larval food plant (*Thymus* species) and larval host and food source, *Myrmica* ant nests, to complete its development. Eggs are laid in the bud of a *Thymus* flower where they feed and develop. At a certain stage, the larva drops from the plant and attracts an ant to pick it up and take it into the ants nest. The larva continues its development within the nest, predating ant larvae. Pupation occurs within the nest and the adults emerge in early summer. The breeding sites for *M. arion* will be a site with *Thymus* sp. plants close to the site of adult emergence and the *Myrmica* ant nest where the larvae and pupae develop.	This species has no clearly defined resting places other than those needed for larval development and pupation. These life stages are covered by the definition of breeding site on the left.

(61) The prohibition of Article 12(1)(d) can consequently be seen as an aspect of habitat conservation, albeit covering only specific parts of the biological cycle. Other parts of the habitat, e.g. feeding areas, are not covered unless they coincide with breeding sites or resting places. An example of this is the butterfly species, *Parnassius apollo*, whose breeding sites coincide with locations where adults lay eggs and caterpillars live and feed (in Finland, stands of the plant species *Sedum telephium*). Consequently, a proper implementation of Article 12(1)(d) requires a good knowledge of the ecology (biology, habitats, population size, distribution and dynamics) and behaviour of the species (life cycle, organisation, interaction within and between species).

(62) **'Narrower' or 'wider' definition of breeding sites and resting places?** Discussions in the Article 12 working group and elsewhere have shown that the "framework" definition given above provides room for different interpretations. This is also because of the great variety of species listed in Annex IV. One frequent debate concerns whether breeding sites and resting places should be delimited in a narrower or a wider sense. For example, the wood-boring beetle *Osmoderma eremita* lives for the majority of its life within the rot-filled cavity of mature deciduous trees, usually of the *Quercus* species, and a high proportion of individuals do not leave the natal tree: so what is its breeding site and resting place? Is it the single tree or is it maybe that part of the woodland with trees inhabited by *O. eremita*? There are arguments for both views. From the Commission services' point of view the 'wider' definition seems to be more meaningful here in conservation terms, as it allows the woodland as a whole to be taken into account, linking both the protection measures under Article 12 and any derogations under Article 16 to the wider unit of the woodland and focusing on the continued functionality of that site as a whole for the species under consideration. Besides the advantage of a more holistic approach to species protection, this also allows more flexibility when considering impacts on such sites. In the Commission services' view, however, this approach seems more feasible for species with relatively **small home ranges**.

(63) The species dossier on *Triturus cristatus* (see box above) assumes overlapping breeding sites and resting places, stating that "*The functional unit needed to maintain a viable T. cristatus population thus comprises a series of ponds, the majority of which will be resting places and a proportion of which will be breeding sites, as well as a proportion of other areas which will be resting places set within a suitable terrestrial habitat*." This view of an ecological / functional unit suits a species with a small home range. The 'local' population of such a species could play a role in such a definition.

(64) The situation is different for **wide-ranging species**. The particular problem posed by wide-ranging species is already recognised in Article 4(1) of the Directive. Here, it may be advisable to restrict the definition of a breeding and resting site to a locality that can be clearly delimited: e.g. the roosts for bats or the holt of an otter.

(65) In the *Caretta caretta* case, the Court did not give any definition of breeding sites and resting places for species and followed a case-by-case/species-by-species approach. In the case in question, the Court emphasised the importance of Laganas Bay, which was (easily) identified as a "*vital breeding region for the protected species Caretta caretta*"[78]. This clearly identifiable area has the physical and biological factors essential for the reproduction of the species (marine area and nesting beaches). This prudent approach of the Court seems due to the fact that it is difficult to establish a general definition of "breeding sites" and "resting places" because of the wide range of differences in the ecological characteristics of species.

Summary: Breeding sites and resting places are to be strictly protected, because they are crucial to the life cycle of animals and are vital parts of a species' entire habitat. Article 12(1)(d) should therefore be understood as aiming to safeguard the continued ecological functionality of such sites and places, ensuring that they continue to provide all the elements needed by a specific animal to rest or to breed successfully. The protection applies all year round if these sites are used on a regular basis.

[78] Paragraph 27 of the judgment.

II.3.4.c) Concept of "deterioration"

(66) Neither Article 12(1)(d) nor Article 1 of Directive 92/43/EEC contains a definition of the concept of "deterioration", although this term is also present in other provisions of the Directive (e.g. Article 6).

(67) In general, deterioration can be defined as physical degradation affecting a habitat, or a breeding site or resting place. In contrast to destruction, such degradation may occur slowly and **gradually reduce the functionality** of the site or place. Deterioration may therefore not immediately lead to a loss of functionality of a site/place, but would adversely affect functionality in terms of quality or quantity and might over a certain period of time lead to its complete loss. Because of the wide variety of species listed in Annex IV(a), the assessment of deterioration of a particular breeding site or resting place must be carried out on a case-by-case basis. Again, deterioration or destruction that is the result of natural causes (not human-caused) or unforeseeable events does not fall under the scope of Article 12(1)(d). Neither does the deterioration of a site due to natural succession as a consequence of the abandonment of certain human land-uses or the abandonment of a building.

(68) When trying to identify and avoid the causes that lead to the deterioration or even loss of breeding/resting functionality, it is important to establish a clear **cause-effect relationship** between one or more human-induced activities and the deterioration/destruction of a breeding site or resting place. Obviously, the causes for deterioration can be located inside or outside, or possibly even at some distance from, the breeding site or resting place under consideration. Such causes/activities then need to be controlled in such a way that deterioration and destruction can be avoided. Only a clear view of the causes will enable the authorities to act accordingly and avoid further or future deterioration or destruction.

(68a) In cases where the deterioration/destruction of a breeding site or resting place is due to diffuse causes, it will probably be difficult to establish a clear cause-effect relationship with a human-induced activity. For instance, where there is a gradual deterioration (eutrophication) of water bodies due to a complexity of sources in terms of time and origin, it will be difficult to establish a clear cause-effect relationship with agricultural activities. In these situations, it is very unlikely that an infringement of Article 12 can be proven, in particular if the activity complies with obligations arising from other relevant EC environmental legislation, e.g. the Nitrates Directive.

(69) Focusing on the functionality of breeding sites and resting places and the establishment of a cause-effect relationship also gives guidance on the matter of divergences between **different linguistic versions** regarding the term "deterioration". The terms used in the German, Danish, Dutch and Swedish versions of Article 12(1)(d)[79] correspond rather more to the word "damage" than "deterioration". Nonetheless, in Article 6(2) of the Directive, the German version uses a word which corresponds slightly better to "*deterioration*". Given this discrepancy between different language versions, it should be recalled that the Court has on earlier occasions stressed the necessity for uniform application and ruled out the possibility of considering one single version of a text in isolation. Hence, the Court holds that such provisions must be interpreted on the basis of the actual intention of the author and the aim pursued in the light of all language versions[80].

---

[79] The German, Danish, Dutch and Swedish versions of Article 12.1(d) employ the terms *"Beschädigung", "beskadigelse", "beschadiging"* and *"skada"* (damage), respectively.

[80] See the following judgments: 12 November 1969, Stauder, case 29/69, ECR 1969 p.419, paragraph 3; judgment of 27 October 1977, Bouchereau, case 30/77, ECR 1977 p.1999, paragraph 14; judgment of 12 July

(70) In order to define the limits of what one can regard as "deterioration", a scrupulous analysis of Article 12(1)(d) as a whole is indispensable. The purpose of Article 12 is to introduce a system of strict protection for Annex IV(a) species. The explicit protection of breeding sites and resting places in addition to the protection of the species as such, without the qualification "deliberate", demonstrates the importance granted to these sites by the Directive. This specific protection against the deterioration or destruction of breeding sites and resting places is self-evidently linked with the essential function of these sites, which must continue to provide all the elements required by a specific animal (or group of animals) to breed or to rest.

(71) Examples of deterioration under Article 12(1)(d):

- (Repeated) filling in of parts of spawning grounds for the crested newt (*Triturus cristatus*), thereby reducing (in sum) its function as a breeding site.
- Deterioration in the function of parts of a hamster burrow as a breeding and resting place as a result of deep ploughing.
- Hydraulic engineering step by step in a river that is a resting and breeding site for *Acipenser sturio*, so as to gradually reduce the functionality of the site.
- Gradual negative impact on a water soldier (*Stratiotes aloides*) population, which is an egg-laying site for the green hawker (*Aeshna viridis*), due to a point-source discharge into the water body.

Summary: Deterioration can be defined as physical degradation affecting a breeding site or resting place. In contrast to destruction, such degradation might also occur slowly and gradually reduce the functionality of the site or place. If it is possible to establish a clear cause-effect relationship between one or more human-induced activities and the deterioration of a breeding site or resting place, Article 12(1)(d) applies.

II.3.4.d) Measures to ensure the continued ecological functionality of breeding sites or resting places

(72) For cases where projects or activities may have an impact on breeding sites / resting places the distinction between measures under Article 12(1)(d) and those that come under Article 16 needs to be examined. In particular, to what extent are measures that ensure the continued ecological functionality of a concrete breeding site/resting place possible, thereby ensuring compliance with Article 12 (and not requiring derogations under Article 16). The decisive question when drawing the line is: "Does or will a breeding site / resting place suffer from deterioration or destruction (even if only temporarily) due to a certain project/activity?" If the answer is "yes", Article 16 needs to be applied; if the answer is "no", it is reasonable to assume that Article 12 is complied with.

(73) What are "measures that ensure the continued ecological functionality of a breeding site/resting place" (in the following "CEF measures")?

(74) First of all, they must have the character of mitigation measures. Mitigation measures aim at minimising or even cancelling out the negative impact of an activity through a range of preventive actions. However, they may also go beyond this and include actions that actively improve or manage a certain breeding site / resting place so that it does not — at any time — suffer from reduced or lost ecological functionality. This could include e.g. enlarging the site or creating new habitats in, or in direct functional relation to, a breeding

1979, Wörsdorfer, case 9/79, ECR 1979 p.2717, paragraph 6; judgment of 7 July 1988, Moksel, Case 55/87, ECR 1988, p.3845, paragraph 15.

site or resting place, as a counterweight to the potential loss of parts or functions of the site. The ecological functionality of such measures for the species in question would of course have to be clearly demonstrated.

(75) CEF measures may be an option when an activity can affect parts of a breeding site or resting place. If the breeding site or resting place, as a result of such measures, will still remain at least the same size (or greater) and retain the same quality (or better) for the species in question, there will be no deterioration in the function, quality or integrity of the site and the activity can be undertaken with no need for a derogation under Article 16. It is crucial that the continued ecological functionality of the site is maintained or improved. Therefore, the monitoring of CEF measures is important. An interesting approach in this regard is outlined in a Dutch publication entitled "Effective protection of Annex IV species of the EU Habitats Directive: The landscape approach"[81].

(76) In accordance with the precautionary principle, if the measures proposed do not guarantee the continued ecological functionality of a site, they should not be considered under Article 12(1)(d). There must be a high degree of certainty that the measures are sufficient to avoid any deterioration or destruction. The assessment of the probability of success must be made on the basis of objective information and in the light of the characteristics and specific environmental conditions of the site concerned. In addition, the use of CEF measures has to take into account the conservation status of the species concerned. For example, in the case of rare species with an unfavourable conservation status, there must be a higher degree of certainty that the measures will work as intended than in the case of more common species with a favourable conservation status.

(77) CEF measures could be an integral part of the specifications of an activity or project; they could also form part of preventive measures under a strict protection system to comply with Article 12(1)(d). Such measures can be used only in situations where an authorisation or planning regime with formal procedures is in place, and where the competent authorities are able to assess whether the measures taken to preserve the "breeding" or "resting" functionality of a site are sufficient.

(78) Based on the definition of breeding sites and resting places (see chapter II.3.4.b), the approach outlined above seems especially relevant when dealing with animals with small home ranges, where breeding sites / resting places are delimited as "functional units" (i.e. the wider approach is used). Here, it should be stressed that a Member State must be **consistent in its definition** of breeding sites and resting places for a given species and consequently in providing for their protection across its territory.

(79) CEF measures are different from compensatory measures in the strict sense. Compensation measures are independent of an activity/project and aim to compensate for or offset specific negative effects on a species. By definition, **compensatory measures thus imply the deterioration or destruction of a breeding site or resting place** (the effect compensated for). This is not the case with CEF measures, which ensure that the continued ecological functionality of the breeding site/resting place remains fully intact (in quantitative and qualitative terms). Consequently, where there is deterioration or destruction of a breeding site or resting place, a derogation under Article 16 is always necessary. Chapter III.2.3.b deals with the use of compensation measures under Article 16.

[81] Alterra report n° 590, Wageningen, September 2002 (available in English)

Summary: Measures that ensure the continued ecological functionality of a breeding site/resting place in the case of projects/activities with a possible impact on such sites/places must have the character of mitigation measures (i.e. measures minimising or even cancelling out the negative impact), but may also include measures that actively improve or manage a certain breeding site / resting place in such a way that it does not — at any time — suffer from a reduction or loss of ecological functionality. As long as this precondition is fulfilled and such processes are controlled and monitored by the competent authorities, there is no need for recourse to Article 16.

II.3.5. Keeping, transport and sale or exchange, and offering for sale or exchange, of specimens taken from the wild

(80) For Annex IV(a) species, Article 12(2) states that: "Member States shall prohibit the keeping, transport and sale or exchange, and offering for sale or exchange, of specimens taken from the wild, except for those taken legally before this Directive is implemented." Article 12(3) stipulates that the prohibitions in Article 12(1)(a) and (b) and Article 12(2) apply to all life stages of Annex IV(a) species.

II.3.6. Incidental capture and killing of Annex IV(a) species

(81) Article 12(4) requires the establishment of a system to monitor the incidental capture and killing of the animal species listed in Annex IV(a). In the light of the information gathered, Member States have to undertake further research or conservation measures as required to ensure that incidental capture and killing does not have a significant negative impact on the species concerned.

(82) It should be stressed that Article 12(4) could be of relevance in defining the requirements of both a "strict protection system" and an "appropriate surveillance system". A system of strict protection can also make provision for recording the incidental capture and killing of species (for Article 12(4)). In this context, the strict protection measures may ultimately need to include conservation measures required to offset the negative impact of incidental capture and killing.

(83) An example for the application of this provision is the monitoring of the by-catch of Cetaceans in the fisheries sector and the technical measures taken to avoid such incidents (e.g. attachment of pingers to fishing nets). Another example is the monitoring of bat deaths in wind turbines or roadkills.

III. ARTICLE 16

Text of Article 16
1. Provided that there is no satisfactory alternative and the derogation is not detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range, Member States may derogate from the provisions of Articles 12, 13, 14 and 15 (a) and (b): *(a) in the interest of protecting wild fauna and flora and conserving natural habitats;* *(b) to prevent serious damage, in particular to crops, livestock, forests, fisheries and water and other types of property;* *(c) in the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment;* *(d) for the purpose of research and education, of repopulating and re-introducing these species and for the breeding operations necessary for these purposes, including the artificial propagation of plants;* *(e) to allow, under strictly supervised conditions, on a selective basis and to a limited extent, the taking or keeping of certain specimens of the species listed in Annex IV in limited numbers specified by the competent national authorities.* *2. Member States shall forward to the Commission every two years a report in accordance with the format established by the Committee on the derogations applied under paragraph 1. The Commission shall give its opinion on these derogations within a maximum time limit of 12 months following receipt of the report and shall give an account to the Committee.* *3. The reports shall specify: (a) the species which are subject to the derogations and the reason for the derogation, including the nature of the risk, with, if appropriate, a reference to alternatives rejected and scientific data used; (b) the means, devices or methods authorised for the capture or killing of animal species and the reasons for their use; (c) the circumstances of when and where such derogations are granted; (d) the authority empowered to declare and check that the required conditions obtain and to decide what means, devices or methods may be used, within what limits and by what agencies, and which persons are to carry out the task; (e) the supervisory measures used and the results obtained.*

(1) The system of strict protection under Article 12 may be bypassed through derogations under Article 16 of the Directive. A number of activities that would normally be prohibited under Article 12 can be permitted by means of Article 16. In practice, consideration of the application of Article 12 will often arise in conjunction with a derogation argued for under Article 16.

(2) The possibilities in Article 16 for derogating from the restrictions and prohibitions in Articles 12, 13, 14 and 15(a) and (b) are limited. Derogations not only must be justified in relation to the overall aim of the Directive, but are subject to three specific conditions.

(3) The failure to respect any one of these conditions may render a derogation invalid. The competent national and other authorities or conservation bodies must therefore carefully examine all those general and specific requirements before granting a derogation.

(4) Before addressing the provisions of Article 16 in detail, it is worth underlining that the ECJ has already developed a quite extensive case law on derogations under Article 9 of Directive 79/409/EEC on the conservation of wild birds. Given the similarity between the derogation systems established by the two Directives, the reasoning of those judgments is of great importance and can be applied to Article 16[82].

III.1. General legal considerations

III.1.1 Obligation to ensure full, clear and precise transposition of Article 16

(5) The transposition into national law of Article 16 should guarantee the implementation of the derogations by the competent national authorities in an appropriate manner. It should be recalled that a Directive is binding as to the result to be achieved, but leaves a Member State some choice as to the form and methods of achieving that result. However, the Court has set limits to this margin of manoeuvre for Member States when they transpose a Directive. Hence, the national transposition of the derogation system under Article 16 has to comply with some basic legal principles of EC law and must meet a number of requirements.

(6) According to ECJ case law[83], *"the transposition of a Directive into domestic law does not necessarily require that its provisions be incorporated formally and verbatim in express, specific legislation. A general legal context may, depending on the content of the Directive, be adequate for the purpose, provided that it does indeed guarantee the full application of the Directive in a sufficiently clear and precise manner."* Mere administrative practices, which, by their nature, are alterable at will by the authorities and which are not given the appropriate publicity, cannot be regarded as constituting the proper fulfilment of a Member State's obligations under the Treaty and the Directive[84]. Accordingly, the application of the requirements of Article 16 in practice is not a substitute for proper formal transposition.

(7) Moreover, the provisions of the Directives must be implemented with unquestionable binding force, and with the specificity, precision and clarity necessary to satisfy the requirements of legal certainty[85]. The Court was more explicit in Case C-339/87[86], which relates to derogations under Article 9 of Directive 79/409/EEC. The Court stated that "*the criteria which the Member States must meet in order to derogate from the prohibitions laid down in the Directive must be reproduced in specific national provisions, since a faithful transposition becomes particularly important in a case where the management of the common heritage is entrusted to the Member States in their respective territories.*" In its judgment of 20 October 2005, the Court applied this case law to the Habitats Directive and observed that "*in the context of the Habitats Directive, which lays down complex and*

---

[82] The third chapter of the "Guidance document on hunting under Council Directive 79/409/EEC on the conservation of wild birds", which examines the derogation system under Article 9 of the Birds Directive, is a useful reference for the understanding of Article 16. The document is available on the website http://www.europa.eu.int/comm/environment/nature/home.htm.

[83] See the judgment of 28 February 1991, Commission v Germany, Case 131/88, ECR p.825.

[84] For example, see the judgment of 11 November 1999, Commission v Italy, Case C-315/98, ECR p.8001, paragraph 10.

[85] See in particular the following judgments: 30 May 1991, Commission v Germany, Case C-59/89, ECR p.2607, paragraphs 18 and 24; 19 May 1999, Commission v France, Case C-225/97, ECR p.3011, paragraph 37; 17 May 2001, Commission v Italy, Case C-159/99, ECR p.4007, paragraph 32; 13 February 2003, Commission v Luxembourg, Case C-75/01, paragraph 28, ECR p.1585, paragraphs 87-88; 20 October 2005, Commission v UK, Case C-6/04, ECR p.9017, paragraph 27.

[86] Judgment of 15 March 1990, Commission v Netherlands, Case C-339/87, ECR p.851, paragraph 28.

technical rules in the field of environmental law, the Member States are under a particular duty to ensure that their legislation intended to transpose that directive is clear and precise"[87].

(8) Finally, when transposing Article 16, Member States must respect the meaning of terms and concepts used by the Directive with the aim of ensuring uniformity in its interpretation and application[88]. This also implies that national transposition measures should guarantee the full application of the Directive, without modifying its terms, without selectively applying its provisions and without adding supplementary conditions or derogations not provided for by the Directive[89]. For instance, in Case C-6/04[90], the Court found that a derogation authorising acts that lead to the killing of protected species and to the deterioration or destruction of their breeding and resting places, provided such acts are lawful and cannot be reasonably avoided, *"is contrary both to the spirit and purpose of the Habitats Directive and to the wording of Article 16 thereof"*. In Case C-98/03[91], the Court found that German law (paragraph 43(4) of the BNatSchG 2002) was not compatible with Article 16. The German provision provided as the sole condition for derogation that animals, including their nesting or incubation sites, habitat or resting places, and plant species under particular protection must not be subject to deliberate harm. According to the Court, "*even assuming that the two derogations at issue in this case must be the subject of administrative decisions, on the issuing of which the competent authorities do in fact comply with the conditions to which Article 16 of the Directive subjects the authorisation of derogations, the fact remains that Paragraph 43(4) of the BNatSchG 2002 does not provide a legal framework consistent with the derogatory regime established by Article 16. That provision of national law does not submit the grant of the two derogations in question to all of the conditions laid down in Article 16 of the Directive*". In case C-183/05[92], the Court considered that the regime of derogations under Irish legislation (Section 23(7)(b) of the Wildlife Act) was inconsistent with Articles 12 and 16 of Directive 92/43/CEE. The Irish provision provided that acts which unintentionally interfere with or destroy breeding sites or resting places of wild species do not constitute an offence. According to the Court, not only this provisions does not satisfy the requirements of Article 12(1)(d) of Directive 92/43, which prohibits such acts, whether they are intentional or not, but it goes beyond what is provided for in Article 16 of Directive 92/43, since the latter determines, in an exhaustive manner, the conditions under which derogations may be granted.

Summary: Article 16 must be fully and formally transposed with unquestionable binding force. The criteria to be met before granting a derogation must be reproduced in specific national provisions. National transposition measures should guarantee the full application of Article 16, without modifying its terms, without selectively applying its provisions and without adding supplementary conditions or derogations not provided for by the Directive. Mere administrative practices are not sufficient.

87 Judgment of 20 October 2005, Commission v UK, Case C-6/04, ECR p.9017, paragraphs 25-26.

89 Judgment of 13 February 2003, Commission v Luxembourg, Case C-75/01, ECR p.1585, paragraph 28.

90 Judgment of 20 October 2005, Commission v UK, Case C-6/04, paragraphs 109-113.

91 Judgment of 10 January 2006, Commission v Germany, Case C-98/03, ECR p.53, paragraphs 57-62.

92 Judgement of 11 January 2007, Commission v Ireland, Case C-183/05, not yet published in the ECR, paragraphs 47-49.

III.1.2. Appropriate overall application of derogations

(9) Primarily, the national authorities responsible for applying derogations need to take into consideration that, under the case law of the Court of Justice[93], derogations must be interpreted and implemented restrictively to avoid undermining the main provisions of a Directive. This has been also confirmed for the Habitats Directive[94]. In the case of Directive 79/409/EEC, the Court has on several occasions underlined the need for strictness when implementing Article 9 derogations. Given that Article 9 has close parallels with Article 16 in terms of content, it can be reasonably assumed that the Court would take a similarly strict approach regarding the interpretation and implementation of Article 16.

(10) For derogations under Article 9 of Directive 79/409/EEC, the Court[95] has already noted that although Article 9 authorises wide derogations from the general system of protection, its application must deal with precise requirements and specific situations.

(11) As regards measures to be taken under Article 12, the need to implement appropriate and effective measures in a sufficient and verifiable manner has been underlined. The same approach can be followed for the derogations scheme. If used correctly, this ensures that granting derogations does not go against the objective of the Directive[96]. **Applying proportionality does not overrule or marginalise any of the conditions applying to the derogation scheme but can <u>adapt</u> their application in the light of the overall objective of the Directive. As a general rule, the severity of any of the conditions or "tests" will increase with the severity of the impact of a derogation on a species/population**.

(12) Allowing a valid derogation presupposes that the competent national authorities have ensured that all the conditions applying to all the derogations granted have been met and also that the derogations in their totality do not produce effects that go against the objectives of Article 12 and the Directive as a whole. Consequently, applying a proportional approach to the use of derogations needs careful consideration and framing at national and/or biogeographic level within a Member State. The authority with the greatest territorial overview in a Member State (and, if necessary, also a view extending beyond borders in the case of transboundary populations) thus needs to guide this proportional approach, even though it may then be applied in practice at regional or local level[97].

---

[93] See the following judgments of the ECJ: judgment of 8 July 1987, Commission v Italian Republic, Case 262/85, ECR p.3073; judgment 7 March 1996, WWF Italy v Regione Veneto, Case C-118/94, ECR p.1223; judgment of 12 December 1996, Ligue royale belge pour la protection des oiseaux and Société d'études ornithologiques v Région Wallonne, Case C-10/96, ECR p.6775.

[94] Judgment of 20 October 2005, Commission v UK, Case C-6/04, ECR p.9017, paragraph 111 (*"Article 16 of the Habitats Directive defines in a precise manner the circumstances in which Member States may derogate from Articles 12, 13, 14 and 15(a) and (b) thereof, so that Article 16 must be interpreted restrictively"*).

[95] See in particular: judgment of 8 July 1987, Commission v Belgium, Case 247/85, ECR p.3029, paragraph 7; judgment of 8 July 1987, Commission v Italy, Case 262/85, ECR p.3073, paragraph 7; judgment of 7 March 1996, WWF Italy v Regione Veneto, Case C-118/94, ECR p.1223, paragraph 21.

[96] It should be recalled that the Court observed that *"Articles 12, 13 and 16 of the Habitats Directive form a coherent body of provisions intended to protect the populations of the species concerned, so that any derogation incompatible with the directive would infringe both the prohibitions set out in Articles 12 and 13 and the rule that derogations may be granted in accordance with Article 16"* (judgment of 20 October 2005, Commission v UK, Case C-6/04, ECR p.9017, paragraph 112).

[97] This of course does not exclude the possibility that, depending on the organisational structure in a Member State, regional or local authorities will also be in a position to consider the effects of derogations beyond their own territories.

Summary: Derogation provisions need to be interpreted narrowly: they must deal with precise requirements and specific situations. It is up to the competent authority with the greatest territorial overview to ensure that the totality of derogations in a Member State does not lead to effects that go against the objectives of the Directive.

III.2. A carefully controlled system for granting derogations: the 3 tests

(13) Article 16 sets three preconditions, all of which must be complied with before granting a derogation: 1) the demonstration of one or more of the reasons listed in Article 16(1) (a)-(e), 2) the absence of a satisfactory alternative and 3) the assurance that a derogation is not detrimental to the maintenance of populations at a favourable conservation status. Before the second and third preconditions can be examined, precondition 1 must be met: in practical terms, there is little point examining the issue of satisfactory alternatives and impact on conservation status if the actions concerned by the derogation do not come under Article 16(1) (a)-(e).

III.2.1. Demonstration of one of the reasons under Article 16(1)(a) to (e) (Test 1)

(14) Derogations are granted because there is a specific problem or situation which needs to be tackled. Derogations must be based on at least one of the reasons listed in Article 16(1)(a), (b), (c), (d) and (e). Specific derogations not justified by any of these reasons (e.g. a provision exempting acts that lead to the killing of protected species or to the deterioration or destruction of their breeding and resting places, provided they are the result of a lawful operation that cannot be reasonably avoided) are contrary both to the spirit and purpose of the Habitats Directive and to the wording of Article 16[98]. When the competent national authorities are called upon to grant a derogation, they need to explain the particular circumstances justifying the choice of a reason under Article 16(1)(a) to (e) and verify that the specific conditions are met[99].

(a) In the interest of protecting wild fauna and flora and conserving natural habitats

(15) The first reason for granting a derogation is the protection of wild flora and fauna and the conservation of natural habitats. Article 16(1)(a) specifies neither the types of fauna, flora or natural habitats covered nor the types of threats. In the light of the general objective of the Directive, vulnerable, rare, endangered or endemic species and natural habitats (as for example listed in the annexes to the Habitats Directive) are more likely to be concerned by this reason, which would effectively aim to reduce the negative impact of a given species on them. It would be unusual to prioritise the interests of a common and thriving species over the interests of a species meeting the criteria of Article 1(c) and (g) of the Directive. However, one may not exclude other species and habitats completely from consideration.

(b) To prevent serious damage, in particular to crops, livestock, forests, fisheries and water and other types of property

[98] See also the Court judgment of 20 October 2005 (Commission v UK, Case C-6/04, ECR p.9017, paragraphs 109-113).

[99] See also the Order of 19 December 2006 (Commission v Italy, Case C-503/06 R).

(16) The second reason for granting a derogation is to prevent serious damage in particular to crops, livestock, forests, fisheries, water, and other types of property. This derogation takes into account economic interests, and, as noted, the damage to be prevented has to be serious.

(17) It is worth noting that the list is not exhaustive and other damaging situations may be covered. Moreover, property interests are also covered, which is not the case in Directive 79/409/EEC (the Birds Directive)[100].

(18) With regard to Article 9 of Directive 79/409/EEC, the Court noted that: "The aim of this provision of the Directive is not to prevent the threat of minor damage. The fact that a certain degree of damage is required for this derogation from the general system of protection accords with the degree of protection sought by the Directive."[101] It follows that mere nuisance and normal business risk are not covered."

(19) As this provision is intended to *prevent* serious damage, it is not necessary that the serious damage itself has already occurred; it is sufficient that such serious damage is likely to occur.

(c) In the interests of public health and public safety, or for other imperative reasons of overriding public interest, including those of a social or economic nature and beneficial consequences of primary importance for the environment

(20) The third reason for granting a derogation covers "imperative reasons of overriding public interest." This concept is not defined in the Directive but the paragraph mentions public interest reasons such as public health, public safety, reasons of social or economic nature, reasons with beneficial consequences of primary importance for the environment, and also covers other reasons not mentioned, as the list is not exhaustive.

(21) In other fields of Community law where similar concepts appear, for instance the free movement of goods, the European Court of Justice has held that overriding requirements or public interest reasons can justify national measures restricting the principle of freedom of movement: it has recognised public health, environmental protection, and the pursuit of legitimate goals of economic and social policy as such imperative requirements.

(22) The same concept also appears in Article 6(4) of the Directive. So far, the Court has not given clear indications for the interpretation of this specific concept. The Commission's analysis in the Article 6 guidance document[102] is pertinent for a better understanding of the concept and may be recalled here.

(23) Firstly, it is clear from the wording that only public interests, promoted either by public or private bodies, can be balanced against the conservation aims of the Directive. Thus, projects that are entirely in the interest of companies or individuals would generally not be considered as covered.

---

[100] According to Article 9(1)(a), "Member states may derogate from the provisions of Articles 5, 6, 7 and 8, where there is no other satisfactory solution,… to prevent serious damage to crops, livestock, forests , fisheries and water."

[101] Judgment of 8 July 1987, Commission v Belgium, Case C-247/85, ECR p.3029, paragraph 56.

[102] "Managing Natura 2000 sites - the provisions of Article 6 of the Habitats Directive 92/43/EEC", European Commission, 2000, ISBN 92-828-9048-1, also available on the website http://www.europa.eu.int. See, in particular, section 5.3.2.

(24) Secondly, the "overriding" character of this public interest must be underlined. This qualification implies that not every kind of public interest of a social or economic nature is sufficient, in particular when seen against the particular weight of the interests protected by the Directive. Careful balancing of interests is needed here. In this context, it also seems reasonable to assume that a public interest is in most cases likely to be overriding only if it is a long-term interest: short-term interests that would only yield short-term benefits would not be sufficient to outweigh the long-term interest of species conservation.

(d) For the purpose of research and education, of repopulating and re-introducing these species and for the breeding operations necessary for these purposes, including the artificial propagation of plants

(25) Such derogations could for example concern the marking of certain individuals of a species for research purposes (e.g. radio collars) in order to understand their behaviour better, or for conservation projects aiming at the reintroduction of species. Research projects must obviously also be subject to consideration of alternative methods if they are likely to have a negative impact on the population concerned.

(e) To allow, under strictly supervised conditions, on a selective basis and to a limited extent, the taking or keeping of certain specimens of the species listed in Annex IV in limited numbers specified by the competent national authorities

(26) The fifth and last reason for derogation concerns the taking or keeping of certain specimens of the species listed in Annex IV. This reason is subject to several conditions that must be respected[103]. This is why its application in practice seems exceptional:

- "*limited numbers*"

(27) This criterion is not an absolute criterion, but has to be compared to the population level of a species and is directly linked with its conservation status[104]. Therefore it is essential to determine a threshold or quantity below which the derogation can be granted. This threshold/quantity must be fixed taking into account the conservation objectives of the Directive and the need to ensure a system of strict protection for the species concerned.

(28) Derogations should not be granted where there is a risk that the derogation might have a significant negative effect on the population concerned in quantitative or in qualitative (e.g. a negative impact on population structure) terms. In Case C-182/02 (which concerned derogations authorised under Article 9 of Directive 79/409/EEC)[105], the Court confirmed that the condition specifying small numbers *"cannot be satisfied if a hunting derogation does not ensure the maintenance of the population of the species concerned at a satisfactory level."* In Case C-344/03, which concerns the derogations granted in Finland for the hunting of bird species, the Court used the criteria of the ORNIS Committee (1% of the

[103] Paragraphs 3.5.20-3.5.48 of the "Guidance document on hunting under Council Directive 79/409/EEC on the conservation of wild birds" contains useful information especially as regards the concept of limited/small numbers.

[104] In a case regarding Article 9 of Directive 79/409/EEC (judgment of 27 April 1988, Commission v France, Case C-252/85, ECR p.2243), the Court stated that: "It is apparent from Article 2, in conjunction with the 11th recital of the preamble to the Directive, that the criterion of small quantities is not an absolute criterion but rather refers to the maintenance of the level of the total population and to the reproductive situation of the species concerned."

[105] Judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02, paragraph 17.

total annual mortality rate of the populations in question) in order to assess whether the limited numbers requirement was complied with[106].

(29) Obviously, if it can be clearly demonstrated that such derogations will be beneficial to the conservation status of the species or population concerned, there is no obstacle to granting them. However, the Commission services consider that an appropriate plan for the conservation of the species, aiming at restoring favourable conservation status, should be the recommended way of demonstrating compliance with this criterion.

- "*under strictly supervised conditions, on a selective basis and to a limited extent*"

(30) This qualification clearly demonstrates that the EC legislator intended significant constraints.

(31) The principle of strictly supervised conditions implies that any use of this type of derogation must involve clear authorisations that can be related to particular individuals or groups of individuals, places, times and quantities. The term "to a limited extent" supports this interpretation. It also implies the need for efficient enforcement of such derogations to ensure compliance.

(32) The principle of selectivity in turn means that the activity in question must be highly specific in its effect, targeting one species (or group of closely related species), to the exclusion of all others. It also implies that certain technical aspects of the method used should verifiably demonstrate selectivity. There is a need to come to a view on methods that are themselves not entirely selective unless combined with the skills and/or experience of the operator.

(33) From the above, it follows that the implementation of this provision would involve some management, and one way of delivering this would be through a species management/conservation plan. Such plans aim at the long-term conservation of a species and contain measures mainly concerning the viability of the population and the natural range and habitats of the species. Derogations could be provided for in the plan and be part of the regulation of the species population, without this affecting favourable conservation status. Thus, a species management/conservation plan could be an appropriate tool for the use of derogations under Article 16(1)(e), as it is the best way of demonstrating compliance with the strict requirements of Article 16.

Example: Latvian Lynx management plan

The plan was prepared by national experts and confirmed by order of the Minister of Environment and Regional Development in 2002. The entire text is available at www.dap.gov.lv/public/files_uploaded/sugu_plani/lynx_lynx_mp.pdf.

The plan forms the basis for a long-term strategy for the conservation and management of the lynx in Latvia, including strictly limited harvesting of the population by hunting. It takes a long-term view, where the lynx in Latvia currently has its best distribution status within the last 150 years and is considered to have a favourable conservation status. Limited and strictly controlled taking by hunters is considered to have a positive impact on the population as well as on public perception. The practice thus fully complies with Article 16(1)(e) of the Habitats Directive.

[106] See paragraphs 47-59 of the judgment of 15 December 2005, Commission v Finland, Case C-344/03, ECR p.11033.

The following main requirements are imposed to prevent hunting from affecting favourable conservation status:

- The goal is not only to preserve the size and range of population but also to maintain the environmental capacity for and the natural ecological functions of the species in its ecosystem. This allows applications for scientific research providing important data for conservation.
- The season for lynx hunting is adapted to the species' biological requirements.
- Samples for scientific research have to be taken from the harvested animals to monitor the sex-age structure, reproduction rate, diet and health of the population in order to avoid any negative impact on the population structure.
- The annual assessment of population size and distribution range must be continued.
- Annual hunting quotas have to be set considering the monitoring data.
- Public education and involvement must be promoted. Hunters are to be involved in collecting research samples and subsequently informed of the results obtained.

The management plan has been implemented and the national legislation amended accordingly. The authority responsible for supervising management is the State Forest Service (www.vmd.gov.lv).

Summary: the first consideration when envisaging a derogation should be whether it is justified by one of the reasons given under 16(1) (a) to (e). The type and weight of the reason must also be seen in relation to the interest of the protected species in the concrete and specific circumstances in question in order to judge the appropriateness of a derogation.

III.2.2. Absence of a satisfactory alternative (Test 2)

(34) Under Article 16(1), Member States must be certain that "there is no satisfactory alternative" before allowing a derogation. As with Article 6(4) of Directive 92/43/EEC and Article 9(1) of Directive 79/409/EEC[107], this is an overarching condition that all derogations must satisfy.

(35) In conformity with the principle of subsidiarity, it rests with the competent national authorities to make the necessary comparisons and evaluate those alternative solutions. Nevertheless, this discretionary power is subject to several constraints.

(36) Based on the case law of the Court on derogations under Article 9 of Directive 79/409/EEC[108], especially in Case C-10/96, an analysis of whether there is "no other satisfactory alternative" can be considered as having three parts: What is the problem or specific situation that needs to be addressed? Are there any other solutions? If so, will these resolve the problem or specific situation for which the derogation is sought? The following remarks are based on the case law of the Court on Article 9 of the Birds Directive and apply the approach adopted by the Court to Article 16.

[107] For this condition, see also section 3.4 of the "Guidance document on hunting under Council Directive 79/409/EEC on the conservation of wild birds".

[108] Judgment of 12 December 1996, Ligue royale belge pour la protection des oiseaux ASBL and Société d'études ornithologiques AVES ASBL v Région Wallonne, Case C-10/96, ECR p.6775; judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02.

(37) The analysis of whether "there is no other satisfactory alternative" presumes that a specific problem or situation exists and needs to be tackled. The competent national authorities are called upon to solve this problem or situation by choosing, among the possible alternatives, the most appropriate that will ensure the best protection of the species while solving the problem/situation. To ensure the strict protection of species, these alternatives must be assessed with regard to the prohibitions listed in Article 12. They could involve alternative locations (or routes), different development scales or designs, or alternative activities, processes or methods.

(38) In any case, recourse to Article 16 derogations must be a **last resort**[109]**.** The essential common characteristic of any derogation system is that it has to yield to other requirements laid down in the Directive in the interest of conservation.

(39) The same strict approach applies to the interpretation of the term "satisfactory". Given the exceptional nature of the derogation regime and the duty of Member States under Article 10 of the EC Treaty to facilitate the achievement of the tasks of the Community, a derogation would only be justified on the basis of an objective demonstration that there is no other satisfactory solution. According to the Advocate General in case C-10/96, this term "*may be interpreted as meaning a solution which resolves the particular problem facing the national authorities, and which at the same time respects as far as possible the prohibitions laid down in the Directive; a derogation may only be allowed where no other solution which does not involve setting aside these prohibitions can be adopted.*"

(40) As regards the factors for evaluating the existence of another satisfactory solution, it is recognised that this is a matter for the national courts. The appraisal of whether an alternative is satisfactory or not, in a given situation, must be founded on objectively verifiable factors, such as scientific and technical considerations[110]. In addition, the solution finally selected, even if it involves a derogation, must be objectively limited to the extent necessary to resolve the specific problem or situation[111].

(41) Evidently, the requirement to consider seriously other alternatives is of primary importance. The discretionary power of Member States is limited, and where another solution exists, any arguments that it is not "satisfactory" will need to be convincing. Moreover, it should be stressed that another solution cannot be deemed unsatisfactory merely because it would cause greater inconvenience to or compel a change in behaviour by the beneficiaries of the derogation.

(42) The judgment in Case C-182/02 illustrates the strict approach adopted by the Court for derogations under the Birds Directive. In order to determine whether or not a satisfactory solution existed, the Court assessed the "need" and "purpose" of the

[109] See paragraph 33 of the Advocate General's Opinion in Case C-10/96.
[110] See also paragraph 39 of the Advocate General's Opinion in Case C-10/96.
[111] See paragraphs 21-22 and 26-27 of the judgment.

derogation[112]. This judgment confirms the importance of demonstrating that there are compelling reasons to justify a derogation[113].

Managing otter in the fish pond area "Oberes Waldviertel", Austria

While the otter was historically very widespread in Austria, including the Alps, it became rare and nearly extinct during the 19th and early 20th century, most probably due to direct persecution and habitat loss. Since 1980, there has been a slow but steady recovery with the species spreading from its core (relict) populations in the region of Waldviertel (near the border to the Czech Republic) and the Pannonian basin in Burgenland/Styria. The Waldviertel region is known for its fish ponds, mostly for breeding carp. As otters cause damage to these ponds, especially in winter, the need for counter-measures became obvious early on, in the 1980s/90s. The killing or relocation of animals was not an option, however. As the area was (and still is) a core centre of the fragmented Austrian population, an alternative was envisaged: the regional government established a damage compensation scheme for fish pond owners and also financed measures to avoid damage (e.g. electric fences). With these measures, damage to the ponds could be kept down to a certain level and the compensation made the remaining damage acceptable to fish pond owners.

Summary: The second consideration is whether there is a satisfactory alternative to the derogation sought, i.e. whether the problem the authority is faced with can be solved in a way that does not involve a derogation.

III.2.3 Impact of a derogation on conservation status (Test 3)

(43) According to Article 16(1), derogations must not be "*detrimental to the maintenance of the populations of the species concerned at a favourable conservation status in their natural range*". The implementation of this provision should include a two-step assessment: firstly, determination of the conservation status of the populations of a species in its natural range within the Member State concerned (and possibly beyond national boundaries if the populations are shared with neighbouring countries) and, secondly, evaluation of the impact of the derogation on the population or populations concerned. The assessment is thus at two levels: the level of "natural range" and the level of "population". For the sake of clarity, "population" is defined here as a group of individuals of the same species that live in a geographic area at the same time and are (potentially) interbreeding (i.e. sharing a common gene pool). As for the definition of "natural range" and for background on the concept of "favourable conservation status", please see chapter I.2.2.

[112] Judgment of 16 October 2003, Ligue pour la protection des oiseaux and Others v Premier ministre and Ministre de l'Aménagement du territoire et de l'Environnement, Case C-182/02. According to paragraph 16, the condition requiring the absence of a satisfactory alternative "cannot be considered to have been satisfied when the hunting period under a derogation coincides, without need, with periods in which the Directive aims to provide particular protection (see, to that effect, Commission v Italy, paragraph 39). There would be no such need if the sole purpose of the derogation authorising hunting were to extend the hunting periods for certain species of birds in territories which they already frequent during the hunting periods fixed in accordance with Article 7 of the Directive."

[113] See also paragraphs 18-46 of the judgment of 15 December 2005, Commission v Finland, Case C-344/03, not yet published.

III.2.3.a) Scale of assessment

(44) One may ask what level is best considered for evaluating whether the impact of a derogation is detrimental, neutral or even positive for the conservation status of a species.

(45) The conservation status of a species must ultimately be considered across its natural range, according to Article 1(i). In discussions with the Habitats Committee, it was therefore agreed that, for the purpose of reporting under Article 17 (in connection with Article 11), conservation status should be assessed at biogeographic level in each Member State. This would ultimately allow information to be aggregated for complete biogeographic regions across the EU. The conservation status of a species within the relevant biogeographic region within a Member State should be important information to be used when considering a derogation.

(46) However, an appropriate **assessment of the impact** of a specific derogation will in many cases, if not most, have to be at a lower level than the biogeographic region in order be meaningful in ecological terms. A useful level in this regard could be the (local) population. The wording of Article 16, which points to *"populations of the species concerned"*, confirms this interpretation. The approach of course needs to be adapted to the species in question: the killing of individuals of a wide-ranging large carnivore will need to be evaluated at population level (transboundary where applicable[114]), while the impact of the destruction of a breeding site in a rather fragmented amphibian habitat may be better evaluated on site or at meta-population level[115]. It should be kept in mind that, according to established case law, derogations must be applied appropriately in order to deal with precise requirements and specific situations[116]. It follows that assessments at lower levels are normally essential, since the derogations have to deal with specific problems and provide suitable solutions. Such an assessment at a lower level would then have to be seen in relation to the situation on a larger scale (e.g. biogeographic or national), for a complete picture of the situation.

Summary: The overall conservation status of a species in a Member State should, in line with the harmonised reporting framework agreed for Article 17 (in relation to Article 11) of the Directive, be evaluated at biogeographic level in each Member State. An appropriate assessment of the impact of a specific derogation will normally have to be at a lower level (e.g. site, population level) in order to be meaningful in the specific context of the derogation.

III.2.3.b) Derogations and conservation status

(47) To begin with, it must be acknowledged that neither the granting of derogations for species in an unfavourable conservation status nor the use of compensation measures is explicitly provided for in the Directive. However, by interpreting and implementing the provision in 16(1) in a way that puts the focus on reaching the overall objective of favourable conservation status, we believe that both concepts may be incorporated in the

[114] Regarding species with transboundary populations or species that migrate across the frontiers of the EU, the overall natural range of these species, including the migration zones outside the EU, should be considered where possible or feasible.

[115] A metapopulation consists of a group of spatially separated populations of the same species which interact at some level. The term metapopulation was coined by Richard Levins in 1969 to describe a model of population dynamics of insect pests in agricultural fields, but the idea has been most broadly applied to species in naturally or artificially fragmented habitats.

[116] See in particular: judgment of 8 July 1987, Commission v Belgium, Case 247/85, ECR p.3029, paragraph 7; judgment of 8 July 1987, Commission v Italy, Case 262/85, ECR p.3073, paragraph 7; judgment of 7 March 1996, WWF Italy v Regione Veneto, Case C-118/94, ECR p.1223, paragraph 21.

interpretation under the condition that reaching this objective is not compromised in any way.

(48) Obviously, the less favourable the conservation status and trends, the less likely that the granting of derogations would be justified apart from under the most exceptional circumstances. It is also clear that the **application of a proportional approach** to derogations is **only possible within a clear and well-developed framework of species conservation measures**. Again (as with protection measures), the conservation status of a species (at biogeographic and population level) is the core concept for a flexible and proportional approach to the use of derogations. It is therefore important not only to consider the present conservation status, but also to examine how it is developing.

(49) Two things have to be distinguished in applying "Test 3":

1. What is the actual conservation status of the affected species — at biogeographic level and at (local) population level?

2. What is the impact of the derogation as such?

(50) Considering the **first question,** it should be recognised that the conservation status of the (local) population of a species in a certain geographical area might well be different from the overall conservation status of populations in the biogeographic region in the Member State (or even the range). Both situations should be considered and taken into account in any decision.

(51) As for the **second question**, it is generally the rule that no derogation can be granted if it has a **detrimental** effect on the conservation status or the attainment of favourable conservation status for a species at all levels. In other words, if a derogation is likely to have a significantly negative effect on the population concerned (or the prospects of this population) or at biogeographical level within a Member State, the competent authority should not allow it. The net result of a derogation should be neutral or positive for a species[117].

(52) Where the population concerned within a biogeographic region in a Member State is healthy and unlikely to suffer detrimental effects from a derogation, even if the picture at biogeographic level is less good, the derogation would naturally be easier to justify than when the population concerned is already in a bad state and declining. In such cases where the conservation status is different at the different levels assessed, the situation at population level should be considered first, and the impact of the derogation on the population should then be examined in the context of the biogeographic region. In this way, a variety of situations and conservation interests can be taken into account.

(53) In line with the proportionate approach, derogations can be more easily justified if

a) requisite (appropriate, effective and verifiable) measures are established and implemented effectively in a Member State for a species to ensure strict protection and to aim for favourable conservation status

b) the derogation does not work against, render ineffective or neutralise the requisite measures

[117] In responses to human health disasters, however, the net result of a derogation may be negative for the species.

c) in the case of the deterioration or destruction of breeding sites and resting places: sufficient compensatory measures (see below) are taken to offset the impact at population and biogeographic levels

d) the impact of the derogation and the effectiveness of compensation measures are closely monitored and lessons are drawn for the future

(54) One recommended way of implementing a flexible and proportional derogation system as part of a strict protection system is the preparation of **species conservation plans** (even though not required under the Directive). Such plans could, besides informing and guiding the requisite measures under Article 12, also give guidance on the implementation of derogation schemes on a species-by-species basis or at transboundary population level, where applicable (guidance on assessing and monitoring the impact of derogations, possible compensation measures, etc.). Such plans would naturally have to be adapted regularly in the light of improved knowledge and monitoring results. These plans could be considered as a tool for demonstrating that the derogation system is in line with the objectives of the Directive.

The role of compensation measures *(derogations from Article 12(1)(d))*

(55) Compensation measures are independent of the activity causing deterioration or destruction of a breeding site or resting place. Such measures are intended to compensate for or offset specific negative effects on a species. Compensation measures should target precisely the negative effects on the species concerned and it is recommended that they are in place and effective before the negative effect occurs[118].

(56) Even though compensation measures are not mentioned in Article 16, and are as such not obligatory, they may be considered to provide better justification of a derogation if there is a risk that the derogation might have a detrimental effect. Compensation measures may be envisaged for derogations from Article 12(1)(d), i.e. in the case of the deterioration or destruction of breeding sites and resting places. Depending on the biology, ecology and behaviour of species, such measures may work well for some species but not for others. In general, compensation would have to:

i) offset the negative impact of the activity under the specific circumstances (at population level),
ii) have a good chance of success and be based on best practice,
iii) guarantee a species' prospects of achieving FCS,
iv) be effective before or at the latest when deterioration or destruction of a breeding site or resting place starts to take place.

(57) Compensation could thus guarantee that no detrimental effect is produced at either population or biogeographic level. ***However, it does not replace or marginalise any of the 3 tests.*** This means that the adoption of a compensation scheme cannot avoid the need for a derogation to pass all three tests described in chapter III.2.

[118] In some cases, compensation measures may not be fully functional by the time deterioration/destruction is taking place. Whether compensation has to be put in place without delay or whether some delay is acceptable depends on the type of species and the species' habitat. This should be taken into account in the decision authorising such compensation measures.

Compensation under Article 16 — a case concerning *Triturus cristatus*

During the planning stage for a housing area, a small Swedish municipality discovered that a small pond within the area designated for exploitation harboured a population of great crested newts (*Triturus cristatus*).

The population and its breeding site were in a difficult situation, as in previous years the surrounding woodland, probably used by wintering newts, had been destroyed and the habitats adjacent to the pond had been degraded. The chances of long-term survival of the population under these circumstances were considered to be uncertain to low. Closer investigation showed that the population size was about 100 adult specimens.

The completion of the housing area was considered to be of public interest and important in the regional context. Alternatives that would have been less damaging to the newt population could not be found in the neighbourhood. The overall conservation status of the species was unclear, with trends not known, although its range in Southern Sweden was continuous and the total Swedish population was estimated at 100 000 reproductive animals. A new population assessment and a National Action Plan for the species were launched during 2005.

It was therefore decided to create new habitats for the newts as a compensatory measure and to move the whole population. If successful, this action would improve the situation of the population concerned. A suitable compensation site was found less than 10 km away, an area already holding newts and providing sufficient habitat (including terrestrial wintering areas) for the long-term survival of the population. Within this area, a new pond was dug. The newts were translocated using the latest "state of the art" techniques. Studies showed that the number of adult newts had increased to about 160 specimens and the number of young leaving the pond in the autumn amounted to about 1 300 specimens.

The derogation was subject to several preconditions: a survey of the breeding newt population was to be performed in the housing area and at potential new sites; the timing of the construction activities for the housing complex was brought into line with the compensation actions; the permit to catch and move newts was linked to monitoring of the effects on the newt population for the following 8-10 years. Through bottle traps, visual counting and the taking of pictures of individual belly patterns, the long-term development of the population was to be assessed. The project was also intended as a pilot study for tackling future situations and has provided valuable information on the translocation of newts.

How can multi-species derogations be dealt with?

(58) For some projects (e.g. large infrastructure projects of public interest, such as transport networks), a number of Annex IV species might be affected. In such cases, the impact on ***each*** of the affected species should be considered and, based on this information, a picture of the overall impact should be formed in order to determine the solution to be implemented. The solution must also meet all 3 "tests". It is not enough to just list the number of species potentially affected without taking the further step of judging the extent of the problems and finding ways to avoid them.

Summary: the less favourable the conservation status and trends, the less likely will the granting of derogations be justified apart from in the most exceptional circumstances. The net result of a derogation should be neutral or positive for a species; detrimental effects should not occur. Compensation measures may, under certain circumstances, be used to offset the impact of a derogation on breeding sites and resting places, but do not replace or marginalise any of the "3 tests". Species conservation plans are not obligatory but are recommended as tools to demonstrate — among other things — that derogations for a certain species are in line with the objectives of the Directive.

III.2.4 Monitoring the impacts of derogations / Reporting on derogations

(59) Competent national authorities not only have to ensure that all the conditions of the derogation scheme are met *before* derogations are granted, but it is also recommended that they should monitor the impact of derogations and the effectiveness of compensation measures, if any, *after* they are implemented. This should ensure that any risk for a species arising unintentionally through the derogations (possibly in combination with other negative factors) is detected. The Directive does not explicitly provide for such monitoring. However, when advocating a proportional and flexible use of the derogation system (as set out above), we consider that the framework conditions must be right to ensure that the flexible approach does not lead to undesired effects. Monitoring is a key element in this regard.

(60) Such monitoring could also be seen as a part of the general surveillance obligation under Article 11 of the Directive. It would be reasonable for such surveillance to be sensitive to the effects (including cumulative effects and the effects of compensation measures) of derogations implemented for species for which derogations are regularly granted or which are in an unfavourable conservation status (and are nevertheless the subject of derogations).

Reporting obligation for derogations set out in Article 16(2) and 16(3)

(61) Derogations must also satisfy the formal conditions set out in Article 16(2) and (3). In the words of the Court in Case C-118/94 (a Birds Directive case), these formal conditions "*are intended to limit derogations to what is strictly necessary and to enable the Commission to supervise them.*"

(62) Member States do not need to consult the Commission before applying derogations but are obliged to submit a report every two years to the Commission on the implementation of Article 16. Article 16(2) does not define the precise content of these national reports. It is however clear that the information must be factual and cover the details set out in Article 16(3). On the basis of the information provided in the derogation reports, the Commission must be in a position to supervise the application of Article 16 within the Member States and its compatibility with the Directive. In cases where the Commission concludes that the use of derogations is not in conformity with the requirements of the Directive, it has the right to initiate an infringement procedure against the Member State concerned.

(63) Even though not mentioned explicitly in the Directive under Article 16(3), and therefore not obligatory, the Commission services consider that the two-yearly derogation reports might also include details that provide an understanding of the competent authorities' reasoning in applying a proportionate and flexible approach.

(64) Such additional information could include:

- Information on the conservation status of the derogated species (at biogeographic level in the Member State),

- Special justifications for derogations for species in a less than favourable status (e.g. references to conservation plans, conservation measures undertaken and their effects, summary of the impact assessment of the derogation on the species, alternatives assessed)

- Compensation measures taken

(65) Corresponding changes to the derogation reporting format have now been agreed. The new reporting format and a new IT tool, called the Habitats and Birds Directives Derogation System (HaBiDeS), is currently being tested and will be implemented by the Commission services and Member States.

Summary: Competent national authorities not only have to ensure that all conditions of the derogation scheme are met before derogations are granted (i.e. the "3 tests" are met), but it is also recommended that they should monitor the impact of derogations and the effectiveness of compensation measures, if any, after they are implemented. Again, although not obligatory, the Commission services consider that future derogation reports should include information to allow the Commission to understand and evaluate the use of a proportionate and flexible approach by Member States as set out in this document.

List of animal species covered by Annexes II, IV and V of the directive 92/43/EEC

Disclaimer : The table enclosed is a consolidated table produced by DG Environment. It is meant purely as an overview tool but we do not assume any liability for its content. The legally binding versions of the annexes are those officially published in the relevant legal acts. The latest version of these annexes on which the table is based is published in the "Council Directive 2006/105/EC of 20 November 2006 adapting Directives 73/239/EEC, 74/557/EEC and 2002/83/EC in the field of environment, by reason of the accession of Bulgaria and Romania"

The species listed in this Annex are indicated

- by the name of the species or subspecies (in bold and italics), or
- by all the species belonging to a higher taxon or to a designated part of that taxon. The abbreviation « spp. » after the name of a family or genus designates all the species belonging to that family or genus.

An asterisk (*) before the name of a species indicates that it is a priority species of Annex II (Annex VI and V do not distinguish between priority and non-priority species).

The annexes consolidated in this table are :

ANNEX II : SPECIES OF COMMUNITY INTEREST WHOSE CONSERVATION REQUIRES THE DESIGNATION OF SPECIAL AREAS OF CONSERVATION

ANNEX IV : SPECIES OF COMMUNITY INTEREST IN NEED OF STRICT PROTECTION

ANNEX V : SPECIES OF COMMUNITY INTEREST WHOSE TAKING IN THE WILD AND EXPLOITATION MAY BE SUBJECT TO MANAGEMENT MEASURES

Annex III

An example of a species dossier for *Triturus cristatus*

The crested newt, *Triturus cristatus* (senso lato), is a complex of closely related species occurring in Europe. In fact, *T. cristatus* is now considered to be a superspecies comprising 4 species: 1) Northern crested newt, *T. cristatus* (Laurenti, 1768) (sensu stricto): north and central Europe, to the Ural Mts., in the east; 2) Italian crested newt, *T. carnifex* (Laurenti, 1768): Italy and the Adriatic side of the Balkan peninsula; 3) Danube crested newt, *T. dobrogicus* (Kiritzescu, 1903): lowlands of the rivers Tisza and Danube; 4) Southern crested newt, *T. karelinii* (Strauch, 1870): SE Balkans, Crimea and Caucasus.

Even though these species are mostly allopatric, there is some complexity in transitional areas with morphological and genetic intergradation.

As with other members of the same family, the great crested newt shows an alternation between periods of aquatic and terrestrial activity. During the aquatic period it feeds on aquatic invertebrates, tadpoles and occasionally small fish. During the terrestrial periods it is active at night: searching for invertebrates. During the day it rests under stones, logs and other refuges. Breeding occurs during the aquatic period while summer dormancy and winter hibernation occur during the terrestrial one. Dispersion among ponds can be active, by nocturnal movements, or caused by seasonal floods.

The life cycle of newts shows great variation and is dependent upon several key factors, primarily water temperature and availability. The alternation between aquatic and terrestrial activity, and dormancy, shows considerable variation according to climatic conditions. In northern regions (and higher altitudes), there is a period of winter hibernation. In many southern areas, where water does not freeze, newts do not hibernate, and are found in water from autumn to late spring. Summer dormancy is common in areas of drought or where water temperature is raised.

Eggs are usually laid on the leaves of aquatic plants and larvae take refuge in amongst dense aquatic vegetation (plants and algae). Ponds with a large amount of aquatic vegetation and no fish represent the ideal environment for successful newt breeding, because of refuge availability and the lack of fish predation of both newt larvae and invertebrate prey. The occurrence of good structural variation such as dense terrestrial vegetation in or near the ponds, especially old growth forests, is also important because it offers diurnal refuges to adults during their terrestrial (nocturnal) life period.

Threats to the species include: (1) destruction of aquatic habitat; (2) cleaning of artificial springs, water reservoirs and ponds; (3) lowering of subterranean water table; (4) loss of connectivity including deforestation and consequent loss of small water basins; (5) use of pesticides that can accumulate in trophic webs which effect the invertebrate food of newts; (6) introduction of fish species in to ponds.

Interpretation of definitions for T. cristatus

All points of the definition of breeding site apply to *T. cristatus.*

The pond used for mating has individual male territories within which courtship and mating take place. Eggs are laid singly on emergent plants and mature over a period of 12 – 18 days. Young larvae emerge and swim freely.

The pond is, therefore, the Breeding Site.

T. cristatus does not migrate but does disperse to adjacent pools. Healthy populations of *T. cristatus* utilise a series of pools and move between them dispersing over suitable interconnecting terrestrial habitat. ndividuals may move ca. 1 km from their natal pool.

The Resting Places for *T. cristatus* are thus the ponds they inhabit and the adjacent terrestrial habitat that supports them during the terrestrial part of their life cycle as far as these terrestrial areas are essential and resting places can be identified.

The **functional unit** needed to maintain a viable *T. cristatus* population thus comprises a series of ponds, the majority of which will be resting places and a proportion of which will be Breeding Sites, as well as a proportion of other areas which will be resting places set within suitable terrestrial habitat.

FOREWORD

We depend on our forests for a lot. They have to provide timber and other products, but they are important for recreation too. They also play an essential environmental function in protecting biodiversity, enhancing the landscape, and regulating climate, water and soil.

So forests are perhaps the most important natural resource in Europe. That they protect biodiversity is evident from the fact that, compared to other ecosystems, they are home to the largest number of mammals, birds, reptiles and amphibians on our continent. But, sadly, our forests are increasingly under threat, and there is a risk that many species could disappear from some European countries, especially species at the top of the food chain such as the large carnivores and birds of prey.

But European public opinion has consistently demonstrated its interest in the long-term survival of Europe's most valuable and threatened species and habitats. For this reason, in the 1990s, the Community created Natura 2000, and then at the Göteborg summit in 2001 undertook to halt biodiversity decline by 2010. These decisions are crucial in maintaining the Community's commitment to conservation of its natural heritage.

As establishment of Natura 2000 is now virtually complete, with adoption of the lists of designated sites, the 'El Teide' ministerial declaration made clear commitments about involving stakeholders, managing the network and targeting resources. This is especially important for forests, as forest habitats and forest species will be included in over half of all sites. This means that more attention will have to be paid to integrating conservation objectives into forest management.

This document was developed with extensive stakeholder consultation and is designed to give Community citizens a better understanding of Community legislation on conservation of our forests. It makes it very clear that Natura 2000 is not opposed to economic activity in the forestry sector. It explains how sites are designated, and the practical consequences of designation. As another example of the European Commission's policy of openness and transparency, it recommends identifying the measures required to maintain biodiversity through discussion with stakeholders, and expressing the outcome of this process as formal management objectives. A separate section gives numerous examples of creative approaches to implementing Natura 2000 in forests and of the successful combination of forestry with nature conservation objectives. These examples were submitted by Member States and by stakeholders. They come not only from specific conservation programmes such as LIFE projects, but also from integrated projects where nature conservation is just one of several objectives, such as rural development programmes.

I trust you will find this publication informative and will rise to the challenges and opportunities it contains. We may depend on our forests — but they depend on us too!

Margot Wallström
Commissioner for the Environment

118-1873-IMG/K. Sundseth

1. Executive summary

This document aims to clarify the role of forests and forestry in the Natura 2000 ecological network, in order to facilitate the uptake of Natura 2000 among forestry operators.

The document provides an overview of the Natura 2000 concept, the legal framework for biodiversity conservation and the specific requirements of the habitats directive, and the importance of European forests in the global conservation context.

The document then provides indicative guidelines for forest management on Natura 2000 sites. These are based on existing interpretations of the European *acquis* for nature conservation, on initiatives to promote sustainable and multi-functional forest management (SFM — Ministerial Conference for the Protection of Forests in Europe) and on relevant literature.

The premise of this document is that Europe's natural heritage has been transformed by centuries of human use, and that the conservation and sustainable use of this heritage within Natura 2000 sites requires a spectrum of measures ranging from no or minimal human activity to various regimes of sustainable use. This assumes that stakeholders can reach a compromise between the objectives of nature conservation and of economic production. The Natura 2000 network is not intended to block all economic activity in designated sites, but requires that the management of each site is tailored to local circumstances and takes into account both the requirements of nature conservation and economic production.

This text recommends that appropriate site management objectives and measures be identified through meaningful stakeholder consultation, and that the outcomes of such consultation be laid down in transparent, long-term management plans.

In order to further facilitate take-up among forest operators, this document also provides:

- an overview of existing and potential Community funding mechanisms and information on their successful use for nature conservation and ecosystem management on forest sites in the Natura 2000 network;

- examples of the successful combination of economically viable forestry with nature conservation objectives on Natura 2000 sites from various Member States and elsewhere;
- a bibliography and useful Internet links.

Acknowledgements

The basic research and editorial coordination for the first draft of this document was conducted by Tim Christophersen during a traineeship at Unit B2 'Nature and Biodiversity' in the Directorate-General for the Environment.

We especially acknowledge the contributions of the Directorate-General for Agriculture, the European Environment Agency (EEA), the Liaison Unit in Vienna of the Ministerial Conference on the Protection of Forests in Europe (MCPFE), the UNEP Regional Office for Europe in Geneva, the Confederation européenne des proprietaires forestiers (CEPF), the European Policy Office of the WWF (World Wide Fund for Nature), the IUCN office in Brussels and the European Specialist Group on Sustainable Use of IUCN, the Union des sylviculteurs du sud de l'Europe (USSE), the Confederation of European Paper Industries (CEPI), English Nature, Birdlife International, the European Landowners Organisation and the Société royale forestière de Belgique (SRFB). We would also like to thank EU Member State administrations for the remarks and examples that they have submitted.

Nature and limitations of this document

This document has been drafted by the services of the Directorate-General for the Environment of the European Commission, following relevant informal discussions that led to constructive inputs from other Commission services, from stakeholders and from the authorities of the Member States. The document reflects only the views of the Environment DG and is not of a binding nature.

The interpretations provided by Commission services cannot go beyond the directives. This is particularly true for the habitats directive as it enshrines the subsidiarity principle and as such allows Member States a wide margin of manoeuvre for practical implementation of specific measures in relation to specific sites within the Natura 2000 network. In any case, Member States are free to choose how to implement practical measures provided these serve the general purpose of the directive.

This document is not intended to provide definitive answers to site-specific questions. Each site should be dealt with on a case-by-case basis, with reference to the guidelines.

Future revisions of this document are anticipated as further experience is accumulated on forestry and Natura 2000 in Member States and any relevant future case law. The Directorate-General for the Environment may also produce a simplified version of this text for wider distribution at a later stage.

The scope of this document is limited to the 15 current Member States and does not take into account specific situations in the candidate countries. This is because the Commission does not have any competence over nature-protection issues outside the EU, and because preparatory consultations did not include the candidate countries.

2. Introduction

2.1. Purpose of this document

This document aims to clarify the role of forests and forestry for the conservation of Europe's natural heritage within the Natura 2000 network. It is hoped that it will facilitate understanding of the mechanics of the habitats directive among various stakeholders, and that this document may be complemented by more country-specific guidance drawn up by Member States.

Taking into account the large variety of forest habitats throughout Europe and the widely differing socioeconomic situations at regional and local levels, this document proposes general guidelines and recommendations for dealing with forest areas within Natura 2000. This text was written with full awareness of Article 5 of the Treaty to establish the European Community, which institutes the principle of subsidiarity, one of the main pillars of the architecture of the European Union. Following this principle and the implementation procedures of the habitats directive, every decision taken in relation to a certain site should always be made at the most appropriate administrative level, taking into account the specific local circumstances.

Specific objectives of these guidelines are:

- to inform private and public forest owners, forestry operators, nature conservation authorities, NGOs and other stakeholders of existing experiences across Europe in the field of Natura 2000 and forestry;
- to initiate and facilitate communication between different stakeholders;
- to give a framework of non-mandatory guidelines for management of Natura 2000 forest sites and to present case studies on how to achieve the goals of the habitats directive;
- to inform stakeholders of existing and forthcoming funding opportunities for forests and forestry arising from the establishment of Natura 2000.

2.2. Why a comprehensive report on Natura 2000 and forests?

As over half of all proposed sites for the EU-wide ecological network Natura 2000 will include forest areas, specific guidance for forest sites is appropriate. The ongoing establishment of the Natura 2000 network, the most ambitious nature conservation initiative in European history, cannot be completed without the understanding and the contribution of the EU forest sector. This publication is a compilation of existing information regarding forests, protected area management and forest management within the context of Natura 2000. It is addressed at national administrations, forest owners, forestry operators, conservation NGOs and citizens working in or with forests. It forms part of a series of publications by the Directorate-General for the Environment on technical and legal issues concerning Natura 2000 ([1]).

During the establishment of Natura 2000, many misunderstandings arose across Europe (see Table 1). These are partly caused by the fact that different Member States have, very rightly, given different interpretations to what their contribution to Natura 2000 should be. The most widespread misconception is that Natura 2000 is intended to establish a system of strict nature reserves where no economic activities can take place. Although, undoubtedly, many of the most endangered species and habitats listed in the annexes of the habitats directive must be better conserved in future, the majority of sites of Community importance (SCIs) and special protection areas (SPAs — see 3.1) have been influenced by human culture for hundreds of years. In many cases, it is this very human influence that has contributed to development of an ecologically valuable habitat. Thus, Natura 2000 aims to permit appropriate economic activity to maintain or improve the conservation status of certain sites.

The general principle that the conservation of flora and fauna will receive priority when managing natural resources is the basis for management of Natura 2000 areas. As long as favourable conservation status can be maintained or restored in combination with the commercial management of forests expected on most forest sites, economic activities can continue without substantial change. In some cases these economic activities might have to be restricted or, on the contrary, more cost-efficient management may help to meet conservation needs. This can only be decided on a case-by-case basis, depending on the conservation status of each site and, if considered necessary, in the framework of site management plans or site-specific conservation objectives.

Natura 2000 offers opportunity for rural development and the reorientation of forest management, in particular through the possibility of compensation for restrictions of ownership rights. These issues must be addressed by Member States, possibly with the help of co-financing through the Community budget (see Chapter 7).

Council resolution of 15 December 1998 on a forestry strategy for the European Union ([2]) recognises the need for the conservation of areas representative of all types of forest ecosystems and of specific ecological interest. The resolution states that the establishment of Natura 2000 should take into account economic, social and cultural requirements, regional and local characteristics and the involvement of forest owners. Consequently, this report formulates recommendations for a participatory approach, involving all relevant stakeholders, to management measures or management plans for the Natura 2000 sites.

([1]) For further information on Natura 2000 as well as all legal texts of the habitats directive and other relevant information, the reader is referred to the nature conservation homepage on the Europa server: http://europa.eu.int/comm/environment/nature/home.htm

Table 1: Dispelling some of the myths about Natura 2000	
Popular 'myths' about Natura 2000	**Legal and administrative facts**
'The habitats directive is a Community initiative that was concocted in secret by Brussels technocrats'	Ministers of the Member States unanimously adopted the habitats directive in 1992 after five years of debate in the Council and the European Parliament. Many interest groups communicated their position to both the Member States and to Brussels during that period and their observations were taken into account.
'The European Commission decides the sites to be included in Natura 2000'	The responsibility for proposing sites within Natura 2000 lies first and foremost with the Member States. 1. Member States propose a list of sites for their territory. 2. From these national lists, the Commission establishes, in agreement with each Member State, a European list of sites of Community importance (SCI). 3. The Member States designate these sites as special areas of conservation (SACs). For the birds directive the Member States designate sites directly as special protection areas.
'Natura 2000 sites will all become nature reserves'	Member States have a choice of mechanisms to use to manage a site. These can be: ■ statutory (for example, making a nature reserve); ■ contractual (for example, signing a management agreement with the landowner); ■ administrative (providing the necessary means).
'Brussels will dictate to us what can or cannot be done in each site'	The habitats directive, and Natura 2000, are based on the principle of subsidiarity. It is up to the Member States to decide how best to conserve the sites, in compliance with the objectives of the directive. Although not an obligation, management plans are mentioned as a useful tool.
'We will have to stop all our activities within a site for the sake of preserving nature'	Conserving species or habitats can be quite compatible with well-managed human activities,such as tourism, hunting and forestry. Many natural areas are highly dependent upon human activities (such as agriculture). Nature conservation also provides additional opportunities for human activities (environmental tourism, pursuit of leisure activities, labelling of natural produce, etc). Any restricting or stopping of certain activities that are a significant threat to the species or habitat needs to be addressed on a case-by-case basis.
'It is the inhabitants of the Natura 2000 sites that will have to support the costs of this protection'	Member States and the European Commission ensure that the costs of Natura 2000 are shared by all. Member States are asked, at the time of submitting their national list of sites, to evaluate the cost of managing those areas hosting priority species or habitat types and to communicate this to the European Commission. The European Commission will then be required to set up a scheme to co-finance these costs. There are a number of existing Community funds that may be used for this process (such as, agri-environment measures, structural funds, LIFE, etc.).
'There is a general lack of transparency on Natura 2000'	Every effort is made to ensure that the European Commission's activities with regard to the establishment of Natura 2000 are as transparent as possible. A newsletter is produced three times a year and is made available to all those who are interested in following this process.
'Once a site is included in Natura 2000 it becomes untouchable as regards future developments'	The habitats directive does not a priori prevent any new activities or developments within a Natura 2000 site from taking place. Any new plans or programmes that are likely to have a significant effect on a designated site have to undergo an appropriate impact assessment before being implemented. If a proposed activity is likely to cause significant damage to a site and all possible alternatives have been exhausted, it may still go ahead only if it is of overriding public interest and if there is compensation foreseen.

2.3. The importance of stakeholder involvement

The public's right of access to information on environmental issues and legislation has improved over the last years, and the Commission is continuously striving to improve the transparency of its actions in all policy fields. The Commissioner for the Environment, Margot Wallström, expressed this view quite clearly in her foreword to the publication *Managing Natura 2000 sites: the provisions of Article 6 of the habitats directive* ([3]): 'To be successful [Natura 2000] requires, in the first instance, the active involvement of the people who live in and depend upon these areas.'

Widespread concern about the public right of access to information on environmental legislation led to the adoption of the UN/ECE Convention on access to information, public participation in decision-making and access to justice in environmental matters on 25 June 1998 in the Danish city of Aarhus. All EU Member States and the European Community have signed the Convention. After the adoption of three directives — on public access to information, participation in consultation exercises and on access to justice — the European Union will be a full party to the Convention.

The 'Aarhus Convention' ([4]) is a new kind of environmental agreement, with far-reaching consequences for European citizens. It links environmental rights and human rights and is based on the fact that sustainable development can be achieved only through the involvement of all stakeholders. It focuses on interactions between the public and the authorities in a democratic context and it forges a new process for public participation in the negotiation and implementation of international agreements.

Since the habitats directive came into force in 1992, all Member States have, to varying degrees, made efforts to inform stakeholders and the general public about the establishment of Natura 2000. Some Member States followed a very participatory and transparent approach in the designation process, whereby consultations took place and appeals before administrative courts were possible. Other Member States have favoured a more top-down approach. In many regions there has been, and still exists, a lack of information on Natura 2000 at operational level. This shows that further efforts are needed to effectively communicate to the public and each other the important role of Natura 2000 for the future of the European natural heritage. Although it is principally the task of the Member States to inform the stakeholders concerned and the public about Natura 2000, the Directorate-General for the Environment aims to assist these information campaigns where possible.

In the case of forestry, the participation of all concerned (including forest owners, rural communities and forestry operators such as contractors, forest industries and conservation NGOs) in managing Natura 2000 areas is particularly important, as the conservation of biodiversity often depends on the maintenance of human activities, especially if non-climax vegetation formations are to be maintained.

([3]) The publication can be downloaded from the Internet or requested from the European Commission, Directorate-General for the Environment, Unit B.2, Rue de la Loi 200, B-1049 Brussels. Information on the European nature conservation legislation can be found under http://europa.eu.int/comm/environment/nature/legis.htm

3. Natura 2000

3.1. The concept

Directive 92/43/EEC (the 'habitats directive') from 1992 sets the goal of establishing a European network for nature conservation, called Natura 2000, consisting of 'special protection areas' (SPAs) under the Birds Directive 79/409/EEC and the forthcoming 'special areas of conservation' (SACs) under the habitats directive. The underlying idea of Natura 2000 is simple: nature does not stop at administrative borders, so if we want to preserve the vitality and the diversity of our natural surroundings, we have to think and act on an international scale. A successful protection of natural resources and their variety on the European continent can therefore only be reached at European level. The approach of the habitats directive is an integrated one — as well as ensuring the conservation of biodiversity it also aims to promote sustainable activities supporting the conservation objectives for the Natura 2000 areas. It can thus be used as an opportunity for promoting new models of also rural development, in particular in some of the EU's most marginal regions. The habitats directive also has an important political significance because its provisions are legally binding for EU Member States.

It is expected that the network will eventually cover some 450 000 km², which means on average ([5]) 10–15 % of EU territory. Natura 2000 is an important joint effort of the EU Member States to comply with international conventions and agreements in the field of biodiversity protection, such as the Convention on Biological Diversity that was adopted at UNCED in 1992.

The European Parliament stated in its resolution ([6]) on the European Community biodiversity strategy COM(98)0042 that 'in contrast to a number of other environmental problems, it is impossible to make up for losses of diversity of species, ecosystems and natural gene banks.' According to information compiled by the European Environment Agency in Copenhagen, biodiversity in Europe is decreasing, many

([5]) This figure is not to be seen as an objective, as it is a mean value around which large deviations will occur because of specific situations in the Member States and differences between regions within Member States.

([6]) OJ C 341/12, 9.11.1998.

species face severe threats, or are nearing extinction (*Europe's environment: the second assessment'*, EEA, 1998 and *The environment at the turn of the century*, EEA, 1999). The declining species are mostly indigenous, associated with natural habitats, clean water and air and little human disturbance. Establishing Natura 2000 will be of great importance in halting the continuous loss of habitats and species and, if possible, reverse the trend of impoverishment of our natural heritage and countryside resources.

Therefore, a coherent network like Natura 2000 will be a step towards a successful protection of our indigenous habitats and species. Even with 15 % of EU territory expected to be ultimately part of Natura 2000, the remaining land area of the EU will still be important for the overall goal of sustainable development and management of biodiversity, in forestry too. This shows the need for much wider integration of biodiversity concerns in national forestry programmes and initiatives, and into general forestry practices for which Natura 2000 can have a pilot function.

3.2. The technical implementation

For the establishment of Natura 2000 it was necessary to elaborate a scientific basis for the site designation process. The habitats listed in Annex I to the habitats directive were originally grouped in five biogeographical regions, based on the Corine land cover identification system. These are the Alpine, Atlantic, Continental, Macaronesian and Mediterranean region. In 1995, when Austria, Finland and Sweden joined the EU, the boreal region was added to this list by a Council decision. The biogeographical regions allow for an assessment that is objective and is not based on national boundaries of the existing natural heritage and the habitats and species in the annexes of the habitats directive.

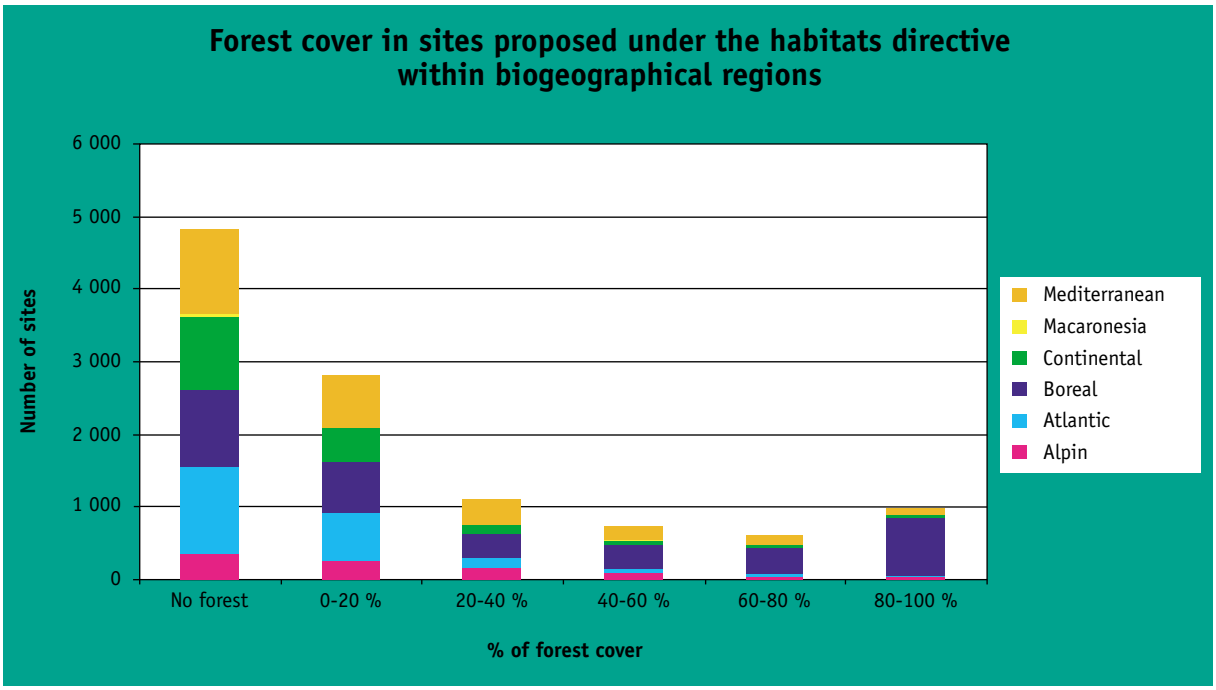
A total of 59 forest habitat types that are rare or residual and/or host species of Community interest are listed in Annex I to the habitats directive, grouped into the following six forest habitat categories of European conservation interest:

- western taiga
- oak and beech forests
- deciduous Mediterranean forests
- sclerophyllous Mediterranean forests
- temperate mountain conifer forests
- Mediterranean and macaronesian mountain forests.

Next to habitats, the habitats directive also identifies some 200 animal and over 500 plant species as being of Community interest. This implies that several types of measures have to be taken to assure their conservation status, such as designation of sites (Annex II), general protection measures (Annex IV) and regulation of use (Annex V).

The birds directive lists in its Annex I over 180 bird species for which special protection areas (SPAs) have to be designated by a procedure of direct notification from Member States to the Commission. Many of these species are associated with forest habitats, either directly (woodpeckers, grouse, finches and warblers) or

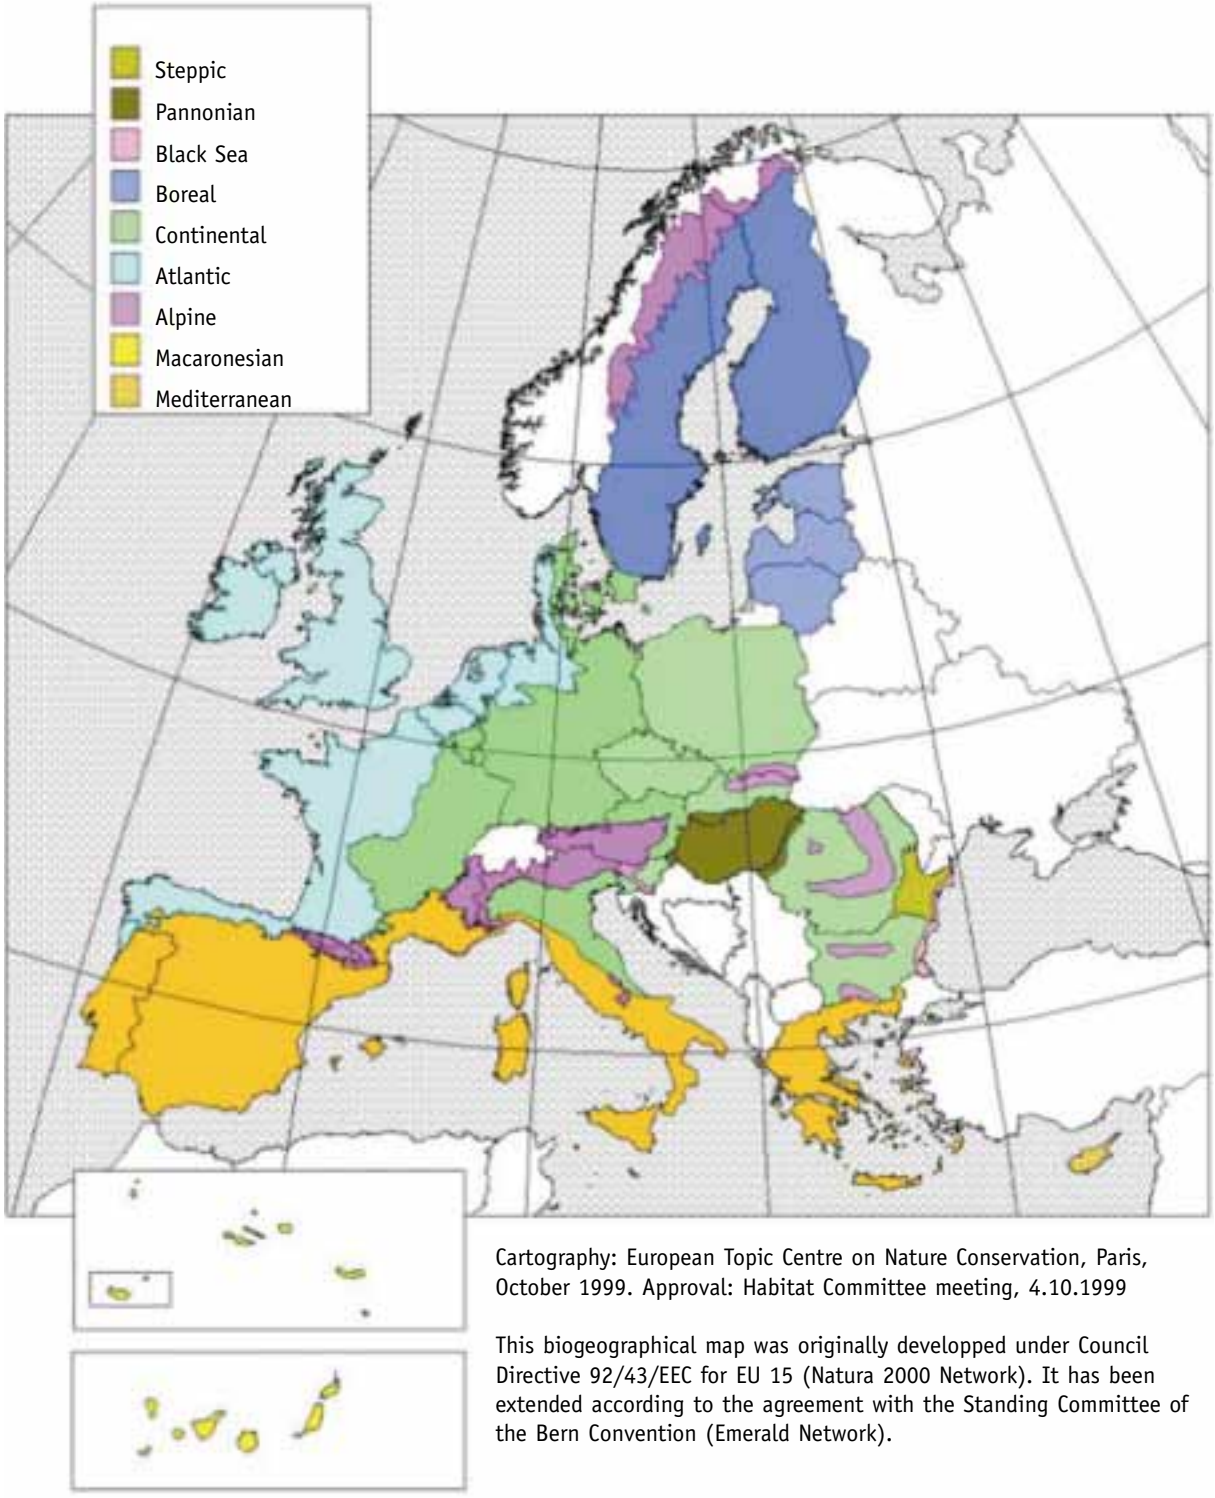
Table 2: The biogeographical regions (see map on p.14)



Biogeographical region	*Countries whose territory falls in this region*
Alpine region	Germany, Spain, France, Italy, Austria, Finland, Sweden
Atlantic region	Belgium, Denmark, Germany, Spain, France, Ireland, the Netherlands, Portugal, Sweden, UK
Boreal region	Finland, Sweden
Continental region	Belgium, Denmark, Germany, France, Italy, Luxembourg, Austria, Sweden
Macaronesian region	Spain, Portugal
Mediterranean region	Greece, Spain, France, Italy, Portugal

in connection with varying landscape features like small wetlands (waders, shorebirds) and forest edges (owls and other birds of prey).

According to Article 4 of the habitats directive, Member States are required to propose sites of Community importance related to these forest habitats for each of the six biogeographical regions. It is the explicit aim of the European Commission to ensure that Natura 2000 includes a coherent network of forest areas. The biodiversity action plan for the conservation of natural resources ([7]) sets the ambitious target of having all forest types from Annex I to the habitats directive assessed and sufficiently represented by 2002. This highlights the importance of forest habitats for Natura 2000 and for the overall protection of biodiversity.



Since 1992, the establishment of Natura 2000 has progressed to varying degrees in all Member States. Some 14 000 sites in the six biogeographical regions in all 15 EU Member States have been listed as proposed sites (pSCI — proposed sites of Community importance) for the network. These proposed lists are then discussed between the Member States, the Directorate-General for the Environment, and observing NGOs such as landowner associations and nature conservation organisations. Revised lists of special areas of conservation (SACs) have then to be designated by Member States, at the latest in June 2004.

The figure above gives an overview of the importance of the forest cover (Annex I HD habitats) within Natura 2000 sites in the different biogeographical regions, according to the actual state of the pSCI designation ([8]).

([7]) The action plan (COM/2001/0162 f) is an instrument for the implementation of Article 8 of the CBD.
([8]) All figures mentioned in this report reflect the data that were available in February 2002.

Indicative map of biogeograpical region EU-15 + 12

Cartography: European Topic Centre on Nature Conservation, Paris, October 1999. Approval: Habitat Committee meeting, 4.10.1999

This biogeographical map was originally developped under Council Directive 92/43/EEC for EU 15 (Natura 2000 Network). It has been extended according to the agreement with the Standing Committee of the Bern Convention (Emerald Network).

4.

Facts about EU forests, forestry and the environment

EU forests cover approximately 113 million hectares (36 % of the Union territory), of which 87 million hectares are considered productive forests. Some 65 % of EU forests are privately owned.

With the accession of Austria, Finland and Sweden, the EU became the world's second largest paper and sawn-wood producer. It is the foremost importer and the third largest exporter of forest products. Forests are also of high importance in the Mediterranean area because of their protective functions and importance for biodiversity. Altogether, the EU forest-based industries' production value amounts to nearly EUR 300 billion, employing some 2.2 million people.

Differences in forest type, forest cover and ownership structure within the EU

- Austria, Finland and Sweden are heavily forested and have substantial forest products industries based predominantly on coniferous forest;
- Greece, Spain, France, Italy and Portugal have Mediterranean woodland, managed primarily for protection and where fire is potentially a serious threat. France and Italy, in particular, also have large areas of temperate forest and mountain forests, including coppice areas, farm woodlots and community forests;
- Belgium, Germany, France and Luxembourg have a mixed ownership structure and a range of forest types with production being significant but not always the primary aim in any forest;
- Denmark, Ireland, the Netherlands and the UK have predominantly artificial forest, based on plantations, although the objects of management have been widened in the last decade to encompass service values;
- south-west France, northern Spain and parts of Portugal have large areas of industrial wood plantations, mainly destined for pulping.

The environmental state of EU forests

(*Sources:* Europe's environment, the second assessment, EEA 1998 and *The environment in the EU at the turn of the century*, EEA, 1999.)

- Forest cover has fluctuated greatly during this millennium, with very low or poor coverage in many countries.
- Present forest cover is a result of a steady increase in recent decades, mainly by planned afforestation and regrowth in semi-natural areas after abandonment of cultivation or grazing. The forest area is still growing and will continue to do so as a result of the evolution of the CAP, which is expected to free more land.
- Forest habitats are changing through intensification of management, the increase in uniformity, fragmentation, the use of exotic tree species, the introduction or maintenance of animal species for hunting, drainage and air pollution.
- Productivity and total production are increasing in many areas, despite declining forest health and severe pest attacks. The increase is probably due to a combination of use of high-yield strains, management including fertilisation and pest control, high levels of airborne CO_2 and eutrophication.
- Only a very small proportion of the natural forest which once covered most of Europe remains untouched, mostly in isolated pockets, and the loss continues for old natural and semi-natural deciduous and coniferous woodlands. In western Europe, less than one third of total forest area is semi-natural and there are nearly no truly natural old forests left.
- Some new forest habitat types are being created, for instance the habitats associated with short rotation Christmas trees, energy woodlands or the use of exotic species such as eucalyptus; these generally have low biodiversity.

Summarising, one can say that, although the absolute area of EU forests is expanding, the environmental quality of the forest ecosystems is often in decline.

Biological importance of European forests

Forests can still be considered as the most important component of European nature. One indicator of the vitality of forests is that the forest biotope remains home to the largest number of vertebrates (mammals, birds, reptiles and amphibians) on the continent.

The distinctive nature of European ecosystems is often forgotten. Even the dominant species of the forests are virtually restricted to Europe. Trees like the European beech and holm oak are not found further east than the Black Sea or the Caucasus. The ordinary sessile oak does not survive further east than the Ural mountains, on the border of Europe. European hornbeams still thrive in the Caucasus but not in Asia proper. Thousands of species of insects and invertebrates are confined to forest habitats constituted by these trees.

Many habitats and plant associations are indeed exclusively European and thus it is solely the responsibility of European countries to safeguard their future. Moreover, Europe hosts a number of restricted-range endemic species.

The changes that forests have undergone over the last few centuries (see Annex I) have brought a great number of species to the verge of extinction. Many species are about to disappear from several European countries and perhaps from the whole continent. This is especially true for organisms at the top of the food chain such as large carnivores and birds of prey.

As part of a new UN/ECE/FAO assessment of the temperate and boreal forests of the world (TBFRA 2000), new data on forest dwelling species were gathered, showing that the number of threatened taxa is alarmingly high. Typically, 20 to 50 % of mammals, and 15 to 40 % of birds of the forest-dwelling species were categorised as threatened. A typical European country harbours several endangered mammals and bird species. In many countries, the proportion of endangered mammals and birds was over 40 %. The situation was almost as bad for lichens, mosses and vascular plants — in some countries, nearly half of the forest-associated lichen species are thought to be at risk.

Sustainable forest management — SFM

Article 10 of the Convention on Biological Diversity encourages the sustainable use of components of biological diversity. For forests, this use should be ensured in the form of sustainable forest management.

Box 1: The first Rio principle

'Human beings are at the centre of concerns for sustainable development. They are entitled to a healthy and productive life in harmony with nature.'
(Principle 1 of the Rio Declaration, United Nations Conference on Environment and Development, 1992.)

The definition of 'sustainable forest management' has evolved over time according to the changing needs of society. Although comprehensive regulations to balance timber yields and harvests can be traced as far back as the 'ordonnance' of Colbert under Louis XIV in 1667, the first recorded mentioning of the word 'sustainability' actually appeared in connection with forestry in the early 18th century. In 1713, in the German mining town of Freiberg, the local mining authorities urged the foresters to observe the sustainable annual yield of the forest. This historic meaning of sustainability, as it was developed by the forest sector almost three hundred years ago, mainly considered the sustainable yield of woody biomass to cope with historic timber and energy shortages. However, the modern definition of sustainability also includes important social and ecological aspects.

The Brundtland Report ([9]), a key document for the United Nations Conference on Environment and Development (UNCED) in Rio de Janeiro in 1992, defined sustainable development as follows:

'Sustainable development is development which meets the needs of the present without compromising the ability of future generations to meet their own needs.'

On the basis of this UNCED concept of sustainability, the Ministerial Conference on the Protection of Forests in Europe (MCPFE) ([10]) has developed a common definition of SFM that was adopted at the Helsinki Conference in 1993 ('Resolution H1'):

'The stewardship and use of forests and forest lands in a way, and at a rate, that maintains their biodiversity, productivity, regeneration capacity, vitality and their potential to fulfil, now and in the future, relevant ecological, economic and social functions, at local, national and global levels, and that does not cause damage to other ecosystems.'

This document uses the abovementioned definition of the MCPFE as it was agreed during discussions between experts from the more than 40 States participating in the Council of Europe, including the current 15 EU Member States and all CEECs currently negotiating EU accession.

The same definition was also endorsed by the EU Council in its resolution on the EU forestry strategy ([11]) that was proposed by the Commission in 1998 ([12]) (see below).

More specifically, criteria for sustainable forestry include (Helms, 1998):

(a) conservation of biodiversity;

(b) maintenance of productive capacity of forest ecosystems;

(c) conservation and maintenance of soil and water resources;

(d) maintenance of forest contributions to global carbon cycles;

(e) maintenance and enhancement of long-term benefits to meet the needs of societies;

(f) a legal, institutional and economic framework for forest conservation and sustainable management.

The application of this modern, multi-functional understanding of sustainability can lead to a higher biodiversity in forests. Certain forms of forest management can have positive effects on biodiversity, by creating a high diversity of habitats on a small area and by imitating natural processes of disturbance in the forest ecosystem, including certain forms of agroforestry such as cork production in southern Europe.

([9]) The report 'Our common future' was presented by the World Commission on Economic Development in 1987, and is often referred to by the name of the chairperson, former Norwegian Prime Minster Gro Harlem Brundtland.
([10]) Please refer to the information on the MCPFE in Chapter 5. Further information at: http://www.mcpfe.org
([11]) Council resolution of 15.12.1998, OJ C 56/1, 26.9.1999.
([12]) COM(1998) 649 final of 3.11.1998.

The changing role of forestry in Europe

From being feared as wild, uninviting frontiers that have to be conquered to yield their natural riches, forests are increasingly perceived as a valuable, limited resource that provide much more than timber. Many economic activities in the EU depend on forests as a source of raw material, but forests also provide conservation of the gene-pool and protect other natural resources such as air and water. They provide us with tranquillity, peace of mind, natural beauty and relaxation. These important 'forest services' are becoming increasingly valuable in a rapidly changing world where people tend to prioritise the creation of human living spaces over natural habitats.

Box 2: Framework for Community actions according to the EU forest strategy

- Promotion of forestry activities in rural development action, notably concerning the conservation and the enhancement of ecologicial values of forests.
- Conservation of forest biodiversity, both as an integrated component of forest management and in the establishment of protected forest areas , such as those falling under Natura 2000 designations.
- Enhancement of the role of forests in the mitigation of climate change, both by promoting of woody biomass as a source of energy and increasing the role of forests as a carbon sink.
- Analysis of the possibilities of supporting objectively verifiable, comparable and credible forest certification schemes.

The objectives of forest management are changing towards sustainable management for a variety of results in many Member States and other countries, focusing on new aims as well as the traditional objective of sustainable yield of timber. Different management concepts are becoming closely linked through initiatives such as forest management for sustainability, assessments of external benefits of forests and the introduction of certification schemes for timber extracted from forests where the management regime meets environmental criteria. More attention is being given to the environmental and social functions of forests, for example, for biodiversity, water resources, CO_2 sequestration and recreation. However, most European forest areas are still under the type of management that takes little account of general biodiversity concerns and gives priority to the traditional objective of sustainable timber yield (*Europe's environment, the second assessment*, EEA, 1998).

More detailed information on global forest issues, importance of EU forests, European forest history, naturalness of forests and the role of forestry can be found in Annex I 'General information on forests and forestry'.

The framework for biodiversity protection

Biological diversity is not only of ecological and economic benefit, but also an irreplaceable part of our cultural heritage and history, and a legitimate resource for future generations. At the same time, the rate at which biological diversity is decreasing shows no sign of easing up (*Europe's environment: the second assessment*, Chapter 8, EEA, 1998). The main reasons for this development in the EU are highly intensive forms of land use, pollution, and the break-up of natural habitats through infrastructure and urbanisation. Over the past decades, a series of international instruments have been developed with the objective of protecting our natural heritage.

At the European Council in Göteborg on 15 and 16 June 2001, the Heads of State or Government of the EU Member States agreed on the ambitious target of halting the loss of biodiversity in the EU by 2010 ([13]). This target has also been set in the sixth Community environmental action programme of the EU. The successful establishment of Natura 2000 will be one of the key requirements in reaching this goal.

Annex II summarises the instruments for the protection of natural heritage in Europe.

([13]) See Presidency conclusions at http://europa.eu.int/comm/gothenburg_council/index_en.htm

5. Integration of environmental policy into other EU policy fields

Although the Treaty establishing the European Community does not contain any reference to a comprehensive common forest policy, Community policies on nature conservation, as a part of overall environmental policy, have an effect on national forest policies. The birds and habitats directives are examples of Community legislation that is cutting across forest policy and other policy fields throughout the Member States.

5.1. The Treaty of Maastricht

With the Maastricht reform of the EC Treaty in 1992, the Member States of the European Community agreed on the integration of environmental issues into all fields of Community policy. The Treaty in its consolidated version, last amended by the Amsterdam Treaty, which was signed in 1997 and came into force in 1999, now has a number of articles that are relevant for policy integration at European level.

To further ensure the integration of environmental policy into other EU policy fields, the Treaty of Amsterdam added an explicit reference to sustainable development. In Article 2 of the Treaty, describing the tasks of the European Community, the importance of a 'high level of protection and improvement of the environment' is stressed. Article 6 of the Treaty now demands that environmental protection requirements must be integrated into all Community policy fields.

Article 10 of the Treaty requires that Member States abstain from any measures that might jeopardise the achievement of its objectives. This is important in the context of Natura 2000, as it effectively prevents the development or implementation of any plans or projects that could endanger the conservation status of habitats and species on sites not yet part of Natura 2000 but fulfilling the designation criteria.

5.2. Cross-compliance

According to the cross-compliance principle, projects in the Member States can only be (co-)funded by the Community budget if they comply not only with the

legislation for the operation of the specific budgets, but also with all other existing Community legislation. To stress the importance of an effective implementation of the habitats and birds directives, the Commission requested all Member States in June 1999 to screen measures proposed in their regional development plans for compliance with the nature protection directives. In practice, this means that Member States should not propose any actions to be funded by the EC budget which might have negative effects on Natura 2000 sites.

This support for Natura 2000 was reinforced by an agreement between the Directorates-General for Regional Policy and Environment, signed by Commissioners Wallström (Environment) and Barnier (Regional Policy) and resulting in clear instructions from Commissioner Barnier to avoid deterioration of Natura 2000 sites in connection with Structural Funds spending. The same principle was also applied by Commissioner Fischler to the rural development programmes.

Therefore:

- the rural and regional development plans of the Member States must contain clear and irrevocable commitments to ensure compliance with Community legislation on nature protection (habitats and birds directives);
- the implementation of EU co-financed plans or projects must not have any negative effects on proposed or potential Natura 2000 sites.

Failure to comply with these requirements may result in the loss or delay of the transfer of structural funds and rural development funds to Member States or regions.

5.3. The EU forestry strategy

To coordinate all activities related to forestry at EU level, the Commission communicated to the Council and the European Parliament a 'Forestry strategy for the European Union' in 1998 (see Section 4). This strategy contains a framework for Community action, in which a section on 'Conservation of forest biodiversity' addresses biodiversity concerns in three areas: conservation, sustainable use and equitable benefits arising from the use of forests' genetic resources, as demanded by the CBD. As there are only a few forest areas in Europe which are withheld from commercial use, the most important action for the protection of biodiversity is finding appropriate forest management systems that take biodiversity concerns sufficiently into account, thereby observing multi-functional management objectives throughout all forestry operations.

The EU forestry strategy therefore calls on forest managers to take into account the following guidelines for the conservation of biodiversity:

- appropriate ecological site adaptation measures through diverse silvicultural techniques combined with accessory measures (such as respecting dead wood and other key micro-habitats present in forests);
- maintenance of forest ecosystem health and vitality by enhancing regenerative capacity, resistance and adaptive capacity of forest ecosystems;
- restoration and rehabilitation of degraded areas, species, populations, habitats and ecosystems;
- maintenance of traditional management of those silvo-pastoral systems with high levels of biodiversity which may be lost if these areas are abandoned (for instance, in the Mediterranean regions);
- improving harvesting techniques to keep related damages as limited as possible;
- conducting afforestation measures in a manner that does not negatively affect ecologically interesting or noteworthy sites, habitats and ecosystems (for example, the chosen tree species should be well suited to local conditions and ecosystems; native species or local provenances should be preferred; whenever species are introduced, sufficient attention should be taken to ensure the conservation of native flora and fauna).

Moreover, the EU forestry strategy calls for the establishment of protected forest areas as a complement to sustainable management of forests, especially through Natura 2000. Such protected areas should contribute to enhance social, cultural, environmental and economic benefits of forests.

6. Management of Natura 2000 forest sites

As it is the responsibility of Member States to establish concrete conservation measures and possible restrictions on use of Natura 2000 sites, the local conditions will be the decisive factor for the management of each individual site. However, the habitats directive sets some principles for the management of Natura 2000 sites, based mainly on Articles 4 and 6. This chapter presents a set of non-mandatory guidelines, based on existing interpretations of the directive and on the widely recognised criteria for sustainable forest management adopted by the Ministerial Conference on the Protection of Forests in Europe (MCPFE). These guidelines should be understood as a broad framework within which the concrete negotiations for management plans or measures at site level will be conducted by the stakeholders and local authorities involved. They are not intended, however, to change regulations concerning those Natura 2000 sites that are under strict protection regimes.

During the consultations for this document, forest owners have repeatedly mentioned that many Natura 2000 sites will already comply with the main requirements which are to be listed in this chapter. On the one hand, it is true that there is no need to change existing forest management practice on Natura 2000 forest sites, provided the present management has helped to create or maintain a forest of high biodiversity with a structure and species composition which are in line with the conservation objectives for which it was designated. In this context, the merits of both private and public European forest owners, who stand as a worldwide role model for the sustainable use of forest resources, have to be acknowledged. On the other hand, it has been reported that some Natura 2000 sites are under management that is contrary to the conservation objectives compulsory after their designation.

6.1. Forestry and nature conservation

The concept of multi-functional forestry lies at the heart of the EU forestry strategy and is widely acknowledged in Europe. This concept integrates all the important benefits that forests can yield to society (ecological, economic, protective and social functions).

The nature conservation strategies which Member States have used to implement the nature protection directives vary widely across the European Union (Sunyer and Manteiga, 1998).

In some regions, predominantly in central and northern Europe, there is a tendency towards the designation of small and medium-sized Natura 2000 sites. These regions are characterised by intensive land use, and nature conservation competes strongly with other land-use practices, leaving little room for natural or semi-natural areas. In this strategy, which could be termed 'intensive', the protection of natural sites often involves the purchasing of land or the rights to its use and direct interventions in the dynamics of the ecosystem. This type of management is based on a more distinct environmental culture, greater budgetary provisions and the motivation to recover lost habitats by conserving them at a fixed stage of the natural succession over a reduced area ('reserve'-based approach).

In regions where extensive farming and forestry systems with a high ecological value continue to exist, generally in the south and east European regions, but also in some highlands and mountains in other European countries, the proposed sites of Community importance tend to be larger in size. Here, their conservation is closely related to the maintenance of specific farming systems or forestry practices. In these regions, conservation strategies are different and tend to seek the integration of nature conservation and rural development, in what could be termed an 'extensive' nature conservation strategy.

These two main nature conservation strategies have also been termed 'integrative', that is, integrating all functions into the — rather extensive — land use of large areas, and 'segregative', that is, setting aside areas exclusively for nature conservation purposes amidst intensifying land use on the remaining areas, sometimes beyond the sustainable limit. However, when looking exclusively at forest habitats, this distinction may be less clear, as forestry has always had a considerably lower ecological footprint than, for example, agriculture. Forestry in Europe has mainly followed an integrative strategy in the past. Many forest areas today can be called 'semi-natural', and the need for habitat restoration is not as apparent as it often is, for example, in wetlands and mires where economic use has totally altered landscape features and biodiversity levels.

Preservation of biodiversity in forests across Europe calls for a careful balance between the two conservation strategies previously described, depending on the local and regional situation. The continuation of economic activities under sustainable forest management might very often be part of a nature conservation strategy for forest ecosystems in regions with widely accepted historical traditions of forest use.

Another distinction between existing nature conservation strategies can be made between a static and a more dynamic approach. In most cases, especially in forests, natural dynamics and change must be understood as an integrative part of the nature conservation objective. The natural disturbance of the forest ecosystem through windfalls, lightning and death of old trees, which is often 'simulated' by harvesting operations in sustainable forestry, is an important factor in maintaining a variety of habitat structures, a mosaic-like distribution of different

Box 3: Multi-functional forestry in Europe, a promising model for the future?

A research project called EFISCEN (European forest information scenario model) recently examined the long-term development of European forests under alternative regimes until 2050. The project compared different scenarios by modelling a multi-functional scenario combining the objective of producing more wood (and thus more employment and more bioenergy possibilities) with ecological objectives (thus allowing more dead and decaying wood, forest reserves, more diversity in species, spatial and age structure).

The results showed that, apart from being able to provide society with sufficient renewable natural resources in the form of timber, active multi-functional forest management can also enhance the ecological and recreational quality of European forests (cf. Nabuurs et al., 2001).

age-groups and a high level of biodiversity. This dynamic understanding of nature conservation is needed on Natura 2000 forest sites if conservation strategy is to be integrative.

Yet, not all the objectives of nature conservation can be reached through sustainable forest management. The setting-aside of areas exclusively for nature conservation purposes has to be considered in the case of especially rare or valuable habitats whose conservation status would otherwise decline. Therefore, Natura 2000 will be a network of conservation areas, enjoying a varying degree of protection from absolute reserves to individual species-based restrictions.

In this context, the existence of forest areas undisturbed by economic activity is especially important from a scientific point of view, for example, as 'reference areas' for biodiversity monitoring, and from a nature conservation point of view, for example, as refuge areas for species that require dead or dying wood or large undisturbed habitats. Therefore, 'old growth' ([14]) or 'virgin' forest areas will deserve special attention among Natura 2000 forest sites. In the EU, such forests are now limited to small pockets in managed complexes or to certain regions with specific ecological and social conditions, such as northern Fennoscandia. The degree of human interference that can be reconciled with safeguarding the conservation value of such sites will depend on their regenerative capacity, which may mean that no intervention at all may be the rule in the case of very low growth rates.

Natura 2000 also has the task of consolidating existing systems of strictly protected zones as a scientific reference base and as a possibility of diversifying rural income, such as through tourism. Many of these strictly protected sites are already protected today, for example, as parts of national parks, others might have to be established, such as to safeguard remaining old-growth forests.

6.2. General requirements for forest management on Natura 2000 sites

The basic legal texts for the establishment of Natura 2000 are the Directives 79/409/EC ('birds directive') and 92/43/EEC ('habitats directive') ([15]). According to the habitats directive, the aim of Natura 2000 is to establish 'favourable conservation status' for the habitats and species that are listed as being of Community interest. The concept of 'favourable conservation status' is defined in Article 1 of the habitats directive by reference to species population dynamics, trends in the range of species and habitats and the remaining area of habitats.

The nature protection directives only indicate the result to be achieved through national implementation. They do not prescribe any concrete conservation measures. Therefore the Commission must assure that the objectives of the directives are reached, but it does not have any direct influence on the regional and local negotiation of the management measures on Natura 2000 sites. This also means that Member States may impose a stricter legal framework on their territory than what is required by the habitats directive, but should not fall back on Community legislation to justify this ([16]).

Therefore only a limited number of general forest management requirements can be derived from the directives and it is not possible to give specific indications on areas such as the restriction of harvesting levels, the dimensions of clearings, timing of interventions, etc. as these depend on management measures that have to be negotiated on a local level between the authorities in charge and the forestry operators/owners.

Article 4 of the habitats directive clearly states that as soon as an area is designated as a site of Community importance, it is to be treated according to the provisions of Article 6. First of all, it must be

([14]) Generally defined as not having had any human interference for over 100 years.
([15]) The text of the directives is available in all official Community languages on the nature conservation homepage of the Directorate-General for the Environment: http://www.europa.eu.int/comm/environment/nature/legis.htm
([16]) Environment DG letter of 19 September 2001 to the transport administrations of Belgium, Germany and the Netherlands in relation to the 'Iron Rhine' railway project.

ensured that land-use practices do not lead to a deterioration of the conservation value of the site. For forest sites, this could include, for example, not clearing large areas, not changing the form of land use or not replacing existing indigenous tree species by other, exotic tree species.

Article 6 of the habitats directive states that plans or projects which are not directly connected with or necessary for the management of Natura 2000 sites but which are likely to have a significant effect on them, either individually or in combination with other plans and projects, must undergo an appropriate assessment of the effects on the sites. For example, a forest management activity like logging, track construction or soil drainage falls under this provision, which means that it will have to form part of a management plan or be decided on a case-to-case basis.

Article 6 of the habitats directive also requires specific conservation measures of statutory, administrative or contractual nature to specify the management of the sites. These will be developed on a local basis. Contractual measures are, under certain conditions, generally more widely accepted amongst private forest owners than statutory or administrative measures and should therefore be preferred, where applicable.

The Directorate-General for the Environment has published an interpretation guide 'Managing Natura 2000 sites' ([17]) from which the following baselines for negotiations on site management with forest owners and operators can be derived ([18]).

- If the actual forestry practices do not lead to a decline in the conservation status of habitats or species and are not contradictory to the Member State's own conservation guidelines, then this form of economic use can be continued.
- If the actual forestry practices lead to a deterioration of the conservation status of the habitats or species for which a given site was designated or is contradictory to the Member State's own conservation objectives, then Article 6 of the habitats directive should be applied and forest management targets will have to be adapted.

The Directorate-General for the Environment has addressed the following guidelines and directions for forest management on Natura 2000 sites to Member State authorities ([19]).

- It is preferable to designate perimeters with a sufficient extension to allow conservation objectives to be integrated into existing management plans, rather than to designate small plots corresponding exactly to the descriptions in the habitats reference guide.
- Conservation of habitats and species at the level of an entire site should be the result of measures in favour of habitats and species for which the site was designated, leading to a stable 'biodiversity offer' for the site as a whole. It is self-evident that, in the case of cyclical interventions (in space and in time), such a situation is more easily attained on sites covering larger surfaces.
- Interventions leading to temporary disturbance of forest cover on a limited space (for example, group cuttings) or with a limited intensity (such as thinning) are legitimate, provided that they allow recovery of the initial situation by natural regeneration, even if several stages of natural succession have to follow one another.

These guidelines and orientations apply to habitats as well as species and sometimes a combination of the measures for habitats and species may be required to obtain the desired results.

An example of this is the conservation of the capercaillie (*Tetrao urugallus*), a species of Annex I to the birds directive. If this bird is living in a Natura 2000 forest site, the management should be able to demonstrate that silvicultural measures are adapted to maintain or improve the conservation value of the site for this species. As the capercaillie requires a mosaic of

([17]) Specific advice on the requirements for the management of sites can be found in the publication by the Directorate-General for the Environment 'Managing Natura 2000 sites — The provisions of Article 6 of the habitats directive' on http://www.europa.eu.int/comm/agriculture/fore/index_en.htm and http://www.europa.eu.int/comm/environment/nature

Box 4: Main requirements for forest management resulting from the habitats directive

- Nature conservation measures have to be considered for each Natura 2000 site, in the form of appropriate statutory, administrative or contractual measures. The development of a management plan is recommended (Article 6(1) of Directive 92/43/EEC).
- Nature conservation objectives must have priority on Natura 2000 sites, while the economic and social function of the forest should also be taken into account.
- The conservation status of the site, in relation to the quality of the habitat and the conservation value for the species, must be maintained or improved.
- Projects or plans which might have a negative impact on a Natura 2000 site must undergo an appropriate assessment (Article 6(3) of Directive 92/4/EC).
- The quality of the site must be periodically monitored and reported on by the competent Member State authorities.

different structures in its forest habitats, it is one of many animal species whose populations can benefit from appropriate and carefully planned forest management, without having to put an end to economic exploitation. So far, in most European countries, the few remaining local populations of the capercaillie are declining, because the management is not sufficiently focused on reaching nature conservation objectives.

Another example of conservation-oriented forest management comes from the French Jura, where large sections of the forests are exploited in a manner which leaves a diverse structure of small clearings, underbrush, tall trees, etc. (*futaie jardinée*) as a good habitat for the capercaillie. A LIFE project in the Jura (LIFE/99/ENV/F/00477) developed guidelines for forestry which were agreed with the representatives of the public forest service and the private forest owners. About 20 000 hectares in the project area are now managed under these guidelines (see Chapter 8).

Effective multi-functional management approach also exists in the Hainich beech forest in Thuringia, Germany. A large part of this forest was managed traditionally yielding a great diversity of structure. When the Hainich was designated a Natura 2000 area and a management plan was developed for it, this selective felling system (*Plenterwaldwirtschaft*) was explicitly encouraged and maintained.

6.3. Operational-level guidelines for sustainable forest management on Natura 2000 sites

This section proposes to adopt elements that are relevant for nature protection from the resolutions of the Ministerial Conferences on the Protection of Forests in Europe (MCPFE- cfr. Annex II) at Helsinki (1993) and Lisbon (1998) as the basis for forest management guidelines on Natura 2000 sites.

Using these resolutions as guidelines for the management of sites has several advantages:

- the acceptance amongst stakeholders is high, as the resolutions were developed using a participatory approach involving national authorities and civil society;
- all EU Member States, as well as all candidate countries for EU accession, have been involved in the pan-European process on the protection of forests since its beginning;
- all resolutions and guidelines were prepared by working groups consisting of recognised forestry experts and drawing on national, regional and local experience in forest management from forest authorities, scientists, forest owners' associations and environmental NGOs across Europe;
- the findings of the working groups were endorsed at political level by the ministers responsible for forests
- the EU Council endorsed the results of the pan-European discussions on forests as one of the most important elements of the EU forestry strategy ([20]).

([20]) Council resolution of 15.12.1998, OJ C 56/1, 26.9.1999.

The 'Pan-European criteria and indicators for SFM' adopted at the MCPFE in Lisbon (1998, Resolution L2), have been developed on the basis of resolutions H1 and H2 of the Helsinki MCPFE which concern SFM and forest biodiversity.

The six pan-European criteria providing a basis for monitoring sustainable forest management are:

- **C1**: maintenance and appropriate enhancement of forest resources;
- **C2**: maintenance of forest ecosystem health and vitality;
- **C3**: maintenance and encouragement of productive functions of forests (wood and non-wood);
- **C4**: maintenance, conservation and appropriate enhancement of biological diversity in forest ecosystems;
- **C5**: maintenance and appropriate enhancement of protective functions in forest management (notably soil and water);
- **C6**: maintenance of other socioeconomic functions and conditions.

As a complement to these criteria, the MCPFE has defined a series of operational-level guidelines for sustainable forest management, from which many elements can be applied to verify the compatibility of forest management with Natura 2000 designation on a given site.

A selection from both the guidelines for forest management planning and the guidelines for forest management practices, based on nature conservation as a priority management objective for Natura 2000 sites, is given below:

C2: Maintenance of forest ecosystem health and vitality

- 'Forest management practices should make best use of natural structures and processes and use preventive biological measures wherever and as far as economically feasible to maintain and enhance the health and vitality of forests. Adequate genetic, species and structural diversity should be encouraged and improved to enhance stability, vitality and resistance capacity of the forests to adverse environmental factors and strengthen natural regulation mechanisms.'
- 'Appropriate forest management practices such as reforestation and afforestation with tree species and provenances that are suited to the site conditions or the use of tending, harvesting and transport techniques that minimise tree and/or soil damages should be applied. The spillage of oil through forest management operations or the indiscriminate disposal of waste on forest land should be strictly avoided.'
- 'The use of pesticides and herbicides should be minimised, taking into account appropriate silvicultural alternatives and other biological measures.'

C3: Maintenance and encouragement of productive functions of forests (wood and non-wood)

- 'Regeneration, tending and harvesting operations should be carried out in time, and in a way that does not reduce the productive capacity of the site, for example by avoiding damage to retained stands and trees as well as to the forest soil, and by using appropriate systems.'
- 'Harvesting levels of both wood and non-wood forest products should not exceed a rate that can be sustained in the long term, and optimum use should be made of the harvested forest products, with due regard to nutrient offtake.'
- 'Adequate infrastructure, such as roads, skid tracks or bridges should be carefully planned, established and maintained to ensure efficient delivery of goods and services while at the same time minimising negative impacts on the environment. '

C4: Maintenance, conservation and enhancement of biological diversity in forest ecosystems

- 'Forest management planning should aim to maintain, conserve and enhance biodiversity on

ecosystem, species and genetic level and diversity at landscape level.'

- 'Forest management planning and terrestrial inventory and mapping of forest resources should include ecologically important forest biotopes, taking into account protected, rare, sensitive or representative forest ecosystems such as riparian areas and wetland biotopes, areas containing endemic species and habitats of threatened species, as well as endangered or protected genetic *in situ* resources.'
- 'Natural regeneration should be preferred, provided that the conditions are adequate to ensure the quantity and quality of the forests resources and that the existing provenance is of sufficient quality for the site.'
- 'For reforestation and afforestation, origins of native species and local provenances that are well adapted to site conditions should be preferred. Only those introduced species, provenances or varieties should be used to supplement local provenances if their impacts on the ecosystem and on the genetic integrity of native species and local provenances has been evaluated, and if negative impacts can be avoided or minimised.'
- 'Forest management practices should, where appropriate, promote a diversity of both horizontal and vertical structures such as uneven-aged stands and the diversity of species such as mixed stands. Where applicable, the practices should also aim to maintain and restore landscape diversity.'
- 'Traditional management systems that have created valuable ecosystems, such as coppice, on appropriate sites should be supported when economically feasible. '
- 'Infrastructure should be planned and constructed in a way that minimises damage to ecosystems, especially to rare, sensitive or representative ecosystems and genetic reserves, and that takes threatened or other key species — in particular their migration patterns — into consideration.'
- 'Standing and fallen dead wood, hollow trees, old groves and special rare tree species should be left in quantities and distribution necessary to safeguard biological diversity, taking into account the potential effect on health and stability of forests and surrounding ecosystems.'
- 'Special key biotopes in the forest such as water sources, wetlands, rocky outcrops and ravines should be protected or, where appropriate, restored when damaged by forest practices.'

C5: Maintenance and appropriate enhancement of protective functions in forest management (notably soil and water)

- 'Areas that fulfil specific and recognised protective functions for society should be registered and mapped, and forest management plans or their equivalents should take full account of these areas.'
- 'Special care should be given to silvicultural operations on sensitive soils and erosion-prone areas as well as on areas where operations might lead to excessive erosion of soil into watercourses. Inappropriate techniques such as deep soil tillage and use of unsuitable machinery should be avoided on such areas. Special measures to minimise the pressure of animal population on forests should be taken.'
- 'Special care should be given to forest management practices on forest areas with a water protection function to avoid adverse effects on the quality and quantity of water resources. Inappropriate use of chemicals or other harmful substances or inappropriate silvicultural practices influencing water quality in a harmful way should be avoided.'

C6: Maintenance of other socioeconomic functions and conditions

- 'Forest management planning should aim to respect the multiple functions of forests to society, have due regard to the role of forestry in rural development, and especially consider new opportunities for employment in connection with the socioeconomic functions of forests.'

- 'Property rights and land tenure arrangements should be clearly defined, documented and established for the relevant forest area. Likewise, legal, customary and traditional rights related to the forest land should be clarified, recognised and respected.'
- 'Sites with recognised specific historical, cultural or spiritual significance should be protected or managed in a way that takes due regard of the significance of the site.'
- 'Forest management practices should make the best use of local forest-related experience and knowledge, such as of local communities, forest owners, NGOs and local people.'

6.4. The importance of formal adoption of management principles

The general requirements for management of Natura 2000 sites are given in Article 6 (1) and (2) of the habitats directive. These provisions have been dealt with in detail in the Commission's guidance document 'Managing Natura 2000 sites' ('The provisions of Article 6 of the Habitats Directive 92/43/EEC ') which was published in all Community languages in 2000 and is available on the Directorate-General for the Environment's website: *http://europa.eu.int/comm/environment/nature/*.

It should be recalled that Article 6 of the habitats directive does **not** prescribe any format, procedure or structure for the management measures concerning Natura 2000 sites. The directive only mentions 'the necessary conservation measures' and 'appropriate statutory, administrative or contractual measures' to be taken **by the Member States**. This means that the principle of subsidiarity is fully applicable to the way in which the management of Natura 2000 sites, including forests, is applied at field level. It is also clearly indicated that adopting management plans is not a mandatory but an optional step. Section 8.1 provides numerous examples of management measures taken and procedures followed by Member States' national, regional and local authorities.

In practice, the way in which management decisions or options are formalised will depend on different factors, such as ownership of the site, intensity of economic use, occurrence of priority species and habitats, the relative rarity and sensitivity of the habitats or species concerned and the existing traditional or customary rules on use of natural resources.

Given past experiences with pilot projects (see Section 8.2 — LIFE projects) and the existing practices in the EU forest sector (see Section 8.1 — examples from the Member States), the Directorate-General for the Environment recommends that management objectives for Natura 2000 forest sites be formalised in long-term management plans with legal value. Such management plans may be part of existing or general forest management plans but they may also be specifically designed for Natura 2000 sites or for certain habitats or species. It is clear that the management objective for a very small site, such as a core area of high conservation value, will be quite different from that for a whole national park in which there are obvious possibilities for continuing resource use without loss of conservation values. Management plans are particularly appropriate for establishing a coherent approach to interrelated sites or for cross-border sites. Along with management plans, other instruments, such as contract conservation and conditional compensation payments can also be considered (see Chapter 7).

The following is a non-limitative indicative overview of factors which can be taken into account when defining management principles for Natura 2000 forest sites:

- felling system: clear felling (size), strip felling, group felling, selection felling, absence of exploitation;
- regeneration technique: planting, vegetative multiplication, natural regeneration (with any additional measures to influence the species composition);
- use of exotic vs indigenous trees; use of site-specific indigenous species composition;
- origin of regeneration material (in compliance with the mandatory Community regulatory framework on movement of forest seeds, cuttings and plants, it should be borne in mind that use of indigenous species for reforestation can result in

failure and genetic pollution if the provenance of material is not verified);

- rotation length (by stand or by tree);
- ploughing or other soil disturbing activities;
- thinning regimes;
- game management and grazing;
- use of controlled fire;
- continuation of traditional practices (for example, coppice and standards, *taillis-sous-futaie/Mittelwald*).

These factors are of key importance to biodiversity, which is why they should be taken into account in relation to Natura 2000 implementation. In cases of designation based on existing natural resources use, it will mean these factors may not need to be changed, unless on a voluntary basis and/or with the help of financial incentives from outside. However, changing these factors in an environmentally negative way (for example, increasing clear felling size or shortening rotations) could come into conflict with the guidelines mentioned in Section 6.3. On the contrary, optimising these factors for environmental benefits on a voluntary basis and/or with the help of incentive measures, is to be welcomed as a positive contribution to the overall enhancement of Natura 2000.

6.5. Recommendations for biodiversity conscious forestry on protected areas and beyond

In addition to the points raised in the preceeding sections, a series of practical recommendations can be given for day-to-day management practices in Natura 2000 sites and beyond.

Indeed, as only 5 % of the land surface of the earth falls under some form of nature protection status, one should be aware that there will always be more net biodiversity in the countryside in general than in areas targeted especially for conservation — which are principally a refuge from where the recolonisation of cultural landscapes can take place after disturbance. Therefore, the ideal form of biodiversity management is an integrated approach that does not affect parts of a territory for one function exclusively. Just as Natura 2000 should not only be a system of strict reserves, the surrounding cultural landscape should not be a monofunctional production line where everything but a few cultivated plants or animals can be eradicated.

Forest managers and planners may consider the following recommendations for preserving biodiversity at the management unit level, that is, taking into account local circumstances:

- conserving individual, mature and dead or decaying trees, which offer suitable habitats for woodpeckers, birds of prey, insects and many lower-level plants (fungi, ferns, bryophytes, etc);
- conserving trees with cavities which could be used as nesting sites for small birds and mammals;
- conserving large trees and their immediate surroundings if they appear to be regularly occupied by nesting raptors;
- maintaining forest ponds, brooks, springs and other small water bodies such as mires and fens in a state that allows them to play their role in the reproductive cycle of fish, amphibians, insects, etc., by avoiding excessive fluctuation in water levels, damage to natural embankments and water pollution;
- appropriate zoning, both regarding forestry operations and tourism/recreation, of large forest areas according to different levels of management intervention, allowing to apply buffer zone measures around protected areas;
- using management decisions after natural disasters such as large-scale windfall and fires to take account of the possibilities for biodiversity enhancement by allowing natural succession processes to proceed in potentially interesting areas;
- adapting the timing of silvicultural and logging operations so as to avoid interference with the reproductive season of sensitive animal species, most notably the spring nesting and breeding of forest birds;

- maintaining adequate distances to avoid disturbance of rare or threatened species whose presence has been confirmed;
- allow a cyclical rotation of areas with different degrees of intervention in time and space;
- if not contradictory to existing forest laws and regulations, it is worth considering not filling up all the available space when replanting, so as to maintain small natural environments associated with forests, such as grassy patches, calcareous grasslands, heaths, mires, bogs, alluvial bottomlands and landslides. All these can enormously enrich the overall biodiversity offer of an estate, because of the increased occurrence of transitions ('ecotones') between different vegetation types;
- by the same logic, a decision not to replant the 'fallout' spots in recent economical plantations may provoke additional variation and scattered spontaneous recolonisation by pioneer species, which leads to an increase in biodiversity in the long term by providing adequate niches for a large variety of species; moreover, the added value of 100 % complete regeneration is usually low, as replanting operations are very expensive;
- assuring regular monitoring of the richness of natural species, so as to gauge the effects of certain measures and to assure awareness of the presence of rare or threatened fauna and flora elements.

This type of measure and the absence of certain interventions can easily be introduced in the management of public forest holdings, given the political will to do so. For private forests they may well be subject to grants, contractual agreements, tax breaks, technical assistance, etc. in order to compensate owners for income foregone, services rendered to society as a whole and, if applicable, capital depreciation.

Metsäpanoraama/J. Luhta

7. Financial instruments

An adequate approach to the financial and economic implications of Natura 2000 is one of the most important conditions for the acceptance of the network amongst the rural population, landowners and economic operators using natural resources on designated areas. Such an approach is required according to Article 2 of the habitats directive, which holds that measures related to Natura 2000 have to take account of social, economic and cultural circumstances. It must also be mentioned that this issue has to be seen in the light of Article 17 of the Charter of Fundamental Rights of the European Union ([21]), which sets the principle of compensation for income foregone. On 9 May 2002, the 'El Teide Declaration' ([22]) endorsed the prominent role of Natura 2000 in delivering the EU's biodiversity objectives. It also recognised that the delivery of the EU's biodiversity objectives 'requires targeted resources'.

Article 175(4) of the EC Treaty holds that environmental measures have to be paid for by the Member States. This implies that costs resulting from the operation of a network for the protection of the European natural heritage have to be settled by the Member States. This chapter gives more information on the possibilities for Member States to use financial support from the EC budget for managing Natura 2000 sites. Until now, not many of these possibilities have been used by national, regional or local authorities and the forestry sector has not been well informed about them.

Community financing of Natura 2000 is dealt with in Article 8 of the habitats directive. At the moment, the only Community funding dedicated exclusively to Natura 2000 is the LIFE-Nature fund, which is used to promote management planning and pilot/demonstration projects for habitats and species management. In several Member States, local compensation schemes or grant funds operate on a reduced scale.

([21]) Article 17: Right to property
1. Everyone has the right to own, use, dispose of and bequeath his or her lawfully acquired possessions. No one may be deprived of his or her possessions, except in the public interest and in the cases and under the conditions provided for by law, subject to fair compensation being paid in good time for their loss. The use of property may be regulated by law in so far as is necessary for the general interest.
2. Intellectual property shall be protected.
(OJ C 364/12, 18.12.2000).

([22]) The declaration was made by the Commissioner for the Environment, Margot Wallström, and the Spanish Minister for the Environment, Jaume Matas, on behalf of the Council.

Other policy measures, in particular elements of the rural development programmes, are already providing substantial support to the implementation of the network by way of payments for non-intensive agricultural management of land or for more ecologically oriented forestry. In some Member States, there has also been significant use of regional development funding to finance specific investments related to Natura 2000 sites ([23]). On the basis of these various elements, the Directorate-General for the Environment created a working group on Article 8 of the habitats directive in 2001 to formulate proposals for developing a structured approach to financing Natura 2000. An outline of the conclusions of this working group ('Final report on financing Natura 2000' — available to the public at the end of 2002 ([24])) is given hereafter.

7.1. Existing support systems

7.1.1. Contract conservation

Contract conservation consists of establishing management measures on privately owned land by specifying the measures in contractual agreements between conservation authorities and landowners. These agreements usually lead to financial benefits for those landowners whose income from land-use practices is affected by restrictions that result from conservation measures. The advantage can be in the form of direct payments, tax breaks, soft-lending conditions, other land-use rights, etc. The conservation measures can be carried out by the landowners or holders of user rights themselves (who are then paid for the work) or they can be carried out by others, such as contractors or volunteers of NGOs. Under specific circumstances, the measures can also be co-financed by the Community budget (rural development and regional development policies).

Contract conservation has been successfully applied in several Member States to meet the requirements laid down by the habitats directive under the national nature conservation legislation for privately owned Natura 2000 sites. To ensure the maximum acceptance of this instrument, a number of basic recommendations about the characteristics of such contracts can be made (based on Giesen, 2001).

- The most important aspect of a contract should be that it offers security, that is, that the contract should, as far as possible, be final in its requirements. The forest owner must be able to depend upon the negotiated agreement, and be free from further demands from the nature conservation authorities, insofar as this security is possible under national legislation. This means that contracts should be of long duration and their application should be adequately monitored.
- A conservation contract must be economically viable. Any form of compensation for measures must be proportional to the incurred costs or the loss of income. Compensation does not have to be limited to monetary remuneration: even the guarantee of fast and effective cooperation with the authorities can be a valuable form of compensation.
- Conservation contracts must be tailored to local circumstances, but at the same time they must be based on a certain national or regional standard. The owner must be able to rely on this basic standard contract, without having to carefully check each new contract agreement and without having to consult professional advice.
- Standards for assessment of compensation levels should be jointly agreed between competent authorities, forest owners' organisations and scientific experts.

Contract conservation should not, however, be seen as an alternative to designation of Natura 2000 sites.

7.1.2. Forestry measures under EU environmental policy: LIFE

General description

The LIFE programme is intended to fund pilot environmental actions, the results of which can be applied to the 'main' financial instruments of the EU,

([23]) The EC has already published a full study on this: 'Financial instruments for the Natura 2000 network', Sunyer & Manteiga, 1998.
([24]) See website http://europa.eu.int/comm/environment/nature/

such as the agricultural and Structural Funds budgets.

LIFE was created in 1992. The first phase was completed in 1992–95, the second phase ran from 1995 to 1999 and LIFE III is now continuing from 2000 to 2004 with a total budget of EUR 640 million. Before LIFE, other financial instruments, such as the ACE fund ([25]), provided Community support to actions in the field of the environment.

Actions eligible for LIFE funding belong to three fields:

- **LIFE Environment**: innovative and demonstration actions for industry; demonstration, promotion and technical assistance actions for local authorities; and preparatory actions to support Community legislation and policies ([26]).
- **LIFE Nature**: pilot actions aimed at the conservation of natural habitats and of wild fauna and flora of EU interest ([27]). This means that LIFE Nature is directly targeted at priming the operation of the Natura 2000 network.
- **LIFE Third countries**: technical assistance in the establishment of environment-related administrative structures, nature conservation actions and demonstration actions to promote sustainable development.

Maximum rates of support for LIFE projects are 50 % of the eligible costs (exceptions: 30 % of eligible costs for income-generating actions) and 75 % of eligible costs for actions concerning priority natural habitats or priority species as defined in Directive 92/43/EEC or species of birds in danger of extinction.

LIFE is open to 'all natural or legal persons'.

LIFE Nature and forestry

With an annual budget of approximately EUR 80 million completely devoted to nature conservation measures linked to Natura 2000, LIFE Nature is the most important financing mechanism for the establishment of the network. Since 1992, 237 projects with relevance to forests or forest management have been funded under LIFE Nature. These can be divided into three categories (Table 3). Table 4 shows the key activities of the funded projects, grouped in 18 categories. Here, only the projects of category I and II (*Key forestry project* resp. *Relevant forestry project*) are examined.

Many of the LIFE Nature projects focus on an extensification of forest management or on more ecologically friendly forms of forestry. Achieving a balance between nature conservation objectives and the economic aspects of land use and landowners rights is often the main focus of LIFE Nature projects.

LIFE Environment and forestry

The scope of LIFE Environment is much wider than that of LIFE Nature and is **not directly related to Natura 2000**. This part of the LIFE programme has financed projects for setting standards to integrate biodiversity concerns in forestry outside Natura 2000 areas. It has also supported projects for improving the environmental efficiency of forest industries. Some examples of relevant LIFE Environment projects are given in Section 8.2.

7.1.3. The new generation of Community funds, 2000–06

Once the common agricultural policy had guaranteed food security and modernised European agriculture, a need to develop more economically oriented and environmentally sustainable agriculture became apparent at the end of the 1980s. The 1992 CAP reform made the first changes towards decreasing market support, reduction of surpluses and agri-environmental and afforestation programmes. Forestry profited from rural development measures through the afforestation premiums within the framework of Regulation 2080/92. This regulation led to the afforestation of over 900 000 hectares of agricultural land between 1994 and 1999, and contributed to rural development by the

([25]) A brief history of the Community financing for nature conservation, environment and third countries projects is available at http://europa.eu.int/comm/environment/life/life/nature_history.htm
([26]) Further information is available on the LIFE-Environment homepage: http://www.europa.eu.int/comm/life/envir/index.htm
([27]) Further information is available on the LIFE-Nature homepage: http://www.europa.eu.int/comm/life/nature/index.htm

Table 3: Main categories of LIFE Nature projects with relevance for forestry

Category	*I* *Key forestry project*	*II* *Project with relevance for forestry*	*III* *Horizontal forestry project*
Relevance for forestry	The relation between forest management and biodiversity is the main focus of the project, for example, forest management is used to achieve nature conservation objectives.	Forest management is one of several aspects of the project, for example, as part of a management plan.	The project involves one or more forest areas without focusing on forest management.

Multilateral/ transboundary cooperation	3
Local Agenda 21 implementation	1

creation of a total of 150 000 jobs in forestry (IDF, 2001).

As the European public became increasingly aware that agriculture is not just about food production, but also about maintaining traditional landscapes and rural communities, the Commission submitted a communication on 27 January 1999 entitled 'Directions towards sustainable agriculture', which stressed the need for better integration of environmental requirements in agriculture. The ensuing 'Agenda 2000 reforms' of the CAP introduced links between support to farmers and compliance with environmental standards and gave a much higher profile to the objective of supporting a 'greener' agriculture. It is the explicit aim of the EU biodiversity action plans ([28]) to further promote the integration of biodiversity concerns into programming documents under the Rural, Structural and Cohesion Funds and other programmes relevant for EU and third countries.

Possibilities for supporting Natura 2000 under EU rural development policy and under EU regional policy have been explored by a working group on Article 8 of the habitats directive.

7.2. Working group on Article 8 of the habitats directive

Financing Natura 2000

Article 8 of the habitats directive foresees Community co-financing of measures required for the implementation and ongoing management of Natura 2000. The text of the article makes reference to the use of existing Community instruments, but until now the provisions of Article 8 have not been implemented. In addition, the nature of the legal interpretation of Article 8 may be of importance in deciding on what kind of financial support systems to establish in the future.

When considering the financing of Natura 2000 one has to be aware that in the near future the European Union will expand, resulting in an obligation to co-finance a network for 25 Member States. Rough estimates indicate that a higher percentage of land area in the candidate countries will be designated as Natura 2000 sites than in current Member States. At the moment no precise figures are available regarding numbers of sites or the area that will have to be added. Therefore the working group has concentrated on the current EU network of 15 Member States.

Composition and mandate of the working group on Article 8 of the habitats directive

In order to address the financing issue in a comprehensive and effective way the European Commission set up, in December 2001, a working group on Article 8, involving experts from Member States and stakeholders**.** Representatives from the Directorate-General for the Environment along with those for Agriculture, Regional Affairs and Budget supported this group. The Habitats Committee of 30 November 2001 agreed with the establishment of this working group.

The remit of the group includes the following main objectives:

- to develop a common understanding of the provisions of Article 8 of the habitats directive;
- to obtain estimates of the financial costs associated with the future management of the Natura 2000 network of sites across the Member States;
- to make recommendations on the necessary Community funds for the co-financing of these costs.

Proceedings of the Working Group on Article 8 of the habitats directive

Three meetings were held (on 17 December 2001, 28 February 2002 and 18 April 2002) to decide the approach of the group, to examine relevant publications, to develop a questionnaire to be sent to Member States and to discuss potential procedures, methods and results.

In April 2002, the questionnaire was sent to Member States, asking for information on the way in which financial aspects of Natura 2000 had been worked out at national or regional level. The response was

([28]) Available on the Europa server at http://europa.eu.int/scadplus/leg/en/lvb/l28023.htm

considered at a meeting of the group held on 11 and 12 September 2002, and the content and approach of this final report were also decided. The last meeting of the working group was held on 4 November 2002 to finalise the report.

The approach has been based on the need to explore solutions to the current absence of an agreed framework for funding Natura 2000. Without such agreement the objectives of the network will never be realised. This meant that the group did not confine itself to an examination of Article 8 alone. Instead, it set out to explore options which take into account the changes which have taken place since 1992 in the use and the purpose of EU funding instruments, in the Community budget, and in policy initiatives — such as the environmental action programmes and in the integration of biodiversity and sustainable development considerations.

7.3. Conclusions of the working group on Article 8 of the habitats directive

General aspects

Taking account of the opinion of the legal services and having regard to the original rationale behind Article 8, the working group came to the common understanding that Article 8 was drafted in recognition of the 'exceptional financial burden' that the habitats directive might place on Member States, and particularly on those countries rich in biodiversity. Since 1992, the habitats directive and Natura 2000 have assumed greater strategic importance than many people anticipated. They are now recognised as being the EU's principal tools for achieving the CBD commitments and the new global and EU objective of halting the decline in biodiversity by 2010. At the same time, there has been a continuous improvement in the level of integration of environmental aspects in the legislation that governs the use of the main EU financing instruments directed to the rural world, such as the Rural Development Regulation (1257/99) and the Structural Funds Regulation (1260/99).

The working group has made an estimation of the total cost that would arise for managing a completed Natura 2000 network, on the basis of different calculation techniques (extrapolation/addition), a literature review, the nature of activities to be considered and information submitted by Member States through a questionnaire. From this has resulted a best estimate for the total cost of managing Natura 2000 of between EUR 3.5 and 5.7 billion per annum.

The working group has identified the range of existing and potential Community funding mechanisms which can be used for managing Natura 2000 sites. An overview of these sources of financing is given in Table 5. During this work it was also concluded that there is a clear perception amongst the authorities responsible for Natura 2000 that current EU co-financing has been insufficient, too subject to chance, and too time-limited to form an adequate basis for providing support to Member States in meeting the requirements of the directive. Funding arrangements are very complex, potentially involving a large number of funds, each with separate application processes and each designed to deliver against their own objectives, rather than those of Natura 2000.

Analysis of future funding options

On the basis of existing funding possibilities, the working group concluded that current arrangements are inadequate to meet the needs of Natura 2000. Based on this analysis, the group agreed that three main options are available for securing future co-financing for Natura 2000. These three options are:

- **Option 1** — using existing EU funds, such as the RDR, Structural Funds, etc, but modify these as necessary in order to deliver against Natura 2000 needs;
- **Option 2** — enlarging and modifying the LIFE Nature instrument to become the principal delivery mechanism;
- **Option 3** — creating an entirely new funding instrument dedicated to Natura 2000 management.

The working group further examined the various strengths and weaknesses of these funding options, drawing on the experience of the group members and on the responses to the Member State questionnaire.

This led to the following final recommendations:

1. In the short term (actual budgetary period 1999–2006), the mid-term review of the CAP would be the most straightforward opportunity to increase funding for managing Natura 2000 sites. If the trend of shifting resources from direct support to farmers to rural development measures can be confirmed and even enhanced, important opportunities will emerge for the forest sector, and not least for more ecologically conscious forest management. At the same time, the conclusions of the group should be taken into account when deciding about a future fourth phase of the LIFE fund after 2004.

2. In the long term, the financing of managing Natura 2000 should be an intrgral part of the discussions about the use of Community financial instruments during the next budgetary period starting in 2007. Introducing a specific requirement in all major EU funding instruments, including EAGGF, ERDF and ESF, for them to support the achievement of EU environmental legislation and in particular, the proper management of the Natura 2000 network should certainly be among the options to be considered during the upcoming budget negotiations.

3.To aid the development of EU funding measures as well as promoting the provision of adequate funding by the Member States themselves, nature planners and land managers from across the EU should work together to prepare guidelines to improve the coherence and cohesion of the Natura 2000 network, and promote the development of multiannual management programmes to enable the proper planning and delivery of funding for site management. This work needs to be supported by further research to improve knowledge about site condition and management requirements, which is crucial for setting appropriate intervention levels for management of sites across the EU.

120-2068-IMG/K. Sundseth

Table 5: Overview of financing instruments of the EU, which could potentially be used for Natura 2000 and forestry

Financing mechanisms:	*Main objective of the funds*	*Responsible Directorate-General*	*Budget per year (in the financial year 2001):*	*Possibilities for the funding of sustainable forestry on Natura 2000 sites (examples):*
LIFE III (2000–04) (LIFE Nature and partly LIFE Environment)	Promote and support nature conservation, support the establishment of Natura 2000	Directorate-General for the Environment	EUR 0.08 billion	Pilot projects for Natura 2000: ■ Measures towards ecological forestry ■ Habitat restoration ■ Direct conservation measures ■ Land purchase ■ Development of management plans ■ Information campaigns ■ Stakeholder involvement ■ Inventory and monitoring of Natura 2000 sites
EAGGF (Guidance Section)	Afforestation, according to Article 31 of RD Regulation 1257/99	Agriculture DG		■ Afforestation
Structural Funds for rural development (Regulation 1257/99, for example Articles 30 and 32);	Improvement of the economic, social and ecological structures of rural areas, especially in the fields of agriculture and forestry	Agriculture DG	EUR 4 495 billion	■ Training of farmers and foresters ■ Agro-tourism ■ Measures towards ecological forestry ■ Fire-protection corridors ■ Innovative projects for rural development, for example regional tourism concepts
Community initiative Leader +	Development of rural areas through high quality and ambitious integrated strategies for local rural development	Agriculture DG	EUR 2 020 billion (financed by the EAGGF Guidance Section)	■ Strategic, innovative concepts for rural development, especially multi-stakeholder and intersectorial concepts ■ Visitor and information centres
Community initiative Interreg III	Support for transboundary, transnational and interregional cooperation in balanced rural development, especially in areas adjoining accession countries	Regional Policy DG	EUR 4 875 billion (total 2000–06)	■ Transboundary projects, for example, in the field of nature tourism ■ Transboundary management for protected areas

Table 5: Overview of financing instruments of the EU, which could potentially be used for Natura 2000 and forestry

Financing mechanisms:	*Main objective of the funds*	*Responsible Directorate-General*	*Budget per year (in the financial year 2001):*	*Possibilities for the funding of sustainable forestry on Natura 2000 sites (examples):*
European Regional Development Fund (ERDF)	Creation of jobs by fostering competitive and sustainable development	Regional Policy DG	EUR 30 billion	■ Diversification of farm income ■ Training and further education of land and forest hosts ■ Innovative rural development initiatives ■ Exchange of experience between regions and countries
ESF (European Social Fund)	Creation of jobs through further education	Employment and Social Affairs DG	EUR 60 billion (total 2000–06)	■ Training and further education for foresters and nature conservation staff
Cohesion Fund (minimum volume of projects: EUR 10 million	Strengthening the economic and social cohesion within the Union through projects in the fields of environment and trans-European traffic networks	Regional Policy DG	EUR 2 717 billion	■ Natura 2000 databases ■ Reafforestation ■ Development of management plans ■ Habitat restoration ■ Strategic territorial and spatial planning

8. Best practices, examples and experiences

Examples and experiences about management of Natura 2000 forest sites can be drawn from various sources. Though far from complete, this section lists some examples and experiences throughout the EU that combine nature conservation and forest management objectives on Natura 2000 sites. It also gives indications of the kind of 'statutory and administrative measures' mentioned in Article 6(1) of the habitats directive that have already been taken by Member States.

These following examples have been selected from the LIFE Nature database ([29]), from various other Commission programmes and from information supplied by Member States after a request by the Directorate-General for the Environment to the Habitats and Standing Forestry Committees. They show the potential for finding practical solutions and the importance of communication and exchange of experiences between Member States.

8.1. Examples submitted by Member States

Forestry and nature protection authorities from 12 Member States have submitted information for this chapter. As expressly requested by several Member States, selected examples are reproduced here for the benefit of sharing and disseminating ideas for the implementation of the birds and habitats directives and for the management of Natura 2000 sites throughout the EU.

8.1.1. Belgium

Walloon Region

Fiscal measures:

In the Walloon Region of Belgium, all Natura 2000 sites are exempted from inheritance tax and from property tax. By this positive example of indirect financial support towards private owners of protected sites, the loss of property value that has been reported to be a possible effect of the designation as a Natura 2000 site can be compensated.

([29]) http://www.europa.eu.int/comm/life/nature/index.htm

Management measures:

- The 10 forest habitats of Annex I to the habitats directive that occur in the Walloon region would originally have covered 130 000 hectares of forest land. Of the total area of 160 000 hectares that has been designated as pSCI until present, more than 40 000 hectares lie in public forests which are administrated by the regional forest service according to legally binding management principles. These are based on a multi-functional approach to forestry which takes into account biodiversity concerns and protection of water resources. This is put into practice by providing management unit directors with guidelines on:
  - conservation *in situ* of old trees and deadwood;
  - maintaining clearings and forest edge vegetation;
  - regulation of forest exploitation activities with respect for nesting and breeding seasons of birds;
  - avoiding afforestation of peat soils;
  - limitation of the dimensions of clearcuts;
  - prohibition of drainage measures on certain soils.
- For private forest owners, the forestry chapter of the regional rural development plan for 2000–06 foresees possibilities of financial compensation for the following actions:
  - establishment of private forest reserves;
  - forest biodiversity conservation measures;
  - protection of soils and water;
  - establishment of ecological corridors between forest areas;
  - establishment of management plans.

It is expected that these measures will make designation under Natura 2000 more attractive to landowners.

Legislative measures

On 28 November 2001, the Regional Assembly adopted a specific 'Décret Natura 2000', which establishes the legal bases for designation of sites, establishment of constraints and associated management measures.

Contact person: *Mr Patrick De Wolf*
Tel. (32-81) 33 58 16
E-mail: p.dewolf@mrw.wallonie.be

Flemish Region

Specific conservation measures

The Decree on Nature Conservation of 1997 foresees the creation of a 'Flemish nature structure' consisting of the Flemish Ecological Network (VEN — 125 000 hectares of core conservation areas with other activities being allowed only under specified conditions) and the Integral Supporting and Interweaving Network (IVON — 150 000 hectares of multi-functional conservation area, linked by interconnecting areas.

The proposed VEN designation includes at least 90 % of the pSCI, of which almost half are in forests. Public consultations on the VEN/IVON designations started in September 2002 and will run into 2003. It is assumed that all pSCIs and SPAs will ultimately be taken up in the Flemish Nature Structure.

For all sites included in VEN, IVON and for all pSCI and SPAs, a nature objective plan has to be developed indicating the site-specific measures to be taken to implement the objectives developed for that site. A proposal for general measures and the site-specific measures that can be taken in VEN areas was accepted in principle by the Flemish government and is now scheduled for final approval. This decision includes financial support for private owners to carry out conservation measures on their land.

Nature and forest reserves

About 7 000 hectares of forests are included in both private and public nature reserves. Another 1 650 hectares are currently included in forest reserves. Both protection statutes have nature conservation as their primary goal: the biological value of the forests will be enhanced through specific management or non-intervention (spontaneous development: estimated area = 5 000 ha). A large majority of these areas are included in the pSCI (for example, 1 440 out of 1 650 hectares of forest reserve).

General measures

In Flanders, the Forest Decree of 1990 replaced the Forest Act of 1854, which is still valid in Wallonia. The new legislation defined the 'forest' concept, which applies to public as well as private property and explicitly states that all forests are multi-functional. Together with the Nature Conservation Decree of 1997, this has resulted in forest management being quite tightly regulated for all types of property status and a general principle of 'stand-still' being applied to most valuable biotopes by limits on afforestation and drainage.

Practically, this means that the actual extension of most habitat types — such as heaths, fens, bogs, wetlands, marshes, inland dunes and historic permanent grasslands — which have declined after the intensification of forest management, is 'frozen' and their management made subject to specific conservation measures. There is also a general ban on timber harvesting during the spring breeding season and an absolute ban on deforestation.

In 2001, management rules for public forests were adopted which address the objectives of biodiversity conservation and nature protection by permitting the natural succession of vegetation types in a spatial variation — this is achieved by cyclic interventions in forest complexes with a mosaic-like age–class distribution. The same guide sets out an official policy for replacing conifer plantations with forests with indigenous species by natural regeneration. As the larger part of Flemish public forests are designated under Natura 2000, these policy measures are an important step towards their adequate management.

8.1.2. Denmark

As in other countries with reduced forest cover and highly anthropised rural areas, forest conservation discussions in Denmark are mainly about naturalness of existing forests and about the composition of 'pristine' forests that preceded them. The question of the 'openness' of primeval ecosystems and the role of herbivores in them has led to different models of primeval ecosystems (of north-west Europe) such as the 'high forest model' and the 'wood-pasture model'. This has increasing influence on the setting of management objectives for protected areas that are part of Natura 2000 sites.

Danish designation criteria for Natura 2000 and forests

The Danish pSCI series has been proposed on the basis that Annex I forest habitats are mainly semi-natural woodland and that such woodland in general is rare (structurally natural or near-natural stands) or residual (other stands — including coppice, wood pasture and other quite intensive management types). Certain cases, this can also include planted forests of native trees if they form high forest, have typical undergrowth (meaning that they can be referred to as a forest community/association) and host species of Community interest. For planted stands, Denmark has taken the view that such stands must have attained a fairly high age, implying that young, even-aged, planted monocultures do not qualify.

Several Danish SPAs comprise large forest districts. These are mostly planted forests including large spruce plantations managed to a wide extent with clearcuts and replanting. This has proven beneficial and seems to be a necessary feature for the continuous presence of *Lullula arborea, Lanius collurio* and *Caprimulgus europeaus* of Annex I to the birds directive. These species usually decline or disappear in Danish forests without clearcuts.

Denmark has about 163 000 hectares of broadleaved forest (status 2000), of which about 25 000 hectares or 15 % are in accordance with one of the Natura 2000 forest types. The rest are either other Corine forest types (not in Annex I to the habitats directive) or planted stands without sufficient semi-natural quality or without species of Community interest.

In order to develop and disseminate a better understanding in Denmark of the Natura 2000 habitat types including forests, the Danish Forest and Nature Agency has published a book with descriptions, key

and photographs of the Danish Natura 2000 habitat types (Buchwald and Søgård, 2000). A preliminary edition of the book (text only) was used in 1999 when mapping the Natura 2000 forest types in State forest pSCIs. The book represents the official Danish understanding of what is included under the definition of each Natura 2000 habitat type in Denmark.

Denmark made a preliminary proposal in the range of one third to three quarters of the area of each Natura 2000 forest type as pSCI, depending on their rarity, representativity and other qualities as described in Annex III to the directive. The figures are preliminary because field inventories and mapping/digitising of the Natura 2000 forest types have only been carried out in the pSCI of the forests of the Ministry of the Environment (State Forests), while other areas are estimated.

Thoughts about future management

Denmark is preparing/updating the scientific and legal framework for establishing the necessary conservation measures for SACs as stipulated in Article 6.1 of the directive. A very significant contribution to the conservation of forests has been the 'Strategy for natural forests and other forest types of high conservation value in Denmark' launched in 1992 and implemented mainly since 1994.

The natural forest strategy defines terms and objectives (overall aim is biodiversity protection) and sets targets for protecting large areas with a variety of conservation management schemes for which management principles are defined (untouched forest, grazing forest, coppice woods, selective felling and other special forest management systems). From 1992 to 2000, the area of protected forest in these categories greatly rose, partly financed by the LIFE project No B4-32000/95/513- 'Restoration of large areas of natural forest for the benefit of endangered birds, plants and biotopes'.

Conservation objectives

For each Natura 2000 habitat type and species found in Denmark, conservation objectives at national and SAC/SPA levels are being set — British publications have been used as inspiration for this (English Nature 1999). Guidelines will be further developed after the involvement of stakeholders.

In general, the guidelines must take into account that many pSCIs/SPAs consist of a mosaic of different Natura 2000 habitat types, and that each of these may be represented in each pSCI by several (sub)localities, which may have differing quality, management, species content, continuity, representativity, etc. and therefore should also in the future have differential management.

Flexibility concerning Natura 2000 forest habitats in SPAs/SACs

Requirements for Natura 2000 forest habitats may allow the following approach when setting conservation targets and associated management measures:

National/biogeographic level:

favourable conservation status as defined in Article 1 (e) of the directive.

pSCI/SAC level:

1. Management activities and prescriptions shall ensure that the natural qualities and features, structures, functions, species and variations of relevance to Natura 2000 are preserved or enhanced. The approach shall allow for dynamic evolutions and changes.

2. No 1 may be deferred by way of specific prioritisation in conservation objectives/management plan, for example, by allowing/planning for a priority type/species to be enhanced in area or population at the cost of population or area of a non-priority type/species.

3. No 1 may be deferred because of natural dynamics for example, natural vegetation evolution/succession or natural coastal/hydrological/aeolian sand movements, etc.

4. No 1 may be deferred because of economic, social and cultural requirements, pursuant to Article 2.3 and 6.4 of the habitats directive.

Examples of the application of this flexible approach to restoration projects:

1. In a SAC there is a raised bog (7110) surrounded by degraded bog (7120) and bog woodland (91D0). Both the last two types were type 7110 before human impact in the form of peat extraction and drainage. The management plan can (but

does not need to) prescribe that type 7120 and 91D0 wholly or partly be managed in a way which enhances restoration to type 7110. This can mean total clearcutting of the 91D0 forest, which in this case is acceptable. In other cases preservation of the woodland with or without forest management would be the case.

2. Several of the largest Danish forest districts are wholly or partly appointed pSCI and are SPAs already. The areas are typically a mixture of non-forest, non-native plantation forest, native planted forest, managed semi-natural forest and semi-natural forests. They may be under non-intervention or planned management (for example, selective cutting) from before their appointment as pSCIs. Several different Natura 2000 forest types usually occur, parts of which are native planted forest, while other parts are semi-natural with variable degrees of management from intensive to non-intervention, and with a variable age–class structure. In these cases, the *minimum* requirement must be to preserve the balance between management regimes (because different typical species like different regimes) or to change the balance in a way which is deemed beneficial (or unchanged) for the relevant biodiversity/typical species. As mentioned above, at least some Annex I BD birds in Denmark are known to thrive in the clearcuts of plantation forests (*Lullula arborea, Caprimulgus europeaus* and *Lanius collurio*), while they cannot live in forests without clearings. Therefore the minimum requirement must not include a ban on clearcuts or planting.

3. In 1996, the Danish Forest Act was changed. One of the changes was a paragraph stating that 'Oak scrubs shall be conserved…'. The State subsequently had to register oak scrubs in order to ensure their conservation. Almost all stands of Natura 2000 type 9190 'Old acidophilous oak woods with *Quercus robur* on sandy plains' fall under the definition of oak scrub in the Forest Act. Since 1996, all oak scrubs have been registered and most were deemed worthy of conservation. For a large number of them, agreements have been made on a specific management regime with the private owners, including economic compensations. As a principle, planting of tree species non-native to this habitat type is now prohibited, and any deliberate regeneration must use the local oaks by either coppicing, natural regeneration or planting/sowing offspring from the same stand. Use of pesticides and fertilisers is banned and the same goes for (deep) ploughing. Harrowing is permitted to enhance regeneration. The authorities have the right to remove non-native invasive trees/shrubs if it is deemed necessary and the owner does not do it.

8.1.3. Germany

I. A working group set up between the federated states to deal with nature protection and recreation issues was indicated by the federal authorities as the best source of information about the state of implementation of Natura 2000. They submitted the following elements.

Since the implementation of Natura 2000 is still in full progress and the local coordination with the forest authorities for the necessary conservation measures has not yet been completed in many *Bundesländer*, there is still a lack of concrete experience of conservation-oriented forest management in Natura 2000 areas. A number of projects were initiated in the *Bundesländer* and the administrative background for the implementation of Natura 2000 in forests is progressing well. It appears that the individual *Bundesländer* use different means in order to achieve a lasting protection for the Natura 2000 areas. Indeed, adaptation of legislation, formats for management plans, relations with forest owners and with the public are all handled differently. On the whole, about half of the *Länder* (not counting the city states) have started statutory and/or administrative procedures related to forest management in Natura 2000 areas.

The following selection of projects was highlighted by the abovementioned working group:

1. **Implementation of conservation measures within the framework of large-scale-projects for nature protection (*Naturschutzgrossprojekte*)**

Large-scale projects for nature conservation are funded by the federal government, and are carried out in areas with important natural resources. In the

project areas, conservation measures are financially supported.

The federal government deals with 75 % of the costs, the *Bundesländer* with 20 % and a regional body with 5 %. The funds are spent principally in the so-called core zones, where the habitats or species to be conserved are concentrated. The regional body is a local NGO, with representatives of the local political groups, land users, regional planners and conservation authorities. Wooded areas are included in these projects and the required conservation measures are set out in a management plan. Such projects are run, for example, in Sachsen-Anhalt at the middle Elbe and in the nature park Uckermaerkische Seen in Brandenburg (lakes in the Uckermark).

2. Assurance of property rights by assignment of land to conservation foundations or nature conservation associations

In accordance with an agreement between the *Bundesländer* and an association or a foundation, land is given in custody without payment for conservation purposes. This is done by a public tender in which the basic management criteria are specified and to which conservation organisations can apply with detailed implementation proposals in order to be selected. The areas concerned are either already safeguarded as a protected area or their designation as a protected area is underway. The contractual partners have to comply with the provisions of the regulation on protected areas and/or obligations going beyond that which are specified in the agreement. In order to assure the durability of the conservation objectives, a written guarantee of custody for nature protection over the assigned land is recorded in the land register. The agreements furthermore include stipulations for ecologically sound forest management. Forest areas which are designated as pSCI must, beyond that, according to the agreements, be treated in compliance with formally stated conservation aims. This approach was used in Brandenburg on land which was assigned for nature conservation purposes from the federal government to the *Länder*.

3. Contractual conservation measures for the implementation of the habitat directive

For special conservation measures undertaken by the forestry owners, which go beyond traditional practice and natural forestry, forest owners can underwrite contracts, which honour the special expenditure required for nature protection measures to be carried out. In the *Bundesländer* Schleswig-Holstein, Bavaria, Nordrhein-Westphalia and Saxony the legal conditions for this type of 'contract conservation ' have been established.

In Schleswig-Holstein, for example, conservation contracts can be concluded for private forests which have special conservation functions. Thus, it is possible to implement conservation measures which otherwise could only be carried out by land purchase or formal legal procedures. Some of the contracts are co-funded by EU instruments, such as the rural development plans. For such measures, forests in Natura 2000 areas are given priority. Other contracts, which are concluded under a local programme 'The future of the rural area' (without EU co-funding), run for over 30 years.

4. Management plans for nature parks and national parks

For large protected areas, such as national parks or natural parks, specific conservation plans are prepared, which contain explicit articles about forestry practices. These plans are established after consultations with a specialised advisory body, consisting of local politicians, regional authorities, NGOs, representatives of land users and specialists. The plans are advertised in the region and are discussed. In order to make these plans accessible to the maximum number of people, executive summaries of the final versions are published. It has to be noted that German national and natural parks are not nature reserves. They mostly consist of areas in which legal restrictions of land use already exist (for example, on landscape protection) and in which the forest administration has made a commitment to taking a more ecological approach.

5. Cooperative agreement between forest and conservation authorities in Thuringia for the protection of bogs

With regard to the implementation of the habitat directive, the bogs situated in the Thüringer Wald and in the Westliches Schiefergebirge are of special importance. These bogs are not large areas of con-

tinuous habitat types listed by the directive, but they are outstanding and rare ecosystems.

Because most of these bogs are in a bad state of conservation, it was vital to act in order to conserve these valuable biotopes and/or to restore the damaged bogs. Since most of the bogs were already wooded to a certain degree, a close collaboration was necessary between conservation and forest administrations for the implementation of necessary conservation and restoration measures. A common operational framework was agreed, with the goal of ensuring favourable conservation conditions for the bog habitats. Important outcomes were a coordinated overall concept for the future development of the bog woodland as well as a priority list of measures to be taken.

6. The LÖWE programme in Lower Saxony

In the German forests of Lower Saxony, the forest administration is implementing a strategy for 'close-to-nature forestry' called 'LÖWE' (an acronym for long-term ecological forest development in the State forests of Lower Saxony: *Langfristige Ökologische Walderneuerung*). One of the effects of LÖWE since its introduction was that costs for harvesting per cubic metre were drastically reduced, as well as the costs for planting, as LÖWE uses the forces of nature wherever possible, such as for the natural regeneration of forests. LÖWE was supported by measures that are essential for the change to ecological forest management, in particular ensuring an adequately low number of deer per hectare to be able to naturally regenerate the forests without the use of expensive fencing (Janssen, 2000; www.forstnds.de/portrait/loewe.htm).

The realisation of the LÖWE programme has been carried out with great success until now. The LÖWE programme was drafted in 1991 as a comprehensive production and nature protection strategy. Economical considerations were originally not part of the 13 principles of the LÖWE programme, but they can be derived from them. The objectives of girth limit felling, for example, have resulted in a profit increase. After only eight years of realisation praxis, ecologically orientated forestry based on the principles of the LÖWE programme has already led to a considerable reduction in expenditure and a corresponding income increase in the Lower Saxon state forests.

This example shows that ecologically based forestry can also, under certain conditions, be the most economically viable form of management.

The working group also mentioned the kind of financing techniques that were used.

1. *Länder*-owned forest

The measures are an integral part of the management of the state forest by the state forest authority (*Landesforstverwaltung*). The implementation lies within the scope of the executive work by the local forestry authorities.

2. Corporate and private forest

The necessary measures are coordinated by mutual agreement between the forest administration and the forest owners. The measures can be implemented by state forest workers. The costs are shared by the forest and nature conservation administrations, with no costs arising for forest owners.

In this manner, spruce plantations have been cleared in the nature reserve Saukopfmoor on the Regenmoorkalotte over an area of more than 7 ha, which is the property of the private company Bodenverwertungs- und -verwaltungs GmbH. Similar measures can also be funded under the programme for the promotion of nature conservation and the preservation of the countryside in Thuringia.

3. Job-creation measures (ABM) and/or structural adjustment measures (SAM)

In the case of the implementation of nature protection measures forestry administrations have often been supported by employees of the secondary job market. The implementation of certain measures (for example, water engineering projects, cleaning clear cut areas) represent a meaningful opportunity to employ jobseekers, at little cost to the employer.

4. Compensation measures for impacts in nature and landscape

In the western slate mountains (Westliches Schiefergebirge) disturbed forest moors were restored in compensation for the impact the building of the power station *Goldisthal* had on nature and land-

scape in the area. These measures were planned together by forest and nature authorities and undertaken under the direction of the local forestry commissions.

II. In Nordrhein Westphalia (NRW), comprehensive legislation for Natura 2000 implementation with the following basic characteristics is currently being adopted.

- All pSCIs in NRW must receive the status of nature protection areas or form part of landscape planning regulations.
- Obligatory state-wide models for contracts between landscape authorities and forest owners were developed. Thus habitats directive-compliant management of designated forest complexes is ensured and forest owners have a long-term planning security. Furthermore, a decree of the *Land* (Nordrhein-Westfalen) regulates the involvement of the nature conservation associations.
- Regular monitoring of the state of conservation of habitats and species in pSCIs will take place in all forest areas, whereby forest structure, species inventories and outside influences will be taken into account. To carry out this work, NRW has developed specific guidance on cartography and assessment methodology.
- The designation of forest Natura 2000 sites has to focus on surfaces containing 'natural forest cells' that are able to function as core areas in which natural developments can take place with human intervention. Existing forest management in surrounding stands must strive towards a balance between the different succession stages that can exist in semi-natural forests.
- Characteristics of existing habitat types listed in Annex I of the habitats directive must be preserved by forest management measures if possible (for example, maintain more than 50 % oak in 'Old acidophilous oak woods with *Q. robur* on sandy plains' / 9190).
- General management prescriptions are as follows:
  - no replacement of broadleaves by conifers;
  - conifer percentage to be stabilised at actual occurrence;
  - up to 10 trees per hectare to be maintained to provide nesting space for bats, day raptors, owls, woodpeckers, black stork;
  - clearcuts larger than 0.3 hectares not allowed.
- Detailed guidelines and decrees regulate the degree to which these measures are obligatory or voluntary in relation to specific habitats and species.
- Compensations for economic losses are foreseen in relation to:
  - the maintenance of well-defined levels of decaying trees and deadwood;
  - transformation of conifer stands into indigenous broadleaved forest.
- A separate support facility has been created for the conservation of *Luzulo-Fagetum* beech forests (hab. type 9190) and 'Old acidophilous oak woods with *Q. robur* on sandy plains (hab. type No 9190)

III. Bavaria has introduced management planning measures for Natura 2000 forest sites with the following characteristics:

- Implementation of Natura 2000 should be completely transparent and should have the cooperation of stakeholders.
- Division of tasks between several public bodies who are involved:
  - the state Ministry of the Environment has overall steering competence;
  - the state Forest Service and nature conservation authorities work out the concrete conservation objectives;
  - the state Forest Service is completely responsible at site level (planning and carrying out of management plans, monitoring, controls, reporting) because it has long-standing experience with ecologically sound forestry, disposes of considerable administrative resources and enjoys a high level of confidence from private forest owners.
- Landowners are involved and informed at all stages of management planning: before starting the work, during field studies, by commenting on

draft plans and during completion of the work. They have full access to complete text versions and maps on the Internet.

- The knowledge of local experts and conservation NGOs is seen as a valuable source of information for management planning.
- All the above-listed procedures and principles were first tested in pilot projects.
- For state forests, a Natura 2000 management plan will be an obligatory component of the valid forest management plan.

IV. The Federal Nature Protection Authority (BfN) commissioned a study by the University of Freiburg with the objective of defining the concept of 'good forestry practice' on the basis of existing rules and regulations in the 15 federal states.

- This study, led by Professor G. Winkel, defined good forestry practice on the basis of a series of criteria for the integration of nature protection in forest management. Meeting these criteria would then be seen as a threshold that forest management must reach in order to become eligible for compensation of lost income resulting from specific ecological requirements.
- It has to be stressed that BfN has only presented this study as the basis for initiating a more intensive dialogue with the forest sector and not as a series of mandatory rules. Most of the quantitative figures that are needed to make the criteria operational will have to be established by intersectoral discussion.
- The criteria for 'good forestry practice' presented by Prof. Winkler are:
  - use of natural regeneration;
  - use of natural succession processes;
  - strictly regulated use of forest machinery;
  - minimising soil disturbance by tillage;
  - careful planning of forest road systems;
  - setting of minimal rotation lengths;
  - protection of specific biotope elements, such as individual trees;
  - integration of nature protection measures in commercial stands;
  - respecting the ecological functions of structurally diverse forest edges;
  - limitation of the use of pesticides, herbicides and chemical timber protection;
  - maintaining adequate game densities;
  - avoiding the use of genetically modified organisms;
  - limiting the establishment of large single-species stands;
  - limiting the use of exotic tree species;
  - avoiding the use of nitrogen fertilisers;
  - limiting clearcuts to a minimum size.

8.1.4. Greece

Greece submitted experiences derived from several LIFE projects, where forestry should be viewed in an integrated way, taking into account biological diversity and landscape conservation. One of the first steps in the planning process is the drawing up of management plans. Up-to-date forest management plans should not just include sustainable logging practices, but should also reflect biodiversity conservation issues.

In the case of Natura 2000 forest sites, management plans have to prescribe actions targeted to habitat types and plant and animal species of Community interest. Monitoring the results of management actions in relation to the conservation status of the species listed is considered as essential feedback to management. A national project 'Conservation and management of sites of Community importance in Greece' was executed on 10 pSCIs of which five are forest sites where the following principles were applied.

1. The project began by setting the context, that is, the elaboration of guidelines and specifications that reflected the current scientific knowledge and the spirit and content of Directive 92/43/EEC and the Biodiversity Convention. The pilot element was that, for the first time since the adoption of Directive 92/43/EEC, specifications for management plans for forest areas were elaborated (addressing the abovementioned requirements) and a monitoring guide was produced, providing the framework for the design of monitoring programmes, at site, habitat type, and species level.
2. Existing forest management practices were reviewed and management actions were prescribed with special emphasis on logging, road network design and construction, and visitor management. Inherent to the management plans was a monitoring system which was proposed for each site, at site, habitat type and species level, based on the monitoring guide.

As an overall benefit, it can be concluded that these projects have re-oriented forest management to take into consideration the conservation objectives of Natura 2000 sites.

Another interesting example, in this case for the use of forest areas for tourism, comes from Crete, where the palm forest of Vai lies on the north-east coastal tip of the island, covering around 20 hectares, within a semi-arid ecosystem. Its significance is inversely related to its size, since it is the only natural palm forest in Europe, and possibly the only forest of *Phoenix theophrasti* in the world. It is one of Crete's main tourist attractions, with some 200 000 visitors every year. The project combined awareness raising, restoration and reforestation efforts to create a sustainably managed tourist destination.

8.1.5. Finland

The Finnish Ministry of the Environment submitted the following examples of best practice concerning relations between forest management and management of the Natura 2000 network.

National forest programme 2010

At national level the Government of Finland has adopted the national forest programme 2010 as a tool for forest policy. The drafting process of this programme has been accessible both to experts and to a large number of interest groups and private citizens. According to this programme, the ecological sustainability of forestry will be secured by further development of the ecosystem management of commercial forests and by the establishment of nature conservation areas on the sites included in national conservation programmes. Most of these sites also belong to the Natura 2000 network.

Since the adoption of the national programme in 1999, regional forest programmes have been prepared for all provinces. In addition, the government has set up a special working group to prepare a forest protection programme covering the south of Finland, the western parts of the province of Oulu and the southwestern region of Lapland. The working group is expected to give its proposals by the end of June 2002.

Natura 2000 network in Finland

In accordance with the Finnish government decision on the designation of Natura 2000 sites, the network in Finland includes around 1 500 sites and covers roughly 4.77 million hectares. Most of these sites are existing nature conservation areas (30 %), wilderness areas (30 %) or belong to the national conservation programmes (30 %), which means that they will be protected as nature conservation areas in the near future. In general, commercial forestry is not allowed on these sites or is allowed only within certain limitations. On certain sites, however, more flexible implementation is possible because of the habitat types or species found on them.

Example from the public sector: Landscape ecological forest management planning by the forest and parks service Metsähallitus

This method is applied especially on those Natura 2000 sites which are mainly used as State-owned national hiking areas (about 28 000 hectares) but also on some other forested sites, which include, for example, habitat types such as 'Coniferous forests on eskers' (9060), 'Bog woodland' (91D0), 'Fennoscandian springs and springfens' (7160), 'Western Taiga' (9010).

Landscape ecological planning (LEP) is integrated with forest management planning. The idea is that ecological goals are aligned with different forms of forest use, while bearing in mind the objectives of forestry in the area. LEP views an extensive forest area as a whole including managed forests, nature conservation areas, game areas and special areas for recreational use.

The long-term objective of LEP is to assure the survival of the area's native species as viable populations. Among other things, this requires the conservation of valuable existing habitats and allows for new ones to evolve. In this way planning contributes to the continued existence of valuable habitats as defined in the Forest Act and the Nature Conservation Act in Finland. Planning can also be used to focus nature management activities including restoration operations on the sites that are the most crucial in ecological terms. The planning also attempts to assure the necessary conditions for the spread of various species. In this scheme, the valuable habitats and ecological processes in managed forests complement and enhance already existing nature conservation areas. Together these form an ecological network, which preserves biodiversity.

Another central goal of planning is to ensure that the conditions exist for multiple forest uses and for nature-based sources of livelihood. The procedure thus involves inventories of game habitats, scenic value and cultural, educational and research sites. In northern Finland, the demands of reindeer husbandry play an important role. The weight given in planning to recreational use depends on the characteristic features of the area and on the recreational needs of the region.

Landscape ecological plans are drawn up in an open, interactive and people-oriented way. The participatory management as applied in the LEP includes disseminating information, gathering value-based and geographic input, talking with the stakeholders and the public and giving them feedback. The aim is to improve the working relationship with all those stakeholder groups and citizens interested in the use of State lands and in the LEP process of Metsähallitus (Finnish Forest and Park Service). For this purpose, open forums and working groups of stakeholders are arranged during the planning process. All public input is documented, analysed and, if feasible, taken into account. It is envisaged that, through participatory management, Metsähallitus will take care of the common property in a broadly acceptable way.

More than 100 people, including more than 20 professional biologists, have participated in the fieldwork during the past five years. The costs of this work totalled EUR 7.5 million. The results, including the map material, are published as landscape ecological plans and they are available on request from Metsähallitus at a nominal price.

Currently, the completed LEP covers 6.4 million hectares. Some 3.3 million hectares of this is standard production forest by land use. Of the productive forestland, 129 400 hectares have been designated as key-biotopes and ecological corridors. Commercial forestry activities will no longer be carried out on these lands. These new areas increase the strictly protected forest area in Finland by 18 %. Furthermore, 205 000 hectares of productive forest land subject to conservative forestry activities has been designated as an area subject to limited forestry operations. The aim of forestry activities is to secure the special characteristics and functions of these areas. These areas consist mainly of valuable scenic areas such as riparian forests and important game areas such as Capercaillie leks.

It is obvious that the positive impact of the key biotopes and ecological corridors on biodiversity is higher than their proportion of the commercial forest land area, since they are based on a systematic analysis and field inventory of the natural resources of each individual LEP area. These areas are concentrated in older forest stands on more fertile sites than commercial forest land in general. These stands are the most valuable ones in economic terms as well. Subject to the extended rotation periods, the key biotopes, ecological corridors and stands reduce the annual cutting budget of Metsähallitus by 12 %. In other words, the investment in nature conservation, recreation, culture and other resources reduces the business profit of Metsähallitus annually by EUR 24 million.

Example from the private sector: LIFE project 'Protection of taiga and freshwater ecosystems in central Finland' (management plan preparation by the Forestry Centre of Central Finland)

This project concerned two Natura 2000 sites in central Finland owned by private landowners.

The Forestry Centre of Central Finland supervises the forestry legislation in central Finland. The aim of the LIFE project was to prepare forest management plans for two Natura 2000 sites, protected under the Forest Act, totalling 400 hectares. The management planning areas are owned by private landowners. The Forestry Centre prepared the management plans for the two Natura 2000 sites: 'Vaarunvuoret' (FI0900039) in Korpilahti and on 'Iilijärven alue' (FI0900083). The Forestry Centre was responsible for negotiations with private landowners and for the preparation of plans which included suggestions for the management of each forest compartment and the supervision of possible harvesting.

Thorough inventories were needed before the plans could be drawn up. Aerial photography was an important tool for this task. Inventories that targeted species and habitats under the habitats directive and the birds directive were carried out. Additionally, a Centre expert identified key habitats under the Forest Act and sites of endangered and rare birds, insects, fungi and vascular plants, which were taken into account in the management plans.

Inventories were essential to avoid the harmful effects of forest management on biodiversity. Some of the inventory work was carried out in collaboration with biologists from the Central Finland Regional Environment Centre. Several endangered and rare beetle species were observed in the planning areas. Detailed suggestions of management were prepared for each forest compartment by the Forestry Centre.

Landowner participation was essential for the success of the project. Therefore, the Forestry Centre contacted 27 landowners directly. Nine forest management plans were drawn up, covering 488 hectares of forest. Compensation was paid to some landowners because they agreed to preserve the most diverse sites of their forests by leaving them outside commercial management. Much effort was put on the personal guidance of landowners in order to increase understanding of the plan contents and targets. The forest management planning procedure was welcomed because most of the landowners held the view that the project would provide new choices and approaches for managing their forests. Earlier, before the project began, landowners were uncertain about the targets of the Natura 2000 network and in doubt as to how they would be allowed to manage their forests. The project was successful in adapting forestry activities to the conservation aims of the sites. The landowners will be able to use their property efficiently without causing the deterioration of habitats or the disappearance of the species for which these forested areas were designated as Natura 2000 sites.

8.1.6. France

A. General presentation of Natura implementation in France

In 2001, France completed the transfer of the nature protection directives in its legislation by enacting separate legislation on site designation and on site management.

Three essential choices were made:

- acting in transparency and cooperation, at all the stages of the procedures, in particular through the steering committee set up for each site;
- development of contract management, based on the initiative and motiviation of the owners and managers of the territories concerned;
- incorporating environmental aspects into the management and development of rural areas.

Essential elements of the French approach to implementing Natura 2000 are the following:

The 'objectives document' (document d'objectifs — DOCOB)

The DOCOB defines the management guidelines and the contractual conservation measures and indicates, if necessary, the administrative and regulatory measures to be implemented on the site. It specifies methods of financing the contractual measures. It is established by a technical operator chosen by the State administration, in cooperation with the local actors concerned who meet on the steering committee for the site. On the basis of the objectives doc-

ument, approved by a prefect's decree, Natura 2000 contracts are drawn up.

To help with drawing up objectives documents, several tools are at the disposal of the public services and the operators:

- a methodological guide worked out following an experimental operation on 37 'pilot' sites, co-financed by the European Union;
- a training plan which has been functioning since 1999 for officials and operators, and which includes exchange of experiences between the regions;
- a series of habitat guides giving a synthesis of knowledge on the habitats and the species targeted by the habitats directive and their management.

The steering committee

The steering committee is the main instrument for the exchange of information and for cooperation on each site. It is set up and chaired by the local prefect and brings together partners concerned with the site such as elected representatives, owners, users, NGOs etc. It meets regularly and can set up specialised working parties.

This committee is associated with the drawing up of the objectives document. The technical operator reports to the commitee on the results of his work and takes account of its opinions. After approval of the DOCOB by the prefect, the committee is informed about its implementation and is asked to come to conclusions about the measures being applied and subsequently to evaluate them.

Natura 2000 contracts

Individual participation in the implementation of the DOCOB by the actors who are in charge of management and maintenance of the natural environments will be regulated by public service contracts called 'Natura 2000 contracts'. These contracts will enable the signatories (owners, farmers, foresters, hunters, associations and communes) to be remunerated for the work and the services rendered to the community and have to be passed directly between the State (via the prefect of the department) and the holders of land-use rights to the sites concerned. Their duration will be at least five years.

Natura 2000 contracts will define the tasks required to achieve preservation or restoration of the natural habitats and the species which justified the designation of the site. They will give the nature and the modalities for remuneration by the State (and the local authorities if necessary) in exchange for the conservation benefits to be provided. Partly financed by the European Union, under the rural development budget in particular, this public aid will be granted as investment subsidies or annual aid per hectare. The contracts will have to be in conformity with the regulations of the objectives document and will offer attractive conditions of financing in the case of Natura 2000 sites.

In this way, Natura 2000 will be endowed with substantial financial resources, and will be a genuine tool for territorial development, guaranteeing the conservation of flora, fauna and natural habitats.

B. Implementation of Natura 2000 in forestry environments in France

Scientific and technical tools

The French authorities have published guidance documents for biodiversity-oriented forest management which are of an exceptional quality because of the way in which they link scientific accuracy and practical recommendations.

1. With the support of a LIFE Environment project that was carried out together with the Walloon Region in Belgium and the Grand Duchy of Luxembourg, an excellent guide for identification and integrated management of forest habitats and species was published in 2000. This guide, called *Forest management and biological diversity,* consists of three volumes, relating to Wallonia and the Grand Duchy and to Atlantic and continental France respectively. It is a useful tool which allows forest owners to identify habitats and species found in their own forest and to draw management conclusions with the help of a vast range of descriptions of practical situations. The publications also contain a substantial chapter with basic information about biodiversity and nature protection. A most interesting aspect of the project is that forest owners' organisations cooperated in the compilation of the reference book,

making it a kind of bottom-up, participatory approach that aimed at increasing the acceptance of Natura 2000 amongst key stakeholders.

2. In 2001, the Ministry of the Environment and the Ministry of Agriculture, together with the national Museum for Natural History, started the publication of a series called *Natura 2000 habitats references*, with a comprehensive guidance document about forest habitats in France. This is the first publication of a series of detailed guides on the habitats and species listed in the annexes to the habitats directive, to be followed by editions about coastal, humid pastoral and rocky habitats and also by two volumes about species, one on fauna and one on flora.

This forest habitat guide has been conceived as a system of records, in which each habitat is listed under its French name with the Natura 2000 and Corine codes. Next follows information about diagnosis, phytosociological position, succession stages, associated habitats, floristic composition, conservation value, potential threats, production capacities and economic use, management practices and research needs.

The outstanding value of this guide lies in its integrating approach, which presents forest managers with a systematic linking of conservation-related data and economic use.

Specific measures under rural development for the contractual management of forest environments

The French national rural development plan envisages Community co-financing under the Guarantee Section of EAGGF for measures of contractual management of Natura 2000 sites (individual measures carried out in the perimeters of pSCIs and SPAs forwarded to the European Commission). As regards collective actions for Natura 2000, the RDP also comprises training and awareness-raising measures.

Aid for the contractual implementation of the management of the Natura 2000 sites in forests and associated environments is thus envisaged in measures I.2.7 and I.7.2 of the RDP (corresponding to Chapter VIII, Articles 30 and 32 of the rural development regulation). This concerns investment as well as management support (cfr. first indicative list of eligible forestry measures).

Indicative list of measures for contractual management of Natura 2000 sites in forests and associated environments eligible for measures I.2.7 and I.7.2 of the French RDP:

I. TYPOLOGY OF ELIGIBLE MEASURES UNDER MEASURE I.2.7 OF THE RDP (ARTICLE 30 OF THE RDR — operations not dealt with within the framework of forestry investment aid):

- creation and restoration of clearings in closed forest stands, in order to create environments favourable to maintenance and to the reproduction of habitats or of species habitats of Community interest;
- creation and restoration of forest ponds essential to maintenance and to the reproduction of habitats or of species habitats of Community interest;
- enrichment of plantations with non-productive objectives, with a view to restoring habitats or species habitats of Community interest;
- preparation and monitoring of natural regeneration in stands which are not very productive and where existing forest policy would have recommended artificial regeneration;
- clearing and thinning of stands with non-productive logic, with a view to restoring habitats or species habitats of Community interest that need significant increase in the light on the forest floor;
- creation and restoration of riverine forests, including the works for stabilisation of banks, with a view to restoring habitats or species habitats of Community interest;
- establishment of complex, multi-storey and gradual forest edges, with a view to restoring habitats or species habitats of Community interest;
- covering excess costs connected with manual clearing or undergrowth thinning, corresponding to the protection of habitats or of species habitats of Community interest on sites where the existing forestry policy would have resulted in resorting to mechanical or chemical interventions;
- creation of simple and sturdy crossings of small water-courses in forests that include aquatic habitats or fish species of Community interest, in order to prevent forest machinery from destroying these habitats;

- fencing and safeguarding small areas with natural regeneration, making it possible to reduce the surface of the basic unit of regeneration significantly when the maintenance of habitats or of particularly fragile species of Community interest habitats requires the creation of a mosaic-like horizontal forest structure.

II. TYPOLOGY OF ELIGIBLE MEASURES UNDER MEASURE I.7.2 OF THE RDP (Article 32 of the RDR):

- participation in the financial charges resulting from increased stand heterogeneity, with a view to restoring habitats or species of Community interest, when it leads to losses of expected value and reduced exploitability;
- maintenance of clearings and ponds in forests, in order to guarantee the conservation of habitats and reproduction species of Community interest;
- establishment of complex, multi-storey and gradual forest edges, with a view to restoring habitats or species habitats of Community interest.

STUDY FOR THE DEVELOPMENT OF A TECHNICAL-ECONOMICAL REFERENCE FRAMEWORK FOR THE MANAGEMENT MEASURES IN FORESTS AND ASSOCIATED ENVIRONMENTS

To facilitate the drafting of the DOCOB and of the contractual measures following from them in forest environments, the Ministry for Ecology and Sustainable Development launched a study in June 2002 to define an initial technical and economic reference framework and to assemble the existing data in this field at regulatory level, especially in relation to technical matters and financing methods. This reference framework does not aim to draw up a limitative and exhaustive list of contractual measures eligible for financing Natura 2000. On the contrary, its design envisages simple updating methods to supplement it along with the advance of Natura 2000 implementation.

The study, carried out by a consultancy, is co-managed by the Ministry of the Environment and the Ministry of Agriculture. It will last 10.5 months and presents three phases:

National phase

The following will be worked out in parallel:

- a national practical guidebook on the general methods of implementation: administrative procedures, eligibility conditions, general principles of calculation of aid, organisation of the various sources of financing and definition of good forestry practices excluded from the field of financing;
- a national guidance book of technical measures (compensatory investments or payments) for forest habitats, forest species, habitats and micro-habitats associated with forests.

As a result of a national steering committee meeting which included the various Natura 2000 actors, and after joint validation of the choices by the Ministry of the Environment and the Ministry of Agriculture, final editions of these books will be produced in order to be able to start discussions at regional level.

Regional phase: 'sylvo- environmental meetings'

In order to further develop the national guidebook into 22 regional catalogues of measures and to refine the definition of tasks on the basis of field experience, 12 meetings will be organised in the various French regions. The technical and financial aspects of the measures will be approached during these meetings.

Final phase: final catalogue of measures and financial reference framework

On this basis, the national reference framework of measures (synthesis of the 22 regional catalogues) will be written with all the technical indications and their financial aspects. The production of the final documents and of the summary report will be based on the choices and proposals of the national steering committee and finally those of the Ministry of Agriculture and the Ministry of the Environment.

8.1.7. Ireland

The Department of Marine and Natural Resources of the Irish Forest Service 'Coillte' has submitted the following elements on forest management in and around Natura 2000 sites in Ireland.

The ways in which Natura sites and forestry can interact in Ireland may be broken into the following three categories:

1. Natura forest sites that have been designated for their intrinsic forest values;
2. forests within (larger) Natura sites;
3. afforestation in or near Natura sites.

These are more fully described below.

1. Natura forest sites that have been designated for their intrinsic forest values.

These are semi-natural (usually referred to as semi-natural woodland) and are those that most resemble natural forests. Many now require management in order to ensure that their biodiversity potential is realised and protected — the Native Woodland Scheme (described below) will support this. The People's Millennium Forests project (also described below) has been very successful in raising the profile of Ireland's semi-natural woodlands.

Background.

While Ireland has approximately 9 % forest cover, semi-natural woodland is quite rare and occupies a fraction of 1 % of the land cover. The area of semi-natural woodland in Natura (forest) sites is approximately 6 000 hectares — the forest types represented are old oak woodland, alluvial woodland, bog woodland and yew woods.

The threats to these forests are (a) the introduction and proliferation of exotic species — Rhododendron ponticum is a major threat to semi-natural woodlands on acid soils, conifers were planted in them in the past — and (b) grazing by sheep or deer. It is a common feature of many of these woodlands that they (a) are not managed (they may have been managed in the past but management often ceased about a century ago) and (b) they are even aged. The result is often a canopy dominated by one species. It is necessary to bring these woodlands within a management regime. It is envisaged that this management will be supported to a very significant extent by the native woodland scheme.

Brief description of the native woodland scheme.

The scheme has been launched by the Forest Service in close cooperation with Dúchas, the Heritage Service, Department of the Environment and Local Government and with the Native Woodland Scheme Development Group (which includes statutory bodies, all sectors of the forest industry, researchers, landowners and non-governmental organisations).

The scheme consists of two elements — native woodland conservation and native woodland establishment. It provides for grants for work carried out to approved standards and for annual premium payments. It is a key feature of the scheme that the plan for each project is drawn up by a forester and an ecologist. The primary objective is to protect and expand Ireland's native woodland resource and associated biodiversity using appropriate 'close to nature' silviculture. Where compatible, the realisation of wood and non-wood potential is also encouraged. Conservation and biodiversity are prioritised, with wood production encouraged where appropriate.

The People's Millennium Forest Project.

The People's Millennium Forests consisted of tree planting and woodland restoration. Much of this occurred on Natura 2000 sites where exotic species (including rhododendron and conifers) were removed, the fencing of the sites was secured and appropriate native species of trees were planted. Awareness of the concept of native woodlands was raised through an outreach programme and by involving local people and the schools in planning the work. In addition trees were planted where appropriate — each family in the country was assigned a newly planted tree. A certificate describing the location of the relevant tree was issued to each family. The trees for each family are on a permanent register.

2. Forests within Natura sites

Forests in this category tend to be in Natura sites because of their place in the landscape. For example they may be within a protected riparian zone or

within a special protection area (SPA) — they form part of a greater landscape. These forests may range from semi-natural to older and new plantations of both indigenous and exotic tree species.

In these cases the management objectives vary depending on the environmental constraints. In the case of the managed plantations at least, timber production is a primary objective. The environmental and economic values of the forests and of the larger landscape are balanced through consultation. The management plan for the Natura site (the responsibility of Dúchas) follows widespread consultation. In addition to that, the issuing of felling licences (as required by the 1946 Forestry Act) to enable harvesting within these sites requires prior consultation with Dúchas.

3. Afforestation in or near Natura sites

There is consultation and regulatory procedures are in place to ensure that any afforestation that does occur does not diminish the Natura site in question.

Afforestation requires prior approval from the Forest Service, Department of Communications, Marine and Natural Resources. The following consultation is required before a decision is taken concerning approval in and near protected sites (including Natura 2000 sites):

- if the site proposed for afforestation is within a Natura site, the proposal is subject to public notification and consultation, including consultation with Dúchas as well as with An Taisce, the environment non-governmental organisation (eNGO);
- if the site is within 3 km upstream of a protected site, the Forest Service consults with Dúchas prior to making a decision on the issuing of afforestation approval.

8.1.8. Italy

General management principles

The management of Natura 2000 forest sites in Italy intends to implement all necessary and reasonable conservation initiatives to maintain or improve the conservation status of the features (habitat or species) for which the site was notified (object-oriented conservation strategy).

The decision-making process requires an adequate knowledge of the following elements: the assessment, through appropriate indicators, of the condition of the features of interest in the given site; the detection of actual (or potential) local factors that (may) lead to a deterioration of those habitats or species; the application of the most appropriate management measures to preserve the site's features of interest.

Depending on the local situation, habitats may be maintained by continuing the economic activities traditionally carried out on the site and by undertaking appropriate remedial action (restoration measures) when the habitat is in unfavourable conservation status or when local influence may lead to decline of its conservation.

Forests in Italian Natura 2000 sites frequently represent areas where human intervention has complemented nature to produce an ecological equilibrium: in this way the management of semi-natural areas, a key component in maintaining the coherence of the Natura 2000 network, becomes an effective means of development for the rural areas and forests they contain. In this way, the state of conservation of forest habitats becomes a quality indicator of the environmental integration of human activities and, at the same time, a continual testing-ground for the effectiveness of management guidelines adopted.

Specific technical guidelines

I. Under the Life project 'Verification of the Natura 2000 network and management guidelines', the Italian Nature Conservation Direction has produced a primary framework of guidelines for managing Natura 2000 sites and a reference book with specific management indications. To demonstrate the network structure of Natura 2000 sites, these management indications are arranged according to the 24 categories into which the Italian Natura 2000 sites have been classified on the basis of their respective features of interest. In 10 categories the feature of interest is one or more forest habitat.

This project is specifically focused on the following.

- Information provided by the reference book on the management of forest categories: habitats of interest; habitat ecological requirements; parameters for a statistical description, at national level, of main deterioration factors (such as fire risk, grazing pressure, percentage of built areas in the site) acting upon the classified sites; indicators for the assessment of habitat conservation status; indication of the actual (or past) forestry practices that lead to a deterioration of the habitats of interest; sustainable forest management guidelines, that is, suggested forest management actions in relation to habitat conservation status.
- Guidelines for the development of conservation measures for three categories specifically related to Mediterranean forest habitats, as outlined in the table below:

II. Because a high number of forest sites are contained in nationally protected areas, another technical instrument was produced to promote and clarify the correct ways for managing Natura 2000 forest habitats: 'Guidelines for a sustainable management of the forest resources in protected areas'. This guidance document, a result of collaboration between Italian Nature Conservation Direction and the Italian Academy of Forest Sciences, is also aimed at designing measures to maintain or restore the favourable conservation status of natural and semi-natural forest habitats of Community interest, taking into account the economic, social and cultural requirements and the regional and local characteristics.

	Habitat of interest	***Measures of prevention from deterioration factors***	***Sustainable forest management guidelines***
Mediterranean *Quercus* sp.forests	6310, *91H0, 9280, 9330, 9340	Fire control, suspension or regulation of grazing activities	Habitat in favourable conservation status: 1. continuation of coppice cultivation by application of less intensive management methods favouring retention trees and compositional diversity; 2. high stand conversion. Habitat in favourable conservation status: 1. high stand conversion, where ecologically and economically feasible; 2. extension of cultivation cycles, application of appropriate management practices for the restoration of coppices.
	9250, 9350	Contractual measures for the acquisition of nearby lands suitable for a (new) establishment of the *Q.trojana* and the *Q. macrolepis*	
Mediterranean and (oro) Mediterranean *Pinus* sp. Forests	9530, *9535, 9540	Fire and pests control	Active management oriented to in situ conservation of genetic diversity of endemic pines (P.nigra, P. leucodermis)
Mediterranean dune scrub	2260, *2270, 5211, 5212	Coastal erosion control, regulation of accessibility and circulation of visitors in sand dunes.	Habitat in unfavourable conservation status: restoration of vegetation cover on sand dunes by plantation of dune herbaceous and sclerophyllous species

* Priority habitats as defined in Article 1(d) and listed in Annex I of the habitats directive (92/43/EEC).

8.1.9. Netherlands

The Dutch Government submitted the following comment.

1. Management of Natura 2000 sites

Nearly all Natura 2000 sites are managed by either the State Forest Service, or by private nature conservation organisations (Vereniging Natuurmonumenten and Provinciale Landschappen), although up to now even these organisations have hardly been involved in the process of the selection of Natura 2000 sites. This means that, so far, no special projects or initiatives to involve NGOs or private forest owners have been carried out and that nearly all designated forest sites are already under a nature conservation-oriented management.

The existing experiences with forest management on Natura 2000 sites are mainly based on information from the State Forest Service (Staatsbosbeheer), which suggests that the concept of 'sustainable forest management' offers a useful and acceptable approach.

For the State Forest Service, sustainable forest management can have different objectives:

- in forests with emphasis on natural values: management activities are directed at increasing natural values, for example, stimulating structural diversity, removing introduced tree species, very limited harvest or no harvest, etc.;
- in multi-functional forests with normal forest management: management includes normal harvesting (but never more than 70 % of the annual increment), no clear fellings or clear felling of very small (< 0.5 hectare) size, avoidance of summer fellings, preference for natural regeneration and presence of dead wood and older trees with diameter > 40 cm.

An important prerequisite for sustainable (forest) management is the availability of a management plan with, among other things, a description of the actual situation, relevant processes (both internal and external), goals and management methods (including monitoring) and an evaluation of the management results. Such a management planning system is used by the State Forest Service and the private nature conservation organisations, Natuurmonumenten and Provinciale Landschappen, and it seems to work quite well for all habitats in the Natura 2000 network.

The State Forest Service has set up a sound and common set of indicators as an indispensable tool for the evaluation of management results. Experience so far suggests that further elaboration is needed on the basic characteristics (indicators) for the quality of the habitat types (including forest types).

For the near future, some aspects related to the national selection and delimitation of the Natura 2000 habitats seem to **need further clarification**; in a few years we hope to have more information on the following issues:

- the proper maintenance of small units of certain forest habitat types. (Often small areas only have one age class or development stage of a forest type);
- the status (and management) of non-target forest habitats, within the designated areas (such as the areas of oak and pine forest within 'de Sallandse Heuvelrug', where only the heathland communities are priority habitats);
- the impact of recent dramatic changes in abiotic conditions. The most obvious case here is De Biesbos — this is a floodplain forest where, after completion of the Deltaplan, the tidal regime has been replaced by a much more stable water level, but many other areas are affected by long-term changes in hydrology and nitrogen inputs.

2. Economic use and SFM in relation to Natura 2000

A special aspect of the management of Natura 2000 forest sites in the Netherlands is the role of recreation. Basically, all Dutch State forest land is open to the public and recreational use is incorporated in the management planning. So far there is no clear evidence that recreational use is in conflict with the Natura 2000 regulations. However, further analyses of the effects of recreational use on the quality of the designated habitat types might be necessary. Recreational use often offers opportunities for compromise between economic benefits and conservation measures.

The EU-funded research project 'Niche markets for recreational and environmental goods and services from multiple forest production systems' (RES-project / FAIR1 PL95-0743) developed market solutions and strategies for various forest outputs. These, however, were considered to be unmarketable or barely marketable.

A case-study-report of the RES-project describes several successful cases of multi-functional forest management on (or in the vicinity of) Natura-2000 sites in the Netherlands.

National Park Foundation — De Hoge Veluwe

The park area of about 5 500 hectares belongs to a private foundation (50 % of woodlands, the rest are dunes and fens). The park is well known for its game species (red deer, boars and does). Besides the beautiful natural resources, a variety of recreational and information facilities are offered. Another component of the park is a famous art museum.

The park is fenced and entrance fees vary according to the number of vehicles, the ages of visitors and the duration of their stay. The capacity of the park is approximately 700 000 visitors. In total, 42 permanent and 40 freelance staff are employed. At present the park covers its costs.

Fees for the recreational use of a national park — Province of Noord-Holland

The province of Noord-Holland lets a nature preservation area to a waterworks. The waterworks firstly uses the soil water, but the managers have also developed the area for recreational purposes and charge an entrance fee. The landscape in the area is very beautiful and attracts five million visitors annually. The visitors can choose between 30 different hiking paths, and the area has panoramic views and restaurants. The waterworks markets the area independently. Retailers are involved and they get commission on the sale of tickets. At present, a profit is made. An important legal framework condition was regulations concerning water preservation.

Tree crown path — State Forest Service

A national forest administration (3 000 hectares of woodlands) offers an information path visiting tree tops. Other RES products are paths for hiking and riding, educational nature paths, tours with a horse-driven tram and activities for children.

Nature preservation weekend — Vereniging Natuurmonumenten

The nature conservation organisation offers a package of a nature preservation weekend at the Loonse and Drunense Duinen (2 500 hectares), which consists of a stay at a luxurious hotel, a slideshow, a visit to an information centre, a bicycle tour, a bird-watching trek and an information package.

Environmental sponsoring foundation — Het Gelders Landschap

The nature preservation organisation, Het Gelders Landschap, maintains approximately 9 500 hectares of nature preservation areas, and for this purpose acquires sponsors for financing. The main sponsors are three waterworks which finance, for example, the transition from conifer plantations to hardwood forests to improve groundwater supply.

3. Other instruments to promote and support sustainable forest management

In a densely populated country like the Netherlands, the ecological and social forest functions have become more important than timber production. This situation is reflected in existing structures and regulations to support sustainable forest management which can play an important role in financing conservation-oriented management on Natura 2000 forest sites.

Nature management scheme

This scheme provides output-based financial incentives to private forest owners for the provision of social and ecological forest functions. The level of financial compensation is based on the type and level of services (biodiversity, landscape, recreational, environmental services) provided by the forest. A contract is signed between the forest owner and the government in which both parties agree upon a set of measures to be taken to achieve specified ecological and other goals.

Tax exemptions and dispensations

Three tax exemption rules, based on the Estate Act of 1928, are relevant for the forest sector:

- woodlands (and nature areas) with public access get dispensation from inheritance tax;
- legal bodies and private owners are exempted from property taxes for forests;
- income from forestry and nature management is free from income tax (but financial losses are not deductible).

According to the nature preservation law, landowners can benefit from a special tax advantage system on condition that they leave at least 30 % of their property under forest cover.

Contact person: *Mr Ghijs van Tol*
E-mail: g.van.tol@eclnv.agro.nl

8.1.10. Spain

The Spanish Ministry of the Environment has sent three examples of multi-functional forest management in large public and mixed property estates which are both SPAs and pSCIs. One example shows that the existing management can sometimes fit well under Natura 2000. In the other example, adequate management concepts were developed with support of the regional rural development plan.

As environmental and nature protection issues are a decentralised matter in Spain, regional governments have the responsablity of producing detailed guidelines for the management of Natura 2000 sites. Many regional governments have already enacted legislation on forest management plans that takes into account Natura 2000, and others are to follow ([30]).

1. The Valsaín forest in Segovia

The Valsaín forest complex covers almost 14 000 hectares on the northern slopes of the Sierra de la Guadarrama. An estate that formerly belonged to the crown, it has now passed into public hands and is managed by the autonomous Spanish National Parks Service. The forest is dominated by *P. sylvestris* with associated broadleave formations. It has been managed for the production of softwood timber of exceptional quality for centuries and current production is estimated at approximately 35 000 m^3/yr.

As well as the historic and current importance of commercial timber production and sawmilling, the area has always offered an exceptional range of biodiversity, which is why it was designated under Natura 2000. Over 800 plant species have been recorded and over 100 species of nesting birds, among which 10 from Annex I to the birds directive have been observed. The continuous presence of *Aguila adalberti* and *Aegypus monachus* as well as several endemic bat species has been confirmed. There are 54 species of endemic invertebrates in the area and over 400 insect species have been recorded.

Nevertheless, it is a truly multi-functional forest, in which different types of use such as timber cutting, grazing, collection of non-wood products, nature conservation and recreation are all being maintained by a forest management system that is based on cyclic selective group cuttings and natural regeneration. For special conservation purposes, one of the 25 *cuarteles* (management units) has been set aside as a non-intervention area. **In the case of the Valsaín forest, designation under Natura 2000 has not brought many changes in the existing management**.

2. The Alduide area in Navarra

Two thirds of this complex of more than 9 000 hectares in the foothills of the western Pyrenees consists of semi-natural beech stands, with the remainder under different types of traditional pastoral use. More than half of the area under beech is considered to be of Community importance, and pastoral use is in decline. The site is nearly completely owned by local public entities. The area is known as a major woodpecker site and has some of the best populations of river trout.

In this case, the Natura 2000 designation has caused important changes in the management of the site because the previous forms of economic use had provoked a substantial decline in natural resources.

- Positive aspects of previous management were the use of natural regeneration, the very marginal use of exotic species, a balanced age–class distribution, very effective protection against erosion and good conservation status of forest fauna.

([30]) See http://www.larioja.org/ma/econoticias/indexgob.htm for an example from La Rioja

- Negative aspects of the former management (from a conservation point of view) were the concentration on one economic species (*Fagus sylvatica*), the lack of ecological links between different forest stands, the build-up of standing timber volume in homogenous stands with little clearings or understories.

Under the rural development plan (2000–06) for Navarra, a project to develop an adequate management plan for the area was carried out in consultation with all local stakeholders. The agreed management plan included not only specifications of exploitation levels and regeneration techniques, but also an obligation to reinvest a fixed percentage of revenue in activities related to forest use and nature protection. Specific guidelines have been agreed to move away from the monoculture of beech, to establish more gradual transitions between forest stands and other types of land use, to increase the amount of dead wood on the forest floor, to increase the structural variability of the forest stands by opening the canopy, to allow non-wooded clearings to subsist and to manage wetland areas and water courses for conservation purposes.

3. The 'Montes de Aralar' in the Basque Country

The Aralar Natura 2000 site in the Gipuzkoa province covers over 10 000 hectares of which two thirds are publicly owned. Multi-functional use in the past has produced a varied landscape dominated by beech forest ('Atlantic acidophilous beech forest' / Hab. No 9120) and extensive pastures ('Species-rich *Nardus* grasslands' / Hab. No 6230). One of the problems with the management of this site is that the natural beech stands are in a state of severe degradation because of a long history of exploitation under coppice and overgrazing. The regional Basque government has approved separate management plans for the wooded parts and the open landscapes with the aim of achieving a more balanced use of the natural resources. In the case of the beech forests, this is done by the implementation of a high forest restoration plan that is based on quite straightforward forest management: adoption of a rotation period of 140 years and subdivision of the existing stands in seven regeneration sectors. Timber production is an essential part of the scheme and occurs through group cutting, allowing the regeneration process to succeed according to the specific light requirements of *Fagus sylvatica*.

8.1.11. Sweden

The Conservation Section of the Swedish Environmental Protection Agency (SEPA) submitted the following best practice examples on Natura 2000 and forests. It is interesting to note that both of these examples relate to cooperation of the public and the private sector.

Example 1: *Project Snöberget*

This is an example of a cooperation project between the county administration, the Regional Forestry Board and a private forest company SCA. The Nature Conservation Association (NGO) was also involved. The scope of the project was to reach both conservation and production goals in the area through ecological landscape planning and to get the authorities to cooperate on this. The project has involved ecological landscape planning, the development of new methods and the establishment of a nature reserve. Geographical information systems (GIS) also played an important role.

In 1993, the Forestry Board was given new goals, equally important for production and environment. Previously there was a production goal, which included a consideration for nature conservation. The State authority, the county administration, has the main responsibility for the creation of nature reserves.

Snöberget is situated in the north of Sweden in the county of Norrbotten and the municipality of Luleå. The involved bodies have all participated financially with their normal funding.

The result of the project is a model, the Snöberget Model, which is a concrete example of how the planning process should proceed when important conservation interests conflict with strong forestry interests. It is also an example of how the economical responsibility for a landscape's biological resources can be shared between the State and the forestry companies.

Contact: The Regional Forestry Board, Håkan Håkansson.

Example 2: *Project white-backed woodpecker landscapes and new nature reserves (Fjornshöjden)*

This is an example involving the same groups as above, the Swedish Conservation Association, the Forestry Board and the county administration. The Swedish EPA was also involved. The white-backed woodpecker *Dendrocopus leucotos* is endangered in western Europe. Its most important habitat is the 'western taiga'. The population of these birds has declined considerably, mainly because of loss of habitat. The scope was to preserve and develop natural boreal forests with aspen to improve the white backed woodpecker habitat and to ensure the landowners were interested, involved and positive to the necessary measures. Among the activities were nature reserves, biotope reserves, and conservation agreements as well as environmental measures. The work was based on landscape planning. An information campaign targeting the landowners was launched in order to raise awareness of the need to preserve these ecologically important natural forests. The project also involved practical habitat management such as forest fire.

The project concentrated on 10 areas in southern Sweden where 'western taiga' is the dominating habitat. The total area for these 'Woodpecker landscapes' was some 20 000 ha. Fjornshöjden for example is situated in the middle of Sweden in the county of Värmland and municipality of Årjäng. This was financed by LIFE Nature and the groups involved financed the Swedish part with their normal funding for nature reserves and conservation agreements. A total of SEK 30 million (EUR 3 million) were spent, of which half came from LIFE Nature.

Results

The total area protected as nature reserves (NR), biotope reserves (BR) and conservation agreements (CA) was 1 913 ha. Another 250 ha were managed to increase natural values (AF). This included conservation burning, increasing the abundance of dead wood by girdling, removal of spruce to increase the proportion of deciduous trees, etc. It was important to involve the landowners in all parts of the project. Voluntary conservation and environmentally adapted forestry (EMF) without economic compensation cover a large part of the area.

Habitat restoration is being followed by experimental introduction of new specimens to increase the population size. This is being coordinated by a group with representatives from the Swedish Society for the Conservation of Nature, the Swedish Environmental Protection Agency, the National Board of Forestry, Stora-Enso forest-company and the Swedish University of Agricultural Sciences. This activity is being continuously evaluated.

Contact person: Ms. Helene Lindahl,
Tel. (45-8) 698 14 22
E-mail: helene.lindahl@naturvardsverket.se

8.1.12. United Kingdom

The UK Forestry Commission submitted information about the Sunart Oakwood Project as a good example of forest management in Natura 2000 areas. A characteristic element in this project is that it has managed to secure funding from different sources while continuously and patiently working towards the same objectives over a considerable period of time.

Location: Loch Sunart Atlantic Oakwoods, Ardnamurchan, Lochaber, Scotland.

The Sunart Oakwood Project

This project is a successful woodland restoration project covering almost 3 000 hectares which, from modest beginnings, has grown into a major woodland initiative. It is driven by efforts to conserve and restore the Atlantic oakwoods, but also to maximise rural development benefits provided by the woodlands to the fragile local rural communities of the area. The key to success has been the development of strong working partnerships, particularly with the community but also between agencies. These partnerships have helped to secure substantial funding, particularly from Europe, to implement restoration, community engagement, recreation and tourism work, to date in excess of GBP 1.5 million.

Sources of public funding

- **Domestic.** Forestry Commission (through the Woodland Grant Scheme and Forest Enterprise), The Highland Council, Scottish Natural Heritage,

Local Enterprise Company (Lochaber Enterprise), Millennium Forest for Scotland (Lottery), Crofters Commission and Rural Challenge Fund (Scottish Executive).

- **European**.
  - Leader 2: Initial survey of threats to oakwoods, chainsaw training, recreation and interpretation facilities and project manager.
  - LIFE Nature: Removal of threats on public and privately-owned SAC and adjacent catchment. Focus on control of grazing and rhododendron and removal of planted conifers, extended to access and interpretation with additional bid.
  - Objective 1 transitional fund administered by the Highlands & Islands Partnership Programme — Developing recreation, green tourism, community involvement and project staffing.

Best practice demonstrated by the project

Undertaking positive conservation work with the additional objective of maximising rural development opportunities has led to considerable local input to the project, a widening of its objectives and local economic and conservation benefits.

Community involvement:

- wide consultation using planning for real techniques;
- formation of steering group with strong community representation to coordinate the project;
- participation of local schools, for example, in developing the interpretation and establishing tree nurseries;
- employment of locally based project manager and community ranger;
- gaining local political support for restoration and expansion of the oakwoods;
- programme of meetings and events to demonstrate and discuss opportunities;
- greater awareness of the importance and potential of the area's woodlands and increased community capacity in woodland management;
- participation of local private woodland owners in positive forest management, in some cases as a diversification from agriculture.

Economic benefits:

- a locally run forestry and environment training programme resulting in an improved local skills base and a pool of locally based skilled contractors;
- employment of these local contractors to undertake most of the restoration work. Contractors have been employed on a flexible basis to fit in with other job commitments such as tourism, fishing and crofting. Some have invested in machinery capable of smaller-scale forestry work;
- improved access and interpretation of the woodlands and marketing through a local tourist association;
- support in the supply of timber to a locally based sawmill, and other small-scale wood users.

Conservation benefits:

- ongoing improvement in the condition of the woodlands through removal of threats (grazing, rhododendron, conifers and neglect), improving extent, age structure and species mix;
- ongoing refinement of restoration techniques in the light of experience;
- widespread monitoring of regeneration, butterfly and deer populations to inform management decisions;
- public education —'global' environmental issues such as biodiversity, sustainability, etc. addressed through local action.

Wider objectives:

- public sector owners acting as a catalyst for demonstrating restoration and the opportunities for rural development, and attracting public funding to private owners;
- formation of the Sunart Oakwoods Research Group to undertake community-based survey and recording of archaeological features including past woodland management systems;

- innovative partnership approach between public and private owners to collectively manage grazing including deer control, now extending to wider management issues;
- a study completed by Professor George Peterken and Dr Rick Worrell identified the optimum conservation management of the SAC oak woods. The potential for this management to support rural development has established a new and more widely applicable benchmark for the integration of best practice conservation management and local socioeconomic benefits;
- long-term development of a forest habitat network based on the SAC core but linking other native and non-native woodlands in the area.

The provision of substantial EU funding has been crucial not in realising the oak wood restoration but also to unlock the rural development benefits that are provided by both public and private woodlands. The link between the designation of sites and EU financing has led to growing awareness of the practical benefits for communities. Later, the designated area was extended to include some additional woodlots where conifers have been removed and conservation-oriented management is underway.

8.2. Examples from selected LIFE Nature and LIFE Environment projects

LIFE project data	*Project description*
Country: Austria Title: Ramsar management for March-Thaya floodlands (LIFE95 NAT/A/000768) Beneficiary: Distelverein, Franz-Mair-Strasse 47, 2232 Deutsch-Wagram Österreich Contact: Mr Michael Kaplan Tel. 432 24 75 11 08 Fax 43 22 47 51 10 89 Duration: 1 April 1995 to 1 July 1998 Total budget: EUR 1 963 200 LIFE contribution: EUR 981 600 (50 %)	The March-Thaya floodplain landscape east of Vienna is unique in Austria. The lower March river, with its shallow gradient, is a typical meandering lowland river. Its peculiar hydrodynamic regime (slow currents, extensive spring flooding) and the effects of the continental climate combine with the traditional extensive farming practised here to generate a wide range of biotopes attractive to birds in particular. The aim is to preserve this wetland of European significance, which simultaneously has cultural heritage value as an example of traditional farmland. Ecologically sustainable forms of land use and resource exploitation are to be fostered or taken up again (for example, grazing of periodically inundated meadows) without formalising this too excessively and thereby alienating the community. Farmers, hunters, fish farmers and forest owners will be approached as potential partners in joint actions for sustainability, and intensive public relations work will be carried out to gain local support. Technical measures include initiating restoration of natural conditions in the rivers to improve the hydrological regime of the floodplains in collaboration with the river management authorities, as well as management actions for the meadows and alluvial forests. Trilateral cooperation with the Czech and Slovak Republics will be strengthened.
Country: Denmark Title: Restoration of large areas of natural forest for the benefit of endangered birds, plants and biotopes (LIFE95 NAT/DK/000216)	The Danish government launched, in 1992, an ambitious 50-year national strategy for Denmark's natural forests. This LIFE project is destined to help implement that part of the programme relating specifically to the conservation of the 14 most strategically located and important candidate SAC forest sites. Thus, approximately 65 hectares of priority natural forest will be purchased, management agreements will be negotiated on 400 hectares of private land and urgent management work undertaken on 700 hectares of land within two State forests.

LIFE project data	*Project description*
Beneficiary: Ministry of the Environment, National Forest and Nature Agency, Haraldsgade 53 2100 Copenhagen Ø Danmark Contact: Mr Mickeal Kirkebaek Tel. (45) 39 27 20 00 Fax (45) 39 27 98 99 Duration: 1 April 1995 to 1 October 1999 Total budget: EUR 2 430 800 LIFE contribution: EUR 1 215 400 (50 %)	Finally, if the national strategy is to succeed, there must also be a change in perception amongst the foresters themselves. Thus, an essential component of the project will be the running of a nationwide conservation training course for foresters as well as other public-awareness initiatives. As our knowledge of endangered fauna and flora improves, it is becoming increasingly clear that natural broad-leaved forests are tremendously important for safeguarding Europe's biological diversity. However, throughout Europe, and especially in Denmark, these natural forests have been disappearing at a constant and rapid rate over the centuries, originally, to make way for agricultural land but, more recently, to be replaced by highly productive commercial forest plantations. Today, only around 34 000 hectares of Denmark's natural forest remains, representing less than 1 % of its territory. Yet, despite their scattered and fragmented state, they are still of high conservation value. Amongst others, they hold eight priority habitat types under the habitats directive and numerous Annex I species under the birds directive. This importance is reflected in the number of candidate forest SAC sites put forward by Denmark. Their conservation is, however, far from easy, especially when they are in private ownership, as they are of considerable commercial value. Moreover, in State forests as well as in private forests, any change in management practices for conservation benefit, even with little or no economic impact, requires understanding and acceptance by the foresters themselves.
Country: Finland Title: Quark Archipelago (LIFE97 NAT/FIN/004110) Beneficiary: Länsi-suomen ympäristökeskus (West Finland Regional Environment Centre) Koulukatu 19a — PO Box 262 65101 Vaasa Finland Contact: Ms Susanna Ollqvist Tel. (358-61) 325 65 11 Fax (358-61) 325 65 96 Duration: 1 February 1997 to 1 January 2001 Total budget: EUR 2 323 480.89 LIFE contribution: EUR 1 161 740.45 (50 %)	The miracle is that Merenkurku is still so unspoilt. In order to properly integrate nature conservation, recreational use and local people's traditional use of land (hunting, berry-picking, firewood cutting, etc.), LIFE will complement other initiatives towards sustainability funded under the ERDF, Interreg and Regulation 2078/92, by drawing up a management plan in collaboration with landowners, tourism operators and other local interest groups for part of the archipelago. It will include land-use zoning and a tourism master plan so that recreational use and small-scale nature tourism dovetail with the aims of nature conservation. Meanwhile, LIFE will also quadruple the size of the protected core areas, by financing land purchase and compensation for giving up rights to build holiday homes or exploit forests. Planted forestry monocultures will be removed while grazing by sheep and hay-making will be started up again in grove and meadow habitats. Felling of forests, reforestation with pine, uncontrolled nature tourism and boating, building of holiday homes and the decline of traditional grazing are all looming over the internationally unique Merenkurku (also known as Kvarken or Quark) Archipelago. Geomorphologically unusual in being one of the best examples in the world of the long and narrow De Geer moraines, a rare formation shaped by the last Ice Age, Merenkurku's bizarre topography is a product of the withdrawal of the icecap, submergence by the Baltic Sea and rapid isostatic uplift (about 9 mm per year) of the land in reaction to the disappearance of the ice. This foundation in turn hosts an extraordinarily representative succession series (vegetation and geoformations): lagoons, fladas and glo-lakes; barren heaths, old spruce-dominated mixed forests, birch forest, shore meadows and park-like birch groves grazed by sheep. This is the northernmost place where the marine fauna and flora of the Baltic Sea occur.
Country: France Title: Forests and linked habitats in Burgundy (LIFE99 NAT/F/006314) Beneficiary: Direction Régionale de l'Office National des Forêts de Bourgogne 29 rue de Talant 21000 Dijon, France	The project aims to define and implement sustainable methods of managing woodland environments by striking a balance between the economic, social and environmental functions of the forests. It is based on a close partnership between the public authority responsible for managing public forests in France (the ONF) and a regional NGO (Conservatoire des sites naturels bourguignons). The work will be carried out in the public forests of the nine pSCI involved in the project, and will lead to the development of a sustainable forest management strategy which can also be used for private forests. Over 500 hectares of private forest habitats of special interest need to be included to facilitate this management strategy. Forest management plans and restoration work programmes will be drawn up for all these sites in order to apply the aforementioned strategy. Arrangements will be made to compensate private owners for any operating

LIFE project data	*Project description*
Contact: M. Jean-Pierre Perrot Tel. (33-3) 80 76 98 35 Fax (33-3) 80 76 98 49 Duration: 1 May 1999 to 1 December 2002 Total budget: EUR 2 048 599.22 LIFE contribution: EUR 1 024 299.61 (50 %)	constraints. Limits on public use will be imposed. Finally, it is anticipated that regulations will be drawn up to protect those forests with the most outstanding features. The 11 000 hectares covered by the nine proposed sites of Community interest involved in the project include 7 500 hectares of public forests (beech, oak, maple, box and juniper pioneer vegetation, etc.) and associated open habitats (calcareous grasslands and meadows, scree, limestone pavements, etc.). The area contains 20 types of habitat of Community interest, six of which have priority status, and 17 of the species listed in Annex II to the habitats directive, including the plants *Cypripedium calceolus* and *Liguria sibirica* and the insect *Callimorpha quadripunctaria*. These woodland environments are struggling against economic demands resulting from the intensification and standardisation of forestry production techniques or, conversely, suffer from neglect. In order, therefore, to conserve at least some of the natural habitat of these environments, changes must be made to the methods of forestry management employed, in order to nurture all the stages of plant growth, in both time span and area, through actions ranging from the maintenance of open habitats to the preservation of old trees.
Country: France Title: Integrating biodiversity in the management of forest ecosystems (LIFE95 ENV/F/000542) Beneficiary: Institut pour le développement forestier Contact: M. Gérard Dume Tel. (33-1) 40 62 22 80 Fax (33-1) 45 55 98 54 E-mail: idf.paris@wanadoo.fr Duration: 1 January 1996 to 1 January 1999 Total budget: EUR 839 593.26 LIFE contribution: EUR 406 007.69 (48.36 %)	The creation of the Natura 2000 network required by the habitats directive has deeply disturbed the French country actors, especially the forest owners and managers. In fact, they are not yet familiar with such environmental questions as forest biodiversity, though they officially appear on the forest policies in France, Wallonia and the Grand Duchy of Luxembourg. Therefore it was necessary to initiate a broad programme of awareness-raising, information and training for the locally elected councillors and the forest professionals: ■ on the forest habitat types and species from Annexes I and II, including birds (Directive 79/409/EEC), ■ on the principles and good practices for the sustainable management of forest sites with ecological interests in the three member countries. The first aim of the project is to search for representative field examples of various habitat types and species habitats on Directive 92/43/EEC whose past management operations are known. Some of these will make up a demonstration system of reference in the field. A field-guide to recognition and sustainable management of the forest species and habitats of European interest within the Atlantic and continental biogeographic regions of France, Wallonia and Luxembourg, will be published. It will include a descriptive part and an operational part, stemming from previous field observations. This book will be an educational aid for an awareness-raising, information and training programme for local elected councillors, professionals in charge of forest economic organisations and managers of public and private forests. In that respect, the demonstration system of reference will serve to assist the field trips.
Country: France Title: Sustainable management of deciduous non-even-aged high forests. (LIFE99 ENV/F/000477) Beneficiary: Société Forestière de Franche-Comté, 22bis, rue du Rond-Buisson, 25220 Thise, France	Some tools for a sustainable non-even-aged deciduous high forest management already exist. But there is a real need for complementary tools, and above all for ensuring the demonstration, development and diffusion of all these tools, in order for them to be largely and efficiently applied. The project then contains four operations: ■ elaborating complementary tools, decision making, management and monitoring tools. They will be constructed by studying existing information (forest management plan, databases, etc) and by discussions between experts of various origins; ■ setting up a demonstration network of these tools in conjunction with forest-owners: a forest management plan on 1 000 pilot hectares and 50 demonstration sites; ■ carrying out development operations (training, sensitising, popularisation) aimed at forest owners and managers: involving some 1 100 persons;

LIFE project data	Project description
Contact: Ms Marie Cosar Tel. (33-3) 81 47 47 37 Fax (33-3) 81 80 26 00 Duration: 1 September 1999 to 1 March 2003 Total budget: EUR 596 311.95 LIFE contribution: EUR 296 326.59 (49.69 %)	■ ensuring a wide and efficient dissemination of the results through the diffusion of informative documents (sylviculture guide, decision-making document for the choice of the treatment, forest management plan scheme, monitoring tools document, videotape), publications (Bulletin de la Société Forestière de Franche-Comté, Revue Forestière Française, Bois National...) and international meetings. Communes will be closely associated with the whole process as forest-owners. Whereas even-aged high forest management has been used for a long time and is now well known, non-even-aged high forest management is innovative and remains badly mastered in deciduous forests: it is therefore handled in an intuitive and limited way. Now, in order to achieve sustainable forest management, it is necessary to have several well-mastered management methods at our disposal to adapt to the diversity of local situations. In particular, non-even-aged high forest management allows in some cases for a better integrated environment. Finally, the intuitive approach to non-even-aged management entails high risks of deviating from a sustainable management path. In that context, the project aims to provide forest-owners (communes and private owners) and forest managers with reliable technical tools for developing sustainable non-even-aged deciduous high forest management. The project will be conducted in Franche-Comté, the most forested region in France where partners are used to working in a concerted way. Supported by the EU, the Regional Council of Franche-Comté, the Ministry of the Environment and the Ministry of Agriculture, it will involve partners of public and private forests (SFFC, ONF, CRPF and owners), experts and scientists. At its completion (March 2003), the project will permit: ■ a sustainable non-even-aged high forest management of deciduous forests (regeneration, equilibrium, stability); ■ biodiversity enhanced through diversification of management methods; ■ in some contexts, better preservation of the ecosystem and sensitive landscapes; ■ economic advantages for owners; ■ gain in rural employment.
Country: Germany Title: Integrated Habitat Protection for the Grouse in the Black Forest (LIFE98 NAT/D/005087) Beneficiary: Forstliche Versuchs- und Forschungsanstalt Baden-Württemberg Contact: Mr Rudolf Suchant Tel. (49-761) 40 18-0 Fax (49-761) 40 18-333 E-mail: suchant@fva.lfv.bwllfv.bwl.dbp.de Duration: 1 May 1998 to 1 May 2002 Total budget: EUR 228 651.21 LIFE contribution: EUR 114 325.61 (50 %)	The Feldberg in the southern Black Forest is, at 1 493 m., the highest mountain in Baden-Württemberg and a popular destination all the year round for tours and outdoor sports. To serve the two million visitors a year, a dense network of hiking tracks, cross-country skiing routes and downhill ski fields has been created, and it is planned to expand this further. Simultaneously the Feldberg area is, because of its altitude, one of the last refuges of sub-Alpine fauna and flora outside the Alps themselves. Typical species are two kinds of grouse, the capercaillie and the hazel grouse. Wherever they or their tracks are spotted in the forests, one can be sure that other characteristic species of the higher altitude forest habitats are not far off. However, the number of grouse have been declining radically for many years, and not only on the Feldberg — the Black Forest is, in fact, a last stronghold for grouse between populations in the Alps and small groups in the central European ranges such as the Vosges and Ardennes. The tourist infrastructure and its year-round use is certainly one of the contributing factors to the decline, but forestry, by fostering high-yield plantations unable to fulfill the birds' habitat requirements, must also bear part of the blame. Baden-Württemberg's Forestry Research Institute is taking on the role of advocate for the grouse, and will try to involve all interested parties in establishing a forward-looking, landscape-oriented tourism and a more ecological kind of forestry. This will improve the habitat conditions for the grouse and other species. The Institute is drawing on a model already applied successfully in the central Black Forest and will be aided by experienced colleagues from a similar LIFE (Nature) project in the French Jura. The objective is to achieve and maintain grouse populations able to survive in the longer term and to augment the value of the unique forest habitats on the Feldberg. The project will prepare and implement an integrated resource management plan which

LIFE project data	*Project description*
	bears the interests of forestry, tourism and conservation in mind. The idea is that all concerned collaborate from the beginning. Instead of unilateral bans, clever visitor guidance and well-targeted alterations to forest structures should improve the prospects of survival for the grouse and act as a model for similar projects.
Country: Germany Title: European Network of Natura 2000; management plan for the future nature reserve Hainich (LIFE95 NAT/D/000070) Beneficiary: Thüringer Ministerium für Landwirtschaft Naturschutz und Umwelt Contact: Mr Uwe Spangenberg Tel. (49-361) 21 44 330 Fax (49-361) 21 44 750 Duration: 1 November 1995 to 1 January 1999 Total budget: EUR 1 151 200 LIFE contribution: EUR 575 600 (50 %)	The planned establishment of a national park in the Hainich to preserve the beech forests and the succession zones, could at the same time offer the local communities promising opportunities and could function as a catalyst for economic development. The LIFE project's principal task is therefore to draw up a management plan which, besides the usual planning aspects, will also grapple with social and economic issues, that is, how the planned national park can contribute to the local economy. To gain the support of the local inhabitants, the management planning work will be accompanied during the project by intensive public relations work, in particular through exchanges with mayors and other representatives of communities located in existing national parks elsewhere. The Hainich zone covers 20 000 hectares of a mainly forested ridge in the Thuringian Basin, over which almost no roads run and which boasts the largest coherent deciduous wood in Thuringia. Two recently-abandoned Red Army military training areas have become a showcase for undisturbed ecological succession from bare ground to deciduous forest; with their total surface area of 8 000 hectares they are the most extensive sites in Germany where succession towards a beech forest can be observed. Other curiosities in the Hainich are the 4 000 hectares of 'Plenterwälder' (forests shaped by centuries of traditional selective logging) and 25 hectares of juniper heathland. Because the area lay near the borders of the GDR, it remained relatively undisturbed, but since the Wall came down it has been under constant threat from infrastructure development plans. As in many other parts of eastern Germany, local unemployment is very high, so that decision-makers are putting all their efforts into working out concepts for the economic revival of the district.
Country: Greece Conservation and management of Mainalo Mountain (LIFE99 NAT/GR/006481) Conservation and management of Mainalo Mountain Beneficiary: Arcadia SA — Development Agency of ArcPref Eleftheriou Venizelou, 34 22100 Tripolis, Ellas Contact: Mr Panayiotis Giannopoulos Tel. (30-71) 23 41 24 Fax (30-71) 23 42 09 E-mail: plan@tri.forthnet.gr Duration: 1 January 2000 to 1 January 2003 Total budget: EUR 1 418 515.68 LIFE contribution: EUR 709 257.84 (50 %)	The project aims to promote the legal protection, conservation and sustainable management of the region. One of the main measures is to design and implement a management plan that focuses on managing the black pine forests. The project also aims to reorganise the intensive silviculture by applying a forestry certification system (ISO 14000). Lastly, it plans to create an action plan for tourist access so as to help the local authorities succeed in drawing up a sustainable plan for their tourism activities. The specific protection and conservation measures include fencing off sensitive regions, managing vegetation and creating small lakes for the amphibian populations. It is also planned to limit access to some forest tracks, maintain forest footpaths and set up an information centre and two kiosks. The awareness-raising actions include producing information brochures, posters and slides and organising seminars for forest ecosystem users. Mount Mainalo is in the centre of the Peloponnese and exemplifies a well-preserved natural and cultural heritage. It is composed of a vast natural forest area, Mediterranean-type thickets and alpine meadows, which are surrounded by a number of small villages of great historical and cultural interest. The geographic location of this region increases the mountain's ecological value, as Mount Mainalo forms a natural link between the massif of the northern Peloponnese and the mountains of the southern (Taigetos) and eastern (Parnonas) Peloponnese. Because of the value of the timber resources, the region is subject to major commercial silviculture and the construction of an extensive network of forest tracks. The habitats of the alpine meadows have the problem of overgrazing and are simultaneously threatened by the uncontrolled development of mountain tourism. These activities have the result of fragmenting and destroying the biotopes. Combined with the pressure caused by hunting and the illegal gathering of plants, this creates unfavourable conditions for the endemic plant species and fauna listed in Annex II to Directive 92/43/EEC. Despite the ecological importance of the region, no appropriate legal framework exists to protect its natural resources.

LIFE project data	*Project description*
Country: Italy Title: Integrated plan of action to protect two Natura 2000 sites (LIFE98 NAT/IT/005112) Beneficiary: Università degli Studi di Udine, Dip. di Scienze della Produzione Animale Via S. Mauro, 2 33010 Pagnacco (UD) Italia Contact: Mr Piero Susmel Tel. (39-432) 65 01 10 Fax (39-432) 66 06 14 E-mail: Piero.Susmel@dspa.uniud.it WWW-Page: http://www.uniud.it/dspa/ Duration: 1 January 1999 to 1 January 2002 Total budget: EUR 665 799.42 LIFE contribution: EUR 332 899.71 (50 %)	The project intends to introduce an integrated system of wildlife management and forest grazing to the two pSCIs which is to allow conservation to be combined with social and economic objectives. One of the first targets is to have the Tarvisio Forest designated SPA under the birds directive. Elaboration of a management plan will be accompanied by a series of actions geared towards the preservation of the 7 habitats and 14 species of Community interest occurring there. Bringing some order to tourism, elaborating a management plan for hunting and involving local interest groups in forestry and livestock management will, together with PR work, aim at reducing human pressure. Actions in the forestry sector, besides improving the habitats, will aim at maintaining and expanding populations of *Rosalia alpina*, *Lynx lynx*, *Canis l*upus, *Ursus arctos* and various bird species listed on Annex I to the birds directive. The Tarvisio forest, strategically located where the borders of Italy, Austria and Slovenia meet, is being used as a corridor by bears from these two countries to recolonise Italian habitats. Because the forest is also important for many bird species of Community interest, the site manager, the Ministry of Agricultural Policy, has launched the administrative procedure to have it designated SPA. The two pSCIs already present at the site display a very rich and heterogeneous vegetation: considerable tracts are covered in *Pinus nigra* forests, mixed beechwoods, Alpine calcareous grasslands, Alpine and subalpine heaths and Nardus grasslands. Besides the brown bear, other priority species such as the wolf and the *Rosalia alpina* beetle occur. Summer and winter tourism is the main human impact, and it is often disorganised, taking no account of the forest's equilibria and the biological cycles of wildlife. As well as tourism, hunting is popular, and is directed with particular intensity at ungulates and at game birds. The abandonment or modification of traditional forest grazing means that the meadows are shrinking and the typical creatures of the forest environment are declining.
Country: Italy Title: Valgrande Wilderness (LIFE95 NAT/IT/000764) Beneficiary: Ente Parco Nazionale Valgrande Villa S. Remigo, Via S. Remigo 28922 Verbania Pallanza (VB) Contact: Ms. Franca Olmi Tel. (39-323) 55 79 60 Fax (39-323) 55 63 97 E-mail: parco.nazionale.valgrande@comunic.it www: http://www.parks.it Duration: 1 January 1995 to 1 January 1999 Total budget: EUR 228 800 LIFE contribution: EUR 114 400 (50 %)	Through LIFE, the EC will provide the necessary support to elaborate the management plans which follow from these strategic priorities. Specifically, plans will be drawn up for forest management, controlled access to the park, wildlife management, land use and the ecological management of the park.. The park will set up a geographic information system (GIS) in collaboration with the regional and national authorities, which will allow networking with the databases of these bodies, in order to keep tabs on the development of the plans and to promote their implementation. Public awareness campaigns will also be launched to inform and involve the local population in creating conditions for a sustainable development of the entire wilderness area. The Valgrande in Piedmont is one of the most important wilderness areas left in the Alps, where there are only a few roads open to traffic, economic activity is very limited and tourist infrastructure is non-existent. Within the Valgrande is a 12 000 hectare national park which in turn encompasses a 3 400 hectare SPA boasting numerous habitats and species listed in the annexes to Directives 79/409/EEC and 92/43/EEC, including priority habitats such as species-rich Nardus grasslands and active raised bogs, as well as siliceous screes. The Valgrande national park was established in 1993 and the two top priorities of its management board, appointed this year, are developing methods to prevent and fight the numerous fires which break out here and to tackle the negative impacts brought on by unregulated tourist access.

LIFE project data	*Project description*
Country: Sweden Demonstration of methods to monitor sustainable forestry (LIFE98 ENV/S/000478) Beneficiary: Skogsstyrelsen, 551 83 Jönköping, Sverige Contact: Mr Erik Sollander Tel. (46-36) 15 57 27 Fax (46-36) 16 61 70 E-mail: erik.sollander@svo.se www: http://www.svo.se Duration: 1 July 1998 to 1 January 2002 Total budget: EUR 1 950 071.29 LIFE contribution: EUR 968 337 79 (49.66 %)	The project will demonstrate and compare methods to monitor all aspects of sustainable forestry in Sweden, France, Denmark, Germany and Finland. Gap analyses relating to the pan-European process on the protection of forests will show the need to develop methods. New methods will be developed and existing methods adapted, and relevant methods will be tested in demonstration areas: the result will support the work on sustainable forestry of the European countries. The project addresses the need for effective assessment of sustainability of forestry. Almost every European country has revised its forestry policy in recent years. The project will demonstrate means of monitoring the sustainability of forestry, which reflect new state-of-the-art methods. The Swedish National Board of Forestry is the lead agency. The partners are the Danish Forest and Landscape Research Institute; the Forestry Development Centre TAPIO, Finland; the Institut pour le Développement Forestier and, CEMAGREF, France; the Niedersächsische Forstliche Versuchsanstalt, Germany; and the Swedish Environmental Protection Agency. Six pan-European criteria and quantitative indicators for sustainable forestry form the basis for the work. Phase 1 includes national analyses of how existing monitoring methods fulfil the needs to assess the criteria. This exercise will also be used to identify the need for further indicators. In Phase 2, each country will assess the selected indicators in the demonstration areas. Appropriate organisations will be invited to participate in this process. Special emphasis will be put on validity, accuracy and cost-effectiveness of the methods. The national experiences will be continuously compared and exchanged. Each partner will disseminate the results within its country. The dissemination to other countries will include workshops. The French partners will invite Belgium, Luxembourg and the Mediterranean countries. Niedersachsen will invite the other German states and Austria. The Danes will invite the UK, Ireland and the Netherlands. Finland and Sweden will invite the Baltic States and Norway. Sweden will arrange the initiation workshop and Finland will arrange the concluding workshop. The latter workshop includes an evaluation of the strengths and weaknesses of the methods.
Country: Sweden Title: Protection of western taiga in Svealand and Götaland (LIFE98 NAT/S/005369) Beneficiary: Swedish Environmental Protection Agency (SEPA) Contact: Ms. Christina Lindhal Tel. (46-8) 698 14 09 Fax (46-8) 698 10 42 E-mail: christina.lindhal@environ.se Duration: 1 February 1998 to 1 July 2002 Total budget: EUR 4 007 959.68 LIFE contribution: EUR 2 003 979.84 (50 %)	Western taiga is a priority habitat that only exists in Sweden and Finland within the Community. Characterised by their complex composition of both young and old trees of deciduous and coniferous species, these virgin forests are extremely rich in biological terms, providing habitats for many threatened species of animals and plants. The dead wood, in particular, plays a central role in maintaining this high conservation value and its scarcity is one of the most serious threats to biodiversity. Much of this richness is due to the fact that the forests have had little or no intervention over hundreds of years, other than naturally occuring fires. Today much of the original natural forest has been harvested and replaced with monocultures. It is estimated that only appoximately 3 % remains of the original western taiga and this is under constant threat from commercial forestry. It is for this reason that the habitat type is considered a priority for conservation under the habitats directive and why the Swedish Environment Protection Agency has initiated a nationwide programme for its conservation. The great biological resources represented in the remaining western taiga sites cannot be protected without extensive restrictions on commercial forestry. Thus, purchase of land or compensation to landowners is the only truly effective means of obtaining its long-term preservation. The project targets seven of the best remaining coniferous forest areas (69 to 992 hectares) in south and central Sweden. Once purchased, the areas will be left to develop naturally, but burning in order to restore conditions for species favoured by fire is planned for two sub-areas of forestry affected. Together with the other two projects agreed for western taiga conservation in Sweden this year, the present project should make a significant contribution to the long-term conservation of the habitat type in the EU.

LIFE project data	*Project description*
Country: United Kingdom Title: Securing Natura 2000 objectives in the New Forest (LIFE97 NAT/UK/004242) Beneficiary: Hampshire County Council The Castle, Winchester, Hampshire SO23 8UE United Kingdom Contact: Mr Tim Greenwood Tel. (44-1962) 84 18 41 Fax (44-1962) 84 67 76 E-mail: plantg@hants.gov.uk Duration: 1 February 1997 to 1 October 2001 Total budget: EUR 7 488 389.67 LIFE contribution: EUR 3 744 911.76 (50.01 %)	A powerful consortium of organisations — from graziers and foresters to conservationists — has put together an ambitious programme to undertake a wide range of habitat management and restoration measures designed to tackle the key threats to the New Forest. The main targets are to produce a management plan to cover the entire pSCI; to increase the land owned and managed for nature conservation purposes; and to restore 4 000 hectares of the pSCI habitats to favourable conservation status. Much of the habitat restoration work will involve clearance of rhododendron, removal of planted and invasive conifers, introducing traditional broadleaved woodland management (like pollarding), and repairing/controlling erosion. One of the most innovative elements of the project is the action to secure the long-term viability of grazing animals in the New Forest. Since much of the nature conservation interest is bound up with traditional grazing practices — ponies, cattle and pigs — it is important that these should not decline. New Forest pony grazing is thought to be most at risk and project activities will focus on stock improvement through incentive payments linked to competitions and stock management by pony owners. Originally created as a hunting forest by William the Conqueror in the 11th century (hence its name) the 'New' Forest is an extensive site covering nearly 300 km^2. It is probably best known as an area of ancient woodland and swathes of 'open forest' grazed by roaming herds of New Forest ponies. Its EU nature conservation interest lies in the nine habitat types (including three priority ones) and two species of the habitats directive and the five Annex I birds directive species it supports. Situated in the densely populated south of England, the New Forest is a magnet to visitors — estimated at 16 million annually. This popularity brings with it problems: recreational pressure causes erosion and disturbance. Afforestation with non-indigenous species leaves a legacy of conifer plantations that are out of keeping with the natural character of the area. Other invasive species like bracken and rhododendron all threaten its integrity.

8.3. Leader + and Interreg III examples

LEADER + and Interreg are Community initiatives to enhance sustainable development in rural and cross-border areas. When combining nature conservation and economic objectives in the field of forestry, LEADER + projects could be used as one possibility for financing innovative approaches to management of Natura 2000 sites (See website reference in footnote in Section 8.3.4).

The LEADER group of Garfagnana in the Tuscany region/Italy has implemented a series of projects in the field of forest management with the aim of protecting the environment and creating jobs. In parallel with the introduction of, and experimentation with, ecological forest management in the zone, and based on training programmes, other 'eco-forestry' activities have been carried out: experimenting with new machines which are better adapted to forest exploitation in mountains and, above all, cultivating native plant species used to restore/reafforest a natural environment severely damaged by erosion and flooding.

Key-elements:

- accredited training for forest workers and the unemployed, in order to reinforce the role of a sector essential to local employment and in order to restore a damaged or fragile environment;
- spreading of good practice in the field of recovery of land and vegetation damaged by erosion and flooding;
- specialisation of a forest nursery in the culture of native forest species.

Several other Leader+ projects have worked on small-scale marketing and processing of forest products.

8.4. Rural development plans and forestry

Giving complete information about the forestry elements in the rural development plans for the present budgetary period has proven to be a task that surpasses the scope of this document because of the sheer magnitude of research needed, the complexity of the programmes and the fact that many of the first reports on projects that started from 2001 onwards still have to come in.

A very interesting attempt to present a synthesis of the current state of forest-related activities that are part of rural development programmes is currently being undertaken in the UK by the Universities of Gloucestershire and of Exeter in collaboration with the Institute for European Environmental Policy (IEEP). A team directed by Prof. H. Buller and Prof. M. Winter has presented a report that compares the RDPs of several Member States and presents an overview of their forestry components. This work was commissioned by the UK Forestry Commission and the Great Britain Countryside Agencies' Land Use Policy Group and will be available on www.forestry.gov.uk).

8.5. Pro Silva: practical close-to-nature forestry

Pro Silva is a European federation of foresters who advocate a type of forest management which has been called 'continuous cover forestry'.

Pro Silva supports the implementation of such management in the following ways:

- exchange of information within regional working groups;
- establishment of demonstration forests;
- meetings and excursions in demonstration forests;
- cooperation with educational and scientific institutions, and other bodies.

Pro Silva forestry principles

Pro Silva promotes forest management which optimises maintenance, conservation and use of forest ecosystems in such a way that the ecological and socioeconomic functions are sustainable and profitable while delivering four categories of benefits to society:

1. Conservation of ecosystems

However society may wish to use forests, the vitality and interrelation of lifeforms within the forest ecosystem is seen as the foundation for all the other forest functions. The preservation, and if necessary the restoration, of the ecosystem is therefore the main priority.

Pro Silva recommends the following methods to allow forest ecosystems to function:

- paying careful attention to (that is, maintaining or restoring) the natural forest vegetation pattern, while making use of the forest;
- maintenance of soil productivity, through continuous cover and through the maintenance of biomass in the forest (including dead wood);
- propagation of mixed forests with special attention to rare and endangered species;
- restricting the use of exotic tree species to cases where this is an economic necessity, and if they can be mixed with the indigenous vegetation pattern within certain limits;
- in special cases, forgo any harvest.

2. Protection

Pro Silva considers the following methods essential to achieve the benefits from the protective functions of forests:

- adopt a holistic approach involving perpetual forest cover;
- achieve specific biological protective functions by specific measures, for example, limits on exploitation, use of exotics, fertiliser, harvesting methods, drainage, etc.;
- establish a regional network of protected forest areas of various kinds, including some non-intervention areas.

3. Production

Pro Silva supports the management of forests and the use of renewable resources such as timber and other forest products.

As methods for achieving a functional production forest, PRO Silva recommends:

- continuous forest cover to protect soil productivity;
- adding value by selection felling and tending at all stages of development;
- maintaining growing stock at an optimal level;
- working towards a balance between increment and harvesting in each management unit;
- paying attention to the function of every single tree in tending and harvesting;
- avoidance of clearcuts and other methods which destroy forest continuity;
- abolition of rotation age as the instrument for determining when a tree should be cut;
- spontaneous forest renewal and forest development, through single tree harvesting and group harvesting with long regeneration periods;
- harvesting methods which do not harm the soil or the stand;
- minimising the use of additional materials (fertilisers, plant protection materials);
- limiting game density to levels which are in balance with the carrying capacity;

4. Recreation, amenity, and cultural aspects

Pro Silva recognises the increasing importance of forests for physical and mental health, especially in densely populated countries in Europe.

Pro Silva recommends the following methods for developing the recreational function of forests:

- giving priority to quiet forms of recreation, by providing appropriate trails and other facilities;
- in so far as is needed, the concentration of recreational facilities in specific zones;
- encouraging attractive trees, groves and other special features;
- maintenance and creation of attractive forests by varied forest structures;
- establishment of non-intervention areas where nature is left to follow its course;
- maintenance of forest meadows, valleys, rocky outcrops, water courses, views, etc.

In the light of the above, it is self explanatory that forest management according to Pro Silva principles and Natura 2000 designation can be quite compatible.

A considerable number of public and private forest owners have adopted Pro Silva principles as the basis for the management of their forest estate.

8.6. Conservation easements: the American way

A 'conservation easement' is a legal tool which is commonly used in the USA to maintain land in an undeveloped state by a voluntary agreement between a property owner and a qualified organisation, such as a land trust or a government department. The agreement limits the activities and uses that can take place on the property in exchange for compensations to the landowners. Property owners can give up rights to their property in a selective way and the easement may apply only to part of a property. Usually, a third party is responsible for monitoring the property to ensure that the terms of the agreement are being respected. In any case, the owner retains full entitlement to the land and can sell his property when and to whom he wishes, although the easements have a long-term or perpetual validity and are recorded in the land registry.

This system of compensation for income foregone and capital depreciation has proven to be an effective shield against 'urban sprawl' and has resulted in the preservation of 'working forests' in areas of high biodiversity in many states of the USA. Conservation easements can be purchased by government programmes, with the costs borne by nature protection budgets, or by private foundations with all types of co-financing between public and private funding. An instrument of this kind allows effective cooperation between the public sector and many foundations, corporations, NGOs and individual owner families, without disrupting social structures in rural areas.

8.7. A look down under: nature protection on private land in Tasmania

In order to establish a system of protected areas that is truly representative of the country's enormously diverse natural heritage, the Australian government has established a system of 'conservation covenants' with private landowners that complements public protected areas. Under these contractual agreements, which are established on a voluntary basis, the owners of sites that have a scientifically recognised conservation value can be financially rewarded for not developing their land further, accepting restrictions on economic use or carrying out biotope management work on it.

The regional administration of Tasmania submitted the following description of procedural steps for participation in its 'private forest reserve programme':

1. Contacts between landowners and the programme to initiate an assessment process.
2. A conservation officer visits the site(s), explains the programme's dues and rewards and draws up an assessment of the conservation resources.
3. Using the assessment information, an independent scientific advisory group makes a recommendation about the potential for inclusion of the property in the private forest reserve system.
4. In the case of a positive recommendation, a negotiator is appointed to work out an agreement that suits all parties.
5. An advisory committee considers proposals for agreements that have been negotiated and recommends them for a financing decision at ministerial level.

9. General conclusions about forestry on Natura 2000 sites

Pro-active involvement of forest owners and practitioners in discussions on all levels is a prerequisite to preserving the multi-functionality of forestry on Natura 2000 sites. While there is no intention to block all economic activities on Natura 2000 sites, the economic function of forests, usually the highest priority in forest management, will have to be adapted according to the requirements of the ecological function and the conservation of biodiversity on most Natura 2000 forest sites.

This may call for changes in current forest management practices, either by finding new and additional sources of income to continue a traditional form of management, whose profitability is in decline, or by increasing incentives to use forest products obtained by conservation-based management as a substitute for non-renewable, more polluting and more energy-intensive materials. Finding a balance between the potential for local development based on conservation of landscapes, nature, local cultures and global environmental objectives is not impossible. As most of the regions of great natural interest are catalogued as economically underprivileged it would be a mistake to insist that they should compete with intensive forms of land use. If such areas are to find a competitive advantage, it is necessary to look for a differentiating factor, such as 'quality'.

This quality exists, because Natura 2000 sites are areas where, thanks to the outstanding natural resources, goods and services of high environmental and cultural quality can (continue to) be produced, if possible by applying the integrative concept of SFM that does not consider ecological requirements in isolation from other forest functions but aims to unite economic, ecological and social benefits. This also entails increased efforts towards public relations work on the part of foresters and forest owners' associations, to show society that, if biodiversity conservation commitments are to be met, producing modern commodities with the sustainable methods of the past may sometimes be the most appropriate option for the future.

Annex I: General information about forests and forestry

1. Global forest condition

Forests cover about 3 870 million hectares, or 30 % of the earth's land area. Tropical and subtropical forests comprise 56 % of the world's forests, while temperate and boreal forests account for 44 % (FAO, 2001).

Together, tropical, temperate and boreal forests offer a multitude of habitats for plants, animals and micro-organisms, holding the vast majority of the world's terrestrial species. Forest organisms provide a wide array of goods and services, from timber and non-timber forest products to playing an important role in mitigating climate change as carbon sinks. At the same time, forests provide livelihoods and jobs for hundreds of millions of people worldwide. Forest biological diversity also has an important economic, social and cultural role in the lives of many indigenous and local communities. Forests are therefore essential for the protection of global biodiversity (Kapos and Iremonger, 1998).

In the last 8 000 years about 45 % of the Earth's original forest cover has disappeared, cleared mostly during the past century. This process of global deforestation continues at an unprecedented rate (FAO, 2001), so that numerous species of plants and animals have already vanished forever together with their forest habitats. Between 1990 and 2000, another estimated 5 % of the world's forest cover was lost, at a rate of around 14 million hectares per year. Deforestation is mainly taking place in tropical forests, which present the most valuable reservoir for biodiversity and have important functions for the world's climate, and in boreal forests, which regenerate very slowly.

The EU has been one of the dominant actors in the international discussion on forests. It is working to halt global deforestation and to reach sustainable forest management (SFM) through cooperation in all global policy processes, such as:

- the UNCED follow-up process (for example, the United Nations Forum on Forests and preceding fora IPF and IFF);
- the Convention on Biological Diversity (CBD) and its recently adopted 'expanded programme of work on forest biodiversity'

- development policies which take into account environmental constraints;
- integrating environmental protection in new procurement rules in favour of wood products from sustainable sources ('green procurement').

2. Forests in the European Union

The EU and its Member States have chosen to act responsibly with regard to one of the main ecological challenges of our time, the preservation and the sustainable management of forests, by approving ([31]) in 1998 a forest strategy for the European Union, proposed by the Commission ([32]).

The strong European influence on the international forest policy debate puts an increasing responsibility on EU countries to serve as a role model for forest protection and sustainable forest management. In this context, the successful establishment of Natura 2000 along with other initiatives, for example the national forest programmes and the application of the resolutions of the Ministerial Conference on the Protection of Forests in Europe (MCPFE), are important achievements for the EU at international level.

Socioeconomic importance of European forests

Forests and forestry in the European Union are characterised by a wide variety of climatic, geographic, ecological as well as socioeconomic conditions. About 70 % of the forest area is located in four countries: Finland, France, Germany and Sweden. Nevertheless, the largest potential for preserving and restoring forest biodiversity lies in the south of Europe. The Mediterrenean biogeographical region has an amazing number of 30 000 vascular plants, of which over 10 000 are exclusively regional, making it one of richest areas concerning endemism.

Forestry is an important economic factor in Europe: forestry and forest industries employ about 2.2 million people. The total amount of industrial roundwood produced in the EU per year was 226 million cubic metres in 1998 (FAO, 2001). Sweden, Finland, Germany, France and Austria are among the world's top 10 exporters of forest products. Nevertheless, an increasing part of European exploitable forests tend to be underutilised and a general phenomenon of forest biomass build-up has been noticed. Actually, annual growth exceeds harvests, and thus very densely stocked forest stands are prevailing in many EU countries (e.g. DFWR, 2001). The sustainable use of European forest resources, taking into account economic, social and ecological objectives like biodiversity protection, should therefore be maintained and even strengthened and the consequences in terms of management considered on a site-specific basis if Natura 2000 areas are affected.

There are approximately 12 million forest owners in the EU today, with an average ownership of less than five hectares of forest. Ownership, however, varies widely within the Community. In Greece and Ireland, the State owns about two thirds of forest lands, while in Belgium, Spain, Italy, Luxembourg, France and Germany, local communities play an important role as forest owners. The forest area per capita is 0.3 hectares on EU average, but again varying widely between Member States.

Forest cover in the EU is actually rising, *not only* through afforestation programmes co-financed by the EU (1 million hectares since 1991) but even more as a result of natural succession on abandoned land that was mostly grazed in the past (IDF, 2001), and it has reached over one third of EU land cover (FAO, 2001). Although this trend is generally viewed as positive, there are some issues that give rise to concern. The fact that afforestation, often with exotic species, tends to be restricted to poor soils and marginal areas endangers some key habitats of open landscapes, while it goes along with a trend of intensification and further specialisation on the remaining agricultural land (EEA, 2001). Partly for this reason, significant new afforestation projects which may impact on existing (semi-)natural open landscapes should generally undergo an environmental impact assessment before they can be approved.

([31]) Council resolution of 15 December 1998, OJ C 56/1, 26.9.1999.
([32]) COM(1998) 649 final of 3 November 1998, transmitted to Council, not published.

The rise in forest area also conceals the fact that some of the last pristine forests in Europe, usually rich in biodiversity and endangered species, are still threatened to be replaced by intensively managed semi-natural forests or plantations (EEA, 1998). Moreover, preference for conifers over deciduous trees and of exotic species over the original species can have a negative impact on biodiversity even though the total forest area is increasing. Therefore it is the quality of the forest rather than the quantity that recent initiatives for nature conservation are focusing on.

Europe's recent forest history

Historical research shows that forests have had a fundamental importance as a basic resource for the progress of human settlement and for the creation of a civilised and prosperous Europe. Until the late 18th century, European forests were mainly seen as wild and uninviting realms of nature, and at the same time as inexhaustible sources of materials, fodder and energy at the ready disposal of the growing human population.

Many central European countries faced a sharp decline in their forest area starting in the 17th century, with devastating effects on forest resources reaching far into the 19th century. Only when wood as the main source of energy could be substituted by coal and later by oil, did the depletion of many of Europe's once heavily forested regions come to a halt. For various needs such as shipbuilding, mining, firewood and building material, salt production and production of charcoal and potash for glass, many forest areas had been logged completely, often without basic regards for sustainable yield. To make matters even worse, the same forests were often subject to poorly regulated and little supervised forms of primitive multi-functional use by rural populations enshrined in local 'user rights'. This led to the open landscapes consisting of forests degraded and impoverished by extensive grazing and diffuse gathering of forest products that appear on the first accurate landcover maps of the late 18th century as heaths or inland dune areas. The lack of clear forest ownership structures and extended periods of warfare spurred this development of general forest decline.

The turnaround for the diminished forest resources in many European countries came when the imminent threat of a timber shortage was recognised and forestry became a scientific profession, with higher education of foresters spreading across Europe. During the early 19th century, this led to the extension of the concept of foresters as 'guardians of the woods', which was originally restricted to the estates of Europe's high nobility, to a double function of managing and policing the national forest patrimonium as a whole, entrusted to self-standing forest administrations. As a result, the decline in forest resources was slowly reversed and vast regions were allowed to regenerate or were actively reforested. This trend further accelerated after 1850, when ever more abandoned agricultural land and disused pasture continued to be converted to forests. However, the main objectives of this forest recovery were the fast and efficient production of timber to supply growing markets and protection against erosion. This mostly led to the establishment of monocultures of conifers. Managed as even-aged plantations, these 'new forests' offered only little value for biodiversity, although some of them have become more diverse as a result of natural decay or human intervention.

Wood shortages occurred again in parts of Europe, on a smaller scale, after the first and the second world wars. Many areas that were devastated or had been logged during or shortly after the war years were replanted for timber production, to serve the demands of society at the time. Thus, in many parts of Europe, forests are characterised by relatively young, even-aged stands of few tree species, offering habitats only to a rather limited number of organisms.

These problems did not occur, or at least not to the same extent, in the vast forests of northern Europe nor in the inaccessible alpine areas and mountain regions of southern Europe, where relatively untouched forests and open multi-functional woodlands can still be found today. These areas represent the last remains of natural forests and traditional woodland use in Europe, and thus they are of extremely high scientific and ecological value. As the economic value of the old-growth timber is often equally high and as pressure for agricultural intensification continues to build up, commercial exploitation often collides with the interests of nature conservation in these areas.

Naturalness of European forests

The actual appearance of forests in Europe is the combined reflection of two fundamentally different phenomena (Falinski and Mortier, 1996) ([33]):

- a primary differentiation that occurred during the postglacial recovery by forest building species, starting during the Holocene geological period approximately 10 000 years ago, a process conditioned by climatic and soil factors;
- a secondary differentiation under the influence of human settlement which has modified forest cover and structure from the Neoliticum, starting 5 000 years ago.

A. The glaciations have left a considerable footprint on northern Europe, central Europe and the mountain regions, leading to a floristic north–south gradient that is still very characteristic today.

- Northern Europe's boreal forests are of most recent origin and have less plant species. Their establishment followed the regression of the ice-cap and the youngest formations, such as the oak-beech and beech-spruce forests of central Europe, only took shape some 5 000 years ago. Pioneer formations, such as the pine-birch forests already appeared much earlier.
- Southern Europe's forests are much older. Some of these formations have already existed for over 15 000 years and as they have been much less influenced by the glaciations, their number of species and the diversity of their floristic associations is much higher.

To this has to be added that the climatic west–east gradient from oceanic to continental influence also implies a decrease in richness of species and vegetation types.

B. The history of human settlement and its impact on forests also reflects a north–south gradient, with the oldest colonisation taking place in the south, starting from the Middle East towards Greece about 8 000 years ago and reaching Fennoscandia as recent as 2 500 years ago.

Human influence first produced fragmentation of forest cover in the plains and has further reduced it categorically to conquer space for agriculture, to open pastures and to meet energy needs. The older the colonisation process, the more its consequences are visible in the present-day landscape. As a result, the high forest cover in Fennoscandia and the large forest complexes in central Europe that exist today are in stark contrast with the situation down in the south-west. In France, forest cover was estimated at around 80 % at the dawn of the Roman conquest, whereas it was down to 15 % by 1800 and has risen again to over 30 % today. In Fennoscandia, slash and burn cultivation had an important impact until the 19th century, but considerably more closed forest cover developed after its abandonment.

The most important impacts of human activities on forest biodiversity are the following:

- harvesting of trees before they reach physiological maturity and potential age, resulting in a decrease of species associated with old and decaying specimens;
- clearing of alluvial forests for pasture, change in composition of alluvial forests after alteration of hydrological conditions in swamp forests;
- modification of tree species composition and vertical structure by silvicultural interventions;
- establishment of formations that do not occur naturally, such as fruit-bearing stands of selected species, coppice, coppice and standards, wicker cultivation, agro-forestry systems, etc., often leading to the development of associated biodiversity linked to continued human interference in natural succession processes;
- drainage of peat soils and humid forests to accelerate tree growth;
- construction of timber road networks in wilderness areas;
- reforestation of abandoned agricultural lands and formerly grazed environments.

It has to be understood that these individual factors

([33]) This section is largely based on a publication by the authors mentioned in a special edition of *Revue forestière française* (XLVIII); which itself refers to ample literature on the subject. To a lesser extent, the work of Noirfalise on the Corine vegetation cover definitions was also taken into account.

did not necessarily occur side by side but that they may have had simultaneous or subsequent influences, which have also produced synergetic effects on specific locations.

From the above, it can be concluded that biological diversity and the naturalness of European forests have been influenced to a varying degree by human activities for a very long time and that natural or 'virgin' forests have become absolutely rare throughout Europe and even more so in the EU. Indeed, if the primary and secondary differentiation influencing forest composition and structure were put together in a matrix-like grid of crossing influences, this would result in an infinite number of possible situations, whereby in general it can be concluded that those sites with the highest biodiversity, especially on fertile soils, are probably the ones that have undergone the most intense change, as they proved to be most interesting for human settlement. Very little untouched forest is left, totally artificial forest is not really abundant and the largest part of Europe's forest can be called semi-natural (for example, Anglo-Saxon literature) or subnatural (for example, French-Swiss literature). Thereby the distinction between natural and semi-natural forests is often difficult to establish because past human influence can lead to many combinations of natural and human influences. Among those forests which are considered to be semi-natural today, one can find plantations with and natural regeneration of indigenous species on agricultural land that was abandoned over 100 years ago, natural forests of which the authentic herbaceous layer was nearly completely degraded by grazing and export of litter, natural forests which have been 'enriched' with exotic species that have regenerated spontaneously, etc.

There also exists confusion between naturalness, meaning absence of human influence, and biodiversity, meaning species and structural richness. Indiscriminate mixing of such concepts has led to mythical visions of what could or should be the aspect of the 'original', 'ancient' or 'primeval' forest, which are sometimes put forward as a management objective for protected areas.

Keeping this in mind the habitats that are listed for their community importance in Annex I to the habitats directive can be divided into three functional groups (Barbier, 2000):

- habitats which occur in environments that have always been marginal in economic terms and were never colonised by man, such as riverine formations, dune areas, wet pockets in forests and active bogs;
- little anthropised climax habitats, such as certain oak forests, beech forests and natural spruce forests, which have been exploited for timber and kept in a stable condition by management of the indigenous species;
- habitats which are mainly man-made landscapes or their transition to the climax vegetation, such as heaths, wooded bogs, open (grazed) woodlands, natural grasslands or pastures.

This leads to the conclusion that there is too little conclusive evidence to determine, with a reasonable degree of confidence, what would have been the exact composition of potential natural vegetation cover on any given spot in Europe and that, in many cases, the continuation of human intervention is absolutely essential to habitat conservation.

ENV-Medittерenean forest2 P. sylvestris nevadensis/A. Gutierrez

Annex II: The framework for biodiversity protection in Europe

1. The birds directive

Directive 79/409/EC, known as 'the birds directive', was adopted in 1979 and its main provision is the obligation for EU Member States to designate special protection areas ('SPAs') for a series of listed birds whose conservation status is threatened and for migratory birds in general. A second important feature of this directive is that it sets common baseline rules for hunting and trading of birds in all Member States.

2. The Bern Convention

The Convention on the Conservation of European Wildlife and Natural Habitats, often referred to as the 'Bern Convention', was agreed at the Council of Europe in 1979 and entered into force in the EU in June 1982. It is one of the oldest international agreements on biodiversity protection but its signatory parties are not tied by mandatory implementation provisions.

The Bern Convention aims to ensure conservation of wild flora and fauna species and their habitats. Special attention is given to endangered and vulnerable species, including endangered and vulnerable migratory species specified in appendices. Altogether 44 States have ratified the Convention, ranging from Turkey to Iceland and from Ukraine to Morocco.

3. The habitats directive

Directive 92/43/EEC, known as the 'habitats directive' or the 'fauna, flora and habitats (FFH) directive', was adopted in 1992 as an implementation instrument of the Bern Convention for EU Member States. The aim of this directive is to contribute to the conservation of natural habitats and species of wild fauna and flora in the European territory of the Member States, taking account of economic, social and cultural requirements and regional and local characteristics. The protection of natural habitats and species listed in its annexes is ensured through the adoption and implementation of specific mea-

sures, such as the designation special areas of conservation (SACs) or the establishment of systems of strict protection for species of Community interest. This directive creates the Natura 2000 network and lays down rules for its establishment and operation.

4. The EU enlargement and the emerald network

The emerald network is the common tool for the protection of habitats under the Bern Convention in non-EU States that have ratified this convention. At the same time, the emerald network is an effective preparatory tool for EU candidate countries, as its areas of special conservation interest (ASCIs) will be used as a basis for the later adoption of special areas of conservation (SACs) as required by the habitats directive. As there will be no transition periods for the implementation of the habitats directive, those countries which have undertaken all necessary efforts to set up the emerald network will be in a good starting position for EU accession.

Many candidate countries can be proud of an exceptionally rich natural heritage. Eastern Europe is still rich in untouched river valley and forest complexes with complete food chains thanks to the presence of large carnivores. In Romania alone, an estimated 6 000 bears are still living in the wild — more than twice as many as in all other European Union Member States put together. At the same time, the fast rate of economic development in many of these countries is threatening this rich natural heritage, and it has to be ensured that economic development is carried out in a sustainable way.

As a part of the EU enlargement preparations, technical consultations to adapt the annexes of the birds directive and of the habitats directive to the specific situation of habitats and species of conservation value in CEECs were concluded in 2001.

5. The Convention on Biological Diversity (CBD)

One of the key agreements adopted at the 1992 Earth Summit in Rio de Janeiro is the Convention on Biological Diversity (CBD). This pact among the majority of the world's governments sets out commitments for maintaining the world's natural heritage along with sustainable economic development. The Convention establishes three main goals: the conservation of biological diversity, the sustainable use of its components, and the fair and equitable sharing of the benefits from the use of genetic resources.

Some of the many issues dealt with under the CBD include:

- measures and incentives for the conservation and sustainable use of biological diversity;
- regulated access to genetic resources;
- access to and transfer of technology, including biotechnology;
- technical and scientific cooperation;
- impact assessment rules;
- education and public awareness raising.

The CBD has 186 parties, and 168 signatures at present. The European Community, as well as all individual Member States, has signed the Convention. The European Environment Agency in Copenhagen has set up a 'clearing-house mechanism for biodiversity' ([34]) to ensure optimal flow of information between European signatories.

At the sixth Conference of the Parties of the CBD in The Hague in April 2002, an 'expanded programme of work on forest biodiversity' was adopted. This programme sets out an ambitious series of objectives and activities which the contracting parties have committed themselves to reach, according to their own priorities. They include applying an ecosystem approach to the management of all types of forests and measures to improve protection, recovery and

([34]) A 'clearing-house' originally referred to a financial establishment where checks and bills are exchanged among member banks so that only the net balances need to be settled in cash. Today, its meaning has been extended to include any agency that brings together seekers and providers of goods, services or information, thus matching demand with supply. The EEA clearing-house website is: http://biodiversity-chm.eea.eu.int/

restoration of forest biodiversity by its sustainable use and important monitoring efforts.

6. The EU biodiversity action plans

To ensure that the protection of biodiversity plays a role in other important policy fields, Commission services have recently developed 'biodiversity action plans' for agriculture, fisheries conservation of natural resources and development and economic cooperation (COM/2001/0162 final). These plans set targets to be reached for the improvement of biodiversity protection and are to be adopted by the co-decision procedure of the European Parliament and the Council of the European Union.

The establishment of Natura 2000 is an important element of these action plans. Concerning forests, the biodiversity action plan for the conservation of natural resources sets the target that all forest types from Annex I to the habitats directive should be assessed as 'sufficiently represented' by 2002. This action plan calls also for a further integration of biodiversity supporting measures into programming documents under the Rural, Structural and Cohesion Funds and programmes relevant for third countries.

The adoption at the sixth COP of the CBD of the abovementioned 'expanded programme of work on forest biodiversity' may lead to more attention for forest-related elements in the existing EU biodiversity action plans.

7. National forest programmes

The purpose of national forest programmes (NFPs) is to establish a workable social and political framework for the conservation, management and sustainable development of all types of forests, which in turn will increase the effectiveness and efficiency of public and private operational commitments. They are an outcome of the follow-up process of the Rio Earth Summit in 1992 (UNCED) regarding forests.

- National forest programmes are guided by the elements and principles that were endorsed as proposals for action by the Ad hoc Intergovernmental Panel on Forests (IPF, 1997), established by the United Nations Commission on Sustainable Development.

More than 120 countries have developed or updated their national forest programmes during the past 15 years. The tangible results of these processes include new forestry policies and improved legislation, institutional reforms, redefinition of the role of the State in forestry development, decentralisation of forest management responsibilities, transfer of power to communities and local groups, greater transparency and participation in decision-making processes.

Biodiversity plays an important role in many national forest programmes, in accordance with the abovementioned international commitments. The funding of some of the Community support mechanisms is tied to a successful establishment of NFPs (that is, the support within the framework of Regulation (EC) No 1257/99 for the support of rural development).

8. The Ministerial Conference on the Protection of Forests in Europe (MCPFE)

The Ministerial Conference on the Protection of Forests in Europe (MCPFE) ([35]) is a major initiative of cooperation amongst European countries to contribute to the protection and sustainable management of their forests. It is shared by the more than 40 member countries of the Council of Europe and numerous observers to address threats and opportunities related to forests and forestry. This process is constituted by a chain of political-level conferences and seconded expert meetings for the follow-up work and brainstorming. The participating States are responsible for the national and regional implemen-

([35]) More information on the work of the MCPFE is available in the Internet at http://www.mcpfe.org or at the MCPFE Liaison Unit in Vienna, Marxergasse 2, A-1030 Vienna, Austria; Tel. (43-1) 710 77 02, Fax (43-1) 710 77 02 13, E-mail: liaison.unit@lu-vienna.at

tation of the recommendations made at the conferences. The discussions and exchanges between the conferences are called the 'MCPFE process', which is characterised by a joint approach of national forest administrations and civil society representatives.

The results of the MCPFE process are recommendations in the form of resolutions which are adopted at the ministerial conferences. So far, these have been held in Strasbourg (1990), Helsinki (1993) and Lisbon (1998) and have produced the following resolutions:

S1: European network of permanent sample plots for the monitoring of forest ecosystems

S2: Conservation of forest genetic resources

S3: Decentralised European databank on forest fires

S4: Adapting the management of mountainous forests to new environmental conditions

S5: Expansion of the Eurosilva network of research on tree physiology

S6: European network for research into forest ecosystems.

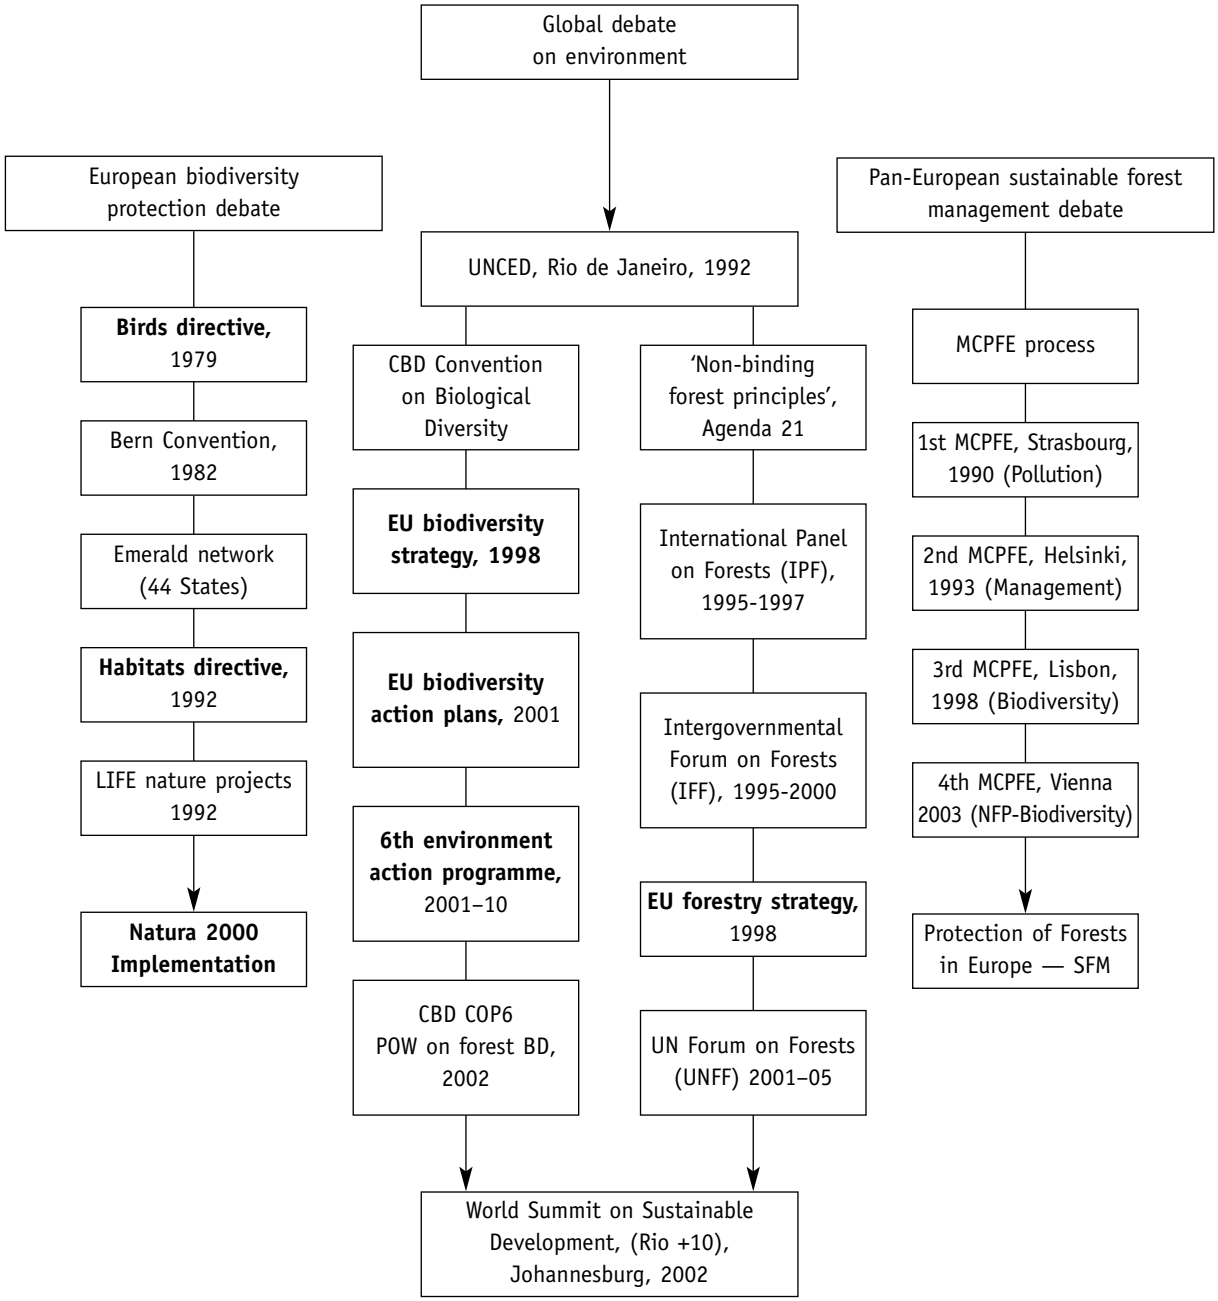
H1: General guidelines for the sustainable management of forests in Europe

H2: General guidelines for the conservation of the biodiversity of European forests

H3: Forestry cooperation with countries with economies in transition

H4: Strategies for a process of long-term adaptation of forests in Europe to climate change.

L1: People, forests and forestry: enhancement of the socioeconomic aspects of sustainable forest management



L2: Pan-European criteria, indicators and operational level guidelines for sustainable forest management.

The resolutions cover protection, conservation and sustainable development of Europe's forests and lay down guidelines for achieving those three objectives, including the implementation of objectives from the Convention on Biological Diversity. Because of the comprehensive nature of the resolutions, the European Parliament has emphasised the importance of this pan-European process in relation to the EU forestry strategy ([36]).

SEEKING A LEVEL OF INVOLVEMENT APPROPRIATE TO THE SITE 59
SPECIFIC RECOMMENDATIONS 60
.Strategy, policy, planning 60
.Offer, Product, Market 61
.Communication, Promotion, Awareness 62
.Evaluate and manage impacts, develop an integrated approach, encourage co-operation 64

Introduction

Who is the document for?

This document is for all stakeholders concerned with the development of sustainable tourism within a Natura 2000 site and, by extension, in protected areas in general. These include managers of Natura 2000 sites or protected areas, suppliers of local tourism services, tour operators and local authorities. It should help inspire local politicians, and be of interest at the national and regional government level.

What kind of area does it concern?

It is relevant to all Natura 2000 designated sites in Europe. These areas are incredibly diverse and include a wide range of ecosystem, from wetlands to mountain areas, and including rural areas. It can be extended to Eastern European areas. It is also relevant to all types of protected area in general.

What is it based on?

The document is the result of the organisation of a European seminar held in Lisbon in December 1999 carried out by the contractor SECA, Société d'Eco-Aménagement (France) in association with ECOTRANS (Germany), THE TOURISM COMPANY (United Kingdom), and the FRENCH FEDERATION OF REGIONAL NATURE PARKS (France). Examples of good practice, existing initiatives and general principles selected and presented at the conference, are analysed here.

In the preparation of the conference, 866 people were contacted from all over Europe, including Eastern European countries, and 70 projects were analysed, of which 47 examples of good practice were selected and presented. The final short list of 47 was chosen to reflect a wide spread of types of area, geographical location, tourism context, organisations, and initiatives. 129 participants attended two plenary sessions and four workshop sessions over three days. The 15 Member States were well represented, and there was a good balance between both the tourism and the environment sectors.

The document is the result of active participation throughout the seminar and in its follow-up, of the many comments gathered in an evaluation form completed by the participants, and of the constant review of the publication in its draft form.

In what context was this document produced?

The EU has established a legislative framework for protecting and conserving Europe's wildlife and habitats in order to encourage its Member States to take nature conservation further.

At the centre of this policy is the creation of a coherent ecological network of protected areas across the EU, known as Natura 2000. This is based on two European directives: *Birds* (1979) and *Habitats* (1992). Each Member State is responsible for the choice of sites and management tools in line with European requirements.

Recently, sustainable tourism has been promoted and supported though several European initiatives: studies, publications, workshops, funding programmes. These initiatives address rural and coastal areas and protected areas in general.

As these initiatives have evolved, it has become increasingly important to address tourism in Natura 2000 sites. These sites are notably more sensitive and vulnerable than traditional protected areas because of their characteristics (size, status, management…).

In order to promote sustainable tourism, the European Commission prepared a seminar in Lisbon in December 1999 which was due to be followed by the publication of a new set of guidelines. Contrary to the original aim of the seminar, **the participants all agreed it was not necessary to draw up new specific guidelines for sustainable tourism in Natura 2000, and on the need to adapt and promote existing initiatives.**

In consequences, this document aims to reinforce previous initiatives and focus on the Natura 2000 network. It aims to introduce the concept of sustainable tourism in the network, to encourage managers and stakeholders to follow and adopt certain guidelines and to promote existing initiatives and good practice from all over Europe.

What does it cover?

This document is in four Parts:

Part 1. Describes the Natura 2000 network, its requirements, the benefits of being designated Natura 2000 and belonging to the network. It analyses the Habitats Directive from a sustainable tourism perspective and gives advice on how to translate it into guidelines and general principles for Natura 2000 stakeholders.

Part 2. Provides a brief description of 17 initiatives relevant to protected areas, which have developed specific recommendations, charters, codes and guidelines for sustainable tourism. A detailed analysis and comparison of two important European initiatives (WWF PAN Parks and the EUROPARC Charter) provides further information for the reader.

Part 3. Presents a list of priorities and general principles for sustainable tourism which are relevant to the characteristics of Natura 2000 sites. These principles are based on the examples of good practice presented at the Lisbon seminar.

Part 4. Provides a summary of specific recommendations and advice addressed to Natura 2000 stakeholders in the light of the Habitats Directive described in Part 1 and based on the general principles in Part 3.

A second volume (annex) gives a description of 21 selected examples of good practices, which illustrate some of the main principles and provide insight into the application of sustainable tourism in practice.

Part 1. Natura 2000, Characteristics and requirements

Introduction au réseau Natura 2000

. LE RÉSEAU NATURA 2000 : COMMENT ET POURQUOI ?

La conservation de la nature est une préoccupation majeure de la politique environnementale de l'Union Européenne depuis les années 1970. Depuis plus de trente ans, les textes législatifs et réglementaires pour la protection de la nature se sont développés également dans les pays de l'Union Européenne. D'autres mesures réglementaires concourent indirectement à la protection de la nature aujourd'hui : lois pour l'aménagement du territoire et sur les études d'impact, planification sectorielle ou territoriale du développement économique et des transports, programmes contractuels, notamment entre les Etats et le niveau local, en faveur du développement économique durable. La mise en place de ces mesures est cependant très variable d'un pays à l'autre et n'a pas permis de voir disparaître les menaces sur certains habitats et espèces.

Au regard de ces menaces persistantes, la Commission Européenne a créé un outil novateur à l'échelle européenne, qu'elle a voulu le plus performant possible en faveur de la protection d'un patrimoine commun à l'ensemble des pays de l'Union : le **Réseau NATURA 2000**. Ce réseau est le symbole de la conservation des ressources naturelles de l'an 2000 et au delà. La protection et la gestion efficace des sites qui constituent ce réseau auront une importance vitale pour la survie à terme de nombreuses espèces ou habitats. Mais plus encore, NATURA 2000 donne l'occasion unique de démontrer que les préoccupations environnementales peuvent être intégrées à d'autres politiques. La conservation de la nature fait partie intégrante de la politique d'aménagement du territoire et peut être compatible avec l'agriculture et les autres activités économiques. Elle peut aussi stimuler la création d'emplois.

Assurer le futur du riche patrimoine naturel de l'Europe suppose la pleine participation de tous les partenaires impliqués et des groupes d'intérêts locaux. Une saine gestion patrimoniale n'est pas du seul ressort des administrations nationales et européenne. Le succès du réseau NATURA 2000 devra s'appuyer sur une large adhésion et sur l'engagement de tous ceux qui sont propriétaires ou gestionnaires ou qui apprécient notre patrimoine naturel.

. QUELLES SONT LES QUALITITÉS D'UN RÉSEAU ?

Si jusqu'ici, il a surtout été appliqué dans les fédérations de sites ou d'acteurs de la conservation de la nature, le concept de réseau de sites naturels, apparaît ou est sous-entendu dans les directives européennes et les traités internationaux en faveur de la conservation de la nature. Le principe du réseau est aussi très développé dans certains pays où la conservation de la nature est déjà ancienne, par les organismes publics ou des associations (Grande-Bretagne, Pays-Bas, France).

Dans la conservation de la nature, **le réseau est d'abord une réalité biologique** : protéger des espèces et des habitats, c'est connaître l'ensemble des sites présentant les mêmes habitats ou des habitats similaires, et accueillant les mêmes espèces (voire les mêmes individus) à tout moment de leur cycle biologique. **Le réseau, est un lien entre les acteurs pour améliorer la cohérence des actions** dans un secteur qui se professionnalise progressivement. La bonne conservation du patrimoine naturel repose sur **l'harmonisation des méthodes (de la gestion et de sa planification) et des suivis essentiels à la bonne évaluation des mesures mises en place**.

Il est reconnu, que localement, les différents groupes d'intérêts s'entendent généralement pour mettre en place des projets concertés. La Commission Européenne a d'ailleurs permis de mener à bien des expérimentations ponctuelles au travers des financements ACE et ACNAT, puis grâce aux LIFE Environnement mais surtout aux LIFE Nature. **Pour que ces expériences localisées, servent à l'intérêt général, les réseaux sont essentiels à la valorisation et à l'extension des bonnes pratiques**.

. *LA SPÉCIFICITÉ DU RÉSEAU NATURA 2000*

Constitués sur la base volontariste de ses membres, les réseaux nationaux ou internationaux de sites protégés ne sont pas représentatifs des enjeux de conservation du patrimoine naturel de l'Union Européenne.

La politique de l'Union Européenne en faveur de la conservation de la nature sur le territoire communautaire repose essentiellement sur deux textes législatifs : la Directive 79/409/CEE du Conseil, adoptée en avril 1979 et qui concerne la conservation des oiseaux sauvages (aussi appelée "Directive Oiseaux") et la Directive 92/43/CEE du Conseil, adoptée en mai 1992 et qui concerne la conservation des habitats naturels ainsi que de la faune et de la flore sauvages (aussi appelée "Directive Habitats"). Ces deux Directives constituent le cadre législatif de la protection et de la conservation des habitats et des espèces sauvages d'Europe. Le réseau écologique cohérent d'espaces protégés NATURA 2000 comprendra :

- des Zones de Protection Spéciale (ZPS) visant la conservation des 182 espèces et sous-espèces d'oiseaux figurant à l'Annexe I de la Directive Oiseaux ainsi que des espèces migratrices

- des Zones Spéciales de Conservation (ZSC) visant la conservation des 253 types d'habitats, des 200 espèces animales et des 434 espèces végétales figurant aux Annexes de la Directive Habitats.

Son objectif est d'assurer le maintien ou le rétablissement des habitats et des espèces dans un état de conservation favorable au sein de leur aire de répartition naturelle.

Le réseau NATURA 2000 fonctionnera sur tout le territoire européen et permettra d'inclure des espaces naturels qui ne sont pas pris en compte par les réseaux actuels de la conservation. Ainsi, le réseau NATURA 2000, tous types de site confondus, et constitué sur la base de critères européens, est une première.

Un site NATURA 2000, bénéficiera d'un gestion planifiée et de mesures en faveur de la préservation des espèces et des habitats pour lesquels il a été désigné. Les actions de gestion

seront mises en place au regard des moyens techniques et financiers à disposition et en fonction des exigences socio-économiques et culturelles.

La cohérence du Réseau NATURA 2000 reposera sur la bonne application des directives dont la responsabilité revient aux Etats. Il est d'ailleurs préconisé dans la Directive Habitats, de traduire cette directive en droit national afin de permettre le cas échéant, de compléter les règlements nationaux en faveur de la protection de la biodiversité. De nombreux pays disposent déjà de textes réglementaires et législatifs dans l'esprit des Directives Habitats et Oiseaux. La Directive tend ainsi à harmoniser ou à renforcer des mesures déjà prises ou à prendre.

. *COMMENT SERA CONSTITUÉ LE RÉSEAU NATURA 2000?*

La constitution du Réseau NATURA 2000, s'effectue en constante collaboration entre la Commission Européenne et les Etats. Sa mise en place, telle qu'elle est définie dans la Directive Habitats se fait en trois étapes:

Etape 1 : Sélection au niveau national
Elle est effectuée sur la base d'**inventaires complets** ou **des connaissances acquises**. Chaque Etat fait l'évaluation de l'état de "santé" de chaque espèce ou habitat visé en fonction des éléments d'information dont on dispose.

Les habitats et les espèces figurant aux Annexes I et II de la Directive Habitats sont reconnus comme étant menacés à l'échelle européenne. Cependant, le niveau de connaissance sur leur répartition et leur état de conservation dans chaque Etat Membre est assez disparate. C'est pourquoi, la première étape du processus de désignation a consisté, pour chaque Etat Membre, en une évaluation précise à l'échelle nationale de chaque habitat ou espèce visé, présent sur leur territoire. Sur cette base, les sites importants pour leur conservation ont été identifiés et soumis sous la forme d'une liste nationale à la Commission.

Le choix des sites est effectué sur la base de critères de sélection standards (définis à l'Annexe III de la Directive). Cela signifie que les décideurs doivent tenir compte de la *représentativité* du type d'habitat sur le site considéré, de la *superficie qu'il y occupe* au regard de la superficie nationale de l'habitat considéré et de la *qualité écologique* de ce type d'habitat sur le site (en intégrant les possibilités de restauration).

De même, pour les espèces, ces critères doivent prendre en compte *la taille et la densité* de la population de l'espèce sur le site considéré en comparaison de la population nationale, la *qualité* du site pour l'espèce visée (en intégrant les possibilités de restauration) et son degré d'isolement sur le site par rapport à l'aire de répartition naturelle de la population.

Dès lors que le Réseau NATURA 2000 vise la conservation des habitats et des espèces sur l'ensemble de leur aire de répartition, il est essentiel que les informations fournies par les Etats Membres soient standardisées. C'est pourquoi, un formulaire NATURA 2000 a été conçu; il doit être complété pour chaque site et transmis en accompagnement de la liste nationale. La précision des informations demandées est importante. Elle est un élément essentiel non seulement pour l'aboutissement du Réseau NATURA 2000 mais aussi pour tout futur débat sur la conservation d'un site dans le cadre d'autres initiatives d'aménagement du territoire (ex: création d'une nouvelle route, ou projet d'écotourisme).

Etape 2 : Sélection au niveau européen : Les Sites d'Importance Communautaire

Les **Sites d'Intérêt Communautaire** *, sont sélectionnés au travers d'une analyse commune aux Etats et à la Commission au sein de 6 grandes régions biogéographiques : alpine, atlantique, boréale, continentale, macaronésienne et méditerranéenne.

Carte des régions biogéographiques

Les sites proposés par les Etats sont retenus au niveau européen lorsqu'ils contribuent de manière significative au maintien ou au rétablissement dans un état de conservation favorable des types d'habitats et des espèces visés, à la cohérence du réseau Natura 2000 et/ou au maintien de la diversité biologique des zones biogéographiques concernées. La liste n'est pas fermée. En novembre 1999, près de 10 000 sites ont été proposés par les Etats membres pour une superficie d'environ 350 000 km². Le Natura 2000 Barometer donne des informations régulières sur le nombre de sites proposés par les Etats (site web de la Commission Européenne et la revue Natura 2000 Informations).

La Communauté abrite six régions biogéographiques distinctes. Chacune possède ses propres caractéristiques et sa propre originalité en matière d'habitats et d'espèces, même si certaines sont communes à plusieurs régions. Du point de vue écologique, il est cependant important de considérer les objectifs de conservation de l'Union Européenne dans leur contexte biogéographique.

La sélection des Sites d'Importance Communautaire est menée sur la base des critères définis à l'Annexe III de la Directive. Ces critères évaluent les sites selon leur *valeur* relative à l'échelle nationale, leur *importance* en tant que voie de migration ou de site transfrontalier, leur *surface* totale, la *coexistence* des divers types d'habitats et d'espèces visés et leur valeur en terme d'unicité pour les régions biogéographiques ou pour l'Union.

Les sites des listes nationales identifiés comme abritant des espèces ou des types d'habitats prioritaires du fait de leur risque imminent de disparition ou d'extinction (signalés par un astérisque dans l'Annexe de la Directive) seront automatiquement sélectionnés en tant que Sites d'Importance Communautaire (sauf si ces sites "prioritaires" représentent plus de 5% du territoire national). De même, la Commission pourra dans des cas exceptionnels proposer d'ajouter un site à la liste, s'il peut être démontré sur des bases scientifiques que ce site est essentiel à la préservation du type d'habitat ou de l'espèce concerné.

Etape 3 : Les Zones Spéciales de Conservation
Une fois retenu comme SIC par le Comité Habitats, un site doit être **désigné Zone Spéciale de Conservation** par l'Etat d'ici à 2004. Cela signifie que l'Etat s'engage à mettre en place, si besoin est, les mesures nécessaires pour sa conservation (plan de gestion, actions de restauration, mesures réglementaire ou contractuelle, etc.). De nombreux sites proposés par le Etats bénéficient déjà de telles mesures.

Les Etats Membres devront traiter prioritairement les sites les plus menacés ou les plus importants en terme de conservation. Cette période préalable à la désignation sera mise à profit par les Etats Membres pour préparer les plans de gestion et de restauration de ces sites afin de leur assurer un état de conservation favorable.

. *ENTRETENIR LE RÉSEAU NATURA 2000*

La plupart des sites constituant le Réseau NATURA 2000 devraient être protégés de fait. Cependant, cela ne signifie pas que le processus s'arrête là ou que le Réseau NATURA 2000 sera figé une fois pour toutes. Il sera essentiel de maintenir une démarche dynamique qui devra être ajustée en fonction des réussites ou échecs relatifs des mesures de protection entreprises. Par conséquent, à l'instar de la Directive Oiseaux, il sera hautement recommandé que des sites continuent à être intégrés au Réseau NATURA 2000 dans l'éventualité où une espèce ou un habitat continuerait de décliner du fait de la dégradation des habitats.

Il est de la responsabilité partagée de la Commission et des Etats Membres de contrôler la réussite du Réseau NATURA 2000 en matière de réalisation des objectifs de conservation de la Directive.

La constitution du réseau NATURA 2000 est un travail ambitieux et progressif. La difficulté technique principale pour proposer des Sites d'Intérêt Communautaire représentatifs au niveau européen et de surface pertinente est de disposer des connaissances nécessaires à l'analyse par les experts du Comité Habitats. Le manque le plus important étant des bonnes cartographies, les données socio-économiques, voire les données naturalistes pour certains sites. Il existe néanmoins nombre de cas où l'on " a fait du NATURA 2000 avant l'heure et sans le savoir" et pour lesquels la désignation en ZSC ne soulèvera aucune contestation. Valoriser ces expériences acquises est aussi l'un des moyens d'illustrer au mieux les implications de l'application de la Directive Habitats. Les promoteurs et les partenaires de ces expériences sont souvent les meilleurs ambassadeurs et constituent les premières éléments de la chaîne de compétences qui va se constituer au sein du Réseau NATURA 2000.

Voir un territoire devenir site NATURA 2000 est plus qu'un label. C'est d'abord la reconnaissance de l'importance d'un site pour le patrimoine européen. C'est ensuite, pouvoir mettre en place des actions concertées de préservation et de développement économique durable avec le soutien de la Commission Européenne et de l'Etat. C'est aussi participer à une œuvre commune avec le volonté affirmée de travailler en concertation avec le plus grand nombre des acteurs (services publics, exploitants, gestionnaires, aménageurs). C'est prendre conscience qu'on a à rendre des comptes aux générations futures par le biais d'une autorité commune. C'est enfin, faire partie d'un groupe, donc ne plus être isolé.

Tourisme durable au regard de la Directive Habitats

Les sites du réseau NATURA 2000 seront des sites protégés pour lesquels les mesures seront prises par les Etats membres (outils réglementaires, financiers, en fonction des contextes locaux, des stratégies nationales…). Le poids réglementaire du réseau Natura 2000 repose sur la responsabilité des Etats. Il est donc nécessaire de pouvoir opposer un règlement ou des obligations à tout promoteur de projet. La Directive Habitats donne les grandes lignes et les régles pour une planification efficace de projet de développement durable sur un site protégé.

Les directives Oiseaux et Habitats servent de base à l'élaboration du réseau NATURA 2000. La Directive Habitats, plus récente, comporte les préconisations faites aux Etats pour la mise en place de ce réseau. Ce sont les articles 2 et 6 qui clarifient le lien entre la conservation et les usages possibles sur les sites NATURA 2000. C'est donc dans ces articles que nous trouvons le cadre possible du développement d'un projet touristique sur les sites Natura 2000 qui constituera un exemple de tourisme durable.

Article 2.3 Les mesures prises en vertu de la présente directive tiennent compte des exigences économiques, sociales et culturelles, ainsi que des particularités régionales et locales. L'homme ou ses activités n'est pas exclu aujourd'hui ou demain. La directive Habitats cherche à promouvoir le développement durable.	On favorisera donc la **concertation** et le **partenariat** en - Développant et en mettant en place des projets répondant à une stratégie de tourisme durable - Tenant compte de la culture locale - Soutenant les productions traditionnelles et l'activité économique locale - Créant ou développant des écolabels, de nouveaux produits, des modes d'hébergement adaptés

. *L'ARTICLE 6 DE LA DIRECTIVE HABITATS*

L'article 6 de la Directive Habitats crée le cadre de la conservation et de la protection des sites. Il s'applique aux Zones de Protection Spéciale (ZPS) classées en vertu de la Directive Oiseaux (sauf article 6.1) et aux sites visées dans la Directive Habitats (ZSC).

L'article 6.1 prévoit le régime de conservation général que les Etats membres doivent instaurer **pour les Zones Spéciales de Conservation (ZSC) désignées**. Il s'agit de mesures dites positives (établissement de plans de gestion, mise en place de mesures réglementaires, administratives ou contractuelles) à prendre en faveur des espèces et des habitats présents sur le site en cause, sauf ceux dont la présence n'est pas significative.
Le régime de conservation des Zones de Protection Spéciale (ZPS) classées est prévu dans les articles 4.1 et 4.2 de la Directive Oiseaux. Les articles 6.2, 6.3 et 6.4 de la Directive

Habitats, comprenant les mesures préventives et les procédures dans le cas de projets d'envergure, s'appliquent au ZPS comme aux ZSC.

L'article 6 de la Directive Habitats incite les Etats à gérer les espaces protégés d'une manière durable et fixe des limites aux activités susceptibles d'avoir un impact négatif, tout en permettant des dérogations dans certains cas. Il constitue l'un des principaux moyens de concrétiser le principe d'intégration environnementale et d'instaurer, à terme le développement durable.

. *ZOOM SUR LE TOURISME DURABLE DANS L'ARTICLE 6 DE LA DIRECTIVE HABITATS*

A. Les mesures actives

*Article 6.1 Pour les zones spéciales de conservation, les États membres établissent **les mesures de conservation** nécessaires impliquant, le cas échéant, des **plans de gestion** appropriés spécifiques aux sites ou intégrés dans d'autres plans d'aménagement et les **mesures réglementaires, administratives ou contractuelles** appropriées, qui répondent aux **exigences écologiques** des types d'habitats naturels de l'annexe I et des espèces de l'annexe II présents sur les sites.*	Les projets touristiques sont possibles sur les sites Natura 2000 dès lors qu'ils respectent la biodiversité et les objectifs de la Directive Habitats et de la Directive Oiseaux. **Tout projet touristique devra tenir compte des mesures nécessaires mises en place pour la conservation.** **Il devra s'intégrer dans une démarche de planification existante ou à mettre en place.** **Il devra s'inscrire dans une stratégie de tourisme durable.**

Le plan de gestion n'a rien d'obligatoire et peut prendre toute forme selon le choix des Etats membres. Le plus important étant qu'il prenne en compte les exigences environnementales. Il doit au mieux s'intégrer dans les cadres de planification existants. Un plan de développement touristique sur un site Natura 2000 peut être développé par un groupe privé, une collectivité publique, l'organisme gestionnaire du site. Si la méthodologie d'élaboration de plan de gestion du site existe, elle peut intégrer une partie spécifique au tourisme durable pour aider le concepteur du projet. Le caractère durable d'un projet de tourisme durable repose sur la bonne méthode de sa planification, de son évaluation et de son actualisation.	Il existe une grande diversité de types de planification au niveau territorial ou sectoriel, au niveau local ou national, voire transfontraliers, qui peuvent concerner un projet touristique quelque soit son importance : - plan de développement des infrastructures de transport - plan territorial de développement économique - plan de gestion de l'urbanisation, de l'occupation de l'espace - plan de gestion et d'exploitation des ressources naturelles - programme de préservation du patrimoine naturel, historique, culturel - plan de gestion de sites naturels protégés de tout type. Un projet touristique durable tiendra compte de ces plans. On peut d'ailleurs y trouver des données socio-économiques, écologiques, historiques nécessaires à analyser ou à intégrer dans le projet. Dans l'idéal, le projet touristique s'inscrit dans la procédure d'élaboration de l'un de ces plans et bénéficie du cadre de concertation que cela peut offrir. La planification d'un projet n'est efficace que dans une démarche partenariale et de concertation. Elle devra être suivie par une approche d'évaluation régulière du projet et par son actualisation avec l'ensemble des partenaires et acteurs concernés.

Les exigences écologiques : définissent tous les besoins écologiques nécessaires pour assurer un état de conservation favorable des habitats et espèces concernés. Cela implique une bonne connaissance scientifique, au travers de critères que l'Etat est appelé à identifier avec l'aide de la Commission si nécessaire.

Un projet de développement touristique sera d'autant mieux appréhendé qu'on aura une bonne connaissance du site et de ses exigences écologiques. En l'absence de bonnes connaissances, le principe de précaution peut amener à limiter fortement les projets. L'élaboration d'un projet de tourisme peut comprendre l'amélioration des connaissances.

Pour tout projet, on doit mettre l'accent sur la recherche de tous les éléments d'information, et garder en mémoire la vulnérabilité des espèces et des habitats qui sont à l'origine de la désignation en site Natura 2000.

Pour cela on doit :

- connaître les limites du site, même si le projet est en dehors du site

- s'informer sur la teneur des mesures réglementaires (lois nationales, réglementations sur le sites qui bénéficient d'un statut de protection) ou contractuelles (dans le cadre de conventions visant la gestion des milieux naturels) qui s'y appliquent.

- se procurer ou à défaut, faire réaliser les cartographies aux échelles adaptées au projet, les études sur les exigences écologiques des espèces et des milieux concernés et leur degré de vulnérabilité, dans le site ou en dehors.

- identifier et évaluer les menaces et les enjeux sur la conservation durable des espèces et des habitats.

Les mesures réglementaires, administratives et contractuelles sont très variables selon les pays et les sites et sont laissées à la discrétion des Etats, de par le principe de subsidiarité. Elles doivent être positives, comme signifier la non intervention, la définition de zones interdites d'accès, etc. Le tourisme, même s'il est durable, ne se développera pas dans tous les sites Natura 2000. Tout site Natura 2000 n'est pas un site potentiel pour le développement touristique, ou de n'importe qu'elle activité économique, même considérée comme durable par ailleurs.	Un site Natura 2000 peut être un espace nécessitant une protection stricte ou destiné à des actions minimales de gestion pour le maintenir dans un état de conservation favorable. S'il est envisageable, un projet touristique devra tenir compte des mesures réglementaires mises en place au niveau national et local. Elles sont parfois nombreuses et d'origines diverses : conditions d'accès aux sites, d'exploitation des ressources naturelles, nécessité d'autorisation spéciale pour l'aménagement ou l'exploitation, etc. Tout promoteur de projet se doit de les connaître, que ce soit les mesures de protection de site, ou les mesures contractuelles dont pourra bénéficier le projet s'il répond aux critères des contrats mis en place. Le projet pourra avoir pour objectif de participer à la conservation et pourra éventuellement faire appel au soutien financier des Etats ou de la Commission Européenne lorsqu'ils existent.

B. Les mesures préventives

Article 6.2 Les États membres prennent les mesures appropriées pour éviter, dans les zones spéciales de conservation, la ***détérioration*** *des habitats naturels et des habitats d'espèces ainsi que les* ***perturbations*** *touchant les espèces pour lesquelles les zones ont été désignées, pour autant que ces perturbations soient susceptibles d'avoir un effet significatif eu égard aux objectifs de la présente directive.*	C'est le principe de prévention qui s'applique à tout type d'activités humaines, comme à des accidents dus à des phénomènes naturels ou non. Cela peut donc concerner des activités en dehors des sites, dont les effets peuvent se faire ressentir à l'intérieur du site. Cet aspect est primordial pour l'élaboration d'un projet économique qui nécessite une bonne connaissance de la fonctionnalité des milieux, de la sensibilité des espaces et des espèces, et des mesures de conservation mises en place. L'information est à diffuser au plus grand nombre. **Développer au mieux les outils d'évaluation, de communication, de valorisation et sensibiliser. Avoir une image vraie de la nature et pas une représentation.**

Indicateurs de détérioration
L'aire de répartition naturelle de l'espèce" diminue ou risque de diminuer ou remet en cause l'existence et la probabilité d'existence d'un habitat suffisamment étendu pour que ses populations se maintiennent à long terme".

Pour le tourisme, cela concerne tous les projets d'infrastructures, de modes de transport, d'augmentation de la densité de la fréquentation, d'aménagements pour l'accueil du public… qui doivent être envisagés selon leurs conséquences au long terme, donc suivis et maîtrisés.

Un projet de tourisme durable peut comporter des aménagements, voire la création d'infrastructures nouvelles qui auront une incidence paysagère, au minimum.

Pour éviter de conduire à une détérioration, il faut avoir une très bonne connaissance des habitats et des espèces autant dans le site, qu'à l'extérieur. Il existe des organismes et des personnes ressources dans ce domaine qu'il peut être nécessaire d'intégrer dès l'élaboration du projet afin d'évaluer au mieux l'impact potentiel du projet.

Si les aménagements et les infrastructures nouvelles impliquent la création de nouvelles activités, une fréquentation plus élevée, on doit en évaluer également l'impact au préalable.

Un projet de tourisme durable doit également promouvoir autant que possible la réduction des pollutions, l'utilisation minimale d'énergie et l'exploitation raisonnée des ressources naturelles, qui sont par ailleurs préconisées pour favoriser le développement durable.

Indicateur de perturbation Sur un site, la perturbation est relative au statut de conservation des espèces au regard de la contribution du site au réseau Natura 2000. Tout événement contribuant à la diminution de la taille de l'habitat des espèces à l'intérieur du site peut être considéré comme une perturbation significative. Cela peut concerner des projets de parcours sur des milieux sensibles, de visites régulières de l'avifaune en particulier. L'absence de limitation de certaines activités (tout genre confondu) est le cas le plus courant de perturbation.	La fréquentation humaine est parfois la source de perturbation la plus importante. Elle repose souvent sur une méconnaisse des espèces et des habitats. On doit donc évaluer les capacités de charge des sites, maîtriser les flux de visiteurs, à l'intérieur ou à l'extérieur des sites. Le promoteur du projet doit aussi envisager une démarche active de sensibilisation, voire d'éducation à l'environnement, qui ne soit pas qu'un outil de promotion ou un slogan. On peut ainsi favoriser les programmes d'éducation à l'environnement, des codes de bonne conduite, les nouvelles technologies, et les modes d'appréhension de la nature par l'interprétation. Le discours "naturaliste" ou "environnemental" est l'une des spécialités en plein développement dans les espaces protégés, le monde de l'éducation. Des organismes et des personnes ressources existent donc et peuvent être étroitement associés à l'élaboration du projet comme à la mise en place de programmes de sensibilisation. Il existe des fonds spécifiques pour ces objectifs à différents niveaux.

C. Les procédures d'évaluation d'un projet

*Article 6.3 Tout **plan** ou **projet** non directement lié ou nécessaire à la **gestion** du site mais susceptible d'affecter ce site de manière significative, individuellement ou en conjugaison avec d'autres plans et projets, fait l'objet d'une évaluation appropriée de ses incidences sur le site eu égard aux objectifs de conservation de ce site. Compte tenu des conclusions de l'évaluation des incidences sur le site et sous réserve des dispositions du paragraphe 4, les autorités nationales compétentes ne marquent leur accord sur ce plan ou projet qu'après s'être assurées qu'il ne portera pas atteinte à l'intégrité du site concerné et après avoir pris, le cas échéant, l'avis du public.* Cet article met l'accent sur l'avis officiel à	Un projet d'écotourisme peut comprendre partiellement ou totalement des infrastructures ou des travaux importants. Il importe dans ce cas de prévoir parallèlement des mesures d'atténuation et les solutions alternatives qui pourraient assurer l'absence d'effets négatifs sur le site. L'étude préalable ou évaluation du projet est alors indispensable et doit être réalisées au regard des objectifs de conservation du site qui sont définis dans le formulaire descriptif du site voire détaillés dans un plan de conservation préétabli (plan de gestion, plan d'action, document d'objectif de conservation) et généralement consultable auprès de l'autorité compétente.

délivrer par une autorité compétente sur tout projet (travaux de construction ou interventions sur l'environnement naturel par exemple) ou sur tout plan (aménagement du territoire, programmes sectoriels par exemple) afin d'évaluer leur compatibilité avec les objectifs des deux directives. La procédure décrite est déclenchée par la seule probabilité d'effets négatifs de plans ou projets situés à l'extérieur ou à l'intérieur du site. On doit également considérer des projets ou plans au regard des éventuels effets conjugués de plusieurs plans ou projets, qui sont proposés effectivement et pas seulement prévus. Si un projet est susceptible d'avoir une incidence négative au regard des directives, il doit comporté des solutions alternatives que l'autorité compétente pourra évaluer à leur tour.	L'évaluation du projet peut suivre la procédure envisagée dans le cas d'étude d'impact environnemental de projets publics ou privés. La Directive européenne 85/337/CEE modifiée par le directive 97/11/CE définit la notion de projet et la forme de l'évaluation à envisager. Elle est un référent incontestable. Les lois nationales sur l'étude d'impact environnemental peuvent également être utilisées dans certains pays qui en disposent. Plus l'étude est détaillée et motivée plus la décision de l'autorité compétente sera facilitée. Cette étude a l'avantage de rendre l'avis émis non critiquable sur un projet, et éventuellement de favoriser le débat, voire la concertation locale. En l'absence de plan de gestion de site on suggère ici au meneur de projet d'avoir une méthode stricte, rigoureuse. Ce qui peut être le cas d'un site Natura 2000 ne bénéficiant d'aucune mesure de protection avant sa désignation.
*Article 6.4 Si, en dépit de conclusions négatives de l'évaluation des incidences sur le site et en l'absence de solutions alternatives, un **plan** ou **projet** doit néanmoins être réalisé pour des raisons impératives d'intérêt public majeur, y compris de nature sociale ou économique, l'État membre prend toute mesure compensatoire nécessaire pour assurer que la cohérence globale de Natura 2000 est protégée. L'État membre informe la Commission des mesures compensatoires adoptées. Lorsque le site concerné est un site abritant un type d'habitat naturel et/ou une espèce prioritaires, seules peuvent être évoquées des considérations liées à la santé de l'homme et à la sécurité publique ou à des conséquences bénéfiques primordiales pour l'environnement ou,*	Les mesures compensatoires doivent être nouvelles (la désignation supplémentaire de site n'en est pas une en soit mais peut l'être exceptionnellement) et vraiment compenser les dommages en allant au delà de la simple application des directives. Elles doivent être mises en place avant et prouver qu'elles fonctionnent quand les atteintes au site visés par le projet sont effectives. Elles peuvent prendre les formes suivantes : - recréation d'habitats sur un site nouveau ou agrandi et incorporation dans le Réseau Natura 2000 - amélioration d'un habitat sur une partie du site ou sur un autre site Natura 2000 dans une mesure proportionnelle aux

après avis de la Commission, à d'autres raisons impératives d'intérêt public majeur Un projet pourra être justifié pour **raison impérative d'intérêt public majeur**, dans le cas d'initiatives ou de politiques visant des valeurs fondamentales pour la population (santé, sécurité, environnement), dans le cas de politiques fondamentales pour l'Etat et pour la société, dans le cas de réalisation d'activités économique ou sociale visant à accomplir des obligations spécifiques de service public. Les mesures compensatoires qui visent à contrebalancer les effets négatifs sur l'espèce ou l'habitat en cause ne sont que le dernier recours.	pertes provoquées par le projet De nombreuses expériences de recréation d'habitats ont été menés par les organismes porteurs de projets de conservation de la nature et constituent des références techniques et scientifiques reconnues. Le principe pollueur payeur signifie que le concepteur ou responsable du projet prend en charge les frais des mesures compensatoires. Le promoteur du projet doit prendre en compte l'appartenance du site qu'il vise à un réseau de sites protégés dont la cohérence doit être maintenue, soit par l'atténuation des effets négatifs de son projet, soit par les compensation envisagées si son projet est reconnu d'utilité publique. Un formulaire d'information pouvant aider à préparer l'évaluation est disponible au auprès des services compétents (Etat ou Commission Européenne).

Les spécificités et caractérisitiques des sites Natura 2000

L'objet de la directive Habitats est d'assurer la protection de la biodiversité dans l'Union au travers de la conservation des habitats et des espèces sauvages présentes dans les pays où s'applique la Directive. Elle propose la mise en place de mesures pour le maintien et la restauration d'habitats dans une état de conservation favorable, en tenant compte des exigences économiques, sociales et culturelles, ainsi que des particularités régionales et locales.

Si les critères de désignation dépendent d'espèces et d'habitats considérés comme prioritaires à protéger, les facteurs anthropiques sont également pris en compte. Les sites Natura 2000 sont des espaces protégés qui n'excluent pas l'homme ou les activités socio-économiques dès lors que cela ne porte pas atteinte aux espèces ou aux habitats pour lesquels le site sera désigné. Il est d'ailleurs reconnu que certaines activités humaines concourent directement à la bonne conservation d'espèces ou d'habitats. De même, le réseau Natura 2000 peut participer au maintien d'activités socio-économiques voire au développement de nouvelles, par le biais de mesures réglementaires ou contractuelles mises en place par les Etats ou leurs déclinaisons locales. Le tourisme durable est l'une des activités qui peut trouver sa place.

. *QUELS TYPES D'ESPACES SONT CONCERNÉS?*

La réseau Natura 2000 est en cours de constitution. Il s'agit principalement d'espaces ruraux, forestiers ou naturels (montagne, littoral, zones humides). A noter qu'au regard de la directive Oiseaux, des sites urbains en particulier portuaires ont été désignés en ZPS et seront intégrés au réseau Natura 2000.

Espaces protégés partiellement ou complètement

En premier lieu, sont proposés par les Etats les sites ou parties de sites bénéficiant de mesures nationales en faveur de la préservation de la nature.

- Les plus communs sont les parcs nationaux, les réserves nationales (réserves naturelle, de chasse, de pêche).
- Les parcs régionaux (ou parcs naturels) constituent des territoires où le développement des activités économiques dépend de mesures contractuelles en faveur de la protection de l'environnement dans son sens le plus large.
- Certaines grandes forêts bénéficient parfois de règlements nationaux spécifiques imposant une forme stricte d'exploitation (publique ou privée).
- Enfin des sites d'intérêt patrimonial international bénéficient de protection par la maîtrise foncière en vue de leur protection, opérée par des organismes publics comme privés.

La majorité de ces sites disposent de plans de gestion formels ou en auront à moyen terme. Tout projet de tourisme durable peut donc s'y intégrer en tenant compte des critères exposés dans le chapitre précédent. Par ailleurs des expérimentations ou des principes ont été élaborés pour de nombreux types de sites, comme détaillé dans le reste de ce rapport.

Espaces non protégés
Les SIC aujourd'hui proposés par des Etats ne bénéficient pas tous d'un statut national de protection réglementaire.
On trouve pour certains pays, des zones désignées par les Etats comme pilotes pour le développement d'une agriculture raisonnée, soutenue par les Etats et la Commission Européenne, accompagnés parfois d'écolabel offrant des produits à valoriser dans le cadre de projets de tourisme durable assez aisément.
Enfin, la plupart des sites désignés par les Etats ont un label au travers d'un traité ou d'une convention international : site Ramsar, réserve Man and Biosphère, etc. Il apparaît évident que ces zones doivent concourir à la constitution du Réseau Natura 2000. Les différents guidelines proposés dans ce rapport présentent un panel de planification de projet adaptable à chaque type de site.

. *QUELLE EST LA DIVERSITÉ DES SITES?*

Les réalités socio-économiques sont très diverses d'un pays à l'autre de l'Union. Il en est de même des politiques publiques et des initiatives privées ou associatives en faveur de la conservation. Le niveau de préservation des habitats/espèces et les connaissances que l'on en a sont aussi divers.

On peut citer schématiquement deux extrêmes qui participent à la richesse du patrimoine naturel européen :

. Les unités nationales ou régionales ayant bénéficié d'un développement économique favorable qui n'aura pas toujours tenu compte de l'environnement et ayant une densité de population élevée, où l'on aura des espaces de nature réduits ou des sites nécessitant une gestion constante pour être maintenus en un état de conservation favorable. C'est d'ailleurs dans ces pays ou ces régions qu'on trouvera les initiatives les plus anciennes de conservation de la nature, un haut niveau de professionnalisation de cette branche et des budgets important privés comme publics sont consacrés à la gestion de sites protégés.

. Les unités nationales ou régionales qui ont un développement économique limité ou qui accusent une déprise dans certains secteurs (industrie, agriculture) et qui laissent des espaces de nature vastes, presque intouchés au côté d'espaces entièrement dégradés. Certains de ces espaces très dégradés étant la conséquence d'un développement touristique non raisonné parfois.

. *LES SITES NATURA 2000 ONT –ILS TOUS UNE VOCATION TOURISTIQUE?*

Les projets de développement de tourisme durable devront tenir compte de cette typologie, aussi schématique soit-elle. Le tourisme durable, en plus du développement économique qu'il peut permettre, peut pourvoir aux besoins financiers de la gestion écologique, sous la forme de taxes professionnelles, de séjour, de location, d'écotaxes à destination de la gestion des sites Natura 2000.

Le tourisme durable à différentes déclinaisons, selon les situations locales.
La pédagogie est primordiale sur des sites très fréquentés. L'éco-citoyenneté peut participer à reréveler la citoyenneté à proximité des zones urbaines en crise. Le tourisme peut être une activité économique de substitution dans les régions ou pays en déprise. Il revient au Etats ou

aux collectivités locales de dresser en premier les objectifs prioritaires d'activités touristiques ou de loisirs durables qui pourront servir de critères de sélection au projets proposés.

Les destinations touristiques littorales restent les plus importantes pour le loisir ou les congés, pour les activités terrestres et maritimes qu'elles proposent. Elles sont par ailleurs très peuplées (60 % de la population mondiale vit sur une bande de 100 à 150 km des côtes). Il est nécessaire d'envisager dès maintenant des projets de tourisme durable sur les zones côtières selon une un mode de gestion intégrée qui englobe un espace plus large que la stricte bande littorale. Dans une moindre mesure, il en est de même pour les zones de montagne.

Des espaces de nature moins connus ou moins prisés, peuvent cependant bénéficier de la création d'activités touristiques. Pour déterminer au mieux la vocation touristique d'un site, il est conseiller de se reporter aux principes généraux déclinés dans le fin de ce rapport.

En tout état de cause, un projet de tourisme durable sur un site Natura 2000 ou à proximité, doit s'intégrer dans une démarche planifiée dans l'espace et dans le temps, qu'elle soit spécifique au projet ou qu'elle soit préexistante. Le projet doit éviter les incidences négatives sur le site, voire concourir à la conservation du site dans la mesure du possible. La planification de la conservation est en cours ou existe sur les sites Natura 2000, il appartient dont au promoteur de projet de s'y intégrer le mieux et le plus tôt possible. Les principes de planification et d'évaluation de projet dans le cas de l'Ecotourisme sont le garant de l'appropriation locale des projets et d'une concertation efficace entre l'ensemble des acteurs et des responsables de la conservation des sites.

Part 2. The description and analysis of existing initiatives (codes, charters, recommendations…)

Why promote existing initiatives?

The participants of the Lisbon seminar came to the conclusion that it was better to promote existing initiatives than develop new ones specifically for the Natura 2000 network.

Out of the twenty-five initiatives collected for the purpose of the seminar, seventeen have been selected and analysed. Two initiatives, considered to be of the most relevance to Natura 2000, are analysed in more detail. These are EUROPARC's European Charter for Sustainable Tourism in Protected Areas and WWF's PAN Parks Principles and Criteria. A comparison of the two initiatives provides insight into their use and application in practice. Complete lists of the criteria and principles developed by these initiatives are provided in annex. Similarly, more detailed information on all the seventeen selected initiatives is to be found in annex.

The seventeen initiatives do not target Natura 2000 sites specifically, but are relevant to stakeholders of Natura 2000 sites. They have been selected because they are relevant to the development of sustainable tourism in sensitive areas in general.

The purpose of this chapter is to help Natura 2000 stakeholders make better use of existing documents in the development of a sustainable tourism strategy.

It should be used in conjunction with the following chapter (part 3) which is the result of this compilation of existing initiatives and contains the suggested principles and guidelines presented at the Lisbon seminar and illustrated by examples of good practice (cf. Annex).

It is clear that co-ordination and collaboration for improved coherence between the promoters of the following initiatives is necessary in Europe and would be useful to the Natura 2000 network.

What does the term " initiative " mean?

The term " initiative " is used here to describe a vast range of documents, which are available to the public. These documents are principles, codes, charters, recommendations, declarations, and statements of commitment... They have been developed by diverse promoters, for different interest groups, and disseminated in different forms (publications, leaflets, kits, and conference proceedings…). Their common objective is the promotion of sustainable tourism in sensitive environment.

Which criteria have been used to select these initiatives?

These seventeen initiatives have been selected according to various criteria. The main selection criteria were the relevance of the initiatives to Natura 2000 in particular, and to protected areas and sustainable tourism in general. The initiatives were analysed and described with the help and verification of the promoters. Promoters were interviewed with the following questions as a basis for discussion.

Context: What type of initiative? Why was it prepared? With what objective? By whom? For whom? Under what circumstances?

Content: What does the initiative refer to? What is the key issues? What are the implications? What are the main requirements?

Impact: What impact has the initiative had in practice? What did the initiative generate? Are there examples of the practical application of the initiative? Will it be developed further in the future?

Diffusion: How widely was it diffused? How wide an audience was reached?

Relevance to Natura 2000: In what ways is the initiative relevant to managers of Natura 2000 sites? How could the initiative be applied to Natura 2000 sites?

What were the results of the interviews?

Impact and influence

Some of the selected initiatives are particularly significant because of their impact and subsequent influence. These are the initiatives which, when placed in context, were especially innovative or generated other initiatives. The World Charter for Sustainable Tourism (1995), for example, had a large media impact internationally and conveyed a message about sustainable tourism that has served as a base-line reference for other initiatives. The charter has been widely distributed in a form of a booklet and is now available on the WTO and UNEP Internet site.

Content

In other cases, it is the content of the initiative that stands out. Several initiatives provide guidelines for a specific type of ecosystem (mountain, coastal, rural…) or protected area (national park, nature park…) such as those mentioned from the Council of Europe which provide recommendations for protected areas (1995) and coastal areas (1997). In contrast, other initiatives refer to sustainable tourism in more global terms or present wide general principles.

Format and intended audience

The format of each initiative depends on the purpose of the document and the audience it intends to reach. Selected initiatives, which are widely read and easy to use, are highlighted as being especially accessible. "Loving them to death?" (1993) and "Integrated Quality

Management in Rural Destinations" (1999) are examples of documents which are easy to use, are well laid out and include case studies illustrating good practice in action.

Relevance to Natura 2000

The initiatives selected are of relevance to Natura 2000 to a greater or lesser extent. The EUROPARC Charter and the PAN Parks Principles and Criteria are the most relevant initiatives today, because they are aimed at protected areas and they promote a conservation and tourism strategy. They constantly refer to the protection of endangered habitats and species. However, some other initiatives will be of importance as well when contracting with the tourism industry. For instance, the Tour Operators' Initiative (1999) supported by UNEP, is very likely to be of relevance to Natura 2000 sites as it envisages supporting conservation projects in natural sites.

Why are these initiatives so diverse?

The selected initiatives illustrate the diversity of existing initiatives concerning sustainable tourism. This diversity does not facilitate the use of these initiatives by those in the field. Moreover, many of the initiatives do not specify who they are aimed at, and why exactly they were developed. This analysis is an initial attempt to clarify their status and facilitate their use.

They address protected areas in different ways. According to their different objectives, they focus on areas ranging from specific destinations and types of protected area or ecosystems to more global issues.

They address different interest groups. They are often aimed at several players: The tourism industry, managers of protected areas, Member States, tourists, host populations, administrations...

They have different spheres of influence**:** Member States of the European Union (4 of the selected initiatives), Europe extended to the EEC (2), the Mediterranean (2) International (8),

They are named after different types of document*:* Six recommendations; one charter (a kit with methodology, action plan, strategy, statement of commitment), one conference report, one statement of commitment, one set of guiding principles, two sets of guidelines, two codes of conduct or ethics, one certification process (criteria for developing a strategy and action plan for the certification process), one declaration (consensus at the end of a conference)

They are promoted and supported by different types of organisation: International organisations (UNEP, Council of Europe, INSULA, UNESCO, and WTO), NGOs (WWF, IUCN), Institutions (Secretariat Convention on Biodiversity, European Commission), Intergovernmental organisations, Tourist industry associations (on a local, regional or international scale), Consultative bodies (MCSD)

They are disseminated according to their format: Official document or report for Member States, publications, conference declarations, contractual commitment, working document, examples of good practice.

They are disseminated in different ways: Printed and disseminated on request, available on an Internet site, or are not for public distribution.

Which initiatives were selected?

The following initiatives have been selected and summarised in a table. More comprehensive details and practical information about each initiative can also be found in annex where each initiative is presented individually in a common framework.

1. LOVING THEM TO DEATH? 1993

(EUROPARC Federation, Kröllstrasse 2, D-8352 Grafenau, Germany, Tel. +49 8552 2839).
The result of a study of the management of tourism in protected areas by a working group to provide guidelines for managers of protected areas. The publication includes special guidance for developing tourism in particularly sensitive areas (mountains, coasts, Mediterranean regions, wetlands) and makes recommendations for action by international organisations, national governments and the tourism sector.

2. THE EUROPEAN CHARTER FOR SUSTAINABLE TOURISM IN PROTECTED AREAS, 1999

(FFPNR, 4, rue de Stockholm, 75008 Paris, France, Tel. +33 1 44 90 86 20)
An initiative which emerged from the report "Loving them to death?", the Charter addresses protected areas, providers of tourism services and tour operators. It contains principles for sustainable tourism, and a detailed methodology for the preparation and implementation of a sustainable tourism strategy. Those who sign the Charter commit themselves to defining a strategy and action plan.

3. PAN PARKS, 1999

(WWF International, Avenue du Mont Blanc, 1196 Gland, Switzerland, Tel. +41 22 364 9426, Internet site: http://www.panparks.org)
A follow-up to the World Conservation Union's (IUCN) recommendations in 'Parks for Life' (1992), this initiative aims to create a pan-European network of large-scale, well-managed protected areas awarded the PAN Parks quality mark. It includes principles and criteria to be met for the development of a sustainable tourism strategy and for the award of the logo.

4. TOWARDS QUALITY RURAL TOURISM - INTEGRATED QUALITY MANAGEMENT (IQM) OF RURAL TOURIST DESTINATIONS, 1999

(European Commission Enterprise Directorate, 200 re de la Loi, B-1049 Brussels, Belgium, Tel. +32 2 296 9700)
The result of a study into how the concept of IQM can be applied to the management of sustainable tourism in Europe's rural tourist destinations. Aimed at all those concerned with the management of rural areas, it sets out recommendations based on the analysis of 15 case studies of good practice.

5. PARKS FOR LIFE: ACTION FOR PROTECTED AREAS IN EUROPE, 1994

(IUCN Publications Services Unit, 219c Huntingdon Road, Cambridge, CB3 0DL, UK)
A well-detailed publication intended as an action plan for protected areas in Europe. It sets outs the policies and actions which each country should make to ensure an adequate, effective, well-managed network of protected areas. Important initiatives are endorsed, recommendations are made to governments and 30 priority projects are highlighted. This action plan was updated in 1997.

6. TOUR OPERATORS' INITIATIVE, 1999

(Secretariat Tour Operators' Initiative for Sustainable Tourism Development, UNEP, division of Technology, Industry and Economics, 39-43, Quai André Citroën, 75739 Paris Cedex 15, France, Tel. +33 1 44 37 14 50, Internet site: http://www.toinitiative.org)

A voluntary, non-profit-making initiative open to all tour operators regardless of their size or geographical location. Tour operators sign a statement of commitment committing themselves to putting into practice the various principles of sustainable development.

7. ECOTOURISM DIAGNOSTIC AND PLANNING GUIDELINES FOR PROTECTED AREAS MANAGERS, 1992

(WWF US, 1250 24th Street N.W., Washington D.C. 20037, USA, Tel. +1 202 778 9624)

A concise method for creating an ecotourism strategy developed by WWF in the USA for managers of protected areas in the form of a technical paper. This document has been widely used in the Southern Hemisphere by protected area managers.

8. TOURISM, ECOTOURISM AND PROTECTED AREAS, 1996

(IUCN, IUCN Publications Services Unit, 219, Huntingdon Road, Cambridge CB3 0DL, UK/ IUCN Communications Division, rue Mauverney 28, CH-1196 Gland, Switzerland)

A comprehensive publication, which reviews the state of nature-based tourism internationally and provides guidelines and case study examples targeted at protected area planners and managers for its development.

9. GUIDELINES: DEVELOPMENT OF NATIONAL PARKS AND PROTECTED AREAS FOR TOURISM, 1992

(IUCN, WTO, c/Capitan Haya, 42, 28020 Madrid, Spain, Tel. +34 1 571 0628/ UNEP, Tour Mirabeau, 39-43 Quai André Citroën, 75739 Paris, France, Tel. +33 1 40 58 88 50)

Guidelines, which aim to encourage appropriate tourism development, targeted at those concerned with the management of national parks and protected areas, particularly in less economically developed countries.

10. COUNCIL OF EUROPE RECOMMENDATIONS, 1993/1999

(Council of Europe, F-67075 Strasbourg Cedex, France, Tel. +33 3 88 41 22 64)

The Council of Europe has produced two official documents, which concern environmentally friendly tourism development in protected areas directly. It has provided recommendations for sustainable development in protected areas (1995) and in coastal areas (1997). Both are aimed at the 41 Member States, EEC included and are approved by the Committee of Ministers.

11. WORLD CHARTER FOR SUSTAINABLE TOURISM 1995

(INSULA, Internet site: http://www.insula.org)

The declaration made at the World Conference for Sustainable Tourism in Lanzarote (27-28 April 1995) comprising principles and criteria for sustainable tourism. With 1000 participants and significant media coverage, the conference declaration aimed to contribute to the implementation of sustainable tourism initiatives and policies, by raising awareness among international, national and local authorities.

12. CONVENTION ON BIOLOGICAL DIVERSITY 1992

(Convention on Biological Diversity Internet site: http://www.biodiv.org)

An international legal instrument for the conservation and sustainable use of biological diversity opened for signature on 5 June 1992 at the United Nations Conference on Environment and Development (the Rio "Earth Summit") and ratified in 1993 with 168 signatures.

13. DRAFT PRINCIPLES FOR (THE) IMPLEMENTATION OF SUSTAINABLE TOURISM, 1998

(UNEP Division of Technology, Industry and Economics, Internet site: http://www.uneptie.org/tourism/new.html)

An official report that consolidates existing guidelines into a set of key principles aimed at guiding governments, intergovernmental, private sector and other organisations in the integration of sustainable tourism into their overall policies for sustainable development.

14. BLUE PLAN, 1999

(Blue Plan, 15, rue L. Van Beethoven, Sophia-Antipolis, 06560 Valbonne, France, and Tel. +33 4 92 38 71 30)

A document produced by the Blue Plan, one of the regional centres of the Mediterranean Action Plan (MAP), which presents recommendations and proposed action for tourism and sustainable development in the Mediterranean adopted by the Contracting Parties to the Barcelona Convention.

15. INTERNATIONAL CONFERENCE ON SUSTAINABLE TOURISM IN SMALL ISLAND DEVELOPING STATES (SIDS) AND OTHER ISLANDS, 1998

(WTO, UNEP Division of Technology Industry and Economics, Internet site: http://www.uneptie.org/tourism/confer.html)

A report produced following the conference held in Lanzarote (25-28 Oct. 1998). It includes recommendations to the United Nations Commission on Sustainable Development (CSD) which focus on the specific requirements of small islands and in particular of small island developing states (SIDS).

16. GLOBAL CODE OF ETHICS FOR TOURISM 1999

(WTO, Internet site: http://www.world-tourism.org)

A 10 point code of ethics aimed at tourist destinations, governments, tour operators, travel agents, workers and travellers. It includes the creation of a World Committee on Tourism Ethics to act as a conciliation mechanism to ensure the implementation of the Code.

17. RESPONSIBLE TOURISM IN THE MEDITERRANEAN, 1999

(WWF Mediterranean Programme, Via Po 25c, 00198 Rome, Italy)

A set of general principles and a code of conduct developed to address specific issues related to tourism in the Mediterranean, which target tourists, the tourist industry and government authorities.

Summary table of 17 selected initiatives relevant to Natura 2000 stakeholders

Name of the initiative	Promoter	Type of promoter	Focus area	Type of initiative	Aimed at	Date	Sphere of influence	Format	Place of distribution	Langs.
1. Loving them to death?	**EUROPARC Federation**	European voluntary organisation	National Parks Nature parks	• Guidelines for the development of tourism in protected areas • Recommendations for developing tourism in particularly sensitive areas • Recommendations to international organisations, national governments and the tourism sector	• Managers of protected areas • Governments • International organisations • Tourism professionals	1993	European Union countries	• Publication • Recommendations • 15 case studies of good practice	FFNPE Kröllstrasse 5 8352 Grafenau Germany Tel +49 8552 2839 Fax +49 8552 3242	Eng. Fr. Ger. Sp.
2. European Charter for Sustainable Tourism in Protected Areas	**EUROPARC Federation, French Federation of Regional and Nature Parks (FFPNR)**	European voluntary organisation	National parks Nature parks	• Charter • Principles • Methodology for the preparation of a strategy and action plan • Checklist for evaluation • Case studies	• Managers of protected areas • Tourism businesses • Tour operators and transport companies	1999	European Union countries	3 reports: • Brochure of official text • Principles and methodology • Brochure of case studies	Fédération des Parcs Naturels Régionaux de France 4, rue de Stockholm 75008 Paris France Tel +33 1 44 90 86 20 Fax 33 1 45 22 70 78	Eng. Fr. Ger. Sp. Catalan It.
3. PAN Parks	**WWF**	Independent conservation organisation	Protected areas	Principles and Criteria (final draft in process)	• Managers of protected areas • Tourism businesses • Other private sector organisations	1997	European	Draft document	WWF International Avenue du Mont Blanc 1196 Gland Switzerland Tel +41 22 364 9426 Fax +41 22 364 3239 Internet site: http://www.panparks.org	Eng.

4. Towards quality rural tourism : Integrated Quality Management (IQM) of Rural Tourist Destinations	**European Commission DG Enterprise**	Institution	Rural tourist destinations	• Recommendations • Code of practice • 15 case studies	Organisations responsible for tourism in rural destinations: • Local authorities • Governments • Politicians • Managers in related sectors	1999	European Economic Area Countries	Publication	Enterprise Directorate General (Tourism Unit) 200 Rue de la Loi 1049 Brussels Belgium Tel +32 2 296 9700 Fax +32 2 295 6969	Eng. Fr. Ger.
5. Parks for Life : action for protected areas in Europe	**IUCN**	Non-governmental organisation	Protected areas	An action plan for Europe's protected areas made up of: • The endorsement of existing initiatives • Recommendations • 30 priority projects	• Decision-making governmental and non-governmental organisations • Managers of PA • Local communities • Businesses • Land owners • The general public	1994	All Europe, EEC countries included	Publication	IUCN Publications Services Unit 219,Huntingdon Road Cambridge CB3 0DL UK	Eng. Fr. Sp. Ger.
6. Tour Operators' Initiative for Sustainable Tourism Development	**UNEP**	International organisation	Global	• Statement of commitment • Principles for sustainable tourism • Programme of activities	Tour operators	2000	International	Statement of commitment Constitution Questionnaire	Secretariat The Tour Operators' Initiative for Sustainable Tourism Development UNEP DTIE 39-43, Quai André Citroën 75739 Paris Cedex 15 France Tel +33 1 44 37 14 50 Fax +33 1 44 37 14 74 E-mail uneptie@unep.fr Internet site: http://www.toinitiative.org	Eng.
7. Ecotourism Diagnostic and Planning Guidelines for Protected Areas Managers	**WWF US (Author: E. Boo)**	Independent conservation organisation	Protected areas	• Guidelines • Methodology for the creation of an ecotourism strategy	Managers of protected areas	1992	International	Technical paper	World Wildlife Fund 1250 24th Street N.W. Washington D.C. 20037 Tel +1 202 778 9624 Fax +1 202 293 9211	Eng. Fr. Sp.

8. Tourism, Ecotourism, and Protected Areas	**IUCN (Author: H. Ceballos-Lascurain)**	Non-governmental organisation	National parks Protected areas	Essential guidance on: • Tourism and the Environment • Negative tourism impacts • Government policy • Creating and managing tourism in protected areas • Assessing, monitoring and management techniques • Preparing protected areas for tourism	Protected area planners and managers	1996	International	Publication	IUCN Publications Services Unit 219, Huntingdon Road Cambridge CB3 0DL UK IUCN Communications Division Rue Mauverney 28, 1196 Gland Switzerland	Eng.
9. Guidelines : Development of National Parks and Protected Areas for Tourism	**WTO, UNEP, IUCN (Authors: H. Ceballos-Lascurain, J.A. McNeely, J.W. Thorsell)**	International organisations	National parks and protected areas in less economically developed countries	Guidelines on: • Costs and benefits of tourism • Tourism considerations in the selection of areas for National Parks • Capacity limits • Planning • Guidelines for the development of facilities • Hunting in protected areas • Guidelines for providing education and interpretation programmes	Organisations responsible for the management of national parks and protected areas: • Managers of protected areas • Administrations • Local communities	1992	International	Publication	WTO C/ Capitan Haya, 42 28020 Madrid Spain Tel +34 1 571 0628 Fax +34 1 571 3733 UNEP Tour Mirabeau 39-43, Quai André Citroën 75739 Paris France Tel +33 1 40 58 88 50 Fax +33 1 40 58 88 74	Eng. Fr. Russ. Sp.
10. Council of Europe Recommendations	**Council of Europe**	Intergovernmental Organisation	Protected areas Coastal areas	• Recommendations • Principles and guidelines	41 Member States	1993 /99	Europe, EEC countries included, 41 Member States	Official document approved by the Committee of Ministers	Mme Bouguessa Council of Europe 67075 Strasbourg France	Eng. Fr.

11. World Charter for Sustainable Tourism	**WTO, Insula, UNESCO, UNEP, UN, European Commission, Spanish authorities**	Intergovernmental organisations	Tourist destinations world-wide	• Declaration • Set of principles and criteria	• The international community • Governments • Public authorities • Decision makers • Tourism professionals	1995	International	Booklet	Insula internet site: http://www.insula.org	Eng. Fr. Sp.
12. Convention on Biodiversity and Tourism	**Secretariat of the Convention on Biological Diversity**	Institution	Global	• International agreement on biological diversity and tourism • Principles • Recommendations	Contracting States	1997	International	Official report	Internet site: http://www.biodiv.org	Arabic Chinese Eng. Fr. Russian Sp.
13. Draft principles for the implementation of sustainable tourism	**UNEP**	International organisation	Global	Set of proposed principles (the consolidation of existing guidelines)	• Governments • Intergovernmental organisations • Private sector organisations	1998	International	Draft	Not for public distribution UNEP Division of Technology, Industry and Economics Internet site: http://www.uneptie.org/tourism/new.html	Eng.
14. Blue Plan	**Mediterranean Commission on Sustainable Development (MCSD)**	Consultative body	Mediterranean	• Recommendations on tourism and sustainable development in the Mediterranean • Proposed actions	21 Contracting Parties to the Barcelona Convention	1999	Mediterranean regions, EU plus all Mediterranean countries	Official document	Blue Plan 15 rue L. van Beethoven 06560 Valbonne France Tel +33 4 9238 7130 Fax +33 4 9238 7131 E-mail planbleu@planbleu.org Internet site: http://www.planbleu.org	Fr. Eng.
15. Conference on Sustainable Tourism in small island developing states (SIDS) and other islands	**WTO, UNEP**	International organisations	Small islands and in particular Small Island Developing States (SIDS)	• Recommendations • Key issues • Case studies	• Governments in small island (and in particular SIDS) • Private sector organisations • The international community	1998	International	Report	UNEP Division of Technology, Industry and Economics Internet site: http://www.uneptie.org/tourism/confer.html	Eng. Fr. Sp.

16. Global Code of Ethics	**WTO**	Intergovernmental organisation	Tourist destinations world-wide	10 point code of ethics: • 9 articles outlining 'rules of the game' for tourism • 10th article for the creation of a World Committee on Tourism Ethics	• Destinations • Governments • Tour operators • Travel agents • Workers • Travellers	1999	International	Code	WTO internet site: http://www.world-tourism.org	Eng. Fr. Sp.
17. Responsible Tourism in the Mediterranean	**WWF**	Independent conservation organisation	Mediterranean destination	• Principles • Code of conduct	• Tourists • Tourism industry • Government authorities	1999	Mediterranean	Short publication	WWF Mediterranean Programme Via Po 25c 00198 Rome Italy	Eng.

A detailed presentation of the two most relevant initiatives

Two initiatives have been identified as the most relevant to characteristics of Natura 2000. They address protected areas specifically on a European level. They have been developed through a wide consultation process with the help of a steering committee and tested throughout several pilot parks. They are widely disseminated in Europe.

They are:

- ☞ The European Charter for Sustainable Tourism in Protected Areas (EUROPARC / FFPNR) resulting from the recommendations of "Loving them to death?",

- ☞ The W.W.F. PAN Parks Principles and Criteria,

The guidelines for implementation of the European Charter for Sustainable Tourism and the PAN Parks Criteria and Principles (3rd draft), are provided in annex.

THE EUROPEAN CHARTER FOR SUSTAINABLE TOURISM IN PROTECTED AREAS

The EUROPARC Federation (the Federation of National and Nature Parks of Europe), founded in 1973, is a politically independent pan-European organisation that works to support and enhance the full range of European protected areas.

Since the 1990s, the question has been raised of the compatibility of nature conservation and tourism in Europe's protected areas. Europe's protected areas are becoming increasingly popular tourist destinations, although most of these fragile regions are ill prepared to receive crowds of visitors.

In 1991, the EUROPARC Federation, aware of this threat, launched an initial study of protected areas and the tourist trade involving more than fifteen European representatives. The project aimed to define guidelines for developing sustainable tourism within and around protected areas and to identify case studies illustrating how sustainable tourism was being developed.

The publication "Loving them to death"

Their work culminated in the publication of the report "*Loving them to death?"* in 1993, a highly practical guide dealing with the appropriate control of tourism in protected areas

The publication reviews tourism and protected areas, and provides:

- **General guidelines** for the development of sustainable tourism in and around protected areas
- **Special guidance** for developing tourism in special areas (mountain areas, coastal areas, Mediterranean regions, wetlands)
- **Recommendations** for action by international organisations, national governments and the tourism sector

One of the publication's recommendations was for the creation of a '**European Charter for Sustainable Tourism**' which would regulate relations between the Parks, providers of tourism services and tour operators. The Federation of National and Nature Parks of Europe had taken part in the report, and was asked to put this into practice.

The European Charter for Sustainable Tourism

In 1995 the European Commission DG Environment financed a LIFE project led by the FFPNR, on behalf of EUROPARC, to establish the Charter.

The preparation of the Charter was based on two ideas:

- bringing together tourism professionals and managers of Protected Areas to form a working group
- basing their work on pilot projects in several Member States of the EU

The Charter was drafted by a Steering Committee made up of representatives of protected areas, the tourism industry and international organisations. Ten pilot parks from six European Union countries took part in the trial phase of the Charter over a period of three years. The text of the Charter was officially presented in April 1999 in Lilles, France.

The Charter consists of three documents:

- ☞ **The official text of the Charter**
- ☞ **A guide to the implementation of the Charter which includes an extensive evaluation checklist**
- ☞ **A brochure outlining the experiences of pilot parks**

Using the Charter

The Charter seeks to be a practical tool in the hands of protected areas, tourist service providers and tour operators. It is presented in kit form:

- The **main principles** and a **detailed methodology** for the preparation and implementation of a sustainable tourism strategy

- An **evaluation process** for the definition of the strategy and the action plan. This is based on a table of criteria aimed to help form an accurate diagnosis of the strengths, weaknesses and potential of the area, and to evaluate how efficient the measures taken have been at the end of the period. Points from 1 to 5 are allocated for various criteria, based on the judgement of their initial state, their level of relevance and level of improvement.

It is aimed at the authorities responsible for the protected areas, the tourism industry and the local community.

Its purpose is to act both as a standard and guidelines, helping each signatory develop high-quality, sustainable tourism, defined as:
"*any form of development or management of tourism activities ensuring the long-term protection and preservation of natural, cultural and social resources and contributing in a positive and*

equitable manner to the economic growth and well-being of individuals living in, working in or visiting the protected areas".

Participation in the Charter is both voluntary and contractual. Protected areas who sign the Charter commit themselves to respecting the principles of sustainable tourism, and defining a strategy and an action plan.

- ***The protected area*** is committed to a strategy and a 5 year action plan, defined in partnership with local tourist businesses and local residents. This intervention ensures consistency between policies and actions in the area.

- ***Tourism service-providers*** define a strategy and a 1-year action plan contributing to the achievement of the area's objectives. In particular, they undertake to adopt management methods, which respect the environment, to value the natural and cultural heritage and to make customers environmentally aware.

- ***Tour operators and transport companies*** are not generally present in the area. Their responsibility is to inform visitors and make them aware, select suppliers who are signatories to the Charter, and support the areas in the marketing of tourist products.

10 principles for sustainable tourism as set out in the Charter

✓*Respect the limits of carrying capacity*
✓*Contribute to heritage conservation and enhancement*
✓*Preserve natural resources*
✓*Support the local economy*
✓*Promote the involvement of local residents*
✓*Develop appropriate high-quality tourism*
✓*Make protected areas accessible to everyone*
✓*Develop new forms of employment*
✓*Encourage behaviour that respects the environment*
✓*Serve as a model for other economic sectors and influence their practices.*

The definition of a strategy and an action plan

The definition of a strategy takes these principles into account, and follows a standard pattern set out in the Charter:

1. Diagnosis
Complete diagnosis of the needs and constraints of the area (environmental, social, economic)
2. Consultation and involvement of all partners
Involvement of local authorities, the local community and providers of local tourist services
3. Definition and implementation of an action plan
The action plan must include a description of the current situation, the main development objectives, and improved criteria and tools for evaluation
4. Evaluation
In theory, the Charter comprises an evaluation process whereby a technical committee evaluates the results of the strategy and the five year action plan and recognises the area as an "area of excellence in the development of sustainable tourism in protected areas".

The key issues surrounding the Charter at present are:

- the actual make-up of the technical committee and the evaluation process
- the form that the final product will take (label, quality mark…)
- sources of funding

As it stands, the Charter has developed a process aimed at improving quality in protected areas. The structure of the Evaluation Committee is still to be defined, and the question of what is to be awarded to the successful protected areas remains as yet unresolved.

The practical application of the Charter

In 1995, 10 European parks became involved in the Charter as pilot parks and made possible the testing of the criteria, which were being developed. During this trial phase, the Charter was tested in different kinds of protected area (national and regional nature parks) and in different situations.

In 2000, 18 parks have signed the Charter, out of which two parks (Zona Volcanica de la Garrotxa Nature Park and Alpi Marittime Nature Park) have reached the final stages of the definition of their strategy and action plan and are ready to undergo evaluation. 10 of these Park are French. Other than in France, parks in Austria, Germany, Italy, UK, Portugal and Spain have become signatory parks.

The Charter's Pilot Parks

Austria	Hohe Tauern National Park
Belgium	The Hautes Fagnes-Eifel Nature Park
France	Cévennes National Park
	Vosges du Nord Regional Nature Park
Italy	Abruzzes National Park
	Alpi Marittime Nature Park
Spain	Sierra de Cazorla Segura y las Vilas nature Park
	Zona Volcanica de la Garrotxa Nature Park
UK	Broads national Park
	Exmoor National Park

The signatory parks today

Austria	Hohe Tauern National Park
Germany	Naturpark Frankenwald
	Naturpark Steinhudermeer
	Naturpark Insel Usedom
France	Avesnois Regional Nature Park
	Cévennes National Park
	Lubéron Regional Nature Park
	Marais du Cotentin et du Bessin Regional Nature Park
	Martinique Regional Nature Park
	Scarpe Escaut Regional Nature Park
	Vercors Regional Nature Park
	Verdon Regional Nature Park
	Vexin français Regional Nature Park
	Vosges du Nord Regional Nature Park

Italy	Abruzzes National Park
	Alpi Marittime Nature Park
	Monti Sibillini National Park
Portugal	Peneda Gerês National Park
	Serra de S. Mamede Nature Park
Spain	Zona Volcanica de la Garrotxa Nature Park
UK	Exmoor National Park

The future of the Charter

The Charter is listed among the priority projects adopted by the World Conservation Union (IUCN) in its action programme for European Protected areas 'Parks for Life. It also pursues the principles for sustainable tourism as formulated by the 1995 World Conference on Sustainable Tourism held in Lanzarote.

The successful application of the Charter depends to a great extent on the protected area itself. The protected area must decide how to translate the Charter in practice, adapting it to the characteristics of their site.

Some parks, such as the Zona Volcanica de la Garrotxa Nature Park in Catalonia, have developed the Charter further than others. The case study of La Garrotxa Nature Park is described in chapter 5, good practice in action.

The FFPNR is currently working on the definition of a mechanism for labelling and evaluating the work of the signatory parks. The next step will be to ensure funding and supporting funds for signatory parks.

Once these are resolved, the FFPNR plans to help implement strategies by means of training programmes and assistance and publicise the Charter to encourage its implementation in other protected areas. A Leonardo training programme and manual is under way to help implement the charter.

Key principles of the Charter:

- Starting from the needs of the area (environmental, economic, social and tourism needs)
- Carrying out a complete survey of the strengths, opportunities, needs and weaknesses
- Working in partnership with all stakeholders, establishing ways of working together
- Designing and implementing a strategy and an action plan
- Setting up criteria to follow up the strategy and monitor results regularly.

. THE PAN PARKS PRINCIPLES AND CRITERIA

Initiated by the WWF and the Molecanten Group (a Dutch leisure company), **PAN (Protected Area Network) Parks** is an initiative which aims to establish a recognisable pan-European network of unique and well-managed protected areas which welcome visitors while giving priority to nature conservation.

The PAN Parks project began as an idea in 1997, and has generated a lot of enthusiasm. As a result, the PAN Parks process is now well underway.

The central idea of the concept is that nature can become the driving force for healthy economic development in the rural areas of Europe. PAN Parks aims to change tourism in Europe's protected areas from a threat into an opportunity by building partnerships with nature conservation groups, travel agencies, the business community and other interest groups on a local, national and international level.

The initiative aims to provide a nature based response to the growing market of nature-oriented tourism by creating a quality mark standing for:

- an expanding network of well-managed protected areas with high conservation value,
- sustainable tourism development of regions and local communities surrounding protected areas,
- responsible high quality nature-based experiences for visitors and tourists,
- the creation of public awareness, appreciation and support for nature conservation,
- the generation of wide political and financial support at all levels for nature conservation.

Once created, the network of highly protected areas will be co-ordinated by a PAN Parks managing body. As well as being a tool for joint marketing and communication, PAN Parks will create economic incentives for nature conservation through the building of partnerships with the private sector.

This quality mark will be awarded to protected areas and companies that fulfil the PAN Parks Verification Principles and Criteria. When finalised, these principles and criteria will form the basis of PAN Parks.

In 1998, seven pilot parks signed a letter of intent to co-operate as pilot areas. Since then, a PAN Parks logo has been developed. The third draft of the Principles and Criteria (October 1999) has been tested in 17 protected areas and is currently being finalised. The network of PAN Parks is expected to be in place by mid 2001.

Principles and Criteria

The Principles and Criteria (P&C) for the award of the PAN Parks logo form the core of the PAN Parks programme. The process of developing this document began in autumn 1998 and has been prepared on the basis of literature and experts' interviews and comments, and on the basis of best practices found in Europe's protected areas. Currently in its third draft, the final document is due to be finalised by July 2000.

PAN Parks Principles and Criteria consists of five principles (cf the complete list of principles and criteria in the annex)

Principles 1-3 cover criteria and indicators for the protected areas and management body (it is the protected area which becomes the actual PAN Park)

Principle 4 sets criteria for a sustainable tourism development strategy to be developed by park managers and relevant interest groups in the region, which will be evaluated

Principle 5 covers criteria and indicators for commercial partners (including tourism accommodation etc.)

The guiding principle in the P&C drafting process has been to elaborate strict quality standards, applicable to different types of nature and administration of protected areas in Europe. The PAN Parks label must prove that endangered flora and fauna of a protected area are protected, and that tourists can visit the park without causing any harm to nature conservation.

Principles 1-3:
These cover detailed criteria necessary for a protected area to become a PAN Park. **PAN Parks will be large areas; strictly protected core areas must be at least 10,000 hectares.** This is important because large protected areas are necessary for the long term conservation of ecological processes and threatened species. There are 2 levels of PAN Parks:

Candidate PAN Park	Areas, which, according to independent verification, meet all essential criteria, but have some minor shortcomings. These parks can get Candidate PAN Parks status, provided they are commited to overcoming all of these shortcomings in 5 years, after which time, they will be reviewed.
PAN park	Areas that, following independent verification meet all PAN Parks P&C.

The PAN Parks logo will only be awarded to parks with high-standards of nature protection, which offer a variety of nature-based activities and facilities, and where visitors can observe and experience wildlife and other natural based features without causing disturbance to nature.

The implementation of a management plan for nature protection will be necessary and must be supported by relevant research and monitoring. Similarly, a visitor management plan is required, including, for example, an inventory of the number and type of visitors, and an estimate of the future trends.

Principle 4:
PAN Parks require the preparation of **a strategy for conservation and sustainable tourism development** for the area concerned. Park managers and relevant interest groups set out numerous criteria and indicators for the development of this strategy. Commercial partners wishing to use the PAN Parks trademark and logo must follow the strategy.

The aim is to ensure that tourism supports nature conservation in the protected area. This means, for example, that a certain share of the profits that tourism brings to the region must return to the "green magnet", for investment in the protected area and its management.

Principle 5:
In order to ensure that nature-oriented tourism brings long-term benefits and jobs to local communities surrounding the protected area, criteria are set out concerning local businesses.

Between December 1999 and March 2000, the Principles and Criteria (third draft) were tested on a large scale. Results of the consultation process and field-testing will be analysed and from that basis, the final version will be prepared. The ultimate responsibility to approve the final document lies with the PAN Parks Supervisory Board. These are vital steps towards the implementation of a full scale PAN Parks system across Europe.

The Practical application of the Principles and Criteria

Pilot areas
WWF is working closely with seven pilot areas on the concept of PAN parks. The areas have signed a letter of intent stating their willingness to work on the initiative.

April 1998:	Bialowieza (Poland) Slovensky raj (Slovakia) Dadia Forest Reserve (Greece)
September 1998:	Duna-Drava (Hungary) Sumava (Czech Republic) Abruzzo (Italy)
April 1999:	Biebrza (Poland)

These will not necessarily be among the first PAN Parks. However, in return for their valuable input, the PAN Parks Organisation provides the pilot areas with support, promotion and funding for small scale projects.

Self-assessment participants
17 protected areas, most of them National Parks, from 14 European countries participated in a self-assessment process between December 1999 and March 2000. The aim of self-assessment was to test the third draft of the Principles and Criteria.
The participating protected areas range from well-established national parks, to newly established nature reserves. The geographic make-up of these protected areas is diverse and includes such ecosystems as deciduous forests, river valley systems, coastal island groups and wetland habitats.

These areas were selected on an ad hoc basis and will not necessarily become the first PAN Parks.

- Bulgaria — Strandzsa National Park
- Czech Republic — Sumava National Park
- Finland — Oulanka National Park
  The Southern Archipelago National Park
- France — Mercantour National Park
- Greece — Dadia Forest Reserve
- Hungary — Duna-Drava National Park
- Latvia — Kemeri National Park
- Poland — Bialowieza National Park

	Bieszcady National Park
	Biebrza National Park
☞ Portugal	Guadiana National Park
☞ Romania	Retezat National Park
☞ Slovakia	Slovensky raj National Park
☞ Sweden	Fullfjallet Nature Reserve
☞ The Netherlands	Terschelling National Park
☞ Turkey	Dilek Peninsula National Park

The self-assessment participants completed a comprehensive self-assessment questionnaire focusing on management policy, visitor management and sustainable tourism development. This questionnaire was based directly on the third draft of the PAN Parks Principles and Criteria. It was evaluated by the PAN Parks European Management Organisation.

The self-assessment process highlighted the following issues:

- ✓ Out of the 17 protected areas, about 4 or 5 already meet most of the necessary criteria to become PAN Parks
- ✓ Although the areas have found the PAN Parks criteria strict, they do not think that the standard should be lowered

The self-assessment process has been a way of turning the initiative into an operational programme by testing the Principles and Criteria on the ground. The results have provided feedback necessary for the finalisation of the PAN Parks Principles and Criteria document.

Steps to becoming a PAN Park:

Step 1	Complete the PAN Parks Self-assessment Questionnaire
Step 2	Compile a working report on the results of self-assessment
Step 3	Carry on an evaluation of the site by an independent certification body
Step 4	Submit the evaluation report to the PAN Parks Principles and Criteria Standard Committee
Step 5	The PAN Parks European Management Organisation will review the result of self-assessment and check whether the PAN Parks label can be awarded

Once a protected area has been certified as a PAN Park, commercial partners in the region of the park can also apply for the PAN parks logo. They too have to meet special conditions and undergo an independent certification process.

The future of PAN Parks

The Principles and Criteria are due to be updated and finalised by July 2000. Once a network of PAN Parks is in place (expected in mid 2001), the PAN Parks product will be launched and a promotional and communication strategy put into action.

Key principles of PAN Parks:

- A basis for partnership between relevant stakeholders
- Raising awareness, pride and a sense of ownership
- Action on a pan-European scale
- Incentive to allow external verification
- Providing economic support for conservation

A comparative analysis of the European Charter for Sustainable Tourism and PAN Parks

. TWO INITIATIVES SUPPORTED AND PROMOTED BY THE SAME ORGANISATIONS

The EUROPARC Charter and the PAN Parks initiative are in line with ”Parks for Life: Action for Protected Areas in Europe“, the first ever action plan for protected areas in Europe. The plan was prepared by the IUCN, together with the EUROPARC Federation, WWF, BirdLife International and WCMC, in co-operation with around 200 contributors from all around Europe. The aim of the Parks for Life programme was simple: ”An adequate, effective and well-managed network of protected areas in Europe“.

This short comparison and analysis of two initiatives on sustainable tourism and protected areas in Europe, supported and promoted by the ”Parks for Life“ is an extract from a paper presented at the Lisbon conference by Andrej Sovinc, "Parks for Life" co-ordinator at IUCN. The presentation is based on summarising the main points of the two initiatives and the points raised might sometimes be simplified.

The preparation of the Charter was listed as one of the ”Parks for Life“ Priority Projects. The IUCN/World Commission on Protected Areas (WCPA) was represented at the Steering Group for this project. ”Parks for Life“ was also involved in the process of setting up the PAN Parks process (an ongoing co-operation) from its early stages as the PAN Parks concept is foreseen as a ”recognisable network of well-managed protected natural areas which welcomes visitors and avoids potentially conflicting activities“. This viewpoint clearly indicates the links with the above-mentioned overall aim of ”Parks for Life“.

. SIMILARITIES, DIFFERENCES AND COMPLEMENTARITIES

Some of the similar or indentical principles of both intiatives

Both the Charter and PAN Parks initiatives:

1) provide concepts for encouraging and managing tourism in protected areas in harmony with the suitable management of natural resources and for the socio-economic benefits of stakeholders.
2) are built on the concepts on partnerships between protected areas, tourism and other businesses and the local population, and of supporting conservation and socio-economic development through tourism.
3) Aim to develop a 'quality brand' for partners involved in the process (protected areas and businesses) which must undergo an independent certification process. (It should be noted that several ”labels“ for tourism industry already exist such as the Council of Europe's ”European Diploma“ for well-managed protected areas).
4) Require the preparation of a strategy for conservation and sustainable tourism development in the area concerned.
5) Involve a ”testing phase“ in evidence in the Charter's ”10 Pilot Parks“ and PAN Parks's self-assessment process.

6) Aim to involve mainly large protected areas, such as National and Regional Parks, with high tourism ambitions and high potentials for the conservation of species, habitats and landscapes. The PAN Parks concept, in principle, defines the minimum size of protected areas to be involved (25.000 ha).

Complementary points of both intiatives

Geographical influence

- Although both initiatives aim to become Pan-European, the Charter, at present, is designed for the EU Member States only (and therefore needs adapting for the CEE countries).
- The PAN Parks initiative started in the CEE National Parks (at present there are seven National Parks from the EU Member States involved). This initiative originated in so-called ”forest“ parks.

Participation process

- The Charter requires close consultation betweem all participatory parties in the preparation of a sustainable tourism strategy and action plan for the protected area. In addition it makes provision for local tourism businesses and for tourism operators using the area to prepare separate Action Plans for their enterprises.
- PAN Parks promotes the establishment of a joint independent executive organisation to define a widely supported plan for conservation and tourism development in PAN Parks.

Main conceptual differences between the two initiatives

1) The PAN Parks initiative aims to include only well-managed protected areas, especially those with outstanding conservation values (”must-see“ sites in Europe; and therefore an ”exclusive club“), while the concept of the Charter sets no such conditions.
2) PAN Parks strives to become a new organisation to be managed by a European management organisation (supported by the Supervisory and Advisory Boards and Certifying Organisation), whereas the Charter is only a strategic approach and a widely used tool for sustainable tourism development and conservation in protected areas.

General conclusions and recommendations

1) Both initiatives provide effective guidelines for developing and managing tourism in protected areas which could be applied, after some amendments, to various types of protected area networks, including european and international designations, IUCN Protected Area categories on a national level and also to Natura 2000 sites.
2) Both initiatives are mutually dependent. The Charter, at present, is in need of a good marketing and communication strategy, whereas WWF's PAN Parks concept should be supporting the use of the Charter's principles and their application in less well-managed protected areas for them to become potential future candidates for PAN Parks. On the other hand, the PAN Parks concept could take advantage of existing EUROPARC principles and criteria so that partners are involved in the process of the creation of the conservation and sustainable tourism strategy for protected areas.

The need for collaboration and co-operation between the 2 initiatives

These 2 initiatives have been promoted by the same organisations and are originally the result of the same analysis. They have been developed separately with similar tools (criteria, pilot sites, tests, validation, signatories, and communication…). They both constitute excellent working material for the Natura 2000 network and could be the testing ground for the development of a specific tool for Natura 2000. They could also be merged into one initiative for all the sensitive and remarkable areas in Europe, made up of a variety of tools according to the different characteristics of such a diversity of sites: size, level of knowledge, stage reached in the drafting of a management plan, status and geographical situation.

The other initiatives described here should serve as a reference and should be used to encourage their partners (tour operators, the tourism industry in general, Member States, Administrations…) to adopt a sustainable tourism strategy and to commit themselves alongside protected areas.

Part 3. Suggested General Principles for Natura 2000

Principles based on existing experience

In preparation of the seminar, a draft list of general principles was drawn up as part of the process of putting together the seminar programme, identifying the examples of good practice and selecting the workshop topics.

This list was submitted to the participants during the seminar and served as a basis for discussion and debate in the workshop sessions. It helped the participants reach the main conclusions, including a general concensus that new detailed guidelines specific to Natura 2000 were unnecessary.

The principles, which are set out below, have been confirmed during the workshops and in the post-seminar evaluation phase. They were based on an analysis of the main principles reflected in the existing initiatives described in Part 2.

The principles can form the basis for the development of charters, strategies, and action plans for sustainable tourism.

Although the principles are not specific to Natura 2000 sites, they reflect general Natura 2000 processes, such as initial inventories, monitoring, environmental impact assessment (EIA), buffer zone co-operation, and local participation.

The principles also form a framework and basis for recommendations made in the final chapter of this report, which empasises particular issues pertaining to Natura 2000 sites in the light of analysis of the Habitats Directive. Examples of good practice, presented at the seminar, and described in the following chapter, also help to refine the principles and inform the recommendations made in the final chapter.

Priorities for sustainable tourism in protected natural areas

. STRATEGY – POLICY – PLANNING

Resource assessment – characteristics of the protected area - carrying capacity – consultation and partnership in developing and implementing a sustainable tourism strategy

Assessing resources, recognising vulnerability, choosing appropriate tourism

- ***Reflect existing designations and plans***
  Keep in mind the requirements of the designation, such as directives 6.1-6.4 for Natura 2000 sites. Integrate the Natura 2000 sustainable tourism strategy into existing management plans. Refer to existing regional and national plans and strategies.

- ***Start by understanding the site***
  Base all that you do on a full knowledge of the site's needs and sensitivities. Carry out an inventory of natural and human resources, assessing their well being and need for conservation, and potential to benefit from tourism. Use, for this purpose, the information available in the Natura 2000 form that was filled in for the designation of the site.

- ***Undertake further research***
  If necessary, bring in new expertise to research areas under pressure and endangered species, to have a better idea of their vulnerability.

- ***Know your existing visitors***
  Use surveys to understand exactly who is visiting the site at the moment, when, why and with what impact.

- ***Be aware of market potential and pressures***
  Be realistic about the volume and type of visitors who might come in future. Be alert to growing pressures as well as market potential.

- ***Identify capacity limits***
  Decide whether, where and when there are limits to the number and types of visitor the site should receive in the future if the environment and heritage is not to be degraded. Consider environmental, social and inter-user capacity limits.

- ***Select types of tourism to match resources and markets***

Based on the assessment of needs, resources and markets, identify the kinds of tourism appropriate to the site in the future.

Creating a strategy based on consultation and partnership

- ***Involve all stakeholders from the beginning***

  Involve a wide range of local partners from the beginning. Consider holding an open forum at the outset. Make sure the strategy is based on a wide consultation between site managers, conservationists, tourism operators and local communities.

- ***Establish partnership groupings***

  Take the strategy forward through establishing working groups and seminars. Encourage an association of local tourism professionals to become official partners responsible for the strategy.

- ***Raise awareness and commitment***

  Promote widespread awareness of the strategy process. Involve local media. Organise field trips locally and to other areas. Ask all stakeholders to formally commit themselves to the strategy, including signing any resulting charter.

- ***Allocate necessary resources***

  Allow sufficient time to create the strategy (minimum of 6 months). If necessary use external consultants to help with methodology, drafting and evaluation. Designate and train a specialist in sustainable tourism to co-ordinate and oversee the strategy.

- ***Ensure the strategy is simple and clear***

  Produce a strategy document, which is well-focused, easy to read and understand and well disseminated.

- ***Keep everyone involved and informed***

  Inform your partners at every stage. Have a wide discussion on early drafts. When finalised, launch the strategy officially through an event and promote early results and visible benefits.

- ***Widen the scope of the area***

  Address strategic issues of tourism management and development in the areas around the site, including buffer zones.

Implementing, evaluating and updating a sustainable tourism strategy. Relating it to national policy.

- ***Establish realistic action programmes and plans***

  Prepare annual action programmes based on the strategy which are realistic and can be implemented.

- ***Select monitoring indicators***

  At the outset, consider what kinds of indicators of performance and impact should be used to monitor the strategy and judge success.

- ***Identify responsibilities for action***

  Through the action programme allocate responsibility for specific actions to appropriate partners.

- ***Use a range of direct action, incentives and controls***

  Include action to be undertaken directly by the site management, as well as incentives and controls on others. Use relevant local and regional laws and measures such as financial incentives, planning controls, labels and awards. Include corrective measures and actions to rectify problems as well as pursuing new opportunities.

- ***Seek evaluation and recognition for the strategy***

  Ask external consultants to evaluate the strategy and results or refer to official national or European assessment processes.

- ***Reflect and influence regional/national strategies***

  Make sure your approach reflects national and regional strategies on sustainable tourism and nature conservation. Through your work, seek to influence policy, laws and actions at these higher levels.

- ***Review the strategy every 3-5 years***

  See the strategy as a dynamic process. Seek to review it every 3 to 5 years.

OFFER – MARKET – PRODUCT

Market studies – Targeting new markets – Product design – Innovative programmes and packages – Contribution to local economy and conservation – Joint venture and partnership with tour operators

Knowing and targeting new markets, creating new innovative packages

- ***Reflect new trends in nature tourism***
  Refer to existing national and international data on new trends in nature related tourism, and relate this to your knowledge of existing visitors.

- ***Explore new markets which fit the needs of the area***
  Identify specific niche markets which can be easily targeted and which fit the needs of the site in terms of special interest, volume, timing of visits and environmentally friendly activities.

- ***Reflect the needs of disadvantaged visitors***
  Pay particular attention to visitors with special needs, especially disabled people but also families, young people and those with limited financial means.

- ***Work with people who are in touch with markets***
  Build up partnerships from the start with specific tour operators that have developed their own sustainable tourism policy, code of ethics and partnership with Natura 2000 sites. Ask them to help design new packages. Ask specialist associations for advice on how to adapt your offer to the needs of specific clientele, such as associations of disabled people.

- ***Design and test innovative packages***
  Identify specific visitor experiences that reflect the real value of the site, and environmental management and educational priorities. Where appropriate, work up packages with tour operators and events with local communities, and test the market reaction to them.

- ***Explore new types of marketing***
  Create specific events to target new markets. Focus on specialised & alternative forms of marketing (fairs on different topics such as birds, trekking and nature...)

- ***Network with other protected areas***
  Work with other sites and protected areas to promote a range of show case packages based on enjoying and learning about nature and cultural aspects of these areas.

Improving the offer; supporting traditional and local products and appropriate accommodation; providing guidance to local entrepreneurs

- ***Assess the quality of the existing offer.***
  Give priority to improving existing facilities and services before developing new ones. Introduce quality checks and improvement procedures based on obtaining feedback and setting standards.

- ***Consider including new themes and sites***
  Make a list of new locations or themes that have not been identified or promoted but have potential for tourism. Consider, in particular, opportunities for observing wildlife, developing new nature guided tours, understanding and participating in local traditions, visiting farms and craft producers, etc. Pay particular attention to opportunities in the buffer zone.

- ***Ensure tourism development which reflects local heritage***
  Favour small-scale tourism developments, which use existing resources and reflect natural and historic heritage in style, design and setting.

- ***Encourage use of local products***
  Identify locally produced food, crafts and other products. Encourage sale to visitors and use by tourism enterprises. Support networks of local producers and improve distribution systems.

- ***Support the local culture***
  Support local events, traditions, dialects, art and music, especially where these reflect the special heritage and themes of the area. Use these creatively to interpret the site.

- ***Provide recreation opportunities that reflect environmental conditions***
  Pay attention to a growing demand for outdoors-recreational activities. Where appropriate identify walking and cycling routes away from the most fragile areas and of a length to meet the demands of different kinds of visitor. Control intrusive recreational activity.

- ***Provide appropriate guidance and training***
  Provide direct advice, seminars and training programmes for local tourism enterprises to help them understand the special sensitivities and qualities of the site, as well as improve their own performance.

- ***Link product providers together***
  Encourage small accommodation enterprises, attractions, nature guides and other local services to work together. Encourage tourism enterprises to work more closely with other sectors, such as agriculture.

Supporting conservation and local economies and communities, applying sustainable management to accommodations

- ***Encourage tourism operators to support conservation***

  Seek direct support from tourism enterprises for conservation schemes. This may be financial or support in other forms (in kind, voluntary & environmental holidays…).

- ***Provide mechanisms for visitors to support conservation***

  Ensure visitors are fully aware of the conservation needs of the site. Explore with tourism businesses specific mechanisms for raising voluntary financial contributions from visitors (visitor payback schemes). Encourage programmes for direct participation by visitors in conservation. Ensure the results of action supported are regularly communicated.

- ***Support traditional economic activities through tourism***

  Support forms of tourism or specific initiatives, which in turn support other traditional sectors, and the maintenance of traditional landscapes, such as low intensity agriculture and wildlife management.

- ***Promote local employment***

  Favour the employment of local people in tourism and educational services. Encourage young people to take up opportunities and provide relevant training.

- ***Involve local residents in tourism planning***

  Ensure local residents are involved in the tourism strategy and have a regular opportunity to express their views and concerns.

- ***Support facilities and services for local residents***

  Support ways of improving the quality of life of local residents, including access to the site and the use of local facilities and services.

- ***Apply environmentally friendly management to accommodations***

  Encourage local accommodation establishments to adopt good environmental practice. Reduce waste by avoiding the use of individually wrapped products and favouring fresh products. Recycle waste as much as possible. Use recycled or partially recycled products as often as possible

- ***Reduce energy consumption***

  Reinforce insulation to avoid heat loss. Reduce CO_2 emissions by using energies such as wind or solar power. Install low-energy bulbs for lighting and low consumption electrical equipment.

- ***Communicate your environmentally oriented strategy***

  Explain the measures you have taken and the reasons for them to your guests and clients through an information leaflet and/or posters. Insist on the results achieved (savings in energy consumption and costs). Inform your guests of rules, which are very

simple to observe, and that can save energy. Organise special events to inform guests about environmentally friendly management through games or competitions.

- ***Encourage the use of environmentally friendly products***
  Encourage the use of environmentally friendly products by "eco-taxing" non-environmentally –friendly products.

COMMUNICATION – PROMOTION – AWARENESS

Image – Messages – Information – Interpretation – Environmental education – Codes of Conduct – New technologies - Ecolabels – Guidelines

Developing the right image, messages, information and interpretation

- ***Identify the core values of the area***
  Identify and discuss the current strengths and weaknesses of all aspects of the tourism and nature product: landscape, biodiversity, living and built culture, facilities and relationships between local people and visitors.

- ***Consult and agree on images and messages***
  Compare the core values with images held by local people, visitors, local tourism enterprises and tour operators (via mixed discussion groups and surveys). Agree on an image to promote and, where appropriate, use experts to help to articulate this.

- ***Develop a communication strategy***
  Establish a working group to prepare a communication strategy. Seek support and involvement from all those who influence the image and its promotion (local people, tour operators, media etc.).

- ***Work with others to implement communication***
  Identify a programme for improving communication and changing images held about the site. Identify the right way of communicating with specific target groups (local people, tourism enterprises, and visitors) and also of improving communication by them to others.

- ***Use creative tools in communication delivery***
  Choose the most appropriate communication tools – word of mouth, local newsletters, regional guides, Internet, etc, - for the target audience. Provide mechanisms for joint promotion between local enterprises and organisations. Form promotional alliances with other sites (horizontal links) or tour operators, conservation bodies, etc. (Vertical links) at a local, national or European level.

- ***Assess and improve on-site information***

Pay particular attention to the quality of on-site information, including signposting, brochures, visitor centres and guiding services, which can have a significant influence on visitor experiences and behaviour. Ensure it is located and available where and when it can have maximum impact on visitors.

- ***Extend environmental education***

  Assess the impact of any educational programmes provided, such as guided walks, and seek to extend their outreach. Consider establishing codes of conduct for visitors.

- ***Use innovative methods to put across educational messages***

  Use original techniques and methods to work with specific targeted groups. Make the learning fun when working with children (video, internet..)

- ***Provide a follow-up to the initiative***

  Produce material on the initiative implemented, emphasising objectives and results achieved. Distribute it to all those who participated. If possible, use it as a tool.

Developing and communicating Eco-label and certification schemes

- ***Communicate good practice in your area***

  Identify examples of good practice (e.g. in accommodation, guided tours or local food and products) and identify their specific strengths with respect to your own priorities. Promote awareness of them within and outside the local area (e.g. through articles in media).

- ***Investigate existing Eco-labels and awards***

  Research and compare existing Eco-labels (from the Internet or experience of others). Check their criteria target groups and achieved success or weaknesses. Compare them with your interests and identify potential for co-operation.

- ***Join suitable existing schemes***

  Discuss with others the “pros & cons” for joining regional, national or international Eco-label and certification schemes. Join or recommend an existing scheme if compatible with your desired image, criteria and target groups.

- ***Develop your own Eco-label if appropriate***

  Develop your own scheme if nothing appropriate already exists. Establish a clear, achievable and dynamic set of criteria. Give advice and support to those who are interested in being awarded, through seminars, individual checking, consultation, manuals and guidance on sources of information. Make sure that the awarding process is transparent and that the awarding institution is independent from and accepted by the applicants.

- ***Promote the awarded products and services***

  Support the marketing of the awarded facilities, services and entrepreneurs through your own communication tools. Co-operate with external information services, networks and

media to multiply the information about your Eco-label and the awarded suppliers and products.

Developing and implementing guidelines

- ***Assess the different guidelines available***
  Find out about the various guidelines available for sustainable tourism in protected areas and sites. Set their objectives, content and approach against your own situation and requirements.

- ***If necessary adapt guidelines to your own situation***
  If existing guidelines do not meet your needs, consider how they can be adapted or improved. Relate them to other accreditation or training schemes for individual facilities in your area.

- ***Provide feedback to producers of guidelines***
  Work with other sites and the agencies developing guidelines to improve them. Give feedback on your impressions and any results arising from implementation.

- ***Encourage consistency between different guidelines***
  Encourage all agencies producing guidelines to ensure consistency between their core principles and approach. Avoid confusion amongst site managers, tourism operators and visitors.

. ASSESSING AND MANAGING IMPACTS – IQM – TRANSBORDER CO-OPERATION

Environmental Impact Assessment – Indicators – Monitoring – Zoning – Conflict Management – Environmental Management – Visitor and traffic management – Soft transportation – Renewable energy – Quality management – Benchmarking

Assessing and measuring the impacts of tourism

- ***Prepare a baseline audit***
  Understand the current state of the natural environment and heritage resource. Make an inventory of existing assets, to form a benchmark against which to observe and measure change.

- ***Use EIAs***

  Ask for an environmental impact assessment of all proposed development of tourism facilities and infrastructure, irrespective of size. Use established methodologies for EIAs.

- ***Work with others to assess impact***

  Form partnerships with local conservation bodies. Encourage, and train local people (including tourism operators) to observe impacts on the environment. Ask visitors to report on changes and problems they encounter. Work with users, groups and clubs to monitor their impact.

- ***Measure tourism flows***

  Keep a regular check on volumes of visitors, including traffic flows and car parking. Concentrate on most densely visited areas, and also on most fragile areas.

- ***Use global and site specific indicators***

  Consider general measurements, such as air and water quality, as well as observational changes on selected sites. Work with local research institutions.

- ***Assess impact on local people***

  Obtain feedback from local people on the impact of tourism. Assess the contribution made by tourism to local jobs, as well as negative impact from congestion and intrusion.

- ***Seek to rectify adverse changes***

  Use measures of impact positively, as a basis for introducing action to reduce negative impact and restore damage caused.

Managing visitors and traffic, reducing energy consumption and pollution

- ***Influence land planning policies***

  Make sure that policies to control and influence the form of tourism development and promote conservation are closely integrated into the statutory planning legislation for the area, and the local management plan for the site.

- ***Use zoning techniques***

  Identify areas most suitable for different forms and levels of tourism activity. Seek to manage tourism and influence development in a buffer zone around the site. Work with neighbouring areas to identify alternative sites to promote away from the more sensitive locations.

- ***Restrict access if necessary***

  If the environment is threatened, be prepared to restrict or reduce access. If necessary, restrict traffic on certain roads or at certain times. However, be aware of the needs of disabled visitors and local residents.

- ***Use information positively***

  Influence visitor behaviour and visit patterns with information, which is positive, explaining the reason for any restrictions and promoting alternative opportunities.

- ***Reduce seasonality***

  If appropriate to the site, promote access at less busy times and discourage over-promotion of the busiest periods. Take account of the natural seasons of the site and species it supports, in terms of how this affects visitor interest as well as vulnerability.

- ***Encourage non-polluting transport***

  Favour access by walking, cycling, non-polluting vehicles and public transport, both to and within the area. Work with local bus and rail operators. Consider providing shuttle services. Promote alternative transport as a positive opportunity for visitors, not just a restriction.

- ***Promote good environmental practice and management***

  Provide advice and training to local tourism enterprises on visitor management and information as well as reducing waste and the use of energy and water. Promote alternative energy systems suitable to the local environment.

Developing integrated quality management, benchmarking and transborder cooperation

- ***Obtain regular visitor feedback***

  Provide a means for all visitors to give their reaction to the site and services offered. Undertake a regular survey of visitors to measure levels of satisfaction.

- ***Obtain regular feedback from staff and partners***

  Ensure everyone working on site management is involved in delivering quality and can make suggestions for improvement. Obtain regular feedback from local tourism enterprises on their needs and opinions.

- ***Set quality standards for all tourism services***

  Ensure all tourism operators meet optimal standards of safety and comfort. Promote existing quality assessment schemes where appropriate. Set quality standards for all services delivered by the site management team.

- ***Maintain a programme of improvement and training***

  Introduce initiatives to improve quality, especially through appropriate training programmes for staff and local enterprises.

- ***Make comparisons with other areas***

  Compare issues, approaches, lessons learnt and quality achieved, with other sites and protected areas. Encourage mutual study tours. Maintain close relationships with

neighbouring sites. Work within networks to improve visitor management and promote sustainable tourism.

- ***Foster cross-border co-operation***

  Where sites are close to international borders, seek partnerships with sites and protected areas across the border. Identify common conservation and visitor management issues and opportunities for co-ordinated programmes. Extend the principles of Natura 2000 and Sustainable Tourism across the whole of Europe, East and West.

Part 4. Summary of advice and recommendations to Natura 2000 stakeholders

This chapter summarises the most relevant recommendations to the Natura 2000 network, following the analysis of the Habitats Directive in Part 1, and of existing initiatives (charters, codes, recommendations...) in Part 2. It reinforces and refines the principles for sustainable tourism for Natura 2000 suggested in Part 3 and which are illustrated by examples of good practice in the annex. These recommendations are based on the comments made by the participants at the seminar and in the follow-up evaluation questionnaire.

This summary of recommendations is addressed to all actors concerned with the implementation of a sustainable tourism strategy in Natura 2000 sites. It casts further light on aspects, which are specific to Natura 2000 such as **biological inventories, the participation of all actors, management plans, zoning, the restoration of degraded sites…**

These recommendations should be read in conjunction with the general principles set out in Part 3. In order to avoid repetition, the summary does not duplicate all these principles, but picks up and elaborates on a number of them. It highlights the main points concerning the Habitats Directive, which require detailed attention and call for particular vigilance on the part of Natura 2000 actors.

Seeking a level of involvement appropriate to the site

There are a number of reasons why Natura 2000 sites should be engaged with tourism:

- Bringing economic benefit to local communities, thereby winning more local support for the designation and management of the site as Natura 2000.
- Improving the management of visitors, reducing adverse impacts from visitor pressure.
- Increasing understanding and appreciation of the special qualities of the site, and hence support for its conservation, amongst local people and visitors.
- Reducing negative impact of existing and future tourism enterprises, while encouraging them to promote and benefit from the site in positive and sensitive ways.

Natura 2000 sites vary greatly in their size, location, and purpose of designation, management regimes and resources. The balance of the above objectives and resultant priorities and actions will vary from site to site. For some sites, it will make sense for them to have only a limited involvement in tourism; for others it will be a key issue. The purpose of this document is to encourage all sites to consider what their relationship should be with tourism, and to set out principles, approaches and examples to follow. Each site should address and interpret these in relation to their own circumstances and resources.

Some sites may wish to develop their own action programme for tourism based on these principles. In some circumstances it may make sense for a joint approach to be adopted for a number of smaller Natura 2000 sites in the same district or region.

Larger protected areas and parks already have emerging mechanisms at the European level for stimulating and recognising sustainable tourism strategies. These have been described elsewhere in this report. The European Charter for Sustainable Tourism in Protected Areas sets out a process and accreditation system for all such areas to follow. Major parks of significant size, providing a high level of wilderness and wildlife experience, may also seek recognition as PAN Parks.

Specific recommendations

. *STRATEGY, POLICY, PLANNING*

Widen and deepen the knowledge you have about your site

" For the designation of a site as Special Protection Area (SPA) and Special Area for Conservation (SAC), the Directive requires preliminary inventories. In the absence of good knowledge of the site and its requirements, caution may lead to tourism projects being limited and the Natura 2000 designation itself being abandoned. Good knowledge of a site and its requirements will help understand the potential impacts that a tourism project could have." (cf. Part 1.)

- Review what data is available, make a summary of scientific inventories carried out in the preliminary selection phase.
- Carry out additional research and investigations into areas, which are less well covered such as socio-economic data, employment, and the expected benefits of the Natura 2000 designation, impacts and monitoring.

Develop a specific management plan for your site with a section on sustainable tourism

"For special areas of conservation, it is advised to produce an adapted management plan incorporated into other development plans, which takes into account the environmental requirements of the site".

- If the site is situated in a protected area, which already has a management plan, adapt the existing document to the specificity of the Natura 2000 site and characteristics.
- If the Natura 2000 site already has a management plan, incorporate a strategic approach to sustainable tourism into it.
- Use the suggested principles in Part 3 and the EUROPARC and PAN Parks initiatives in Part 2, which provide tools for the development of a sustainable tourism strategy in protected areas (criteria in the annex). Refer also to the guide produced in your country on how to produce strategic documents for Natura 2000 sites.

- Encourage national representatives to draw up guidelines and a national handbook on how to develop a management plan and a sustainable tourism strategy.
- Refer to the analysis of the Habitats Directive in Part 1 and the implications the Directive has on tourism projects at all stages of the elaboration of a strategy and a plan.
- Associate all the actors of the site from the very beginning when carrying out inventories, and in the development of a strategy and an action plan. Encourage participation and wide consultation.
- Encourage managers of related projects to refer to the site's sustainable tourism strategy and use it to validate their project.

Encourage the consultation and the implication of all actors involved in the Natura 2000 site at all levels

- After the planning phase, it is necessary to support all forms of participation in the protection of species, the management of the site, and in the better use of traditional activities and local products
- Develop partnership models between managers, the local population and private tourism operators in Natura 2000 sites (conditions, contracts, concessions, charters of commitment, codes of ethics, codes of conduct) which encourage different parties to commit themselves to the conservation of the sites.
- Develop partnerships for maintaining and developing biodiversity in protected areas, semi-natural areas and agricultural areas.
- Associate all sectors (tourism, agriculture, and forestry), including scientists, in the concertation phase. Ensure that environmentalists and private companies have the opportunity to discuss tourism projects.

. *OFFER, PRODUCT, MARKET*

Check how vulnerable your site is and whether developing tourism is appropriate. Remeber that the main objective is to conserve habitats and species

" Not every Natura 2000 site is necessarily a potential site for tourism development. It may be an area, which requires strict protection or is intended for minimal conservation actions. While one site may be under great pressure, often due to the proximity of an urban area, another site may receive few visitors and hope to attract new tourists thanks to the Natura 2000 designation."

- Identify the potential of a site carefully in order to determine how appropriate tourism development is and define the desired level of development. Measure existing flows and work on targeting the most appropriate types of visitor for the site's characteristics.
- Seek a balance, at all times, between tourism and the protection of habitats and species. Establish precise limits between protecting the natural heritage and landscape and favouring economic development and the needs of the visitors.

Develop services which reflect the ecological characteristics of the site

- Work in partnership with the tour operators from the beginning who market products promoting habitats and species to the types of visitor you would like to attract (conservationists, visitors interested in participating in conservation projects...).
- Emphasise cultural, agricultural and industrial activities, which conform to certain conditions and environmental standards.

Develop and encourage different ways for tourism to contribute to the management of sites

- Consider different ways of raising support for conservation from visitors. Various approaches are analysed in the EU publication " Visitor Payback ". Refer to experiences in the following examples of good practice, which highlight collaboration with the private sector - " Discovery Initiatives " and the Lake District National Park's " Pathway Appeal ".
- Develop partnerships with local tourism operators and other private sector companies (sportswear companies, transport companies…) which are likely to be interested in becoming involved in the conservation of a site. Do so from the moment the site is designated, especially if the site does not benefit from any existing management system (sites which are not already part of a protected area).
- Use a diversity of forms of contribution and partnership. These can be financial (professional taxes, ecotaxes.), in kind (donation of material, voluntary work..), or intellectual (contribution of advice and know-how).
- On the basis of these contributions, contract with tourism partners to make the signature of a charter of sustainable tourism one of the prerequisites for obtaining a label or becoming certified. Let the visitors know about this type of initiative.
- Make sure that the tour operators with whom you work are involved in operations such as UNEP's " Tour operators' initiative " (cf. Part 2).

. *COMMUNICATION, PROMOTION, AWARENESS*

Become informed and keep your partners informed and up-to-date about the Natura 2000 procedure

- Disseminate Part 1 of this document widely. It can be used as a brief introduction to Natura 2000 from a sustainable tourism perspective.
- Send off for documents produced by the administrations in charge of implementing the directive and Natura 2000 in your country (usually the Ministry of the Environment) and in neighbouring countries ("documents d'objectifs" in France.).
- Make good use of the documents available on the European Union internet site (the Natura 2000 newsletter, examples of good practice, the LIFE Nature procedure).
- Produce your own documents on Natura 2000, which are adapted to your particular situation.
- Refer to Natura 2000 and the Habitats Directive frequently, in any documents you produce.

Be proud to belong to a European network and make it known

- Use the Natura 2000 designation as an advantage. It shows the importance of your site and its interest at the European level.
- Make it known that your site was identified and designated a site of community importance.

Develop communication and interpretation tools specific to the characteristics of your site

- Create or refer to codes of conduct and codes of ethics which concern particular habitats or threatened species or activities which are likely to cause disturbance (photography, nature observation, canyoning, climbing...).
- Make knowledge about your site and the inventories that were carried out for its designation as SCI accessible to the public. Turn them into interpretation and nature discovery tools.
- Distribute local existing documents widely or develop your own educational tools to promote understanding of the sites and the species and raise awareness about nature conservation.
- Make documents on discovering nature and cultural heritage and codes of conduct for improving nature protection available to visitors.
- Use the guidelines and general principles developed in Part 2 and 3, and on Internet sites, which develop good practice, such as ECOTIP and ECOTOUR, to raise awareness and develop training material, particularly for tour operators.

Work with eco-label schemes as appropriate, to encourage good practice

- Consider the range of existing schemes to promote and identify good sustainable tourism practice in destinations and enterprises in Europe and contact those that appear most relevant and appropriate to your Natura 2000 site. Look at the table comparing European eco-labels from the Internet site ECOTIP in annex.
- Consider joining the eco-labelling initiatives that are currently being developed for protected areas (such as EUROPARC and PAN Parks) if the size and character of your site make it eligible and appropriate. Where it is not, but you are part of a larger protected area, draw these to the attention of the wider protected area management.
- Encourage local service providers on or near your site to join existing regional and national eco-labels aimed at accommodation, restaurants, sites and activities. Look at the following examples of good practice; the FFPNR “Nature Hotels”, ECEAT farm accommodation, the Luxembourg eco-label.
- Study the possibility of developing your own eco-label on a local and regional level to help encourage good practice and formalise partnerships with local suppliers of tourism services. Consider with others how this might relate to the concept of a label for Natura 2000 nationally and at a European level.
- In assessing criteria for an eco-label relating to Natura 2000 sites, emphasise environmental management, renewable energies, reducing the consumption of traditional energy sources (electricity, water, fuel), waste management, the maintenance of traditional landscapes, the restoration of degraded sites, the protection of native species, the creation of private voluntary nature reserves, and the promotion of natural heritage. (cf. the Guadeloupe National Park Mark of Confidence).

. *EVALUATE AND MANAGE IMPACTS, DEVELOP AN INTEGRATED APPROACH, ENCOURAGE CO-OPERATION*

Carry out Environmental Impact Assesment systematically for all tourism projects

" Any project likely to affect the site, shall be subject to appropriate assessment of its implications for the site in view of the site's conservation objectives. It shall not adversely affect the integrity of the site concerned." art. 6.3.

- Ask for an Environmental Impact Assesment to be carried out systematically for all projects concerning tourism infrastructure.
- Ask for Environmental Impact Assesment to apply to development projects which are located in the periphery of Natura 2000 areas at the first suspicion that they would have an impact on the site itself.
- Get hold of and study Environmental Impact Assesment methods for tourism projects, which are available at the European level.

Evaluate, limit and manage impacts and disturbances related to tourism

" While waiting for the publication of the list of the SIC selected to be designated as SAC, the Member State must avoid any activity likely to deteriorate the sites which it has selected and submitted to the Commission "
" The Member States shall take appropriate steps to avoid, in the SAC, the deterioration of natural habitats and the habitats of species as well as disturbance of the species for which the areas have been designated. " Art. 6.2.

- Develop indicators of impact to measure any disturbance or deterioration of the habitats and species and the effects of activities, visitor flows and existing infrastructure on natural sites.
- Encourage eco-audits and self-assessment based on these indicators and criteria for eco-labels.
- Measure impacts regularly and develop appropriate management tools (limiting visitor numbers, authorisations, bookings, guided visits, traffic flow plans, nature observation areas, and restricted zones…). These make it possible to control, assess and limit impacts, which can cause species to become scarce, and habitats to disappear.
- Encourage tourism developers to restrict or to avoid development in sensitive natural areas.
- Encourage the owners of tourist establishments to participate in the rehabilitation and the restoration of the degraded natural habitats (planting native plant species, eradicating pervasive or exotic plant species…).

Set up zoning and differentiated management systems in your site from the very beginning

Natura 2000 sites can be small. They can be isolated and not form part of an existing protected area. They can be highly visited and very exposed to the development of leisure activities. Zoning must respect the conservation objectives of Natura 2000, while, at the same time, meet the needs of visitors in terms of nature and other leisure activities (cf. the experience of Terschelling in Holland). Administrative and contractual legal measures, which the Member

States have to establish should include the definition of restricted access zones and sanctuaries.

- Develop a zoning system and detail it in the management plan. It should treat each type of zone separately; intensively used zones (sports activities), vulnerable zones (nesting, reproduction...), zones for interpretation and nature observation, zones for research.

Develop all types of soft and non-motorised transport

- Develop innovative and non-motorised forms of transport, on the basis of 0 " cars ". Develop cycle tracks, shuttle services...
- In sites, which receive a significant number of visitors, include these forms of transport in a traffic flow and transport management plan.

Develop an IQM (Integrated Quality Management) approach which is specific to Natura 2000

- Look at ways of improving the quality of the site to achieve a range of tourism, community and biodiversity objectives in an integrated way. Pursue an integrated quality management approach, which involves checking and improving all aspects of visitor experiences and impacts, obtaining regular feedback from visitors, enterprises and local people. The EU publication " IQM in rural tourist destinations " explains the approach and provides examples of good practice.

Participate in the creation of a network of sites in your area or country

- Ask for the list of other people who are in charge of Natura 2000 sites. Contact them and exchange information.
- Seek out collaboration between sites, which have the same characteristics.
- Take joint and concerted action with other Natura 2000 sites for conservation and economic development.
- Request the means to carry out workshops, field visits, training, and to exchange know-how.
- Ask local and regional authorities to bring the Natura 2000 network to life through co-ordination and regional events.

Develop transborder co-operation with Eastern European countries

- Set up twinning and transborder co-operation projects between Natura 2000 sites. Contribute to the establishment of a similar network in Eastern European countries.
- Exchange experiences, good practice and other information with other countries or areas interested in this type of action in order to widen your knowledge and understanding of tools used in other areas.

6.2. Fisheries management measures 108

1. INTRODUCTION AND BACKGROUND

Why the need for a guidance document?

The need to fully apply the Habitats[1] and Birds[2] Directives to the offshore marine environment of the European Union, especially with regards to the establishment of the Natura 2000 network, represents a key challenge for EU biodiversity policy in the coming years.

The establishment of a marine network of conservation areas under Natura 2000 will significantly contribute, not only to the target of halting the loss of biodiversity in the EU, but also to broader marine conservation and sustainable use objectives.

To date there have been relatively few Natura 2000 sites identified for the offshore marine environment and this represents the most significant gap in the Natura network. Implementation of the Birds and the Habitats Directives in the marine environment presents substantial challenges, especially in relation to the offshore (as opposed to the coastal) marine environment due to the lack of scientific knowledge on the distribution/abundance of species and habitat types.

At a meeting of the Nature Directors' of Member States, which took place in October 2002, it was agreed that further work was needed to develop a common understanding of the provisions for designating and managing marine Natura 2000 sites. The European Commission was asked to establish an *ad hoc* working group under the Habitats Committee, with a view to providing guidance on this subject.

Since March 2003, a Marine Expert Group has been working to "develop a common understanding of the provisions of Natura 2000 relating to the marine environment in order to facilitate the designation and future management of these areas". As such, it should help the Member States to achieve this important task and to provide useful reference material for other stakeholders. The document will also be of value to the Commission services in the contemplation of any action in this field. It will also provide principal stakeholders with valuable information and more security for planning and development as the Commission opinion on several key aspects of the implementation of Birds and Habitats Directives in the marine environment will be more widely known.

---

[1] COUNCIL DIRECTIVE 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild fauna and flora.

[2] COUNCIL DIRECTIVE of 2 April 1979 on the conservation of wild birds (79/409/EEC)

Scope of the guide

The guide responds to an immediate need to make progress in establishing Natura 2000 in the marine environment. As such its primary focus is on marine species and habitat types that are covered by the site based provisions of the Birds and Habitats Directives. These are the habitat types listed in Annex I and species listed in Annexes II of the Habitats Directive and bird species listed in Annex I as well as migratory bird species covered by the Birds (79/409/EEC) Directive for which marine Natura 2000 sites need to be designated, protected and managed.

The guide aims to explain the relevant legal and technical concepts needed to underpin the establishment of Natura 2000 throughout the marine area of application of the (79/409/EEC) Birds and (92/43/EEC) Habitats Directives. It covers both the inshore and offshore marine environments.

For the purposes of this document, "inshore marine environment" is that which occurs in the internal waters and the territorial sea, as defined by UNCLOS[3], of a coastal Member State; "offshore marine environment" is that which occurs in marine zones extending beyond territorial sea limits where Member States exercise some type of sovereignty rights.

The conservation of the marine habitats and species of European conservation concern will not be achieved solely through designation and good management of Natura 2000 sites. There will also be a need to deal with human pressures on the marine environment beyond such sites as part of a broader marine conservation strategy.

Structure of the guide

The guide contains the following elements and follows the same logic as the implementation process necessary for the construction of the marine component of Natura 2000:

- Chapter 2 considers the process for establishing Natura 2000 in the broader context of EU environmental policies. It provides information about Community and international legislation that is relevant for the establishment of Natura 2000 in the marine environment.
- Chapter 3 clarifies definitions of marine habitat types of Annex I of the Habitats Directive and provides more general information on marine habitats and species, including their occurrence in inshore and offshore waters of Member States.
- Chapter 4 provides information on the best means of locating and assessing marine habitats and species as well as a rationale for site selection.
- Chapter 5 provides guidance on management issues relevant to marine Natura 2000 sites.
- Chapter 6 looks more closely at the relationship between fisheries management and the *"Birds"* and *"Habitats"* Directives.

[3] *UNCLOS, United Nations Convention on the Law of the Sea* http://www.un.org/Depts/los/index.htm

Limits of the guide

The guide is intended to be bound by and faithful to the text of the Birds and Habitats Directives and the wider principles underpinning Community environmental law. It is not legislative in character (not making new rules but providing guidance on the application of those that exist). As such, the document reflects only the views of the Commission services and is not of a binding nature.

It should be stressed that it rests with the EU Court of Justice to provide definitive interpretation of Community law. Therefore, the guidance provided will need to evolve in line with any emerging jurisprudence on this subject.

The guide intends to fully respect the existing case law of the Court. This determines aspects of the guide, especially where clear positions have already been established by the Court. The guide also aims to explain some legal aspects of the law of the sea and other different principles that support the designation process and future management of the marine component of the Natura 2000 network.

It is not possible for this guide to be exhaustive on all the issues related to Natura 2000 in the marine environment, especially as regards the management and protection of the sites. However, it aims to focus on the key issues related to the establishment of the network using available information. Further guidance may be necessary for specific topics at a later stage.

2. BROADER CONTEXT

2.1. The context of EU marine biodiversity and protected areas policy

EU policy for marine biodiversity, including protected areas, is developing in the context of commitments at global, EU and regional levels.

At the EU level, EU Heads of State and government have made a commitment 'to halt the loss of biodiversity [in the EU] by 2010'. And at the global level, they have joined some 130 world leaders in making a commitment 'to significantly reduce the current rate of biodiversity loss [worldwide] by 2010.' Faced with evidence of the continuing and even accelerating loss of biodiversity and of critical ecosystem goods and services – as recently highlighted in the Millenium Ecosystem Assessment - the European Council has repeatedly called for accelerated efforts to meet these commitments.

The 6th Environmental Action Programme of the European Community identifies 'nature and biodiversity' as one of the priority themes for action. Objectives and priority areas for action on nature and biodiversity laid down by the European Parliament and the Council in the 6th Community Action Programme[5] include:

- Establishing the Natura network and implementing the necessary technical and financial instruments and measures required for its full implementation and for the protection, outside the Natura 2000 areas, of species protected under the Habitats and Birds Directives (Art 6.2.a. 7th indent)

- Further promote the protection of marine areas, in particular with the Natura 2000 network as well as by other feasible Community means (Art. 6.2.g. 4th indent)

As a contracting party to the Convention on Biological Diversity (CBD) the European Community has prepared an EU Biodiversity Strategy and Biodiversity Action Plans which aim, *inter alia*, to integrate biodiversity considerations into other Community policies. Marine biodiversity issues are addressed by both the Biodiversity Action Plan (BAP) for Natural Resources, and the BAP-Fisheries. Marine issues have also been raised in relation to the impact of European fishing fleets in international waters.

A 2003-2004 review of EU Biodiversity Policy assessed the implementation, effectiveness and appropriateness of the EC Biodiversity Strategy and Action Plans, in particular within the context of the 2010 targets. The review culminated in the Malahide conference on Biodiversity and the EU, held in May 2004 under the Irish Presidency[6] of the Council of Ministers. The resulting 'Message from Malahide' achieved a broad degree of consensus on priorities towards meeting the 2010 targets. These include completing the Natura 2000 network at sea by 2008, and agreeing and instigating management for all Natura 2000 sites by 2010.

Acting on many of the priorities identified in the Message from Malahide, the Commission adopted in May 2006 a Communication on *Halting the Loss of Biodiversity By 2010 — And*

[5] Decision No. 1600/2002/EC of the European Parliament and of the Council of 22 July 2002 laying down the Sixth Community Environment Action Programme (OJ L 242, 10.9.2002, p.1)

[6] http://ec.europa.eu/environment/nature/biodiversity/develop_biodiversity_policy/malahide_conference/index_en.htm

Beyond [COM(2006) 216 final][7], which sets out an ambitious policy approach to halting the loss of biodiversity by 2010. In particular, it provides an EU Action Plan with clear prioritised objectives and actions to achieve the 2010 target and outlines the respective responsibilities of EU institutions and Member States. In coherence with the above process, the first action identified in this EU Biodiversity Action Plan[8] is to accelerate efforts to finalise the Natura 2000 network. This states: "complete marine network of Special Protection Areas (SPA) by 2008; adopt lists of Sites of Community Importance (SCI) by 2008 for marine; designate Special Areas of Conservation (SAC) and establish management priorities and necessary conservation measures for SACs [by 2012 for marine]; establish similar management and conservation measures for SPAs [by 2012 for marine]". This Action Plan also specifies indicators to monitor progress, and a timetable for evaluations.[9]

This Biodiversity Communication has been broadly welcomed by other Community Institutions, including December 2006 Environment Council, which invited the Commission and Member States to proceed urgently with implementation of the Biodiversity Action Plan.

The Communication and Action Plan take account of various existing international commitments relating to marine protected areas including:

- The World Summit on Sustainable Development commitment to establish a globally representative system of marine and coastal protected areas by 2012.

- decisions on marine and coastal ecosystems and protected areas arising from conferences of the CBD, in particular the COP7 decision to establish (by 2012) and maintain a network of marine and coastal protected areas that are effectively managed, ecologically based, consistent with international law and based on scientific information.

- for the Atlantic and Baltic seas the Commitment of the Joint Ministerial Meeting of the Helsinki and OSPAR Commissions (Bremen 2003) to complete by 2010 a joint network of well-managed marine protected areas that, together with the Natura 2000 network, would be ecologically coherent. Both, HELCOM and OSPAR agreed that the marine Natura 2000 sites qualify for the inclusion into the OSPAR/HELCOM network of marine protected areas.

- for the Mediterranean Sea the 1995 Protocol of the Barcelona Convention Concerning Mediterranean Specially Protected Areas and Biological Diversity in the Mediterranean which provides for the establishment of a List of Specially Protected Areas of Mediterranean Interest (SPAMI List)

- in the Black Sea, the Biodiversity and Landscape Conservation Protocol to the Convention on the Protection of the Black Sea against Pollution was signed in Sofia, Bulgaria in 2003 (ratification process is ongoing). This protocol aims *inter alia* to maintain the Black Sea ecosystem in a good ecological state and its landscape in the favourable conditions, to protect, to preserve and to manage in a sustainable way the biological and landscape diversity of the Black Sea in order to enrich its biological resources.

---

8 See action A1.1.1 of Annex 1 to the Biodiversity Communication http://ec.europa.eu/environment/nature/biodiversity/current_biodiversity_policy/biodiversity_com_2006/pdf/sec_2006_621.pdf

9 See http://europa.eu/rapid/pressReleasesAction.do?reference=IP/06/667&format=HTML&aged=0&language=EN&guiLanguage=en

As regards sites to be protected under the Birds Directive a major conference held under the Netherlands presidency in November 2004 at Bergen-op-Zoom identified significant gaps in designation marine protected areas for birds and consistent with Malahide, recommended the full extension of the SPA network to the marine environment (2008), establish an effective protection regime, put management objectives into place and initiate these for all sites by 2010. DG Environment webpage hosts the report of the Bergen op Zoom conference and other important documentation produced as part of the celebrations or relevant to them. [10]

2.2. The Strategy for the Protection and the Conservation of the Marine Environment: an ecosystem-based approach to ensure conservation of biodiversity and sustainable use of natural resources

The 6th Environmental Action Programme of the Community[11] considered the conservation and the protection of the marine environment a complex issue that required a broad and multidimensional approach and requested the Commission to prepare a Thematic Strategy dealing with it. The Commission adopted the Marine Thematic Strategy, including a proposal for legislative action, in 2005.[12]

The Strategy adopted is based upon an ambitious new approach to the protection and management of marine ecosystems and promotes sustainable use of marine resources. It addresses major threats that were already identified in a previous Communication: [13] an inadequate framework for the management of the seas, given institutional and legal complexities and the number of actors concerned; insufficient basic knowledge, due to insufficient links between research areas in need of action and priorities; and lack of a dedicated policy.

The vision proposed by the Strategy is to protect and restore Europe's oceans and seas and ensure that human activities are carried out in a sustainable manner so that current and future generations enjoy and benefit from biologically diverse and dynamic oceans and seas that are safe, clean, healthy and productive. This new approach develops an integrated policy towards the implementation of a single, integrated and coherent set of measures for the conservation and protection of the marine environment.

The Commission proposes to implement progressively an ecosystem-based approach for the management of human activities affecting the marine, including goals and targets, to ensure biodiversity conservation and sustainable use of marine resources. This approach takes into account the concepts of favourable conservation status and good ecological status as required by the Habitats and Birds Directives and the Water Framework Directive.

Council and Parliament had supported the approach proposed by the Strategy, and have now the responsibility of adopting the proposed legal instrument. Thereafter, Member States will have to ensure that good environmental status in the marine environment is achieved by the year 2021 at the latest, and to continue the protection and preservation of that environment and the prevention of its deterioration.

---

11 DECISION No 1600/2002/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 22 July 2002 laying down the Sixth Community Environment Action Programme, *Official Journal L 242 , 10/09/2002 P. 0001 - 0015*

12 COMMUNICATION FROM THE COMMISSION TO THE COUNCIL AND TO THE EUROPEAN PARLIAMENT. Thematic Strategy on the Protection and Conservation of the Marine Environment and Proposal for a Marine Strategy Directive, COM(2005)504 and COM(2005)505

13 COMMUNICATION FROM THE COMMISSION TO THE COUNCIL AND THE EUROPEAN PARLIAMENT "Towards a strategy to protect and conserve the marine environment", COM(2002)539

According to the proposed Directive, actions to be taken by Member States to deliver good environmental status have to be based on sound and reliable assessments of the impact of human activities on the marine. The proposal makes every effort to ensure that proper systems of monitoring and assessment are set. These systems will include current monitoring obligations defined by the Habitats and the Birds Directives.

ECOSYSTEM APPROACH

The elaboration of guidelines for the implementation in the marine environment of the so-called Ecosystem Approach has been one of the activities undertaken under the aegis of the European Commission during the preparation of the Environmental Marine Strategy.

In this context, the Ecosystem Approach is embedded in the concept of sustainable development, which requires that the needs of future generations are not compromised by the actions of people today. The Ecosystem Approach puts emphasis on a management regime that maintains the health of the ecosystem alongside appropriate human use of the marine environment, for the benefit of current and future generations.

The Convention on Biological Diversity[14] defines the Ecosystem Approach as "a strategy for the integrated management of land, water and living resources that promotes conservation and sustainable use in an equitable way" and the ecosystem can be defined as "an interacting complex of living communities and the environment, functioning as a largely self sustaining unit." It recognizes that humans, with their cultural diversity, are an integral component of ecosystems".

To provide greater specificity for the purposes of the European Marine Strategy the Ecosystem Approach is described as 'a comprehensive integrated management of human activities based on best available scientific knowledge about the ecosystem and its dynamics, in order to identify and take action on influences which are critical to the health of the marine ecosystems, thereby achieving sustainable use of ecosystem goods and services and maintenance of ecosystem integrity.' This description clearly places humans as part of natural ecosystems, and stresses that human activities in these ecosystems must be managed so that they do not compromise ecosystem components that contribute to the structural and functional integrity of the ecosystem.

HELCOM and OSPAR Conventions have adopted other more specific interpretation of the Ecosystem Approach. Full text of this interpretation can be found in
http://www.helcom.fi/stc/files/BremenDocs/JointEcosystemApproach.pdf

2.3. EU Maritime Policy

The above-referred European strategy for the protection and the conservation of the marine environment referred in point 2.2 is to be seen within the broader context of the development of a new EU Maritime Policy.

On 7 June 2006, the European Commission adopted a Green Paper[15] on a Future Maritime Policy for the European Union. This Green Paper is the result of over a year of consulting with stakeholders, identifying gaps between sea-related sectoral policy areas and attempting to adopt best practice and learn from obstacles and challenges. The need for such a policy stems from the economic, social, and environmental importance of the maritime dimension in Europe. The vision is that of a Europe with a dynamic maritime economy in harmony with the marine environment supported by excellence in marine science.

[14] http://www.biodiv.org/programmes/cross-cutting/ecosystem/default.asp
[15] http://ec.europa.eu/maritimeaffairs/policy_en.html

The strategy for the protection and the conservation of the marine environment referred to in point 2.2 will directly contribute to the work on the future EU Maritime Policy.

2.4. Links between the marine coastal environment and the EU Water Framework Directive

The EU Water Framework Directive[16] (WFD) establishes a framework to enhance the protection and to improve the aquatic environment of continental, transitional, and coastal waters.

Coastal waters are defined as a one nautical mile strip extending from the baseline used to define the breadth of territorial waters. The general objectives of the WFD are to prevent any further deterioration in status and to achieve "good status" of all waters by 2015. The concept of water status comprises both "ecological status" and "chemical status". As regards chemical status the scope of WFD is extended to cover all territorial waters.

In these water bodies Member States shall achieve compliance with any standards and objectives by 2015, unless otherwise specified in the Community legislation under which the individual protected areas have been established. Where more than one of the objectives relates to a given body of water, the most stringent shall apply.

In order to achieve the environmental objectives, the WFD foresees the development of a programme of measures as part of a wider river basin management plan. The first of such plans is due in 2009. The planning scale is the river basin district, which comprises one or several neighbouring river basins together with their associated coastal waters. In drawing up the management plans, active public participation from all stakeholders should be encouraged by the competent authorities.

The WFD classification scheme for water quality includes five status categories: high, good, moderate, poor and bad. 'High status' is defined as the conditions associated with no or very low human pressure. This is also called the 'reference condition' as it is the best status achievable - the benchmark. These reference conditions are type-specific, so they are different for different types of rivers, lakes or coastal waters so as to take into account the broad diversity of ecological regions in Europe. Assessment of quality is based on the extent of deviation from these reference conditions, following the definitions in the Directive. 'Good status' means 'slight' deviation, 'moderate status' means 'moderate' deviation, and so on. These definitions are expanded in Annex V to the WFD.

The assessment of water status is based on biological, chemical and hydromorphological quality elements. In case of transitional and coastal waters, the biological elements that should be taken into account include phytoplankton, aquatic flora, benthic invertebrate fauna and fish fauna. Hydromorphological quality elements include features such as wave exposure, structure of the intertidal zone or depth variation. Transparency, oxygenation conditions or nutrients are examples of chemical elements that should be included in the assessment.

[16] DIRECTIVE 2000/60/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 23 October 2000 establishing a framework for Community action in the field of water policy, OJ L327/00, 23.12.2000. http://eur-lex.europa.eu/pri/en/oj/dat/2000/l_327/l_32720001222en00010072.pdf

This framework Directive establishes that as regards Natura 2000 protected areas and all other areas requiring special protection by specific Community legislation their environmental objectives have to be integrated into the relevant River Basin Management Plans. These Plans will include the transitional and coastal areas for which the River Basin Authority is competent.

2.5. The challenge of constructing the Marine Natura 2000 Network. Planning a system of marine protected areas

The marine component of the Natura 2000 network will be an integral component of the overall Natura 2000 European ecological network. As for the terrestrial environment, the marine network will aim to protect sites of European conservation importance for (i) natural habitat types listed in Annex I and (ii) the habitats for the species listed in Annex II of the Habitats Directive, in order to ensure that these features can be maintained or, where appropriate, restored at a favourable conservation status in their natural range.

The marine component of Natura 2000 network will also need to include a coherent network of Special Protection Areas (SPAs) classified pursuant to the Birds Directive. These will be the most suitable territories in number and size for the conservation of marine birds listed in annex I of Birds Directive as well as migratory marine birds, taking into account their protection requirements.

Whereas the species scope of the Birds Directive is already comprehensive for the marine it is recognised that the present Annexes of the Habitats Directive have limited focus on marine species and habitat types, especially those that occur in the offshore marine environment. Notwithstanding, an important first step in protecting the marine environment will be the full implementation of the existing marine Natura 2000 commitments.

This work may need to be complemented in the near future with the listing of additional marine habitat types and species, which would provide a legal basis for extending the scope of the marine network. In the framework of the Marine Strategy, the Commission has proposed a framework for the development of a rational approach for the full implementation of Natura 2000 at sea with a view to consider potential proposals for adapting the annexes to the Habitats Directive to strengthen them with regard to marine habitats and species.

This process is intended to provide the basis for the protection of other relevant habitat types and species. This challenging problem needs to be solved in a cooperative manner at EU level. There are a number of marine habitat types and species of European conservation concern that are not covered at present by the Habitats and Birds directives but which need protection to ensure their favourable conservation status. Many of these habitats and species are identified and listed by regional organisations such as OSPAR, The Helsinki Convention and the Barcelona Convention. Further scientific knowledge and evaluation will be needed to complement these listings.

2.6. Different marine zones. Application of Nature legislation in the European seas.

Member States have an obligation to apply nature legislation in waters under their jurisdiction and, outwards, in waters where they exercise sovereign rights. The Habitats and Birds Directives apply in the European territory of the Member States[17]. Therefore, waters adjacent

[17] see Birds Directive, Art 1

to the French overseas departments (DOM) and to the territories mentioned in Annex II to the Treaty establishing the European community[18] are excluded.

2.6.1. Definition of different marine zones

Under international law coastal states establish several jurisdictional marine zones as the Territorial Sea, the Exclusive Economic Zone (EEZ) and the Continental Shelf. Some coastal states establish other areas in which they claim exclusive sovereignty rights over natural resources such as "fishing protection zones", "environment protection zones"…

The European Community itself accepted the international rules on maritime zones adopted in the 1982 of the United Nations Convention on the Law of the Sea (UNCLOS).

The **Territorial sea** is the adjacent belt of sea where the sovereignty of a coastal State extends, beyond its land territory and internal waters. Under article 3 of UNCLOS all states have the right to establish the breath of the territorial sea up to a limit of 12 nautical miles.[19]

The **Territorial sea** is the adjacent belt of sea (up to 12 nautical miles) where the sovereignty of a coastal State extends, beyond its land territory and internal waters.

Marine waters on the landward side of the baseline of the territorial sea form part of the **internal waters** of the State (see detailed definition of internal waters in UNCLOS, article 8)[20] In the internal waters and the territorial sea, jurisdiction extends to the air space, the water column, its bed and subsoil.
